ABSTRACT

Anabas testudineus (climbing perch) is an economically significant native fish species of north-eastern India. In view of irregular natural breeding and scarcity of seed, the current work was carried out to assess induced breeding and embryonic development of *Anabas testudineus* under controlled aquarium circumstances. Healthy brooders were chosen in the ratio of 2:1 (female:male) and were injected with synthetic hormone S-GnRHa (Ovasis) at 0.3 ml/kg and 0.1ml/kg body weight for male and female respectively. Spawning occurred within 7-10 h after injection and hatching was seen within 16-18 h at 26-28°C. The reported rates of fertilization, hatching and survival were 80%, 60% and 30% respectively. The morula, blastula, and gastrula stages were completed at around 3-4 hours, 7 hours, and 8-9 hours post fertilization. The research shows that induced breeding using synthetic hormone is beneficial for the captive breeding and seed production of *Anabas testudineus*.

Keywords: fertilization, *Anabas testudineus*, nutrition and revenue production

INTRODUCTION

Fish culture has become an essential aspect of aquaculture since it helps considerably to food supply, nutrition and revenue production in underdeveloped nations [1]. Induced breeding methods are frequently used for several economically significant fish species which don't breed successfully in the confined circumstances for enhancement

**Harshita Kashyap et al.,**

of fish seed output. This approach is based on the use of hormonal stimulation to induced the release of egg and sperm from adult brood fish under regulated environmental circumstances. Induced breeding increases breeding success, hatchability and seed supply and decrease reliance on natural sources [2]. The Climbing Perch (*Anabas testudineus*) is a freshwater air-breathing fish of the family Anabantidae Commonly known as Koi or Kawoi. The species is widespread in various tropical and subtropical Asian nations and is prevalent in ponds, marshes, swamps, rice fields, canals and slow-moving freshwater bodies[3]. The fish has a particular respiratory organ, which allows it to tolerate little oxygen and stay alive for a while without water [4]. *Anabas testudineus* is regarded as one of the important indigenous fish species in North Eastern India due to its excellent nutritional quality, customer preference and market worth. The flavor of this species is popular and has *Anabas testudineus* is regarded as one of the important indigenous fish species in North Eastern India due to its excellent nutritional quality, customer preference and market worth also having necessary fatty acids required for human health [5].

It is increasing demand in local markets has generated more interest in its culture and seed production [6]. The natural reproduction of climbing perch mostly happens in the rainy season and is highly dependent on the environmental variables such as rainfall, water level and temperature. These environmental requirements mean natural seed supply is frequently insufficient for large-scale agriculture [7]. Hence techniques of induced breeding are essential for continued seed production under captive settings. In earlier investigations, several hormones and breeding strategies have been effectively employed for induced breeding of this species[8]. Though many works have focused on mating and rearing procedures of the climbing perch, although thorough information on embryonic development under controlled settings is still scarce. Therefore, the current work was carried out to examine the induced breeding performance using synthetic hormone and to investigate the embryonic developmental phases of *Anabas testudineus* under aquarium settings.

MATERIALS AND METHODS

The current study was carried out between February-April 2026 at the laboratory of Pandu College (affiliated college of Gauhati University) located in Guwahati, Assam, India.

Tank Preparation

A medium sized aquarium (45×35×60 cm) is used for broodstock management is thoroughly washed, then cleaned and subsequently rinsed with water to eliminate any germs or bacteria that could infect the brooders.

Collection of brooders and stock management

Brooders are being collected from Deepor Beel, Guwahati, Assam. Aeration was provided which gives an oxygen-rich environment in the aquarium, promoting a healthy habitat for fish. Broods were acclimatized for 10-15 days. Throughout the experimental period, various physicochemical parameters (water temperature, pH, dissolved oxygen) of the brood stock tank were measured following standard methods [9]. Water quality is a critical factor in fish breeding, making it an essential parameter for the success of the process.

Feeding methods

The brood fishes were fed twice a day once in the morning and in the afternoon. The feeds used are white portion of boiled eggs, larvae of insects and commercial feed. Measurement of the fish weight was attained 30-40 grams for both males and females, and the length was measured with a scale of approximately 9-14 cm.

Injection of brooders

Brooders were injected in the intra-muscular part which is generally given in the muscle below the tip of the pectoral fin, at a 45° angle. The brooders were injected in the noon (11:30am) with a dosage of 0.3 ml for females and 0.1 ml for males at the ratio of 2:1 (female: male).

**Harshita Kashyap et al.,****Study of Embryonic development**

Fertilized eggs are being taken in a petri dish for further study of embryonic development. Then they were taken in a slide with the help of a dropper and observed under a stereo zoom microscope and photographed. Fertilization rate was also calculated using the following formula: Fertilization Rate (%) = Number of fertilized egg/Total number of eggs×100, Survival rate was calculated using the following formula: Survival Rate (%) = Number of surviving fry/Total number of hatched larvae× 100

RESULTS**Water Parameters**

During the present investigation, the water quality parameters maintained in the breeding aquarium were found to be suitable for the induced breeding and embryonic development of *Anabas testudineus* (Table 1).

Induced Breeding

The fertilized eggs appeared spherical, transparent, non-adhesive, and buoyant, floating near the surface of the water. In contrast, unfertilized eggs appeared opaque and either remained suspended in the water column or settled at the bottom of the aquarium. After spawning, the brood fishes were removed carefully from the tank to prevent predation and disturbance to the developing eggs. Hatching was observed between 32–34 h after fertilization. Newly hatched larvae were free swimming and were initially fed with small zooplankton and phytoplankton collected from nearby pond water.

Fertilization Rate

A satisfactory fertilization rate and hatching rate (Table 2) was recorded in ovasis induced breeding.

Embryonic Development of *Anabas testudineus*

The embryonic development of *A. testudineus* was observed continuously from fertilization until larval hatching. The fertilized eggs were golden brown in colour, spherical in shape, transparent, and free floating in nature. The first cleavage was observed shortly after fertilization, resulting in the formation of the 2-cell stage. Subsequent cell divisions produced the 4-cell, 8-cell, 16-cell, and multi cellular stages. Cleavage divisions occurred rapidly and uniformly during the early developmental period. Further embryonic development led to the formation of morula and blastula stages, characterized by the accumulation and arrangement of blastomeres. Gastrulation was marked by differentiation and migration of embryonic cells, followed by the initiation of organogenesis. During segmentation, the embryonic body became clearly distinguishable with the development of head and tail regions. Newly hatched larvae possessed a yolk sac attached to the ventral region of the body and showed limited swimming movements immediately after hatching (Figure.10). Different time of stages of embryonic development was also recorded accordingly (Table 3). The first cleavage was seen within 20 minutes after fertilization followed by 4-cell, 8-cell, 16-cell and 32-cell phases at around 1 hour 5 minutes, 1 hour 25 minutes, 1 hour 55 minutes and 2 hours 15 minutes correspondingly. The hatching occurred after 32-34 hours.

DISCUSSION

The current work showed effective induced breeding and embryonic development of *Anabas testudineus* under controlled aquarium condition using synthetic hormone S-GnRHa (ovasis). The recorded water temperature throughout the experiment, pH and DO were found appropriate for effective breeding and larval development. Proper water quality maintenance and constant aeration may have played a crucial role in effective spawning and hatching[10]. Fertilized eggs were clear, spherical and floating, unfertilized eggs were opaque and sank at the bottom. Similar findings were observed in prior investigations of induced breeding of climbing perch[11]. During the

**Harshita Kashyap et al.,**

experiment, the observed low survival rates (30%) may be due to climatic variations, broodstock condition, handling stress and larval nutrition management[12]. Differences in breeding success reported across studies may also be attributable to hormone dose, water quality, climatic circumstances and hatchery techniques[13]. The embryonic developmental phases of *A. testudineus* were closely followed in the research and similarities can be observed in the developmental time of *A. testudineus* while compared with previous research[6,10]. The current research shown that induced breeding using synthetic hormone is a successful strategy for captive breeding and seed production of *Anabas testudineus*. The research also gives helpful information on embryonic development that might be used to improve hatchery management and larval rearing procedures for this commercially important significant indigenous fish species.

ACKNOWLEDGEMENT

The authors would like to acknowledge the Department of Zoology, Pandu, College, Assam 781012, India, for providing experimental facilities to conduct this study.

ABSTRACT

In this paper a new concept of strong α – level sets of bijective single valued neutrosophic sets and its graphs have been defined. Some of their structural characteristics have been established. Further basic set-theoretic operations on Bijective single valued neutrosophic sets, including subset relation, equality, intersection, union, complement and set difference are investigated in neutrosophic environment.

Keywords: Neutrosophic sets, Bijective single valued neutrosophic graph, strong α – level

INTRODUCTION

Graph theory is widely recognized as a branch of applied mathematics. It useful for real-life problems related to optimization and computer science. When uncertainty arises in the set of vertices, edges or both, a graph transforms into a fuzzy graph and intuitionistic fuzzy graphs [1] capturing the essence of ambiguity in its structure. But, when relations between vertices and edges become indeterminate it takes a new structure as neutrosophic graph. A fuzzy set was defined by Zadeh L [2] in 1965. His purpose was to develop a theory for sets which are ambiguous and imprecise. Every element in the universal set is assigned a grade of membership, a value in $[0,1]$. The elements in the universal set along with their grades of membership form a fuzzy set. The concept of neutrosophic sets was first introduced by Smarandache [3,4] as a generalization of intuitionistic fuzzy sets where the degree of membership of each element in X . The neutrosophic set is a powerful mathematical tool for dealing with incomplete, indeterminate and inconsistent information in real world. The neutrosophic sets are characterized by a truth-membership function

Rajalaxmi et al.,

(t), an indeterminacy-membership function (i) and a falsity- membership function (f) independently, which are within the real standard or nonstandard unit interval] $-0, 1 + [$. In order to conveniently use neutrosophic sets in real life applications.

Al-omeri et al. [5, 6, 7] studied about topological and metric spaces. Broumi et al. [8] introduced a neutrosophic graph, which allows the attachment of truth-membership (t), indeterminacy-membership (i) and falsity-membership (f) both to vertices and edges, and some of their properties. Wang et al. [9] introduced the concept of the single valued neutrosophic set (SVNS), as a subclass of the neutrosophic sets. Further [10, 11, 12, 13,14] deals with single valued NS. The single valued neutrosophic graph is a generalization of fuzzy graph and intuitionistic fuzzy graph. Johnson Awolola [15] who initially defined α -level NS, a new notion of α -level NS aimed at enhancing the precision and practicality of outcomes. Within this concept of an α -level NS and a robust variant termed the strong α -level NS. These concepts applied to the domain of neutrosophic graphs, enabling the exploration of diverse properties and their implications. In this paper, a new concept of strong α -level bijective single valued neutrosophic graph has been defined. Basic operations and De Morgan's Laws defined for strong α -level bijective single valued neutrosophic sets. Some of their relation between α -level and strong α -level bijective single valued neutrosophic sets has been studied. It also includes an application of strong α -level bijective single valued neutrosophic graph in agricultural farming.

Basic Operations on Bijective Single Valued Neutrosophic Set

Let X be a crisp set. A Bijective Single Valued Neutrosophic Set (BSVNS) A is characterized by truth membership function $T_V(P)$, an indeterminacy membership function $I_V(P)$ and a falsity membership function $F_V(P)$ for every point $p \in V$; $T_V(p), I_V(p), F_V(p) \in [0,1]$ such that $T_V(P_i)$ and $T_V(P_j)$, $I_V(P_i)$ and $I_V(P_j)$, $F_V(P_i)$ and $F_V(P_j)$ are distinct respectively, for any i and j .

Definition 1.2:[16]

A Bijective Single Valued Neutrosophic Graph (BSVNG) is a triplet $G = (V, \sigma, \mu)$ in which the truth-membership function of vertices and edges are bijective (i.e.) $\sigma_T : V \rightarrow [0,1]$ and $\mu_T : E \subseteq V \times V \rightarrow [0,1]$ are bijective. Similarly, indeterminacy-membership function of vertices and edges are bijective respectively i.e., $\sigma_I : V \rightarrow [0,1]$ and $\mu_I : E \subseteq V \times V \rightarrow [0,1]$ are bijective, and $\sigma_F : V \rightarrow [0,1]$ and $\mu_F : E \subseteq V \times V \rightarrow [0,1]$ are bijective where $\mu_T(V_i, V_j) < \min(\sigma_T(v_i), \sigma_T(v_j))$, $\mu_I(V_i, V_j) > \max(\sigma_I(v_i), \sigma_I(v_j))$, $\mu_F(V_i, V_j) > \max(\sigma_F(v_i), \sigma_F(v_j))$ for and $v_i \in V$ $i,j=1,2,...n$.

The following conditions are trivial in BSVNG as in case of SVNG

- i. $0 \leq \sigma_T(v_i) + \sigma_I(v_i) + \sigma_F(v_i) \leq 3$ for all $v_i \in V$ ($i=1,2,...n$)
- ii. $0 \leq \mu_T(v_i, v_j) + \mu_I(v_i, v_j) + \mu_F(v_i, v_j) \leq 3$ for all $v_i, v_j \in V \times V$ ($i,j=1,2,...n$).

Definition 1.3:

A Bijective Single Valued Neutrosophic Graph $G = (V, E)$ is said to be an Empty Bijective Single Valued Neutrosophic Graph if $V = \Phi$ and $E = \Phi$.

**Definition 1.4:**

Let A be any Bijective Single Valued Neutrosophic set in a non-empty set X . Then for any $\alpha \in [0,1]$ the strong α -level sets of A denoted by $S(V, \alpha)$ and defined as $S(V, \alpha) = \{x \in X : T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\}$

Definition 1.5:

A Bijective Single Valued Neutrosophic Graph $G=(V, E)$ is called strong α -level (or) $S(G, \alpha)$ - level Bijective Single Valued Neutrosophic Graph if

$$T_V(x) > \alpha, I_V(x) + F_V(x) < 1 - \alpha \text{ for all } x \in V$$

$$T_E(xy) > \alpha, I_E(xy) + F_E(xy) < 1 - \alpha \text{ for all } xy \in E, \alpha \in [0,1]$$

Remark 1.6:

If G is a Bijective Single Valued Neutrosophic Graph and if $\alpha = 1$ then $V=\Phi$ and $E=\Phi$.

Definition 1.7:

If A and B are two Bijective Single Valued Neutrosophic sets in a non-empty set X . Then

1. $A \subseteq B \Leftrightarrow T_A(x) \leq T_B(x), I_A(x) \geq I_B(x), F_A(x) \geq F_B(x) \text{ for all } x \in X$
2. $A = B \Leftrightarrow T_A(x) = T_B(x), I_A(x) = I_B(x), F_A(x) = F_B(x) \text{ for all } x \in X$
3. $A \cap B = \{x, \wedge(T_A(x), T_B(x)), \vee(I_A(x), I_B(x)), \vee(F_A(x), F_B(x)) \mid \text{for all } x \in X\}$
4. $A \cup B = \{x, \vee(T_A(x), T_B(x)), \wedge(I_A(x), I_B(x)), \wedge(F_A(x), F_B(x)) \mid \text{for all } x \in X\}$
5. $A^c = \{x, F_A(x), 1 - I_A(x), T_A(x) \mid \text{for all } x \in X\}$
6. $A \setminus B = \{x, T_A(x) \wedge F_B(x), I_A(x) \vee 1 - I_B(x), F_A(x) \vee T_B(x) \mid \text{for all } x \in X\}$

Theorem 1.8:

If A and B are two Bijective Single Valued Neutrosophic sets in a non-empty X and $\alpha, \beta \in [0,1]$, then $A \subseteq B \Rightarrow S(A, \alpha) \subseteq S(B, \alpha)$.

Proof:

Let $A \subseteq B$. Assume that $x \in S(A, \alpha)$

$$\Rightarrow T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha$$

$$\Rightarrow T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha$$

$$[\text{Since, } A \subseteq B \Rightarrow T_A(x) \leq T_B(x), I_A(x) \geq I_B(x), F_A(x) \geq F_B(x)]$$

$$\Rightarrow x \in S(B, \alpha)$$

$$\text{Hence } A \subseteq B \Rightarrow S(A, \alpha) \subseteq S(B, \alpha).$$

Theorem 1.9:

Let A and B be Bijective single valued neutrosophic sets of a non empty set X and $\alpha, \beta \in [0,1]$. If $\alpha \geq \beta$, then the strong α level of A is contained in strong β level of B

Proof:

Let $\alpha \geq \beta$. Assume that $x \in S(A, \alpha)$

**Theorem 1.10:**

If A and B are two Bijective Single Valued Neutrosophic sets in a non-empty X and $\alpha, \beta \in [0,1]$, then

- i) $S(A \cup B, \alpha) = S(A, \alpha) \cup S(B, \alpha).$
- ii) $S(A \cap B, \alpha) = S(A, \alpha) \cap S(B, \alpha).$

Proof:

$$\begin{aligned}
 S(A \cup B, \alpha) &= \{x \in X: T_{A \cup B}(x) > \alpha, I_{A \cup B}(x) + F_{A \cup B}(x) < 1 - \alpha\} \\
 &= \{x \in X: \vee \{T_A(x), T_B(x)\} > \alpha, \wedge \{I_A(x), I_B(x)\} + \wedge \{F_A(x), F_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \{T_A(x) \vee T_B(x)\} > \alpha, \{I_A(x) + F_A(x)\} \wedge \{I_B(x) + F_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \{T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \cup \{T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha\} \\
 &\quad \{x \in X: T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \cup \\
 &= \{x \in X: T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha\} \\
 &= S(A, \alpha) \cup S(B, \alpha)
 \end{aligned}$$

$$\text{Hence } S(A \cup B, \alpha) = S(A, \alpha) \cup S(B, \alpha).$$

$$\begin{aligned}
 S(A \cap B, \alpha) &= \{x \in X: T_{A \cap B}(x) > \alpha, I_{A \cap B}(x) + F_{A \cap B}(x) < 1 - \alpha\} \\
 &= \{x \in X: \wedge \{T_A(x), T_B(x)\} > \alpha, \vee \{I_A(x), I_B(x)\} + \vee \{F_A(x), F_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: T_A(x) \wedge T_B(x) > \alpha, \{I_A(x) + F_A(x)\} \vee \{I_B(x) + F_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \{T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \cap \{T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha\}\} \\
 &\quad \{x \in X: T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \cap \\
 &= \{x \in X: T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha\} \\
 &= S(A, \alpha) \cap S(B, \alpha)
 \end{aligned}$$

$$\text{Hence } S(A \cap B, \alpha) = S(A, \alpha) \cap S(B, \alpha).$$

Theorem 1.11

Two neutrosophic Bijective singled valued sets A and B are equal iff their α level sets are equal for all $\alpha \in [0,1]$

Proof:

Assume that $A=B$

$$\Rightarrow T_A(x) = T_B(x), I_A(x) = I_B(x), F_A(x) = F_B(x), \text{ for all } x \in X.$$

We have, $S(A, \alpha)$

$$\begin{aligned}
 &= \{x \in X: T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \\
 &= \{x \in X: T_B(x) > \alpha, I_B(x) + F_B(x) < 1 - \alpha\} \text{ [Since, } A=B \text{]} \\
 &= S(B, \alpha)
 \end{aligned}$$

$$\text{Hence } A = B \Leftrightarrow (A, \alpha) = (B, \alpha) \text{ for all } \alpha \in [0,1].$$

Conversely, let us consider for $\alpha \in [0,1]$, $S(A, \alpha) = S(B, \alpha)$ but $A \neq B$. Suppose $x \in A$ such that $x \notin B$. So, there exists an $\alpha \in [0,1]$ for each

$x \in S(A, \alpha)$. But, $x \notin B$ implies $x \notin S(B, \alpha)$ for each $\alpha \in [0,1]$. Therefore $S(A, \alpha) \neq S(B, \alpha)$ which is a contradiction to $S(A, \alpha) = S(B, \alpha)$ for all $\alpha \in [0,1]$.

Hence, $A = B \Leftrightarrow S(A, \alpha) = S(B, \alpha)$, for all $\alpha \in [0,1]$.

Theorem 1.12

The strong α level set of the union of a family of sets is equal to the union of their strong α level sets.

Proof:

$$\begin{aligned} & S\left(\bigcup_{i \in J} (A_i, \alpha)\right) \\ &= \{x \in X : T_{\bigcup_{i \in J} A_i}(x) > \alpha, I_{\bigcup_{i \in J} A_i}(x) + F_{\bigcup_{i \in J} A_i}(x) < 1 - \alpha\} \\ &= \{x \in X : \bigvee_{i \in J} T_{A_i}(x) > \alpha, \bigwedge_{i \in J} I_{A_i}(x) + \bigwedge_{i \in J} F_{A_i}(x) < 1 - \alpha\} \\ &= \{x \in X : \bigvee_{i \in J} T_{A_i}(x) > \alpha, \bigwedge_{i \in J} \{I_{A_i}(x) + F_{A_i}(x)\} < 1 - \alpha\} \\ &= \bigcup_{i \in J} \{x \in X : T_{A_i}(x) > \alpha, I_{A_i}(x) + F_{A_i}(x) < 1 - \alpha\} \\ &= \bigcup_{i \in J} S(A_i, \alpha) \end{aligned}$$

$$\text{Hence } S\left(\bigcup_{i \in J} (A_i, \alpha)\right) = \bigcup_{i \in J} S(A_i, \alpha).$$

Theorem 1.13

For any Neutrosophic set A_i ,

$$S\left(\bigcap_{i \in J} A_i, \alpha\right) = \bigcap_{i \in J} S(A_i, \alpha).$$

Proof:

$$\begin{aligned} & S\left(\bigcap_{i \in J} (A_i, \alpha)\right) \\ &= \{x \in X : T_{\bigcap_{i \in J} A_i}(x) > \alpha, I_{\bigcap_{i \in J} A_i}(x) + F_{\bigcap_{i \in J} A_i}(x) < 1 - \alpha\} \\ &= \{x \in X : \bigwedge_{i \in J} T_{A_i}(x) > \alpha, \bigvee_{i \in J} I_{A_i}(x) + \bigvee_{i \in J} F_{A_i}(x) < 1 - \alpha\} \\ &= \{x \in X : \bigwedge_{i \in J} T_{A_i}(x) > \alpha, \bigvee_{i \in J} \{I_{A_i}(x) + F_{A_i}(x)\} < 1 - \alpha\} \\ &= \bigcap_{i \in J} \{x \in X : T_{A_i}(x) > \alpha, I_{A_i}(x) + F_{A_i}(x) < 1 - \alpha\} \\ &= \bigcap_{i \in J} S(A_i, \alpha) \end{aligned}$$

$$\text{Hence } S\left(\bigcap_{i \in J} (A_i, \alpha)\right) = \bigcap_{i \in J} S(A_i, \alpha).$$

Theorem 1.14:

If A is a Bijjective Single-Valued Neutrosophic set then $S(A, \alpha) \subseteq (A, \alpha)$

for all $\alpha \in [0,1]$.

**Proof:**

Let $x \in S(A, \alpha)$

$$\Rightarrow T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha$$

$$\Rightarrow T_A(x) \geq \alpha, I_A(x) + F_A(x) \leq 1 - \alpha$$

$$\Rightarrow x \in (A, \alpha)$$

Hence $S(A, \alpha) \subseteq (A, \alpha)$, for all $\alpha \in [0, 1]$.

Theorem 1.15:

If A is a Bijective Single-Valued Neutrosophic set in a fixed set X . Let $\beta \in [0, 1]$ and $\alpha_i \in [0, \beta)$ for each $i \in J$ where Λ is an indexed set. Then $S(A, \beta) \subseteq \bigcap_{i \in J} S(A, \alpha_i)$.

Proof:

Assume that $x \in S(A, \beta)$

$$\Rightarrow T_A(x) > \beta, I_A(x) + F_A(x) < 1 - \beta, \text{ for all } x \in X$$

$$\Rightarrow T_A(x) > \beta > \alpha_i, I_A(x) + F_A(x) < 1 - \beta < 1 - \alpha_i, \text{ for all } x \in X \text{ and } \alpha_i \in [0, \beta)$$

$$\Rightarrow T_A(x) > \alpha_i, I_A(x) + F_A(x) < 1 - \alpha_i, \text{ for all } x \in X \text{ and } \alpha_i \in [0, \beta)$$

$$\Rightarrow x \in S(A, \alpha_i), \alpha_i \in [0, \beta)$$

Hence $S(A, \beta) \subseteq \bigcap_{i \in J} S(A, \alpha_i)$.

Theorem 1.16:

If A is a Bijective Single Valued Neutrosophic set in a fixed set X . Let $\beta \in [0, 1]$ and $\alpha_i \in (\beta, 1]$ for each $i \in J$ where Λ is an indexed set. Then $\bigcup_{i \in J} S(A, \alpha_i) \subseteq S(A, \beta)$.

Proof:

Let $x \in \bigcup_{i \in J} S(A, \alpha_i)$

Then $x \in S(A, \alpha_i)$ for each $i \in J$

$$\Rightarrow T_A(x) > \alpha_i, I_A(x) + F_A(x) < 1 - \alpha_i$$

$$\Rightarrow T_A(x) > \alpha_i > \beta, I_A(x) + F_A(x) < 1 - \alpha_i < 1 - \beta$$

$$\Rightarrow T_A(x) > \beta, I_A(x) + F_A(x) < 1 - \beta$$

$$\Rightarrow x \in S(A, \beta)$$

Hence $\bigcup_{i \in J} S(A, \alpha_i) \subseteq S(A, \beta)$

De Morgan's Laws in Bijective Single Valued Neutrosophic sets:**Theorem 2.1:**

If A and B are two Bijective Single Valued Neutrosophic sets in a non-empty X . Then the De Morgan's Laws hold:

- $S(A \cup B, \alpha)^c = S(A, \alpha)^c \cap S(B, \alpha)^c$
- $S(A \cap B, \alpha)^c = S(A, \alpha)^c \cup S(B, \alpha)^c$ for all $\alpha \in [0, 1]$.

Proof:

$$\begin{aligned}
 \text{i. } & S(A \cup B, \alpha)^c \\
 &= \{x \in X: T_{(A \cup B)^c}(x) > \alpha, I_{(A \cup B)^c}(x) + F_{(A \cup B)^c}(x) < 1 - \alpha\} \\
 &= \{x \in X: T_{A^c \cap B^c}(x) > \alpha, I_{A^c \cap B^c}(x) + F_{A^c \cap B^c}(x) < 1 - \alpha\} \\
 &= \{x \in X: \wedge \{T_{A^c}(x), T_{B^c}(x)\} > \alpha, \vee \{I_{A^c}(x), I_{B^c}(x)\} + \vee \{F_{A^c}(x), F_{B^c}(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \wedge \{F_A(x), F_B(x)\} > \alpha, \vee \{1 - I_A(x), 1 - I_B(x)\} + \vee \{T_A(x), T_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \{F_A(x) \wedge F_B(x)\} > \alpha, \{1 - I_A(x) + T_A(x)\} \vee \{1 - I_B(x) + T_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: F_A(x) > \alpha, 1 - I_A(x) + T_A(x) < 1 - \alpha\} \cap \\
 &\quad \{x \in X: F_B(x) > \alpha, 1 - I_B(x) + T_B(x) < 1 - \alpha\} \\
 &= S(A, \alpha)^c \cap S(B, \alpha)^c \\
 \text{Hence } & S(A \cup B, \alpha)^c = S(A, \alpha)^c \cap S(B, \alpha)^c
 \end{aligned}$$

$$\begin{aligned}
 \text{ii. } & S(A \cap B, \alpha)^c \\
 &= \{x \in X: T_{(A \cap B)^c}(x) > \alpha, I_{(A \cap B)^c}(x) + F_{(A \cap B)^c}(x) < 1 - \alpha\} \\
 &= \{x \in X: T_{A^c \cup B^c}(x) > \alpha, I_{A^c \cup B^c}(x) + F_{A^c \cup B^c}(x) < 1 - \alpha\} \\
 &= \{x \in X: \vee \{T_{A^c}(x), T_{B^c}(x)\} > \alpha, \wedge \{I_{A^c}(x), I_{B^c}(x)\} + \wedge \{F_{A^c}(x), F_{B^c}(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \vee \{F_A(x), F_B(x)\} > \alpha, \wedge \{1 - I_A(x), 1 - I_B(x)\} + \wedge \{T_A(x), T_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: \{F_A(x) \vee F_B(x)\} > \alpha, \{1 - I_A(x) + T_A(x)\} \wedge \{1 - I_B(x) + T_B(x)\} < 1 - \alpha\} \\
 &= \{x \in X: F_A(x) > \alpha, 1 - I_A(x) + T_A(x) < 1 - \alpha\} \cup \\
 &\quad \{x \in X: F_B(x) > \alpha, 1 - I_B(x) + T_B(x) < 1 - \alpha\} \\
 &= S(A, \alpha)^c \cup S(B, \alpha)^c \\
 \text{Hence } & S(A \cap B, \alpha)^c = S(A, \alpha)^c \cup S(B, \alpha)^c.
 \end{aligned}$$

Remark 2.2:

If $\{V_i \mid i \in J\}$ be a family of Bijjective Single Valued Neutrosophic sets and $\alpha \in [0, 1]$. Then the De Morgan's Laws hold:

$$\begin{aligned}
 \text{i. } & S\left(\bigcup_{i \in J} V_i, \alpha\right)^c = \bigcap_{i \in J} S(V_i, \alpha)^c. \\
 \text{ii. } & S\left(\bigcap_{i \in J} V_i, \alpha\right)^c = \bigcup_{i \in J} S(V_i, \alpha)^c.
 \end{aligned}$$

Theorem 2.3:

If A and B are two Bijjective Single Valued Neutrosophic sets in a non-empty set X and $\alpha \in [0, 1]$. Then $A \subseteq B \Rightarrow S(B, \alpha)^c \subseteq S(A, \alpha)^c$.

Proof:

Given that $A \subseteq B$

Let $x \in S(B, \alpha)^c$

$$\Rightarrow F_B(x) > \alpha, 1 - I_B(x) + T_B(x) < 1 - \alpha$$

Since $A \subseteq B \Rightarrow T_A(x) \leq T_B(x), I_A(x) \geq I_B(x), F_A(x) \geq F_B(x)$

$$\Rightarrow F_A(x) > \alpha, 1 - I_A(x) + T_A(x) < 1 - \alpha$$

$$\Rightarrow x \in S(A, \alpha)^c$$

Hence $A \subseteq B \Rightarrow S(B, \alpha)^c \subseteq S(A, \alpha)^c$.

Theorem 2.4:

If A and B are two Bijective Single Valued Neutrosophic sets in a non-empty set X and $\alpha \in [0, 1]$. Then $S(A \setminus B, \alpha) = S(A \cap B^c, \alpha)$.

Proof:

$$\begin{aligned} S(A \setminus B, \alpha) &= \{x \in X: T_A(x) \wedge F_B(x) > \alpha, \{I_A(x) \vee 1 - I_B(x)\} + \{F_A(x) \vee T_B(x)\} < 1 - \alpha\} \\ &= \{x \in X: \wedge \{T_A(x), F_B(x)\} > \alpha, \vee \{I_A(x), 1 - I_B(x)\} + \{F_A(x), T_B(x)\} < 1 - \alpha\} \\ &= \{x \in X: T_A(x) > \alpha, I_A(x) + F_A(x) < 1 - \alpha\} \cap \\ &\quad \{F_B(x) > \alpha, 1 - I_B(x) + T_B(x) < 1 - \alpha\} \\ &= S(A \cap B^c, \alpha) \end{aligned}$$

Hence $S(A \setminus B, \alpha) = S(A \cap B^c, \alpha)$

Role of Strong α – Level Bijective Single Valued Neutrosophic Graphs In Agricultural Farming:

Agricultural farming is the science, art and business of cultivating soil, producing crops and raising livestock to provide food, fiber and raw materials. As a foundational human activity, it includes various systems from traditional subsistence farming to modern industrial agriculture, driving economic growth and global food security.

Agricultural land or farm land refers to areas used for producing food, fiber and livestock, including arable land (crops), permanent pastures and orchards. Irrigation is the artificial application of water to soil to assist in crop production, particularly in areas with irregular rainfall, dry seasons or to ensure consistent agricultural yields.

Mathematical Representation

To determine the agricultural land suitable for crop cultivation in the context of BSVNG.

Consider a BSVNG, vertices represented as Agricultural lands and edges represented as irrigation efficiency.

A vertex membership values are represented as

T- nature of water

I - uncertainty rainfall

F – lack of moisture

The edges membership values are represented as

T - Drip Irrigation

I – Sprinkle Irrigation

F – Surface Irrigation

Here the vertex set is $V = (A, B, C, D)$ represents agricultural lands $E = (e_1, e_2, e_3, e_4)$ represents an irrigation efficiency in Fig.1

Barley cultivation

Rajalaxmi et al.,

To find which agricultural land is suitable for 10 % of the barley cultivation

Let $\alpha = 0.1$

Then $1-\alpha = 0.9$

10 % of the barley cultivation is given in Fig.2

Agricultural lands A, B, C and D are suitable for 10% of the Barley cultivation.

(i.e.) the nature of water, uncertainty of rainfall and lack of moisture suitable for 10% barley cultivation in agricultural lands are A, B, C and D.

In 10% barley cultivation, irrigation efficiency is suitable for the lands BD and CD.

But there is no irrigation between the lands AC and AB.

Maize cultivation

To find which agricultural land is suitable for 30 % of the maize cultivation.

Let $\alpha = 0.3$

Then $1-\alpha = 0.7$

Agricultural lands B and D suitable for 30% of the Maize cultivation is represented in Fig.3

That is, nature of water, uncertainty of rainfall and lack of moisture suitable for 30% maize cultivation in agricultural lands are B and D.

In 30% maize cultivation, the irrigation efficiency is suitable for land BD.

But there is no irrigation efficiency between the lands AC, AB and CD.

Similarly, we can find the different level of crops cultivation in BSVNG.

CONCLUSION

Some results of Strong α – Level Bijective Single Valued Neutrosophic Graphs have been found using basic operations. De Morgan's Laws verified for Strong α – Level Bijective Single Valued Neutrosophic sets. Relation between α – Level and Strong α – Level Bijective Single Valued Neutrosophic sets has been found. In future, some more properties of α – level and strong α – level bijective single valued neutrosophic graphs can be explored.

ABSTRACT

This study develops two stages ChSP-(0,2) using fuzzy parameters. FOC Curve is explained through illustrations. FOC Curve values are determined using fuzzy parameter where tables and figures are provided by fixing the sample size (n). The optimum value units required in the sample is obtained such that to satisfy both the condition of risks for the given conditions and also minimizes the sum of the risks.

Keywords: Operating Characteristic (OC) Curve , Acceptance Sampling , Fuzzy number, Trapezoidal Fuzzy Number

INTRODUCTION

Acceptance sampling is used to obtain higher quality at a reduced cost and enhance productivity. [15] It is used in industries to reduce product damage during inspection. Occasionally, results acquired in fractional values for proportion defective, acceptance number and sample size are impossible to be displayed as crisp numbers in a few industries. [19] To alleviate this discomfort in acceptance sampling , a fuzzy set is used. In designing medication, meteorology , assembling etc, where fuzzy is applied for numerous spaces of daily life [24]. Montgomery [15] introduced statistical quality control. Schilling [19] acceptance sampling quality control. Dodge [2] provided OC curve and properties of chain sampling plan. Clark [1] studied oc curves for ChSP-1. Frishman and Fred [4] prolonged chain sampling plan. Raju [17] studied contributions of chain sampling plans. Stephens [20] evaluated cumulative results of sampling plans. Stephens and Dodge presented a generalised family of two-stage chain sampling plans that

Kavipriya and Sudamani Ramaswamy

are expansions of ChSP-1 plans [21, 22, 23]. Narasimha murthy [16] studied special purpose plans. Raju and Narasimha murthy [18] proposed two stage ChSP-(0,2) and ChSP-(1,2) as part- I. Jothikumar and Raju [6] developed constructions for two stage ChSP-(0,2) and ChSP-(1,2) as part- II.

Kahraman and Kaya [7] proposed fuzzy acceptance sampling plans for single and double sampling plan. The outcome shows that fuzzy boundary gives greater adaptability and convenience. Jamkhaneh and Sadeghpour Gildeh [5] discussed about ChSP-1 using fuzzy probability theory. Kahraman, Kaya and Turanoglu [8] derived acceptance probability using fuzzy parameters and its OC curves. Kavi priya and Sudamani Ramaswamy [9,10,11] designed MChSP-1, TSMCChSP-1, TSCCChSP-1 plans using fuzzy parameters. Kavi priya and Sudamani Ramaswamy [12,13,14] used fuzzy parameters for various plans like DSP(0,1), RGS and ChSP-(0,1). Basic definitions of fuzzy sets are provided in this work, followed by operating procedures for ChSP-(0,2), FOC curves for two stage ChSP-(0,2) and tables with examples. Binomial distribution is used to obtain the parameters. FPA values are calculated for the given $\bar{AQL}$ and $\bar{LQL}$ which are presented in tables, which can be used for the selection of the plan.

Definitions

Fuzzy Number (Zadeh [24] and Dubis & Prade [3]): "Fuzzy set that are characterized on the arrangement of real numbers having the structure $\tilde{E}: R$ tends to $[0,1]$ are known as fuzzy number. A fuzzy number $\tilde{E}$ will be a fuzzy set in the real line that fulfills the state of both normal and convexity".

Trapezoidal fuzzy number (Zadeh [24] and Dubis & Prade [3]): "If trapezoidal fuzzy numbers (TrFNs) are $\tilde{E} = (e_1, e_2, e_3, e_4)$ and its membership function as"

$$\text{TrFN} = \begin{cases} 0 & , \text{ otherwise} \\ \frac{y-e_1}{e_2-e_1} & , e_1 \leq y \leq e_2 \\ 1 & , e_2 \leq y \leq e_3 \\ \frac{e_4-y}{e_4-e_3} & , e_3 \leq y \leq e_4 \\ 0 & , \text{ otherwise} \end{cases} \quad (1)$$

"The interval of confidence of trapezoidal fuzzy number defined by γ cuts can be written as follows"

$$\tilde{E}[\gamma] = [e_1 + (e_2 - e_1)\gamma, e_4 - (e_4 - e_3)\gamma] \quad (2)$$

Operating Procedure for ChSP- (0,2)

"According to Narasimha Murthy [16], Raju and Narasimha Murthy [18] and Jothikumar and Raju [6]

Step 1: Select a sample of size n from the first lot and each subsequent lot at the outset.

Step 2: Count the number of defective units (d) in each sample and add the total number of defective units (D) in all samples from the first to the last.

Step 3: During the cumulation, accept the lot linked with each current sample as long as $D_i < c_1$; $1 < i \leq k_1$

Step 4: Once all k_1 consecutive samples have been accepted, add the defective units, D , in the samples plus any extra samples up to and including k_2 sample.

Step 5: During the cumulation, accept the lot linked with each new sample as long as c_2 , $k_1 < i \leq k_2$

Step 6: Start cumulating defective units as a moving total over k_2 samples by adding the current sample result while dropping the sample result of the k_2 th preceding sample from the sum once the second stage of the restart period has been successfully completed. Continue this method as long as $D_i < c_2$ allows, accepting in each case.

Step 7: If $D_i > c$, reject the lot, then go back to Step 1 and restart the process again."

Fuzzy Probability of Acceptance (FPA) and Fuzzy Proportion of Defective (FPrD)

Consider $\check{p}_s = (s, e_2 + s, e_3 + s, e_4 + s)$ Where $e_i = b_i - b_1$, $i = 2,3,4$ and $s \in [0,1 - e_4]$ γ cuts of trapezoidal fuzzy number to find fuzzy operating characteristic curve where $\gamma = 0$ and $\gamma = 1$. FPA is calculated using binomial distribution. γ cut of trapezoidal fuzzy number is used to solve ChSP-(0,2) such that $\tilde{E}[\gamma] = [e_1 + (e_2 - e_1)\gamma, e_4 -$

Kavipriya and Sudamani Ramaswamy

$(e_4 - e_3)\gamma$ and taking $\gamma=0,1$ then we get FPrD value as $\check{p}_s[\gamma] = [\check{p}_s^{lb}, \check{p}_s^{ub}]$ and FPA value using $\check{P}_{as}[\gamma] = [\check{P}_{as}^{lb}, \check{P}_{as}^{ub}]$.

The probability of acceptance for ChSP-(0, 2) is given by

$$P_a = \left\{ p_0 + (p_1 + p_2)p_0^{k_1} \left[\frac{(1-p_0^{k_2-k_1})}{(1-p_0)} \right] + p_1^2 p_0^{k_1} \left[\frac{(1-p_0^{k_2-k_1})}{(1-p_0)^2} - \frac{(k_2-k_1)p_0^{k_2-k_1-1}}{(1-p_0)} \right] \right\} \div \left\{ 1 + (p_1 + p_2)p_0^{k_1} \left[\frac{(1-p_0^{k_2-k_1-1})}{(1-p_0)} \right] + p_1^2 p_0^{k_1} \left[\frac{(1-p_0^{k_2-k_1-1})}{(1-p_0)^2} - \frac{(k_2-k_1-1)p_0^{k_2-k_1-2}}{(1-p_0)} \right] \right\}, k_2 > k_1 \quad \dots\dots\dots (1)$$

FPA for ChSP-(0, 2) is given by

$$\begin{aligned} \check{P}_{as} &= \left\{ (1-\check{p}_s)^n + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{1-(1-\check{p}_s)^n} \right] \right. \\ &+ \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1)(1-\check{p}_s)^{n(k_2-k_1-1)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \\ &\div \left\{ 1 + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{1-(1-\check{p}_s)^n} \right] \right. \\ &+ \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1-1)(1-\check{p}_s)^{n(k_2-k_1-2)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \\ \check{P}_{as}^{lb}[\gamma] &= \min \left[\left\{ (1-\check{p}_s)^n + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{1-(1-\check{p}_s)^n} \right] \right. \right. \right. \\ &+ \left. \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1)(1-\check{p}_s)^{n(k_2-k_1-1)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \right. \\ &\div \left. \left\{ 1 + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{1-(1-\check{p}_s)^n} \right] \right. \right. \\ &+ \left. \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1-1)(1-\check{p}_s)^{n(k_2-k_1-2)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \right] \\ \check{P}_{as}^{ub}[\gamma] &= \max \left[\left\{ (1-\check{p}_s)^n + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{1-(1-\check{p}_s)^n} \right] \right. \right. \right. \\ &+ \left. \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1)(1-\check{p}_s)^{n(k_2-k_1-1)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \right. \\ &\div \left. \left\{ 1 + \left(n\check{p}_s(1-\check{p}_s)^{n-1} + \frac{(n\check{p}_s)^2}{2} (1-\check{p}_s)^{n-2} \right) (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{1-(1-\check{p}_s)^n} \right] \right. \right. \\ &+ \left. \left. (n\check{p}_s(1-\check{p}_s)^{n-1})^2 (1-\check{p}_s)^{n k_1} \left[\frac{(1-(1-\check{p}_s)^{n(k_2-k_1-1)})}{(1-(1-\check{p}_s)^n)^2} - \frac{(k_2-k_1-1)(1-\check{p}_s)^{n(k_2-k_1-2)}}{(1-(1-\check{p}_s)^n)} \right] \right\} \right] \\ \check{P}_{as}[\gamma] &= [\check{P}_{as}^{lb}, \check{P}_{as}^{ub}] \end{aligned}$$

Using these above formulae the values are calculated and presented in Table 1.

Table 1 shows that when n value is fixed as 10, $k_1=1$ and $k_2=3$, the fuzzy proportion defective value is computed for both gamma equal zero and one, respectively using γ cut of trapezoidal fuzzy number.

Fuzzy Operating Characteristic (FOC) Curve

OC curve has contains an upper and lower bounds, it is referred to as the FOC Curve. When γ values increases from 0 to 1, FOC Curve value becomes closer.

Kavipriya and Sudamani Ramaswamy

Real Life Application

When the optical manufacturing company produces large number of optical. Before taking optical to showroom for sales, the quality of optical is checked by person working in optical showroom. She used two stage of ChSP-(0,2) to inspect the optical. (whether the frame is in correct size or lens are fixed correctly etc).

Assume that $\check{p}_s = (0.002, 0.003, 0.004, 0.005)$, $n=10$, $k_1=1$ and $k_2=3$. Then γ cut of trapezoidal fuzzy number is used to get fuzzy proportion defective value for $\gamma=0$ and $\gamma=1$ we get FPA as $\check{P}_{as}(0) = [0.9298 \quad 0.8136]$ and $\check{P}_{as}(1) = [0.8523 \quad 0.8319]$.

Example 1

Assuming $\check{p}_s = (0.001, 0.002, 0.003, 0.004)$ and a sample size n is 10, γ cut of trapezoidal fuzzy number is used to compute the interval of FPrD $\check{p}_s[0] = [0.001 \quad 0.005]$, $\check{p}_s[1] = [0.003 \quad 0.004]$ and FPA values as given in Table 2. When comparing the value of $\check{P}_{as}[\gamma = 0]$ to the value of $\check{P}_{as}[\gamma = 1]$, the table 1 shows that the value of $\gamma = 0$ gives a superior outcome. Table 2 shows how the fuzzy parameter is determined using ChSP-(0, 2) for various values of k_1 and k_2 where k_1 is lower than k_2 values.

Example 2

If $\check{p}_s = (0.001, 0.002, 0.003, 0.004)$ and the sample size is changed, the fuzzy proportion defective $\check{p}_s[0] = [0.001 \quad 0.005]$, $\check{p}_s[1] = [0.003 \quad 0.004]$ and FPA values are calculated using γ cut of trapezoidal fuzzy number as indicated in the table below. Table 3 shows that if $k_1=1$ and $k_2=3$ are fixed in ChSP-(0, 2) then sample size values are adjusted using the fuzzy parameter

Determination of Sample size

The risk of producer is denoted by $\widetilde{\alpha}_f$ and the risk of consumer is denoted by $\widetilde{\beta}_f$. Accepting quality level ($\widetilde{AQL}$) is denoted as $\check{p}_{1f}$ and Limiting quality level ($\widetilde{LQL}$) is denoted as $\check{p}_{2f}$. Here two stage of ChSP-(0,2) plan is designed using the fuzzy parameter. The sample size n is calculated in order to satisfy both the inequalities for $\check{P}_{1fa}$ and $\check{P}_{2fa}$ simultaneously for the given values of $\widetilde{\alpha}_f$ and $\widetilde{\beta}_f$. $\check{P}_{1fa} \geq 1 - \widetilde{\alpha}_f$ and $\check{P}_{2fa} \leq \widetilde{\beta}_f$ where $\widetilde{\alpha}_f = 0.05$ and $\widetilde{\beta}_f = 0.10$ is fixed so that the interval of FPA is satisfied the conditions $\check{P}_{1fa} \geq 0.95$ and $\check{P}_{2fa} \leq 0.10$ for different sample sizes.

$$\begin{aligned} \overline{P}_{1fa} = & \left\{ (1 - \widetilde{p}_{1f})^n + \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1 - \widetilde{p}_{1f})^{n-2} \right) (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1)})}{1 - (1 - \widetilde{p}_{1f})^n} \right] \right. \\ & + \left. \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} \right)^2 (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1)})}{(1 - (1 - \widetilde{p}_{1f})^n)^2} - \frac{(k_2 - k_1)(1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)}}{(1 - (1 - \widetilde{p}_{1f})^n)} \right] \right\} \\ & \div \left\{ 1 + \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1 - \widetilde{p}_{1f})^{n-2} \right) (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)})}{1 - (1 - \widetilde{p}_{1f})^n} \right] \right. \\ & + \left. \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} \right)^2 (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)})}{(1 - (1 - \widetilde{p}_{1f})^n)^2} - \frac{(k_2 - k_1 - 1)(1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 2)}}{(1 - (1 - \widetilde{p}_{1f})^n)} \right] \right\} \geq 0.95 \end{aligned}$$

$$\begin{aligned} \overline{P}_{1fa} = & \left\{ (1 - \widetilde{p}_{1f})^n + \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1 - \widetilde{p}_{1f})^{n-2} \right) (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1)})}{1 - (1 - \widetilde{p}_{1f})^n} \right] \right. \\ & + \left. \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} \right)^2 (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1)})}{(1 - (1 - \widetilde{p}_{1f})^n)^2} - \frac{(k_2 - k_1)(1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)}}{(1 - (1 - \widetilde{p}_{1f})^n)} \right] \right\} \\ & \div \left\{ 1 + \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1 - \widetilde{p}_{1f})^{n-2} \right) (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)})}{1 - (1 - \widetilde{p}_{1f})^n} \right] \right. \\ & + \left. \left(n\widetilde{p}_{1f}(1 - \widetilde{p}_{1f})^{n-1} \right)^2 (1 - \widetilde{p}_{1f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 1)})}{(1 - (1 - \widetilde{p}_{1f})^n)^2} - \frac{(k_2 - k_1 - 1)(1 - \widetilde{p}_{1f})^{n(k_2 - k_1 - 2)}}{(1 - (1 - \widetilde{p}_{1f})^n)} \right] \right\} \geq 0.95 \end{aligned}$$

$$\overline{P}_{2fa} = \left\{ (1 - \widetilde{p}_{2f})^n + \left(n\widetilde{p}_{2f}(1 - \widetilde{p}_{2f})^{n-1} + \frac{(n\widetilde{p}_{2f})^2}{2} (1 - \widetilde{p}_{2f})^{n-2} \right) (1 - \widetilde{p}_{2f})^{n k_1} \left[\frac{(1 - (1 - \widetilde{p}_{2f})^{n(k_2 - k_1)})}{1 - (1 - \widetilde{p}_{2f})^n} \right] \right\}$$

Kavipriya and Sudamani Ramaswamy

$$\begin{aligned}
 & + \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} \right)^2 (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1)})}{(1-(1-\widetilde{p}_{2f})^n)^2} - \frac{(k_2-k_1)(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)}}{(1-(1-\widetilde{p}_{2f})^n)} \right] \\
 & \div \left\{ 1 + \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} + \frac{(n\widetilde{p}_{2f})^2}{2} (1-\widetilde{p}_{2f})^{n-2} \right) (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)})}{1-(1-\widetilde{p}_{2f})^n} \right] \right. \\
 & \left. + \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} \right)^2 (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)})}{(1-(1-\widetilde{p}_{2f})^n)^2} - \frac{(k_2-k_1-1)(1-\widetilde{p}_{2f})^{n(k_2-k_1-2)}}{(1-(1-\widetilde{p}_{2f})^n)} \right] \right\} \leq 0.10
 \end{aligned}$$

Minimizing the sum of risks

The sample size is calculated so as to minimize the sum of the risks and it is presented in Table 5 & 6. Where $\widetilde{AQL}$ is denoted as $\widetilde{p}_{1f}$ and $\widetilde{LQL}$ is denoted as $\widetilde{p}_{2f}$ and the corresponding the probability of acceptance values are $\widetilde{P}_{1fa}$ and $\widetilde{P}_{2fa}$. The mathematical expression to minimize the sum of risk is

$$\begin{aligned}
 \widetilde{\alpha}_f + \widetilde{\beta}_f &= 1 - \widetilde{P}_{1fa} + \widetilde{P}_{2fa} \\
 &= 1 - \left[\left\{ (1-\widetilde{p}_{1f})^n + \left(n\widetilde{p}_{1f}(1-\widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1-\widetilde{p}_{1f})^{n-2} \right) (1-\widetilde{p}_{1f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{1f})^{n(k_2-k_1)})}{1-(1-\widetilde{p}_{1f})^n} \right] \right. \right. \\
 &+ \left. \left(n\widetilde{p}_{1f}(1-\widetilde{p}_{1f})^{n-1} \right)^2 (1-\widetilde{p}_{1f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{1f})^{n(k_2-k_1)})}{(1-(1-\widetilde{p}_{1f})^n)^2} - \frac{(k_2-k_1)(1-\widetilde{p}_{1f})^{n(k_2-k_1-1)}}{(1-(1-\widetilde{p}_{1f})^n)} \right] \right\} \\
 &\div \left\{ 1 + \left(n\widetilde{p}_{1f}(1-\widetilde{p}_{1f})^{n-1} + \frac{(n\widetilde{p}_{1f})^2}{2} (1-\widetilde{p}_{1f})^{n-2} \right) (1-\widetilde{p}_{1f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{1f})^{n(k_2-k_1-1)})}{1-(1-\widetilde{p}_{1f})^n} \right] \right. \\
 &+ \left. \left(n\widetilde{p}_{1f}(1-\widetilde{p}_{1f})^{n-1} \right)^2 (1-\widetilde{p}_{1f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{1f})^{n(k_2-k_1-1)})}{(1-(1-\widetilde{p}_{1f})^n)^2} - \frac{(k_2-k_1-1)(1-\widetilde{p}_{1f})^{n(k_2-k_1-2)}}{(1-(1-\widetilde{p}_{1f})^n)} \right] \right\} \right] + \\
 &\left\{ (1-\widetilde{p}_{2f})^n + \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} + \frac{(n\widetilde{p}_{2f})^2}{2} (1-\widetilde{p}_{2f})^{n-2} \right) (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1)})}{1-(1-\widetilde{p}_{2f})^n} \right] \right. \\
 &+ \left. \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} \right)^2 (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1)})}{(1-(1-\widetilde{p}_{2f})^n)^2} - \frac{(k_2-k_1)(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)}}{(1-(1-\widetilde{p}_{2f})^n)} \right] \right\} \\
 &\left\{ 1 + \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} + \frac{(n\widetilde{p}_{2f})^2}{2} (1-\widetilde{p}_{2f})^{n-2} \right) (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)})}{1-(1-\widetilde{p}_{2f})^n} \right] \right. \\
 &+ \left. \left(n\widetilde{p}_{2f}(1-\widetilde{p}_{2f})^{n-1} \right)^2 (1-\widetilde{p}_{2f})^{n k_1} \left[\frac{(1-(1-\widetilde{p}_{2f})^{n(k_2-k_1-1)})}{(1-(1-\widetilde{p}_{2f})^n)^2} - \frac{(k_2-k_1-1)(1-\widetilde{p}_{2f})^{n(k_2-k_1-2)}}{(1-(1-\widetilde{p}_{2f})^n)} \right] \right\}
 \end{aligned}$$

The sum of risks is obtained as interval of fuzzy.

CONCLUSION

In this study a procedure of designing two stage of ChSP-(0, 2) using trapezoidal fuzzy number is presented. Binomial distribution is used to calculate FPA value. FOC Curve values are calculated for the fixed sample size. One can note that fuzzy probability of acceptance is more for $\gamma=0$ than $\gamma=1$ and FOC Curve is closer when $\gamma=1$. For $\gamma=0$, the sample size value is calculated such that it satisfied both the condition of the risks. The optimum value units required in the sample is obtained such that to satisfy both the condition of risks for the given conditions and also minimizes the sum of risks.

ABSTRACT

Autoimmune thyroid disease is rapidly on the rise and is one of the most frequent causes of Hypothyroidism in adults. It is characterised by the formation of antibodies that attack the Thyroid gland resulting in hypothyroidism. Several studies have established that the presence of Anti-thyroid peroxidase (ATPO) and Anti-thyroglobulin (ATG) antibodies are not just associated with thyroid gland damage, but also possibly have a role in systemic inflammation causing extra thyroidal effects including cancer.¹⁾ As thyroid hormones have a key role in the metabolic processes of almost all the tissues in the body, therefore, autoimmune hypothyroidism causes multitude and ambiguous signs and symptoms involving multiple organ systems including a risk of malignancy, and therefore, there is a need to develop effective solutions to treat them. Keeping this in view, a case series of diagnosed autoimmune hypothyroidism treated with individualised Homoeopathic medicines is being reported here. Case summary - 7 diagnosed cases of Autoimmune hypothyroidism were treated with individualised Homoeopathic medicines prescribed after a detailed case taking based on a structured case record proforma. The treatment outcome was assessed based on the ATPO/ ATG titres tested before and after

Vijaykrishna *et al.*,

intervention. The prescribed individualised Homoeopathic medicines were found to have a curative effect in the given cases of Autoimmune hypothyroidism as is evidenced in the reduction in ATPO and ATG titres to normal range, thereby suggesting a good scope of Homoeopathic intervention in the treatment of this condition. Furthermore, large scale clinical trials are necessary to generate more conclusive evidence.

Key words: Case series, Homoeopathy, Autoimmune hypothyroidism, ATPO, Individualised homoeopathic medicines

INTRODUCTION

Autoimmune hypothyroidism falls under the category of primary hypothyroidism and is an organ specific autoimmune disorder which is characterised by infiltration of the thyroid gland by inflammatory cells resulting in the development of auto antibodies to thyroid specific antigens. The two primary thyroid specific antigens are Thyroglobulin and Thyro-peroxidase. The clinical diagnosis of autoimmune hypothyroidism is based on both physical and biochemical abnormalities as well as serological demonstration of autoantibodies to these major Thyroid specific antigens. Autoimmune hypothyroidism has been found to be associated with an exaggerated iodine intake. Radiation exposure, certain viruses such as hepatitis C virus chronic infection, selenium and vitamin D deficiency are some of the environmental risk factors associated with autoimmune hypothyroidism. Stress (both emotional and psychological) has also been identified to be a risk factor for autoimmune hypothyroidism [2]. As per studies, it was found that women are at a higher risk of developing autoimmune hypothyroidism than men. The prevalence of autoimmune hypothyroidism varies from region to region across the globe and was found to be 5.8% in Asia as per a study [3]. As per a cross-sectional, multi-centre, epidemiological study conducted across 8 major cities of India to study the prevalence of hypothyroidism among adult population, it was found that ATPO positivity was very high, with a prevalence of more than 20% in five cities [4].

There is a rise in the prevalence of autoimmune hypothyroidism cases across all age groups, races, genders and regions worldwide. Given the central role of thyroid hormones in systemic metabolism, hypothyroidism is characterized by a wide spectrum of non-specific manifestations affecting multiple organ systems, with potential long-term risks including malignancy. This emphasizes the need to develop effective solutions to treat them. Homoeopathic system is based on a holistic approach and offers a good scope in the treatment of autoimmune hypothyroidism. An exploratory, randomised, placebo controlled, single blind was conducted at Dr. B.R Sur Homoeopathic Medical College, Hospital and Research centre and Institute of Nuclear medicine and Allied sciences, under Defense Research Development Organisation, Ministry of Defense, Timarpur, Delhi on 194 subjects suffering from subclinical hypothyroidism (SCH) with or without autoimmune thyroiditis (AIT). The subjects were divided into 3 major groups – Group A: SCH + AIT (n=38; high TSH with anti TPO ab+), Group B: AIT (n=47; normal TSH with anti TPO ab+), and Group C: SCH (n= 109; only high TSH). These groups were further randomised to two subgroups – verum and control.

Individualised homoeopathic medicine or identical placebo was administered to respective subgroups. Assessment of follow up was done based on changes in serum TSH, serum anti TPO antibody levels and serum FT 4 levels. Homoeopathic remedies were found to have not only brought about a statistically significant decrease in serum TSH and serum anti TPO antibody titres, but also demonstrated a potential to prevent progression to overt hypothyroidism. ($p < 0.006$ and $p < 0.05$) [5]. An open-label, prospective, single-arm trial was conducted on 40 patients suffering from hypothyroidism at the outpatient department of D. N. De Homeopathic Medical College and Hospital, West Bengal, India. The subjects were treated with individualised homoeopathic remedies. Serum TSH and FT 4 were considered as the primary outcomes and Zuleswki's clinical scoring (ZCS) and thyroid symptom

**Vijaykrishna et al.,**

questionnaire (TSQ) as the secondary outcomes, measured at baseline and after 3 months of treatment. Intention-to-treat sample was analysed in the end by paired t-tests. Individualised homoeopathic remedies were found to have promising effects in the treatment of hypothyroidism with a significant reduction in serum TSH and FT 4 levels ($p < 0.001$) [6].

A prospective single-arm clinical study without a control group was conducted in out-patient department (OPD), inpatient department (IPD), thyroid specialty clinic and peripheral health center of Sarada Krishna Homoeopathic medical college (SKHMC) from January 2021 to January 2022, on 30 subjects with elevated thyroid stimulating hormone, anti- microsomal antibody/ anti-thyroid peroxidase antibody, and anti-thyroglobulin antibody. The subjects were administered individualised homoeopathic medicines and followed up every month for a period of 12 months. Treatment outcomes were assessed based on anti-thyroglobulin antibody levels, TSH levels, zulewski's clinical score values of before and after 12 months of treatment. Homoeopathic medicines were found to be effective in the reduction of anti-thyroglobulin-antibody levels. ($p = 0.05$) [7]. This case series of patients diagnosed with autoimmune hypothyroidism and treated with individualised homoeopathic medicines is presented here in accordance with PITCH guidelines, with the aim of further exploring the potential role of homoeopathic intervention in the management of this condition.

MATERIALS AND METHODS

Seven patients diagnosed with Autoimmune hypothyroidism were treated with individualised Homoeopathic medicines. The prime objective of this retrospective case series is to substantiate that Homoeopathy has a curative effect in the treatment of Autoimmune hypothyroidism. All the cases presented here were treated at the out-patient department of Nishika Homoeo Clinic, Bangalore. The cases were diagnosed on the basis of serum ATPO and ATG titres evaluated before treatment. The patients included in this study were those who were not under any other medication at the time of homoeopathic intervention. A detailed history of all the patients was taken as per a structured case record proforma. The cases were analysed according to the principles of Homoeopathy. The individualised homoeopathic medicine was selected based on repertorisation using RADAR 10.0 software and finalised in consultation with the Homoeopathic Materia medica. The medicines were administered in centesimal potency and repeated according to the improvement of the patient. The cases were followed up every month from baseline to 6 months and improvement was assessed based on ATPO and ATG Titres. The individual case profiles are as described below:

Case 1

A 47 year old female, housewife, diagnosed with Autoimmune Hypothyroidism with raised ATG levels, presented with elevated TSH levels since 6 months and increased menstrual cramps before menses since 4 months, with menstrual bleeding characterised by large clots. In the past, she had suffered from COVID in 2020, and was operated for fissure-in-ano. Patient was thermally hot and thirsty and couldn't tolerate hunger. She was short tempered and often quarrelled with family members. She was very picky and choosy by nature, always wanted to be prioritised first and given importance and preferred to buy expensive and branded things. She couldn't bear to be dictated by anyone and often argued with her husband for the same. She would become emotional on seeing or hearing others' sad stories, and was easily moved by sad scenes played on Television too. Respect was of utmost importance to her and she wouldn't take it if anyone spoke rudely to her. She was haughty and would cut off from relationships wherever she felt hurt. Her baseline antibody values were - ATG - 111.2 IU/mL. (Fig 8)

Intervention:

The totality of symptoms was listed and repertorised (Fig 1) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Horrible things, sad stories, affect her profoundly

Vijaykrishna *et al.*,

- MIND - Exclusive, too
- MIND - Casting off people against her will
- GENERALITIES - Hunger, agg

The remedy that came up in the repertorisation was Platina, and upon consulting the Homoeopathic Materia medica, Platina was found to match the patient's disposition. A single dose of Platina 200C was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up- The case was followed up every month for a period of 6 months. There was a gradual reduction in her ATG levels along with a corresponding reduction in the intensity of her pre-menstrual cramps and clot size. The post-intervention antibody levels were - ATG - 3.6 IU/ ml. (Fig 9) The detailed follow-up is shown in Table 1.

Case 2

A 50 year old female, housekeeper by profession, diagnosed with Autoimmune Hypothyroidism with raised ATPO levels, presented with elevated TSH levels since one year and hair fall and weight gain since two years. Patient also reported that she was experiencing a change of voice in the last 6 months. In the past, she had suffered from recurrent renal calculi. She was married to her maternal uncle until his death 13 years ago, and had 3 children. She had attained menopause one year ago. Patient was thermally chilly and thirsty. She could not tolerate injustice and would confront even higher ups at work. She was a hard worker who did her work sincerely. Patient felt extremely guilty about having gotten her daughter married early as she was being subjected to a lot of harassment by her husband and in-laws. She constantly blamed herself for the same and was deeply saddened by it. Patient was constantly worried as to who will take care of her children, if something were to happen to her. Patient preferred to have piping hot food and drinks, and was highly anxious by nature. Her baseline antibody values were found to be - ATPO - 36.4 IU/mL. (Fig 10)

Intervention:

The totality of symptoms was listed and repertorised (Fig 2) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Reproaching oneself
- MIND – Injustice, cannot support
- MIND - Industrious
- MIND - Anxiety, children about, his
- GENERALITIES - Food and drinks - warm food, desire

Upon consulting the Homoeopathic Materia medica, Arsenicum Album was found to match the patient's disposition. A single dose of Arsenicum album 10M was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up- The case was followed up every month for a period of 6 months. Her ATPO levels were found to gradually reduce to normal range with a corresponding significant reduction in hairfall. She regained her normal voice. The post-intervention antibody levels were - ATPO - 7.1 IU/mL. (Fig 11) The detailed follow-up is shown in Table 1.

Case 3

A 45 year old male, anaesthesiologist by profession, diagnosed with Autoimmune Hypothyroidism with raised ATPO levels, presented with hypothyroidism since 2 years. Patient also had depigmented patches on both elbows, and left ankle since 1 year. In the past, patient had suffered from allergic rhino-bronchitis. Patient was thermally chilly and very thirsty. Patient was extremely fastidious, fault finding and short tempered when others would not listen to him. He was very anxious about his health. Patient had a tendency to hit himself when angry. Patient had a

**Vijaykrishna et al.,**

lot of earning, but was very frugal in his spendings. His baseline antibody values were found to be - ATPO - 51.06 IU/mL. (Fig 12)

Intervention:

The totality of symptoms was listed and repertorised (Fig 3) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Striking himself
- MIND - Fastidious
- MIND - Censorious, critical
- MIND - Avarice
- GENERALITIES - Food and drinks - warm food, desire
- SKIN - Discoloration, white

Upon consulting the Homoeopathic Materia medica, Arsenicum Album was found to match the patient's disposition. A single dose of Arsenicum album 10M was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up - The case was followed up every month for a period of 6 months. The patient's ATPO and ATG levels showed a gradual decline toward normal limits, accompanied by repigmentation of the previously depigmented patches over the elbows and ankle, which was interpreted as being consistent with Hering's law of cure. The post-intervention antibody levels were - ATPO - 27.06 IU/mL. (Fig 13) The detailed follow-up is shown in Table 1.

Case 4

A 42 year old male, software professional, presented with hypothyroidism since a week detected on routine annual health check-up. On further investigations, he was diagnosed to have Autoimmune Hypothyroidism with raised ATPO and ATG levels. In the past, patient had suffered from Typhoid. Patient was thermally hot and thirsty and had hunger intolerance since childhood. Patient was an extrovert who could make connections very quickly. He was lazy at home, but driven at work. He was very intelligent, curious and had an affinity towards learning new things. He was extremely disorganised and least bothered about his personal appearance and was dressed shabbily. He yearned to be recognised as a great achiever. On observation, he was found to be extremely talkative with an element of boasting about himself and making theories about everything. His baseline antibody values were found to be - ATPO > 1300 U/mL, ATG - 500 U/mL. (Fig 14)

Intervention:

The totality of symptoms was listed and repertorised (Fig 4) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Curious
- MIND - Boaster, braggart
- MIND - Indifference apathy, appearance, about personal
- MIND - Theorising
- GENERALITIES - Hunger, agg.

Upon consulting the Homoeopathic Materia medica, Sulphur was found to match the patient's disposition. A single dose of Sulphur 200 c was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up - The case was followed up every month for a period of 6 months. A progressive reduction in the ATPO, and ATG levels towards normal limits was observed.

The post-intervention antibody levels were - ATPO - 26.5 IU/mL, ATG - 106 IU/mL. (Fig 15, 16) The detailed follow-up is shown in Table 1.

Vijaykrishna *et al.*,**Case 5**

A 26year old female, software professional, presented with profound depression with intense suicidal thoughts after the break-up of a relationship which occurred a few months ago. She was diagnosed with autoimmune hypothyroidism and reported that she felt numb completely and just wanted to die. She had considered her partner the most important person in her life and described him as a very lively and enthusiastic person. Patient blamed herself for the break-up constantly as she felt that she didn't match up to her partner's personality. It was observed that throughout the history taking, she kept sighing involuntarily as she narrated her symptoms. Patient was thermally chilly and thirstless. She was a highly emotional person, easily moved to tears and didn't like to be consoled. Her baseline investigation values were found to be - ATPO - 21.5 IU/mL. (Fig 17)

Intervention:

The totality of symptoms was listed and repertorised (Fig 5) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Reproaching oneself
- MIND - Suicidal disposition, thoughts
- MIND - Sighing - involuntarily
- MIND - Consolation, agg.
- MIND - Sadness, love; from disappointed

Upon consulting the Homoeopathic Materia medica, Ignatia was found to match the patient's disposition. A single dose of Ignatia 10M was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up - The case was followed up every month for a period of 6 months. A progressive reduction in ATPO levels toward the normal range was observed, alongside significant improvement in the patient's mental health, with complete resolution of suicidal ideation. The post-intervention investigation levels were - ATPO - 6.9 IU/mL. (Fig 18) The detailed follow-up is shown in Table 1.

Case 6

A 74 year old female, homemaker, a known case of hypothyroidism, presented with constantly fluctuating thyroid hormone levels in spite of conventional medication. Her physician had to frequently change the dose of eltroxin administered to her. The patient presented with weight loss, reduced interest in occupational activities, and frequent crying spells. The patient reported frequent criticism from her husband despite her efforts to care for him. The patient attributed her husband's behaviour to her infertility, accompanied by persistent self-blame. She described feelings of inadequacy as a wife and perceived her husband's actions as justified. Patient was thermally chilly. She was a duty-oriented person and performed her duties irrespective of the state of her health. She was very fastidious by nature. Physically, emaciation was markedly noticeable. Her baseline investigation values were found to be - ATPO - 295 U/mL. (Fig 19)

Intervention:

The totality of symptoms was listed and repertorised (Fig 6) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Delusion - reproach; he has neglected his duty and deserves
- MIND - Duty too much sense of duty
- GENERALITIES - Emaciation

Upon consulting the Homoeopathic Materia medica, Aurum arsenicum was found to match the patient's disposition. A single dose of Aurum arsenicum 10M was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month. Aurum arsenicum 10M was repeated once more after 3 months when the improvement came to a standstill.

Follow up - The case was followed up every month for a period of 6 months. A progressive normalization of ATPO levels was observed, along with improvement in body weight and restoration of interest in work.

The post-intervention investigation levels were - ATPO - 30.9 IU/mL. (Fig 20) The detailed follow-up is shown in Table 1.

Case 7

A 63 year old female, homemaker, diagnosed with autoimmune hypothyroidism, presented with swelling on the anterior neck and weight loss since few months. Patient was thermally hot and thirsty. She could not tolerate hunger since childhood. The patient reported that her only daughter had been married to a man settled in the USA; however, she later became aware of abusive behaviour by the son-in-law, with her daughter experiencing considerable distress. The patient expressed marked guilt and self-blame, with recurrent thoughts that the marital alliance had not been adequately evaluated by her. By nature, patient was extremely industrious and very fast in all her activities.

Neck ultrasonography demonstrated thyroiditis with bilateral thyroid nodules. Her baseline antibody values were found to be - ATPO - 306.69 U/mL. (Fig 21)

Intervention:

The totality of symptoms was listed and repertorised (Fig 7) using the synthesis repertory from RADAR 10.0 software. The following rubrics were considered for repertorisation-

- MIND - Reproaching oneself
- MIND - Industrious
- GENERALITIES - Hunger agg
- GENERALITIES - Emaciation

Upon consulting the Homoeopathic Materia medica, Aurum iodatum was found to match the patient's disposition. A single dose of Aurum iodatum 200 was prescribed (4 globules of 30 size pills) to be taken on an empty stomach in the morning followed by placebo twice daily for a period of one month.

Follow up - The case was followed up every month for a period of 6 months. A progressive reduction in anti-thyroid peroxidase (ATPO) levels toward the normal range was observed, along with an improvement in her body weight and resolution of thyroiditis on neck ultrasonography. The post-intervention antibody levels were - ATPO - 3.50 IU/mL. (Fig 22) The detailed follow-up is shown in Table 1.

RESULTS

Out of the 7 cases chosen for the case series, 5 were females and 2 were males. (Fig 23). A majority of 4 of the subjects were found to be in the 40-50 years age group, 2 subjects were found to be in the 60-70 years age group and only 1 subject was found to be in the 20-30 years age group. (Fig 24). A majority of 3 of the subjects were homemakers, 2 were software professionals, while the others were a housekeeper, and an anaesthesiologist, respectively. (Fig 25). A majority of 5 of the subjects were found to have raised ATPO titres only, whereas 1 subject had both ATPO and ATG titres raised, and 1 subject had only raised ATG titres. A maximum number of 2 cases were prescribed Arsenicum album, and the remaining 5 were prescribed Platina, Sulphur, Ignatia, Aurum arsenicum and Aurum iodatum each respectively. (Fig 26). Maximum number of the 4 cases were prescribed the indicated homoeopathic medicine in 10M potency and the remaining 3 cases were prescribed the medicine in 200C potency. (Fig 27). All of the subjects responded well to the indicated homoeopathic medicines as reflected in a complete reversal of their thyroid antibodies to within normal limits with a corresponding improvement in their presenting complaints.

DISCUSSION

This study has shown that autoimmune hypothyroidism is more prevalent in those between the ages 40 to 50 years. Most of the subjects considered for the study were found to be females which is concurrent with the findings of other studies. Most of the subjects were from the working professional group followed by housewives. Arsenicum album was the remedy which was most indicated, having been prescribed to about 2 subjects. Aurum arsenicum, Aurum iodatum, Ignatia, Sulphur and Platina were prescribed to each of the remaining subjects, respectively. These remedies have demonstrated a good scope in the treatment of autoimmune hypothyroidism as they were found to have brought complete reduction in the ATPO and ATG titres to the normal range. Although formal follow-up was conducted for 6 months, additional follow-up suggested sustained normalization of thyroid function tests and antibody titres, with patients reporting resolution of their presenting complaints. These findings suggest that individualised homeopathic medicines, prescribed on the basis of homeopathic principles, have a positive role in the treatment of Autoimmune hypothyroidism. However, owing to the small number of cases taken up for the study, the results of this study can be considered as exploratory and may serve as the basis of future research studies.

CONCLUSION

This study concludes that homeopathic individualised medicine is effective in reducing the levels of ATPO and ATG in autoimmune hypothyroidism. Further studies on larger populations can be helpful in substantiating the effectiveness of Homoeopathy in treatment of Autoimmune hypothyroidism.

ACKNOWLEDGEMENT

The author expresses sincere gratitude to Dr. Munjal Thakar for his invaluable guidance, encouragement, and continuous support throughout the course of this research. The author also extends thanks to Parul University for providing the necessary academic resources and a conducive research environment. Special appreciation is conveyed to Dr. Samir Gupta, Associate Professor, Department of Practice of Medicine, Jawaharlal Nehru Homoeopathic Medical College, Vadodara, Gujarat, and Dr. G. Swati for their support and assistance in the drafting of this research paper. The author further acknowledges the faculty members, peers, and participants for their cooperation and contributions. Finally, the author is deeply grateful to all the patients for providing written informed consent for the publication of their clinical data.

Conflict of Interest:

No conflict of interest.

PID NO: P22723518063962 Age: 46 Year(s) Sex: Female			
Investigation	Observed Value	Unit	Biological Reference Interval
Thyroid Antibodies-TPO and ATG, Serum (Serum, Chemiluminescence)			
Microsomal (TPO) Antibody Titre, Serum	<9.00	IU/mL	< 34.0
Interpretation- 1. Anti-thyroid peroxidase (anti-TPO) antibodies are specific against TPO, which catalyses iodine oxidation & iodination reactions in the thyroid gland. 2. 10-15% of normal individuals & during pregnancy can have raised anti-TPO antibody titres. Anti-TPO antibodies are the most common anti-thyroid autoantibody, present in approximately 90% of Hashimoto's thyroiditis, 75% of Graves' disease and 10-20% of nodular goitre or thyroid carcinoma. Relatives of patients with an autoimmune thyroid disorder (40%-50%) may have elevated serum TPOAb levels. High serum antibodies are found in active phase chronic autoimmune thyroiditis & antibody titer can be used to assess disease activity. Other autoimmune disorders often associated with elevated TPOAb include: Sjogren's syndrome, lupus, rheumatoid arthritis, diabetes mellitus (type1) and pernicious anemia.			
Thyroglobulin Antibody (ATG), Serum	111.20	IU/mL	< 4.11

TEST PARAMETER	RESULT	REFERENCE RANGE	
HORMONE ASSAYS			
ANTI THYROGLOBULIN ANTIBODY (ANTI Tg)			
ANTI THYROGLOBULIN ANTIBODY (ANTI Tg) CMIA/CLIA	3.60 IU/mL	< 4.11 IU/mL	
CLINICAL NOTE: Anti Tg autoantibody measurements are recommended if Anti TPO autoantibody is negative, but clinical suspicion of Autoimmune thyroid disease is high. Detection of these antibodies in cases of Neonatal hypothyroidism suggests transplacental antibody transfer particularly if there is a maternal history of autoimmune thyroiditis.

Comments:
Thyroid peroxidase (TPO) is a membrane associated protein enzyme involved in thyroid hormone synthesis. Anti-TPO antibodies are autoantibodies, which activate complement and are thought to be involved in thyroid dysfunction and pathogenesis of hypothyroidism. It is also used as a tool to detect which patients of subclinical hypothyroidism may progress to overt hypothyroidism and require treatment to prevent it.
High levels are seen in:
1. Autoimmune Thyroiditis/Hashimoto thyroiditis
2. Graves disease
3. Non thyroid autoimmune diseases like pernicious anaemia
4. Thyroid cancers

 DURGADevi, TEMPLE RD, HMT LAYOUT 3RD BLOCK,
 VIDYARANYAPURA, BENGALURU, KARNATAKA
 560097, 560097

TEST NAME	TECHNOLOGY	VALUE	UNITS
ANTI MICROSOMAL ANTIBODY (AMA) Bio. Ref. Interval. :- Negative : < 9 Positive : >=9 (AMA are also called as Anti-TPO Antibodies). Clinical Significance: Microsomes are found inside thyroid cells. The body produces antibodies against microsomes when there has been some damage caused to thyroid cells. Autoimmunity induces the immune system to produce antibodies against host tissue causing inflammation or impairing thyroid function. Presence of antimicrosomal antibody (AMA) is generally associated with autoimmune disorder. A positive test for AMA can indicate Hashimoto's thyroiditis or granulomatous thyroiditis or Rheumatoid arthritis or Autoimmune hemolytic anaemia (rarely) etc.	C.L.I.A	6.9	IU/mL

ABSTRACT

Characterizations of an $(\in, \in)$ -neutrosophic subalgebra and an $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra are provided. Given special sets, so called neutrosophic $\in$ -subsets, neutrosophic q -subsets and neutrosophic $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -subsets, conditions for the neutrosophic $\in$ -subsets, neutrosophic q -subsets and neutrosophic $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -subsets to be subalgebras are discussed. Conditions for a neutrosophic set to be a $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra are considered.

Keywords: Neutrosophic set, neutrosophic $\in$ -subset, neutrosophic q -subset, neutrosophic $\in \vee q$ -subset, $(\in, \in)$ -neutrosophic subalgebra, $(\in, q)$ -neutrosophic subalgebra, $(q, \in)$ -neutrosophic subalgebra, $(q, \in)$ -neutrosophic subalgebra, $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra, $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra.

INTRODUCTION

The Sheffer operation, also known as the Sheffer stroke or NAND operator was first introduced by H. M. Sheffer [2]. This operation holds significance because it can be used on its own, without any other logical operators, to construct a logical system. This means that any axiom of a logical system can be restated using only the Sheffer operation. Because of this property, it becomes easier to control certain properties of the newly constructed logical system.

Radha and Gomathi Sundari

Additionally, it's worth noting that the axioms of Boolean algebra, which is the algebraic counterpart of classical propositional calculus, can be expressed solely using the Sheffer operation. This highlights the fundamental nature and versatility of the Sheffer operation in logical and algebraic systems. In this paper, characterizations of an $(\in, \in)$ -neutrosophic subalgebra and an $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra are provided. Given special sets, so called neutrosophic $\in$ -subsets, neutrosophic q -subsets and neutrosophic $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -subsets, conditions for the neutrosophic $\in$ -subsets, neutrosophic q -subsets and neutrosophic $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -subsets to be subalgebras are discussed. Conditions for a neutrosophic set to be a $(q(k_T, k_I, k_F), \in \vee q(k_T, k_I, k_F))$ -neutrosophic subalgebra are considered

Preliminaries

Definition 2.1: [2] Let $H = \langle H, | \rangle$ be a groupoid. The operation $|$ is said to be a Sheffer stroke operation if it satisfies the following conditions:

$$(S1) \ x|y = y|x$$

$$(S2) \ (x|x)|(x|y) = x$$

$$(S3) \ x|((y|z)|(y|z)) = ((x|y)|(x|y))|z$$

$$(S4) \ (x|((x|x)|(y|y))|(x|((x|x)|(y|y)))) = x.$$

Definition 2.2: [1] A Sheffer stroke Hilbert algebra is a structure $\langle H, | \rangle$ of type (2), in which H is a non-empty set and $|$ is a Sheffer stroke operation on H such that the following identities are satisfied for all $x, y, z \in H$:

$$1. \left(\left(\left((z|z) \right) \right) \right) \left| \left(\left(\left((z|z) \right) \right) \right) \right) = x| (x),$$

$$2. \text{If } x|(y|y) = y|(x|x) = x|(x|x) \text{ then } x = y.$$

Proposition 2.3:[1] Let $\langle A, | \rangle$ be a Sheffer stroke Hilbert algebra. Then the binary relation $x \leq y$ if and only if $(x|(y|y)) = 1$ is a partial order on A .

Definition 2.4: A nonempty subset G of a Sheffer stroke Hilbert algebra of X is called a subalgebra of X if $(x|(y|y))|(x|(y|y)) \in G$ for all $x, y \in G$. A neutrosophic set in X is a structure of the form $A = \{ \langle x, A_T(x), A_I(x), A_F(x) \rangle : x \in X \}$, where $A_T : X \rightarrow [0, 1]$ is a truth membership function, $A_I : X \rightarrow [0, 1]$ is an indeterminate membership function, and $A_F : X \rightarrow [0, 1]$ is a false membership function. For the sake of simplicity, we use the symbol $A = (A_T, A_I, A_F)$ for the neutrosophic set $A = \{ \langle x, A_T(x), A_I(x), A_F(x) \rangle : x \in X \}$.

Neutrosophic subalgebras of several types

Given a neutrosophic set $A = (A_T, A_I, A_F)$ in a set X , $\alpha, \beta \in (0, 1]$ and $\gamma \in [0, 1)$, we consider the following sets:

$$T_{\in}(A, \alpha) = \{x \in X : A_T(x) \geq \alpha\},$$

$$I_{\in}(A, \beta) = \{x \in X : A_I(x) \geq \beta\},$$

$$F_{\in}(A, \gamma) = \{x \in X : A_F(x) \leq \gamma\},$$

$$T_q(A, \alpha) = \{x \in X : A_T(x) + \alpha > 1\},$$

$$I_q(A, \beta) = \{x \in X : A_I(x) + \beta > 1\},$$

$$F_q(A, \gamma) = \{x \in X : A_F(x) + \gamma < 1\},$$

$$T_{\in \vee q}(A, \alpha) = \{x \in X : A_T(x) \geq \alpha \text{ or } A_T(x) + \alpha > 1\},$$

$$I_{\in \vee q}(A, \beta) = \{x \in X : A_I(x) \geq \beta \text{ or } A_I(x) + \beta > 1\},$$

$$F_{\in \vee q}(A, \gamma) = \{x \in X : A_F(x) \leq \gamma \text{ or } A_F(x) + \gamma < 1\}.$$

We say $U_{\in}(A, \alpha)$, $I_{\in}(A, \beta)$ and $F_{\in}(A, \gamma)$ are neutrosophic $\in$ -subsets of X , and $U_q(A, \alpha)$, $I_q(A, \beta)$ and $F_q(A, \gamma)$ are neutrosophic q -subsets of X and $U_{\in \vee q}(A, \alpha)$, $I_{\in \vee q}(A, \beta)$ and $F_{\in \vee q}(A, \gamma)$ are neutrosophic $\in \vee q$ -subsets of X . For $\Phi \in \{\in, q, \in \vee q\}$, the element of $T_{\Phi}(A, \alpha)$ (resp. $I_{\Phi}(A, \beta)$, $F_{\Phi}(A, \gamma)$) is called a neutrosophic T_{Φ} -point (resp. neutrosophic I_{Φ} -point, neutrosophic F_{Φ} -point) with value α (resp. β , γ). It is clear that

$$T_{\in \vee q}(A, \alpha) = T_{\in}(A, \alpha) \cup T_q(A, \alpha),$$

$$I_{\in \vee q}(A, \beta) = I_{\in}(A, \beta) \cup I_q(A, \beta),$$

Radha and Gomathi Sundari

$$F_{\in \vee q}(A, \gamma) = F_{\in}(A, \gamma) \cup F_q(A, \gamma).$$

Definition 3.1: Given $\Phi, \Psi \in \{\in, q, q \in \vee q\}$, a neutrosophic set $A = (A_T, A_I, A_F)$ in a UP-algebra X is called an (Φ, Ψ) -neutrosophic subalgebra of X if the following assertions are valid:

$$\begin{aligned} x \in T_{\Phi}(A, \alpha_x), y \in T_{\Phi}(A, \alpha_y) &\Rightarrow (x|(y|y))|(x|(y|y)) \in T_{\Psi}(A, \alpha_x \wedge \alpha_y), \\ x \in I_{\Phi}(A, \beta_x), y \in I_{\Phi}(A, \beta_y) &\Rightarrow (x|(y|y))|(x|(y|y)) \in I_{\Psi}(A, \beta_x \wedge \beta_y), \\ x \in F_{\Phi}(A, \gamma_x), y \in F_{\Phi}(A, \gamma_y) &\Rightarrow (x|(y|y))|(x|(y|y)) \in F_{\Psi}(A, \gamma_x \vee \gamma_y), \end{aligned} \quad (3.1)$$

for all $x, y \in X, \alpha_x, \alpha_y, \beta_x, \beta_y \in (0, 1]$ and $\gamma_x, \gamma_y \in [0, 1)$.

Theorem 3.2: A neutrosophic set $A = (A_T, A_I, A_F)$ of X is an $(\in, \in)$ -neutrosophic subalgebra of X if and only if

$$(\forall x, y \in X)(A_T((x|(y|y))|(x|(y|y)))) \geq A_T(x) \wedge A_T(y) \wedge A_I((x|(y|y))|(x|(y|y))) \geq A_I(x) \wedge A_I(y) \wedge A_F((x|(y|y))|(x|(y|y))) \leq A_F(x) \vee A_F(y) \quad (3.2)$$

Theorem 3.3: If $A = (A_T, A_I, A_F)$ is an $(\in, \in)$ -neutrosophic subalgebra of X , then the subsets $T_{q_{k_T}}(A, \alpha), I_{q_{k_T}}(A, \beta)$ and $F_{q_{k_T}}(A, \gamma)$ are subalgebras of X for all $\alpha, \beta \in (0, 1]$ and $\gamma \in [0, 1)$ whenever they are nonempty.

Proof: Let $x, y \in T_{q_{k_T}}(A, \alpha)$. Then $A_T(x) + \alpha + k_T > 1$ and $A_T(y) + \alpha + k_T > 1$.

It follows that $A_T((x|(y|y))|(x|(y|y))) + \alpha + k_T \geq (A_T(x) \wedge A_T(y)) + \alpha + k_T = (A_T(x) + \alpha + k_T) \wedge (A_T(y) + \alpha + k_T) > 1$ and so that $(x|(y|y))|(x|(y|y)) \in T_{q_{k_T}}(A, \alpha)$. Hence $T_{q_{k_T}}(A, \alpha)$ is a subalgebra of X . Similarly, we can prove that $I_{q_{k_I}}(A, \beta)$ is a subalgebra of X . Now let $x, y \in F_{q_{k_F}}(A, \beta)$. Then $A_F(x) + \beta + k_F < 1$ and $A_F(y) + \beta + k_F < 1$, which imply that $A_F((x|(y|y))|(x|(y|y))) + \beta + k_F \leq (A_F(x) \vee A_F(y)) + \beta + k_F = (A_F(x) + \beta + k_F) \vee (A_F(y) + \beta + k_F) < 1$. Hence $(x|(y|y))|(x|(y|y)) \in F_{q_{k_T}}(A, \gamma)$ and $F_{q_{k_T}}(A, \gamma)$ is a subalgebra of X .

Theorem 3.4: If $A = (A_T, A_I, A_F)$ is a $(q_{(k_T, k_I, k_F)}, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X , then the subsets $T_{q_{k_T}}(A, \alpha), I_{q_{k_I}}(A, \beta)$ and $F_{q_{k_F}}(A, \gamma)$ are subalgebras of X for all $\alpha \in (\frac{1-k_T}{2}, 1], \beta \in (\frac{1-k_I}{2}, 1]$ and $\gamma \in [0, \frac{1-k_F}{2})$ whenever they are nonempty.

Proof: Let $x, y \in T_{q_{k_T}}(A, \alpha)$. Then $(x|(y|y))|(x|(y|y)) \in T_{\in \vee q_{k_T}}(A, \alpha)$, and so $(x|(y|y))|(x|(y|y)) \in T_{\in}(A, \alpha)$ or $(x|(y|y))|(x|(y|y)) \in T_{q_{k_T}}(A, \alpha)$. If $(x|(y|y))|(x|(y|y)) \in T_{\in}(A, \alpha)$, then $A_T((x|(y|y))|(x|(y|y)))) \geq \alpha > 1 - \alpha$ since $\alpha > \frac{1-k_T}{2}$. Hence $(x|(y|y))|(x|(y|y)) \in T_{q_{k_T}}(A, \alpha)$. Therefore $T_{q_{k_T}}(A, \alpha)$ is a subalgebra of X . Similarly, we prove that $I_{q_{k_I}}(A, \beta)$ is a subalgebra of X . Let $x, y \in F_{q_{k_F}}(A, \gamma)$. Then $(x|(y|y))|(x|(y|y)) \in F_{\in \vee q}(A, \gamma)$, and so $(x|(y|y))|(x|(y|y)) \in F_{\in}(A, \gamma)$ or $(x|(y|y))|(x|(y|y)) \in F_{q_{k_F}}(A, \gamma)$. If $(x|(y|y))|(x|(y|y)) \in F_{\in}(A, \gamma)$, then $A_F((x|(y|y))|(x|(y|y)))) \leq \gamma < 1 - \gamma$ since $\gamma \in [0, \frac{1-k_F}{2})$. Hence $(x|(y|y))|(x|(y|y)) \in F_{q_{k_F}}(A, \gamma)$, and therefore $F_{q_{k_F}}(A, \gamma)$ is a subalgebra of X .

Theorem 3.5: A neutrosophic set $A = (A_T, A_I, A_F)$ of X is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X if and only if

$$\begin{aligned} (\forall x, y \in X) \left(A_T((x|(y|y))|(x|(y|y)))) &\geq \Lambda \left\{ A_T(x) \wedge A_T(y), \frac{1-k_T}{2} \right\} \wedge A_I((x|(y|y))|(x|(y|y)))) \\ &\geq \Lambda \left\{ A_I(x) \wedge A_I(y), \frac{1-k_I}{2} \right\} \wedge A_F((x|(y|y))|(x|(y|y)))) \leq \vee \left\{ A_F(x) \vee A_F(y), \frac{1-k_F}{2} \right\} \end{aligned} \quad (3.3)$$

Proof: Suppose that $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X and let $x, y \in X$. If $A_T(x) \wedge A_T(y) < \frac{1-k_T}{2}$, then we have $A_T((x|(y|y))|(x|(y|y)))) \geq A_T(x) \wedge A_T(y)$. Suppose that $A_T((x|(y|y))|(x|(y|y)))) < A_T(x) \wedge A_T(y)$ and choose α_t such that $A_T((x|(y|y))|(x|(y|y)))) < \alpha_t < A_T(x) \wedge A_T(y)$. Then $x \in T_{\in}(A, \alpha_t)$ and $y \in T_{\in}(A, \alpha_t)$ but $(x|(y|y))|(x|(y|y)) \notin T_{\in}(A, \alpha_t)$. Also $A_T((x|(y|y))|(x|(y|y)))) + \alpha_t < 1 - k_T$, that is, $(x|(y|y))|(x|(y|y)) \in T_{q_{k_T}}(A, \alpha_t)$. Thus $(x|(y|y))|(x|(y|y)) \notin T_{\in \vee q_{k_T}}(A, \alpha_t)$, a contradiction. Therefore

Radha and Gomathi Sundari

$A_T((x | (y | y)) | (x | (y | y))) \geq \vee \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\}$ whenever $A_T(x) \wedge A_T(y) < \frac{1-k_T}{2}$. Now suppose that $A_T(x) \wedge A_T(y) \geq \frac{1-k_T}{2}$. Then $x \in T_{\in} \left(A, \frac{1-k_T}{2} \right)$ and $y \in T_{\in} \left(A, \frac{1-k_T}{2} \right)$, which imply that $(x | (y | y)) | (x | (y | y)) \in T_{\in \vee k_T} \left(A, \frac{1-k_T}{2} \right)$. Hence $A_T((x | (y | y)) | (x | (y | y))) \geq \frac{1-k_T}{2}$. Otherwise, $A_T((x | (y | y)) | (x | (y | y))) + \frac{1-k_T}{2} < \frac{1-k_T}{2} + \frac{1-k_T}{2} = 1 - k_T$, a contradiction. Consequently, $A_T((x | (y | y)) | (x | (y | y))) \geq \vee \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\}$ for all $x, y \in X$. Similarly, $A_I((x | (y | y)) | (x | (y | y))) \geq \vee \left\{ A_I(x), A_I(y), \frac{1-k_I}{2} \right\}$ holds for all $x, y \in X$. Suppose that $A_F(x) \vee A_F(y) > \frac{1-k_F}{2}$. If $A_F((x | (y | y)) | (x | (y | y))) > A_F(x) \vee A_F(y) = \gamma_s$, then $x, y \in F_{\in}(A, \gamma_s)$, not $(x | (y | y)) | (x | (y | y)) \notin F_{\in}(A, \gamma)$ and $A_F((x | (y | y)) | (x | (y | y))) + \gamma > 2\gamma > 1 - k_F$, that is, $(x | (y | y)) | (x | (y | y)) \notin F_{q_{k_F}}(A, \gamma)$, a contradiction.

Hence $A_F((x | (y | y)) | (x | (y | y))) \leq \wedge \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\}$ whenever $A_F(x) \vee A_F(y) > \frac{1-k_F}{2}$. Now, assume that $A_F(x) \vee A_F(y) \leq \frac{1-k_F}{2}$. Then $x, y \in F_{\in} \left(A, \frac{1-k_F}{2} \right)$ and so $(x | (y | y)) | (x | (y | y)) \in F_{\in \vee q_{k_T}} \left(A, \frac{1-k_F}{2} \right)$. Thus $A_F((x | (y | y)) | (x | (y | y))) \leq \frac{1-k_F}{2}$ or $A_F((x | (y | y)) | (x | (y | y))) + \frac{1-k_F}{2} < 1 - k_F$. If $A_F((x | (y | y)) | (x | (y | y))) > \frac{1-k_F}{2}$, then $A_F((x | (y | y)) | (x | (y | y))) + \frac{1-k_F}{2} > \frac{1-k_F}{2} + \frac{1-k_F}{2} = 1 - k_F$, a contradiction. Thus $A_F((x | (y | y)) | (x | (y | y))) \leq \frac{1-k_F}{2}$, and so $A_F((x | (y | y)) | (x | (y | y))) \leq \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\}$ whenever $A_F(x) \vee A_F(y) \leq \frac{1-k_F}{2}$. Therefore $A_F((x | (y | y)) | (x | (y | y))) \leq \wedge \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\}$ for all $x, y \in X$. Conversely, let $A = (A_T, A_I, A_F)$ be a neutrosophic set in X which satisfies the condition (3.3). Let $x, y \in X$ and $\alpha_x, \alpha_y, \beta_x, \beta_y, \gamma_x, \gamma_y \in [0, 1]$. If $x \in T_{\in}(A, \alpha_x)$ and $y \in T_{\in}(A, \alpha_y)$, then $A_T(x) \geq \alpha_x$ and $A_T(y) \geq \alpha_y$. If $A_T((x | (y | y)) | (x | (y | y))) < \alpha_x \wedge \alpha_y$, then $A_T(x) \wedge A_T(y) \geq \frac{1-k_T}{2}$. Otherwise, we have $A_T((x | (y | y)) | (x | (y | y))) \geq \wedge \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\} = A_T(x) \wedge A_T(y) \geq \alpha_x \wedge \alpha_y$, a contradiction. It follows that $A_T((x | (y | y)) | (x | (y | y))) + \alpha_x \wedge \alpha_y > 2A_T((x | (y | y)) | (x | (y | y))) \geq 2 \wedge \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\} = 1 - k_T$ and so that $(x | (y | y)) | (x | (y | y)) \in T_{q_{k_T}}(A, \alpha_x \wedge \alpha_y) \subseteq T_{\in \vee q_{k_T}}(A, \alpha_x \wedge \alpha_y)$. Similarly, if $x \in I_{\in}(A, \beta_x)$ and $y \in I_{\in}(A, \beta_y)$, then $(x | (y | y)) | (x | (y | y)) \in I_{\in \vee q_{k_I}}(A, \beta_x \wedge \beta_y)$. Now, let $x \in F_{\in}(A, \gamma_x)$ and $y \in F_{\in}(A, \gamma_y)$. Then $A_F(x) \leq \gamma_x$ and $A_F(y) \leq \gamma_y$. If $A_F((x | (y | y)) | (x | (y | y))) > \gamma_x \vee \gamma_y$, then $A_F(x) \vee A_F(y) \leq \frac{1-k_F}{2}$ because if not, then $A_F((x | (y | y)) | (x | (y | y))) \leq \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\} \leq A_F(x) \vee A_F(y) \leq \gamma_x \vee \gamma_y$; which is a contradiction.

Hence $A_F((x | (y | y)) | (x | (y | y))) + \gamma_x \vee \gamma_y < 2A_F((x | (y | y)) | (x | (y | y))) \leq 2 \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\} = 1 - k_F$; and so $(x | (y | y)) | (x | (y | y)) \in F_{q_{k_F}}(A, \gamma_x \vee \gamma_y) \subseteq F_{\in \vee q_{k_F}}(A, \gamma_x \vee \gamma_y)$. Therefore $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X .

Theorem 3.6: If $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X , then the subsets $T_{q_{k_T}}(A, \alpha)$, $I_{q_{k_I}}(A, \beta)$ and $F_{q_{k_F}}(A, \gamma)$ are subalgebras of X for all $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (\frac{1-k_I}{2}, 1]$ and $\gamma \in [0, \frac{1-k_F}{2})$ whenever they are nonempty.

Proof: Assume that $T_{q_{k_T}}(A, \alpha)$, $I_{q_{k_I}}(A, \beta)$ and $F_{q_{k_F}}(A, \gamma)$ are nonempty for all $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (\frac{1-k_I}{2}, 1]$ and $\gamma \in [0, \frac{1-k_F}{2})$. Let $x, y \in T_{q_{k_T}}(A, \alpha)$. Then $A_T(x) + \alpha + \frac{1-k_T}{2} > 1$ and $A_T(y) + \alpha + \frac{1-k_T}{2} > 1 - k_T$. It follows from Theorem 3.5 that $A_T((x | (y | y)) | (x | (y | y))) + \alpha + \frac{1-k_T}{2} \geq \wedge \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\} + \alpha = \wedge \left\{ A_T(x) + \alpha, A_T(y) + \alpha, \frac{1-k_T}{2} + \alpha \right\} > 1 - k_T$; that is, $(x | (y | y)) | (x | (y | y)) \in T_{q_{k_T}}(A, \alpha)$. Hence $T_{q_{k_T}}(A, \alpha)$ is a subalgebra of X . By the similar way, we can induce that $I_{q_{k_I}}(A, \beta)$ is a subalgebra of X . Now, let $x, y \in F_{q_{k_F}}(A, \gamma)$. Then $A_F(x) + \gamma + \frac{1-k_F}{2} < 1 - k_F$ and $A_F(y) + \gamma + \frac{1-k_F}{2} < 1 - k_F$. Using Theorem 3.5, we have $A_F((x | (y | y)) | (x | (y | y))) + \gamma + \frac{1-k_F}{2} \leq \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\} + \gamma = \vee \left\{ A_F(x) + \gamma, A_F(y) + \gamma, \frac{1-k_F}{2} + \gamma \right\} < 1 - k_F$; and so $(x | (y | y)) | (x | (y | y)) \in F_{q_{k_F}}(A, \gamma)$. Therefore $F_{q_{k_F}}(A, \gamma)$ is a subalgebra of X .

Radha and Gomathi Sundari

Theorem 3.7: A neutrosophic set $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X if and only if the subsets $T_\in(A, \alpha)$, $I_\in(A, \beta)$ and $F_\in(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$ whenever they are nonempty.

Proof: Let $A = (A_T, A_I, A_F)$ be an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X . For any $x, y \in X$, let $\alpha \in (0, \frac{1-k_T}{2}]$ be such that $x, y \in T_\in(A, \alpha)$. Then $A_T(x) \geq \alpha$ and $A_T(y) \geq \alpha$. It follows from 3.4 that $A_T((x | (y | y)) | (x | (y | y))) \geq \alpha \wedge \{A_T(x), A_T(y), \frac{1-k_T}{2}\} \geq \alpha \wedge \frac{1-k_T}{2} = \alpha$ and so that $(x | (y | y)) | (x | (y | y)) \in T_\in(A, \alpha)$. Hence $T_\in(A, \alpha)$ is a subalgebra of X . By the similar way, we can induce that $I_\in(A, \beta)$ is a subalgebra of X for all $\beta \in (0, \frac{1-k_I}{2}]$. Now, let $\gamma \in [\frac{1-k_F}{2}, 1)$ be such that $x, y \in F_\in(A, \gamma)$. Then $A_F(x) \leq \gamma$ and $A_F(y) \leq \gamma$. It follows from 3.4 that $A_F((x | (y | y)) | (x | (y | y))) \leq \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\} \leq \gamma \vee \frac{1-k_F}{2} = \gamma$ and so that $(x | (y | y)) | (x | (y | y)) \in F_\in(A, \gamma)$. Hence $F_\in(A, \alpha)$ is a subalgebra of X . Conversely, let $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$ be such that $T_\in(A, \alpha)$, $I_\in(A, \beta)$ and $F_\in(A, \gamma)$ are subalgebras of X . If there exist $a, b \in X$ such that $A_T((a | (b | b)) | (a | (b | b))) < \alpha \wedge \{A_T(a), A_T(b), \frac{1-k_T}{2}\}$, then we can take $\alpha \in (0, 1)$ such that $A_T((a | (b | b)) | (a | (b | b))) < \alpha < \{A_T(a), A_T(b), \frac{1-k_T}{2}\}$. Thus $a, b \in T_\in(A, \alpha)$ and $\alpha < \frac{1-k_T}{2}$, and so $(a | (b | b)) | (a | (b | b)) \in T_\in(A, \alpha)$. But, the left inequality in induces $(a | (b | b)) | (a | (b | b)) \notin T_\in(A, \alpha)$, a contradiction. Hence $A_T((x | (y | y)) | (x | (y | y))) \geq \{A_T(x), A_T(y), \frac{1-k_T}{2}\}$ for all $x, y \in X$. Similarly, we can show that $A_I((x | (y | y)) | (x | (y | y))) \geq \{A_I(x), A_I(y), \frac{1-k_I}{2}\}$ for all $x, y \in X$. Now suppose that $A_F((a | (b | b)) | (a | (b | b))) > \gamma \vee \{A_F(a), A_F(b), \frac{1-k_F}{2}\}$ for some $a, b \in X$. Then there exists $\gamma \in (0, 1)$ such that $A_F((a | (b | b)) | (a | (b | b))) > \gamma > \{A_F(a), A_F(b), \frac{1-k_F}{2}\}$. It follows that $\gamma \in (\frac{1-k_F}{2}, 1)$ and $a, b \in F_\in(A, \gamma)$. Since $F_\in(A, \gamma)$ is a subalgebra of X , $(a | (b | b)) | (a | (b | b)) \in F_\in(A, \gamma)$ and so $A_F((a | (b | b)) | (a | (b | b))) \leq \gamma$. This is a contradiction, and thus $A_F((x | (y | y)) | (x | (y | y))) \leq \{A_F(x), A_F(y), \frac{1-k_F}{2}\}$ for all $x, y \in X$. Hence $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X .

Using Theorems 3.6 and 3.7, we have the following corollary.

Corollary 3.8: For a neutrosophic set $A = (A_T, A_I, A_F)$ of X , if the nonempty subsets $T_{\in \vee q_{k_T}}(A, \alpha)$, $I_{\in \vee q_{k_T}}(A, \beta)$ and $F_{\in \vee q_{k_T}}(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [0, \frac{1-k_F}{2})$, then the subsets $T_\in(A, \alpha)$, $I_\in(A, \beta)$ and $F_\in(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$.

Theorem 3.9: Given a neutrosophic set $A = (A_T, A_I, A_F)$ of X , the nonempty subsets $T_\in(A, \alpha)$, $I_\in(A, \beta)$ and $F_\in(A, \gamma)$ of X are subalgebras of X for all $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [0, \frac{1-k_F}{2})$ if and only if

$$(\forall x, y \in X) \left(A_T((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_T}{2} \geq A_T(x) \wedge A_T(y) \wedge A_I((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_T}{2} \right. \\ \left. \geq A_I(x) \wedge A_I(y) \wedge A_F((x | (y | y)) | (x | (y | y))) \wedge \frac{1-k_T}{2} \leq A_F(x) \vee A_F(y) \right) \quad (3.4)$$

Proof: Assume that the nonempty subsets $T_\in(A, \alpha)$, $I_\in(A, \beta)$ and $F_\in(A, \gamma)$ of X are subalgebras of X for all $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [0, \frac{1-k_F}{2})$. Suppose that there are $a, b \in X$ such that $A_T((a | (b | b)) | (a | (b | b))) \vee \frac{1-k_T}{2} < A_T(a) \wedge A_T(b) = \alpha$. Then $\alpha \in (\frac{1-k_T}{2}, 1]$ and $a, b \in T_\in(A, \alpha)$. Since $T_\in(A, \alpha)$ is a subalgebra of X , $(a | (b | b)) | (a | (b | b)) \in T_\in(A, \alpha)$, that is, $A_T((a | (b | b)) | (a | (b | b))) \geq \alpha$, a contradiction. Thus $A_T((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_T}{2} \geq A_T(x) \wedge A_T(y)$ for all $x, y \in X$. Similarly, $A_I((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_I}{2} \geq A_I(x) \wedge A_I(y)$ holds for all $x, y \in X$. Now, if $A_F((x | (y | y)) | (x | (y | y))) \wedge \frac{1-k_F}{2} > A_F(x) \vee A_F(y)$ for some $x, y \in X$, then $x, y \in F_\in(A, \gamma)$ and $\gamma \in [0, \frac{1-k_F}{2})$ where $\gamma = A_F(x) \vee A_F(y)$. But, $(x | (y | y)) | (x | (y | y)) \notin F_\in(A, \gamma)$, a contradiction. Hence $A_F((x | (y | y)) | (x | (y | y))) \wedge \frac{1-k_F}{2} \leq A_F(x) \vee A_F(y)$ for all $x, y \in X$. Conversely, let $A = (A_T, A_I, A_F)$ be a neutrosophic set in X satisfying the condition (3.4). Let $x, y, a, b \in X$ and $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (0, \frac{1-k_I}{2}]$ be such that $x, y \in T_\in(A, \alpha)$ and $a, b \in I_\in(A, \beta)$. Then $A_T((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_T}{2} \geq A_T(x) \wedge A_T(y) \geq \alpha > \frac{1-k_T}{2}$, $A_I((a | (b | b)) | (a | (b | b))) \vee \frac{1-k_I}{2} \geq A_I(a) \wedge$

Radha and Gomathi Sundari

$A_I(b) \geq \beta > \frac{1-k_I}{2}$. It follows that $A_T((x | (y | y)) | (x | (y | y))) \geq \alpha$ and $A_I((a | (b | b)) | (a | (b | b))) \geq \beta$, that is, $(x | (y | y)) | (x | (y | y)) \in T_\epsilon(A, \alpha)$ and $(a | (b | b)) | (a | (b | b)) \in I_\epsilon(A, \beta)$. Now, let $x, y \in X$ and $\gamma \in [0, \frac{1-k_F}{2})$ be such that $x, y \in F_\epsilon(A, \gamma)$. Then $A_F((x | (y | y)) | (x | (y | y))) \vee \frac{1-k_F}{2} \leq A_F(x) \vee A_F(y) \leq \gamma < \frac{1-k_F}{2}$ and so $A_F((x | (y | y)) | (x | (y | y))) \leq \gamma$, that is, $(x | (y | y)) | (x | (y | y)) \in F_\epsilon(A, \gamma)$.

Theorem 3.10: For a neutrosophic set $A = (A_T, A_I, A_F)$ of X , if the nonempty subsets $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are subalgebras of X for all $\alpha, \beta \in (0, 1]$ and $\gamma \in [0, 1)$, then $A = (A_T, A_I, A_F)$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ neutrosophic subalgebra of X .

Proof: Let $T_{\epsilon \vee q}(A, \alpha)$ be a subalgebra of X and $A_T((x | (y | y)) | (x | (y | y))) < \alpha \wedge \{A_T(x), A_T(y), \frac{1-k_T}{2}\}$ for some $x, y \in X$. Then there exists $\alpha \in (0, \frac{1-k_T}{2}]$ such that $A_T((x | (y | y)) | (x | (y | y))) < \alpha \leq \alpha \wedge \{A_T(x), A_T(y), \frac{1-k_T}{2}\}$. It follows that $x, y \in T_\epsilon(A, \alpha) \subseteq T_{\epsilon \vee q}(A, \alpha)$, and so that $(x | (y | y)) | (x | (y | y)) \in T_{\epsilon \vee q}(A, \alpha)$. Hence $A_T((x | (y | y)) | (x | (y | y))) \geq \alpha$ or $A_T((x | (y | y)) | (x | (y | y))) + \alpha > 1$, a contradiction, and so $A_T((x | (y | y)) | (x | (y | y))) \geq \alpha \wedge \{A_T(x), A_T(y), \frac{1-k_T}{2}\}$ for all $x, y \in X$. Similarly, $A_I((x | (y | y)) | (x | (y | y))) \geq \alpha \wedge \{A_I(x), A_I(y), \frac{1-k_I}{2}\}$ holds for all $x, y \in X$. Now let $F_{\epsilon \vee q}(A, \gamma)$ be a subalgebra of X and assume that $A_F((x | (y | y)) | (x | (y | y))) > \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\}$ for some $x, y \in X$. Then

$$A_F((x | (y | y)) | (x | (y | y))) > \gamma \geq \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\} \quad (3.5)$$

for some $\gamma \in [\frac{1-k_F}{2}, 1)$, which implies that $x, y \in F_\epsilon(A, \gamma) \subseteq F_{\epsilon \vee q}(A, \gamma)$. Thus $(x | (y | y)) | (x | (y | y)) \in F_{\epsilon \vee q}(A, \gamma)$. From (3.5), $(x | (y | y)) | (x | (y | y)) \notin F_\epsilon(A, \gamma)$ and $A_F((x | (y | y)) | (x | (y | y))) + \gamma > \epsilon \geq 1$, that is, $(x | (y | y)) | (x | (y | y)) \notin F_q(A, \gamma)$, a contradiction, and hence $A_F((x | (y | y)) | (x | (y | y))) \leq \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\}$ for all $x, y \in X$. By Theorem 3.5, $A = (A_T, A_I, A_F)$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X .

Theorem 3.11: If $A = (A_T, A_I, A_F)$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X , then the nonempty subsets $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$.

Proof: Assume that $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are nonempty for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$. Let $x, y \in T_{\epsilon \vee q}(A, \alpha)$. Then $x \in T_\epsilon(A, \alpha)$ or $x \in T_q(A, \alpha)$, and $y \in T_\epsilon(A, \alpha)$ or $y \in T_q(A, \alpha)$. Hence we have the following four cases:

- $x \in T_\epsilon(A, \alpha)$ and $y \in T_\epsilon(A, \alpha)$,
- $x \in T_\epsilon(A, \alpha)$ and $y \in T_q(A, \alpha)$,
- $x \in T_q(A, \alpha)$ and $y \in T_\epsilon(A, \alpha)$,
- $x \in T_q(A, \alpha)$ and $y \in T_q(A, \alpha)$.

The first case implies that $(x | (y | y)) | (x | (y | y)) \in T_{\epsilon \vee q}(A, \alpha)$. For the second case, $y \in T_q(A, \alpha)$ induces $A_T(y) > 1 - \alpha \geq \alpha$, that is, $y \in T_\epsilon(A, \alpha)$. Thus $(x | (y | y)) | (x | (y | y)) \in T_{\epsilon \vee q}(A, \alpha)$. Similarly, the third case implies $(x | (y | y)) | (x | (y | y)) \in T_{\epsilon \vee q}(A, \alpha)$. The last case induces $A_T(x) > 1 - \alpha \geq \alpha$ and $A_T(y) > 1 - \alpha \geq \alpha$, that is, $x \in T_\epsilon(A, \alpha)$ and $y \in T_\epsilon(A, \alpha)$. Hence $(x | (y | y)) | (x | (y | y)) \in T_{\epsilon \vee q}(A, \alpha)$. Therefore $T_{\epsilon \vee q}(A, \alpha)$ is a subalgebra of X for all $\alpha \in (0, \frac{1-k_T}{2}]$.

By the similar way, we show that $I_{\epsilon \vee q}(A, \beta)$ is a subalgebra of X for all $\beta \in (0, \frac{1-k_I}{2}]$. Let $x, y \in F_{\epsilon \vee q}(A, \gamma)$. Then $A_F(x) \leq \gamma$ or $A_F(x) + \gamma < 1$, and $A_F(y) \leq \gamma$ or $A_F(y) + \gamma < 1$. If $A_F(x) \leq \gamma$ and $A_F(y) \leq \gamma$, then $A_F((x | (y | y)) | (x | (y | y))) \leq \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\} \leq \gamma \vee \{\gamma, \frac{1-k_F}{2}\} = \gamma$ by Theorem 3.5, and so $(x | (y | y)) | (x | (y | y)) \in F_\epsilon(A, \gamma) \subseteq F_{\epsilon \vee q}(A, \gamma)$. If $A_F(x) \leq \gamma$ and $A_F(y) + \gamma < 1$, then $A_F((x | (y | y)) | (x | (y | y))) \leq \gamma \vee \{A_F(x), A_F(y), \frac{1-k_F}{2}\} \leq$

Radha and Gomathi Sundari

$\forall \left\{ \gamma, 1 - \gamma, \frac{1-k_F}{2} \right\} = \gamma$ by Theorem 3.5. Thus $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_\epsilon(A, \gamma) \subseteq F_{\epsilon \vee q}(A, \gamma)$. Similarly, if $A_F(x) + \gamma < 1$ and $A_F(y) \leq \gamma$, then $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_{\epsilon \vee q}(A, \gamma)$. Finally, assume that $A_F(x) + \gamma < 1$ and $A_F(y) + \gamma < 1$. Then $A_F((x \mid (y \mid y)) \mid (x \mid (y \mid y))) \leq \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\} \leq \vee \left\{ 1 - \gamma, \frac{1-k_F}{2} \right\} = \frac{1-k_F}{2} < \gamma$. Hence $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_\epsilon(A, \gamma) \subseteq F_{\epsilon \vee q}(A, \gamma)$. Consequently, $F_{\epsilon \vee q}(A, \gamma)$ is a subalgebra of X for all $\gamma \in [\frac{1-k_F}{2}, 1)$.

Theorem 3.12: If $A = (A_T, A_I, A_F)$ is an $(q, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X , then the nonempty subsets $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$.

Proof: Assume that $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are nonempty for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$. Let $x, y \in T_{\epsilon \vee q}(A, \alpha)$. Then $x \in T_\epsilon(A, \alpha)$ or $x \in T_q(A, \alpha)$. and $y \in T_\epsilon(A, \alpha)$ or $y \in T_q(A, \alpha)$. If $x \in T_q(A, \alpha)$ and $y \in T_q(A, \alpha)$, then obviously $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in T_{\epsilon \vee q}(A, \alpha)$. Suppose that $x \in T_\epsilon(A, \alpha)$ and $y \in T_q(A, \alpha)$. Then $A_T(x) + \alpha \geq 2\alpha > 1$, that is, $x \in T_q(A, \alpha)$. It follows that $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in T_{\epsilon \vee q}(A, \alpha)$. Similarly, if $x \in T_q(A, \alpha)$ and $y \in T_\epsilon(A, \alpha)$, then $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in T_{\epsilon \vee q}(A, \alpha)$. The proof for $I_{\epsilon \vee q}(A, \beta)$ is similar. Now, let $x, y \in F_{\epsilon \vee q}(A, \gamma)$. Then $x \in F_\epsilon(A, \gamma)$ or $x \in F_q(A, \gamma)$, and $y \in F_\epsilon(A, \gamma)$ or $y \in F_q(A, \gamma)$. If $x \in F_\epsilon(A, \gamma)$ and $y \in F_\epsilon(A, \gamma)$, then clearly $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_{\epsilon \vee q}(A, \gamma)$. If $x \in F_\epsilon(A, \gamma)$ and $y \in F_q(A, \gamma)$, then $A_F(x) + \gamma \leq 2\gamma < 1$, that is, $x \in F_q(A, \gamma)$. It follows that $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_{\epsilon \vee q}(A, \gamma)$. Similarly, if $x \in F_q(A, \gamma)$ and $y \in F_\epsilon(A, \gamma)$, then $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_{\epsilon \vee q}(A, \gamma)$. Finally, assume that $x \in F_q(A, \gamma)$ and $y \in F_q(A, \gamma)$. Then $A_F(x) + \gamma \leq 2\gamma < 1$ and $A_F(y) + \gamma \leq 2\gamma < 1$, that is, $x \in F_\epsilon(A, \gamma)$ and $y \in F_\epsilon(A, \gamma)$. Therefore $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_{\epsilon \vee q}(A, \gamma)$. Consequently, $T_{\epsilon \vee q}(A, \alpha)$, $I_{\epsilon \vee q}(A, \beta)$ and $F_{\epsilon \vee q}(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$.

Theorem 3.13: For a neutrosophic set $A = (A_T, A_I, A_F)$ of X , if the nonempty subsets $T_q(A, \alpha)$, $I_q(A, \beta)$ and $F_q(A, \gamma)$ are subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in (0, \frac{1-k_F}{2}]$, then

$$\begin{aligned} x \in T_\epsilon(A, \alpha_x), y \in T_\epsilon(A, \alpha_y) &\Rightarrow ((y) \mid ((y))) \in T_q(A, \alpha_x \wedge \alpha_y), \\ x \in I_\epsilon(A, \beta_x), y \in I_\epsilon(A, \beta_y) &\Rightarrow ((y) \mid ((y))) \in I_q(A, \beta_x \wedge \beta_y), \quad 3.6 \\ x \in F_\epsilon(A, \gamma_x), y \in F_\epsilon(A, \gamma_y) &\Rightarrow (x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in F_q(A, \gamma_x \vee \gamma_y), \quad \text{For all } x, y \in X, \alpha_x, \alpha_y \in (\frac{1-k_T}{2}, 1], \beta_x, \beta_y \in (\frac{1-k_I}{2}, 1] \text{ and } \gamma_x, \gamma_y \in [0, \frac{1-k_F}{2}] \end{aligned}$$

Proof. Let $x, y, a, b, u, v \in X$, let $\alpha_x, \alpha_y \in (\frac{1-k_T}{2}, 1]$, $\beta_a, \beta_b \in (\frac{1-k_I}{2}, 1]$ and $\gamma_u, \gamma_v \in (0, \frac{1-k_F}{2})$ be such that $x \in T_\epsilon(A, \alpha_x)$, $y \in T_\epsilon(A, \alpha_y)$, $a \in I_\epsilon(A, \beta_a)$, $b \in I_\epsilon(A, \beta_b)$, $u \in F_\epsilon(A, \gamma_u)$ and $v \in F_\epsilon(A, \gamma_v)$. Then $A_T(x) \geq \alpha_x > 1 - \alpha_x$, $A_T(y) \geq \alpha_y > 1 - \alpha_y$, $A_I(a) \geq \beta_a > 1 - \beta_a$, $A_I(b) \geq \beta_b > 1 - \beta_b$, $A_F(u) \leq \gamma_u < 1 - \gamma_u$ and $A_F(v) \leq \gamma_v < 1 - \gamma_v$. It follows that $x, y \in T_q(A, \alpha_x \wedge \alpha_y)$, $a, b \in I_q(A, \beta_a \wedge \beta_b)$ and $u, v \in F_q(A, \gamma_u \vee \gamma_v)$. Since $\alpha_x \wedge \alpha_y \in (\frac{1-k_T}{2}, 1]$, $\beta_a \wedge \beta_b \in (\frac{1-k_I}{2}, 1]$ and $\gamma_u \vee \gamma_v \in (0, \frac{1-k_F}{2})$, we have $(x \mid (y \mid y)) \mid (x \mid (y \mid y)) \in T_q(A, \alpha_x \wedge \alpha_y)$, $(a \mid (b \mid b)) \mid (a \mid (b \mid b)) \in I_q(A, \beta_a \wedge \beta_b)$ and $(u \mid (v \mid v)) \mid (u \mid (v \mid v)) \in F_q(A, \gamma_u \vee \gamma_v)$.

Given a subset S of X , consider a neutrosophic set $A_S = (A_{S_T}, A_{S_I}, A_{S_F})$ in X defined by

$$A_S(x) = \{(1, 1, 1) \text{ if } x \in S, (0, 0, 1) \text{ otherwise}\} \text{ That is,}$$

$$A_{S_T}(x) = \{1 \text{ if } x \in S, 0 \text{ otherwise}\}, A_{S_I}(x) = \{1 \text{ if } x \in S, 0 \text{ otherwise}\}, A_{S_F}(x) = \{0 \text{ if } x \in S, 1 \text{ otherwise}\},$$

Theorem 3.14: A nonempty subset S of X is a subalgebra of X if and only if the neutrosophic set $A_S = (A_{S_T}, A_{S_I}, A_{S_F})$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X .

Proof: Let S be a subalgebra of X . Then the subsets $T_\epsilon(A_S, \alpha)$, $I_\epsilon(A_S, \beta)$ and $F_\epsilon(A_S, \gamma)$ are obviously subalgebras of X for all $\alpha \in (0, \frac{1-k_T}{2}]$, $\beta \in (0, \frac{1-k_I}{2}]$ and $\gamma \in [\frac{1-k_F}{2}, 1)$. Hence $A_S = (A_{S_T}, A_{S_I}, A_{S_F})$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X . Conversely, assume that $A_S = (A_{S_T}, A_{S_I}, A_{S_F})$ is an $(\epsilon, \epsilon \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X . Let $x, y \in S$. Then

Radha and Gomathi Sundari

$$A_{S_T}((x | (y | y)) | (x | (y | y))) \geq \wedge \left\{ A_{S_T}(x), A_{S_T}(y), \frac{1-k_T}{2} \right\} = 1 \wedge \frac{1-k_T}{2} = \frac{1-k_T}{2}, A_{S_I}((x | (y | y)) | (x | (y | y))) \geq \wedge \left\{ A_{S_I}(x), A_{S_I}(y), \frac{1-k_I}{2} \right\} = 1 \wedge \frac{1-k_I}{2} = \frac{1-k_I}{2}, A_{S_F}((x | (y | y)) | (x | (y | y))) \leq \vee \left\{ A_{S_F}(x), A_{S_F}(y), \frac{1-k_F}{2} \right\} = 1 \vee \frac{1-k_F}{2} = \frac{1-k_F}{2},$$

which imply that $A_{S_T}((x | (y | y)) | (x | (y | y))) = 1$, $A_{S_I}((x | (y | y)) | (x | (y | y))) = 1$ and $A_{S_F}((x | (y | y)) | (x | (y | y))) = 0$. Hence $(x | (y | y)) | (x | (y | y)) \in S$, and so S is a subalgebra of X .

Theorem 3.15: Let S be a subalgebra of X . For every $\alpha \in (\frac{1-k_T}{2}, 1]$, $\beta \in (\frac{1-k_I}{2}, 1]$ and $\gamma \in [0, \frac{1-k_F}{2})$, there exists an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra $A = (A_T, A_I, A_F)$ of X such that $T_\in(A, \alpha) = S$, $I_\in(A, \beta) = S$ and $F_\in(A, \gamma) = S$.

Proof: Let $A = (A_T, A_I, A_F)$ be a neutrosophic set in X defined by

$$A_S(x) = \{(\alpha, \beta, \gamma) \text{ if } x \in S (0,0,1) \text{ otherwise}$$

that is,

$A_{S_T}(x) = \{\alpha \text{ if } x \in S 0 \text{ otherwise}, A_{S_I}(x) = \{\beta \text{ if } x \in S 0 \text{ otherwise}, A_{S_F}(x) = \{0 \text{ if } x \in S \gamma \text{ otherwise}$, Obviously, $T_\in(A, \alpha) = S$, $I_\in(A, \beta) = S$ and $F_\in(A, \gamma) = S$. Suppose that $A_T((a | (b | b)) | (a | (b | b))) < \wedge \left\{ A_T(a), A_T(b), \frac{1-k_T}{2} \right\}$ for some $a, b \in X$. Since $Im(A_T) = 2$, it follows that $\left\{ A_T(a), A_T(b), \frac{1-k_T}{2} \right\} = \alpha$ and $A_T((a | (b | b)) | (a | (b | b))) = 0$. Hence $A_T(a) = \alpha = A_T(b)$, and so $a, b \in S$. Since S is a subalgebra of X , $(a | (b | b)) | (a | (b | b)) \in S$. Thus $A_T((a | (b | b)) | (a | (b | b))) = \alpha$, a contradiction. Therefore $A_T((x | (y | y)) | (x | (y | y))) \geq \wedge \left\{ A_T(x), A_T(y), \frac{1-k_T}{2} \right\}$ for all $x, y \in X$. Similarly, we can verify that $A_I((x | (y | y)) | (x | (y | y))) \geq \wedge \left\{ A_I(x), A_I(y), \frac{1-k_I}{2} \right\}$ for all $x, y \in X$. Assume that there exist $a, b \in X$ such that $A_F((a | (b | b)) | (a | (b | b))) > \vee \left\{ A_F(a), A_F(b), \frac{1-k_F}{2} \right\}$. Then $A_F((a | (b | b)) | (a | (b | b))) = 1$ and $\vee \left\{ A_F(a), A_F(b), \frac{1-k_F}{2} \right\} = \gamma$ since $Im(A_F) = 2$. It follows that $A_F(a) = \gamma = A_F(b)$ and so that $a, b \in S$. Hence $(a | (b | b)) | (a | (b | b)) \in S$, and so $A_F((a | (b | b)) | (a | (b | b))) = \gamma$, which is a contradiction. Thus $A_F((x | (y | y)) | (x | (y | y))) \leq \vee \left\{ A_F(x), A_F(y), \frac{1-k_F}{2} \right\}$ for all $x, y \in X$. Therefore $A = (A_T, A_I, A_F)$ is an $(\in, \in \vee q_{(k_T, k_I, k_F)})$ -neutrosophic subalgebra of X .

ABSTRACT

The main objective of this study is to presents an innovative approach to improve the performance of evacuated tube heat pipe solar water heaters by optimizing key variables in outdoor settings. These objectives are accomplished by experimentally focusing on the mass flow rate tilt angle, and filling ratio to maximize system efficiency. The selection of an appropriate working fluid and the optimization of operational parameters are critical for enhancing evacuated tube solar water heater system performance. The primary goal of this investigation is to evaluate the effectiveness of different working fluids, including acetone, methanol, and water, under varying operational conditions. Evacuated tube solar water heaters present an environmentally friendly option compared to traditional water heating methods. Research conducted in Navsari, India, from December to May, assessed the effectiveness of a solar collector incorporating a compound parabolic concentrator. The most important results indicate that the efficiency of ETSWH is influenced by heat pipe working fluid, tilt angle, filling ratio, and mass flow rate. Acetone was found to be the most efficient working fluid among the tested substances (water, acetone, and methanol) under the examined conditions of tilt angles (25°, 35°, and 45°), filling ratios (30%, 40%, and 50%), and mass flow rates (0.0042, 0.0047, and 0.0056 kg/s). The significance of the obtained results lies in the highest thermal efficiency, 44% was obtained using a 50% acetone mixture and a 45-degree tilt angle. Parametric analysis indicates that most important parameter is working fluid inside heat pipe, which is followed by liquid filling ratio in addition to inclination angle of heat pipe. As mass flow rate increased, heat pipe efficiency declined and increased with liquid filling level.

Keywords: Solar water heater, Thermal System, Heat Pipe, Working Fluid

INTRODUCTION

Solar water heaters, which employ sunlight to heat water for variety of residential and commercial uses, are an eco-friendly alternative to conventional water heaters that burn fossil fuels. Solar water heaters capture sun's abundant energy by converting sunlight into thermal energy by employing solar panels. Solar water heaters usually employ heat pipe or glass systems [1]. Evacuated tube solar water heater (ETSWH) represents a significant advancement in solar water heating technology. Unlike conventional flat-plate collectors, evacuated tube collectors are constructed from sealed glass tubes that have metal layers inside that absorb energy. When it comes to thermal efficiency and performance, heat pipe design is superior to water-in-glass system. System's overall efficiency is raised and heat loss is decreased by vacuuming these tubes [2]. Many investigations have been performed on evacuated tube heat pipe solar water heaters. Researchers examine how various tilt angles, fill ratios, and working fluids affect performance. Optimizing these systems involves careful consideration of the working medium selection, which directly impacts thermal performance. The effect of several liquids along with their water solutions on evacuated tube heat pipe solar collector efficiency had been investigated by Mukuna et al. [3] and Gryzagoridis et al. [4]. Pure water showed higher efficiency compared to other liquids, while acetone surpassed pure water. Heat transmission in evacuated tube solar collector can be improved by nanofluids, like water and multiwalled carbon nanotubes [5]. Energy and exergy efficiency are also influenced by flow rate and nanofluid concentration [6]. It has been discovered that hybrid nanofluids, such as "magnesium oxide/multi-walled carbon nanotubes (MgO/MWCNT)", enhance thermal performance; an increase in weight ratio of MWCNT nanoparticles considerably enhance collector efficiency [7]. It has been demonstrated that heat transfer and efficiency can be increased by modifying heat pipes with particular internal geometries as well as working fluids [8].

Researcher have conducted in-depth studies on various working fluids and nanofluids concentrations. For optimum performance, other factors including temperature, pressure, and heat transfer mechanisms must be taken into consideration. Optimizing efficiency of solar water heaters requires more investigation into working fluids along with their characteristics [9]. One important parameter for optimization is solar irradiance, which has a direct effect on thermal performance and energy efficiency of heat pipe ETSWHs [10]. Solar energy received by evacuated tubes determines temperature and rate of heat transfer fluid [11]. Higher solar radiation increases heat absorption, raising the temperature of the leaving water and enhancing system performance [12]. Optimizing the tilt angles of collectors based on solar irradiance data maximizes useable energy collection and energy savings [13]. Higher solar radiation leads to higher energy production and less reliance on conventional sources, significantly impacting the system's cost savings and payback period [14]. Therefore, optimizing solar radiation is crucial for cost-effectiveness and efficiency of evacuated tube heat pipe solar water heaters. A heat pipe solar water heater's tilt angle significantly influences effectiveness of heat exchange between water tank and heat-absorbing pipe. Optimizing tilt angles and brackets can reduce water flow resistance, improving heat exchange efficiency [15]. Inclination angle of heat collection tube determines angle of incidence (ϕ) of solar radiation, affecting system's solar energy utilization efficiency [16]. Studies show optimal tilt angle for maximum sun share is about $\phi+(0\rightarrow10^\circ)$ for northern regions as well as $\phi+(0\rightarrow20^\circ)$ for southern regions [17]. Adjusting the tilt angle based on geographical location or season can improve thermal performance and energy production [18]. Various studies demonstrate that adjusting the collector's inclination angle can maximize energy and cost savings [19].

According to experiments conducted in various locations, optimal inclination angle for solar water-heated two-phase closed thermosiphon heat pipes (TPCT) is 26° ; higher angles decrease efficiency as well as capability of heat transfer [13]. Tilt angle has no discernible effect on performance, according to studies on evacuated tube solar collectors, while 30° produces marginally better results than 15° [20]. Modified coaxial heat pipe experiments showed that inclination "angle of evacuated tube influences thermal efficiency of solar collector, necessitating optimal angle [21]. Yang et al. [22] discovered that concentrated evacuated tube heat pipe solar collectors perform well thermally when tilted 60 degrees from horizontal. According to Sobhansarbandi et al. [23], an evacuated tube solar air collector with reflector performed better thermally at a tilt angle of 30° than at 45° . For heat pipe-based evacuated tube solar

**Jignesh Patel and Vijay Dhiman**

collector with" Al_2O_3 -water 0.1% nanofluid as working medium, Putra et al. [24] discovered that a 30° tilt angle offers best thermal performance [25]. Ratio of volume of working fluid to total volume of heat pipe is known as filling level. Sarafraz et al. [26] discovered that 0.6 was optimal filling ratio for their collection. Joudi and Al-Joboory [5] discovered that system's overall efficiency increased with load conditions, and that system with a 22mm heat pipe and 1800mm evaporator length performed best. When Kabeel et al. [27] experimented with various filling ratios, they discovered that "heat pipe solar collector's thermal efficiency rose as filling ratio did. Thus, thermal efficiency as well as overall performance of evacuated tube heat pipe solar water heaters can be increased by regulating filling ratio. Thermal performance of evacuated tube heat pipe solar water heaters is" directly impacted by mass flow rate, rendering it a crucial parameter for system optimization. Higher thermal efficiencies and energy transmission to solar working fluid can be achieved by optimizing system through changes in mass flow rate [28]. Amount of working fluid that flows through system is determined by mass flow, which also influences working fluid's temperature rise and outflow temperature [29].

Furthermore, two-phase flow in the outer tube may be influenced by mass flow, which could lower system's efficiency [30]. System can function at maximum efficiency and generate required outlet temperature by assessing optimal mass flow [12]. For evacuated tube heat pipe solar water heaters to operate as effectively and efficiently as possible, mass flow optimization is essential. Since thermal performance of heat transfer devices and systems varies depending on location, it is required to experiment with various parameters and working fluids. Researchers can learn how various parameters impact system's overall performance as well as heat transfer efficiency by adjusting mass flow rates, filling ratio, heat input, along with adiabatic length [31]. Use of different working fluids allows comparing their thermal properties and performance. This research introduces a novel method to enhance these systems by fine-tuning variables like tilt angle, mass flow rate, in addition to filling ratio in outdoor environments. Increasing efficiency of evacuated tube heat pipe solar water heaters requires optimizing working fluid with efficient parameters. Working fluid, optimal tilt angle, filling ratio, as well as mass flow rate are key components that are examined in current investigation of ETSWH systems. Primary objective is to assess experimentally effectiveness and performance of different working fluids, like acetone, methanol, as well as water. To evaluate thermal performance of these fluids, study involves monitoring and recording solar radiation, ambient temperature, and heat transfer rates. It is expected that findings would advance current research in this area by offering insightful information about best way to choose various parameters and operating fluids for ETSWH systems.

Experimental Setup and Procedure**Experimental Setup**

Two concentric borosilicate glass tubes make up evacuated tube solar collectors. Receiver tube measures 1800mm in length and 58mm in diameter. Thermosiphon heat pipe has been placed in a vacuum tube that serves as receiving tube. Vacuum tube contains thermosiphon heat pipe. Elmosbahi et al [33] state that vacuum tube specifications were basis for selection of thermosiphon heat pipe specifications. Copper thermosiphon heat pipe employed in this experiment measured 1700mm in length and 8mm in diameter. Initial step involved utilizing a rotating vacuum pump for creating vacuum in copper pipe having pressure of up to 5Pa. To prevent heat loss to environment and guarantee efficient heating, condenser portion, which measured 215mm in length, of which 155mm was located inside storage tank and remaining 60mm was insulated outside with Armaflex. The 2.67-liter storage tank that holds condenser is filled with distilled water. Tank is galvanized cylinder made of 3mm thick wall. Interior surface was thoroughly cleaned using distilled ethanol as a cleaning solution, and a pressure gauge was affixed to end of condenser to assist with evacuation as well as fluid injection. Air is effectively purged from the heat pipe by a mechanical evacuated pump operating at 5 Pa. The liquid payload was boiled to eliminate non-condensable gases after the air was removed. They were successfully removed, as evidenced by fact that working fluid had been injected into pipe once an evacuation was created. A filling degree of 30%, 40%, and 50% of injected working medium must be achieved, which corresponds to copper pipe's total volume. Heat pipe is heated by the absorber's absorption of solar radiation, which causes liquid inside to evaporate. Resultant vapor rises to heat pipe's top condenser, where

**Jignesh Patel and Vijay Dhiman**

it cools down from the water reservoir as well as condenses. After that, condensed liquid gravitationally reaches evaporator again.

Experimental setup utilized to assess performance of solar collectors with CPC at different parameters that most significantly affect system performance is depicted in Figure 1. An evacuated tube positioned in center of CPC apparatus, a water circulation system, and data collection system make up experimental setup. A water storage tank, part of circulating water system, collects heat through evacuated tube. Water's inlet and outlet are monitored by a temperature sensor. Flow rate is controlled by a flow control valve. Thermosyphon heat pipe serves as an absorber in this evacuated tube test apparatus. Working fluid fills a portion of the heat pipe while leaving the remaining portion empty. The two sections of the evacuated tube are the condenser and evaporator sections. These sections contain the Thermosyphon heat pipe installation. Heat from the thermosyphon heat pipe can be harvested by the circulating water system by placing the condenser inside evacuated tube. To adjust collector's tilt angle and optimize solar energy collection, evacuated tube with CPC is directed southward. A metal frame that is angled from 0-90 degrees toward the horizontal supports the model. The system's tilt angle is changed to 25, 35, and 45 degrees during the test. Using acetone, methanol, and water as working fluids, goal is to examine thermal efficiency of a gravity-assisted 2-phase thermosyphon under same conditions (tilt angle and liquid filling amounts of 30, 40, and 50%).

Choice of working fluid for a heat pipe ETSWH should consider several factors, like material compatibility, temperature range, as well as heat transfer characteristics. Strong heat transfer properties, low viscosity, and a high boiling point are desirable characteristics for the working fluid. Heat pipe absorbers have good heat conduction and a low heat capacity in solar collector systems used to produce hot water in Gujarat. Use an evacuation tube to mount on solar water heater and change tilt angle according to the season to optimize the production of solar energy. Over several days, the working liquid volume was adjusted to be between 15 to 24 ml, as a filling charge ratio. Temperature and solar radiation data are collected by data collection system from multiple locations within evacuated tubes. A METRAVI 207 solar power meter, which was mounted at side of solar collector, had been employed for measuring amount of solar radiation. To guarantee precise data collection, 7 K-type thermocouples were placed in experimental setup, labelled T1-T7, and calibrated. To assess temperature distribution, 3 thermocouples were positioned on heat pipe at top T5 and bottom T3 sections. A single T2 thermocouple was positioned on evacuated tube's surface. 2 thermocouples were also placed at water collecting system's entrance T1 and output T7, which collect heat energy through evacuated tube. Finally, atmospheric temperature had been measured using a K-type thermocouple T4.

Experimental procedure

Each experiment carried out outside of the residence (73.04 E, 21.07 N) was carried out in Gujarat. ANSI/ASHRAE 2003 standard (Section 6.1), European Standard 2001, and ISO 1994 standard are most often employed standards for stationary "testing of glazed solar thermal collectors. An instantaneous thermal efficiency test, incident angle modifier test", in addition to collector time constant test are mandated by three standards. Collector performance measurements provided by these standards can be used to assess minor variations in requirements over long term. Location receives no more than nine hours of sunlight between 9 a.m. and 5 p.m. Therefore, all experimental trials will be conducted throughout same time frame, which is December 25, 2021, to May 22, 2022. Thermal performance of the evacuated tube collector by varying the mass flow rate of water. The flow rates were set at 0.0042, 0.0047, and 0.0056 kg/s to determine the optimal balance between useful energy gain, outlet temperature, and overall thermal efficiency. In addition to water temperature at inlet and outlet, temperature at several points along a thermosyphon heat pipe was observed. The entire solar heater experiment was redesigned using a method design and the identical experimental protocol was followed. According to a literature review, numerous studies have been conducted on heat pipe performance. With a constant, uniform heat source and fluctuating heat fluxes, majority of tests employed short test durations. In this case, solar energy was employed to cool water jacket for heat pipe condenser and heat evaporator.

Jignesh Patel and Vijay Dhiman

Efficiency calculations

$$Q_s = I * A \text{ kW} \quad (1)$$

where Incident solar energy, represented by Q_s , is calculated using equation (1). The projected area receiving solar radiation is denoted by A , with I representing the solar irradiation density. Equation (2) expresses length of evaporator (L_e) section of evacuated tube, as well as area can be determined by employing aperture width (B)

$$A = B * L_e \text{ m}^2 \quad (2)$$

Heat energy absorbed by moving water within EHP has been determined by utilizing the specific heat (C_w), mass flow rate (M_w), and temperature variances between outlet as well as inlet, as outlined in equation (3).

$$Q_w = M_w C_w (T_{wO} - T_{wI}) \text{ kW} \quad (3)$$

The assessment of immediate efficiency of solar system entails calculating the proportion of “heat energy absorbed by water from absorber tube to total solar radiation reaching CPC collector. Equation (4) represents instantaneous efficiency”. [32]

$$\eta_{inst} = \frac{Q_w}{Q_s} \quad (4)$$

RESULTS AND DISCUSSIONS

Impact of tilt angle on ETSC's thermal characteristics and instantaneous efficiency is covered in this section with regard to composite parabolic concentrators. Between December 25, 2021, and May 22, 2021, experiments were conducted using tilt angle changes of 25°, 35° and 45°. Effectiveness of evacuated tubes used in thermosiphon heat pipe and CPC solar collectors is investigated and compared with relevant research findings (CPCs). Prior research on similar systems has reported efficiencies ranging from 30 to 50 percent, especially when standard working fluids like water were employed. Under various operating conditions and solar radiation angles, the study's working fluids, acetone and methanol had average efficiencies that were relatively close to one another. These devices probably performed better when a CPC and other working fluids were included, which direct sunlight onto evacuated tube over a large angle of incidence. Operating angle was changed to align with average sun angle at each site, increasing efficiency. This is consistent with previous studies that emphasized significance of increasing tilt angle when considering local solar angles. Many investigations examine CPC's wide acceptance angle and robustness, even though it can maintain high efficiencies over a larger range of solar incidence angles. Absence of a working heat pipe mechanism or an unintegrated system frequently results in temperature gradients along tube. Findings indicate better homogenous heat transmission as well as absorption.

According to research, performance is impacted by cloudy weather and specific times of the day. Configuration's dependability highlights the advantages of combining a heat pipe mechanism and CPC having evacuated tube system. Overall, system functioned well, with very little convection loss and some reflection loss. Numerous studies show that comparable losses are commonly experienced and that it is difficult to eradicate these inefficiencies everywhere. Less loss occurs in these systems, though, which increases benefits even further. When contrasted with similar systems reported in literature, integrated evacuated tube design having thermosiphon heat pipe solar collectors as well as CPC indicated superior performance under a range of operating circumstances and working fluid types. Investigation highlights potential of this integrated approach as a benchmark for future solar thermal system design and development. The daily variation in sun radiation intensity starting at 9:00 a.m. is depicted in Fig. 2. until 5:00 p.m.

Since temperature increases with increasing solar power, Fig. 3 shows how intensity of solar radiation significantly affects temperature of heat pipe walls. More usable energy is produced as a result of this influence. Working fluid condenses, transferring heat obtained through absorber or evaporator section to tank. Cooling water in tank will get heat by natural convection through copper wall and conduction through condenser wall. These results are displayed in Figure 4, where acetone is utilized as working fluid at mass flow rate of 0.004167kg/s and inclination angle of 35°, while water's ambient temperature remains nearly constant. However, hot water's temperature will fluctuate in

Jignesh Patel and Vijay Dhiman

tandem with sun's intensity. It's clear that during noon, the maximum temperature of hot water reaches roughly 32°C, a difference of nearly 10 °C from the ambient temperature.

Since temperature increases with increasing solar power, Fig. 3 shows how intensity of solar radiation significantly affects temperature of heat pipe walls. More usable energy is produced as a result of this influence. Working fluid condenses, transferring heat obtained through absorber or evaporator section to tank. It's clear that during noon, the maximum temperature of hot water reaches roughly 32°C, a difference of nearly 10 °C from the ambient temperature.

The Effect of Various Factors on Efficiency

Effect of filling ratio for a different working fluid

The heat pipe solar water heater's optimal overall efficiency as shown in Figure 5, was determined by experimentation with many configurations, using acetone “as working fluid, a 50% filling ratio, a 35° inclination angle, and mass flow rate” of 0.0042. Methanol, on other hand, reached a maximum efficiency of 54% in Figure 7 with a 50% filling ratio, a 25° inclination angle, and a 0.0042 mass flow rate. With water as working fluid, a 35° inclination angle, mass flow rate of 0.01442, and 30% filling ratio, the working fluid achieved a 43% efficiency, as demonstrated in Figure 6.

Effect of Mass Flow Rate for a Different Working Fluid

Fig. 8 illustrates how mass flow rate affected heat pipe solar water heater's overall efficiency. However, acetone reached a maximum efficiency of 60% at a 35° inclination angle and 50% filling ratio; at that time, mass flow rate was 0.0042kg/s. Under same conditions, methanol seemed to have a maximum efficiency of 54%, but water had such a maximum efficiency of 38%. There is a correlation between maximum efficiency of a setup and the temperature difference. As a result, temperature difference in acetone peaks at 0.0042 kg/s, or around 10°C, as seen in Fig. 9. On the other hand, methanol displays a temperature difference of around 8 °C at 0.0042kg/s mass flow rate, which is comparable to acetone, while water displays a temperature difference of 6 °C at 0.0055 lit per hour in Figure 10. According to fig.11, acetone and methanol as working fluids attain maximum efficiency at an inclination angle of 35 degrees. See fig.12 water, on the other hand, performs best at a 45-degree angle. This implies that best performance of heat pipes at different inclinations is significantly influenced by working fluid selection. Figure 13 shows how altering inclination angle affects temperature difference between incoming and outflow water. It is crucial to remember that setup's maximum efficiency is directly correlated with temperature difference. As a result, the temperature differential in acetone peaks at an angle of 35 degrees, or around 10 degrees Celsius. Water, on the other hand, has a temperature differential

Optimization of Impact of Various Parameter on EHPSWH

Non-Dimensional Parameter

$$x'_i = 2 \times \left(\frac{x_i - x_{av}}{x_{max} - x_{min}} \right) \quad (7)$$

$$x^{av} = \left(\frac{x_{max} + x_{min}}{2} \right)$$

here X_i denotes “ith value of X, X_{min} denotes minimum value of X and X_{max} denotes maximum value of X. Full factorial design” dictated that 81 experiments were needed, or 4 variables with 3 levels apiece, for complete analysis. Every experiment needed to be conducted twice to ensure that findings could be repeated. Experimental design-based method of Taguchi's L-27 orthogonal array was employed for reducing number of experiments carried out in current

Jignesh Patel and Vijay Dhiman

investigation. MINITAB was employed for optimizing combination of several parameters, resulting in a set of 27 experiments. Codes "+1" and "-1" indicated two levels of variable. Between these two levels the third level's central level is "0". The response surface model was constructed using a Taguchi's L-27 orthogonal array that had five replicates and four variables at its centre. Fig.14 illustrates the specific steps that were taken for the analysis. A total of 81 experiments were carried out using various combinations of mass flow rate (B), filling ratio (A), working fluid (D), and heat pipe inclination (C), as advised by the application of RSM. The responses were examined using MINITAB software to establish association between efficiency (η) and various study parameters. Quadratic regression model that follows was created by taking into account the relationships between the various variables.

$$\eta = \beta_0 + \sum_{i=1}^3 \beta_i \cdot X_i + \sum_{i=1}^3 \beta_i \cdot X_i^2 + \sum_{i=1}^3 \sum_{j=i+1}^3 \beta_{ij} \cdot X_i X_j \quad (9)$$

where the uncoded independent variables are X_i and X_j , and "regression coefficients for intercept, linear, quadratic, and interaction terms are β_0 , β_i , β_{ii} , and β_{ij} , respectively. By employing multiple regression analysis, response (η) was associated with 3 independent variables by employing second-order quadratic polynomial as per equation" (9). Equation (10) shows that expansion of equation (9) produced 15 terms. Five relevant terms encompassing constant, B, AD, BC, and B2 were suggested by MINITAB software. Table 2 shows that 4 terms are significant at 95% confidence level, having minimum significance level (p) < 0.05.

where, η denotes efficiency, A denotes fluid filling ratio, B denotes mass flow rate, C denotes working fluid and IA denotes inclination of heat pipe.

Interdependent Parameters' Effect

Figures 15 and 16 demonstrate how altering liquid filling ratio and heat pipe inclination angle affects heat pipe's efficiency by employing interactive (2-D and 3-D) graphs made with MINITAB software. There is a benefit to raising the liquid filling ratio. This effect was found to be more promising in vacuum conditions, even though it affects efficiency at all pressures. This occurs as a result of working fluid's saturation temperature dropping at low pressure, which raises latent heat of vaporization and causes steam generation to begin early. Stronger steam development is also a result of the higher filling level. As a result, the heat transfer to the liquid is increased by both factors. Consequently, in certain conditions, higher performance was obtained with a larger filling ratio. Steam formation was delayed and latent heat was reduced as a result of the saturation temperature rising in tandem with the pressure. At a 50% fill level and a 45° inclination angle, the maximum efficiency was approximately 0.44. Efficiency increased almost linearly as the filling degree and inclination angle were increased. Increasing both parameters at the same time improved efficiency as well. The reason for this is that when the filling level is increased, a lot of steam is produced, necessitating a quick movement of the condensed steam from condenser to evaporator section.

To facilitate condensed vapor's backward movement and replenish the liquid to enable quick heat removal at the evaporator, angle of inclination (and consequently force of gravity) was increased. The combined impact of altering mass flow rate of 0.0042 and fill ratio of 50% on ETHPSC efficiency is demonstrated in Fig.17 and 18. The

**Jignesh Patel and Vijay Dhiman**

performance of the ETHPSC was found to be positively impacted by both parameters. The efficiency rises (non-linearly) with increasing filling ratio at mass flow rate of 0.0042. This is because an almost linear increase in efficiency was obtained by both decreasing water mass flow as well as increasing filling ratio. Efficiency increased almost linearly with a decrease in flow rate as the tilt angles shown in Figures 19 and 20 increased.

This is because, as the slope rose, the condensed vapor's gravity-assisted reflux increased as well, leading to a faster replenishment of liquid and quicker heat removal at evaporator. Additionally, as anticipated, a steeper slope turned out to be more advantageous. Efficiency was also improved, albeit not as much, by simultaneous rise in both parameters, except vertical orientation (i.e. E. heat pipe's 45° inclination. This is a result of gravity effect controlling the condensed vapor's transition in this instance from the condenser to the evaporator region. The efficiency for both parameters was found to be more dependent on the mass flow than on the inclination angle Table 3 & 4 displays quadratic response surface model's analysis of variance (ANOVA) sum of squares, between- and within-group degrees of freedom, mean square, and grand total. Statistical study on basis of ANOVA model shows that proposed mathematical model may be applied to samples with a 95 percent confidence level. Both R-squared and adjusted R-squared values for model were 0.9844 and 0.9739, respectively. Null hypothesis is rejected, indicating that current model is statistically significant, as indicated by observed p-value of 0.0001.

Optimization & Validation of the mathematical model

Purpose of “response surface optimization is to find optimal values for independent variables where response can be either maximum or minimum.” Highest ETHPSC efficiency value that could be found in this investigation was found using MINITAB software. The maximum ETHPSC efficiency, as determined by the RSM results, was 44% at fill ratio of 50%, mass flow rate of 0.0042, and 45° inclination. Experimental findings showed an efficiency of 0.4407, greatest value under these operating conditions. A comparison between ETSC efficiency derived from experimental investigations and efficiency “predicted by quadratic model provided in Equation (10), is presented in Fig. 21. Fact that more than 90% of operational points were observed to be within $\pm 10\%$ of experimental values” indicates that quadratic model and experimental data agreed quite well.

CONCLUSIONS

The following are study's main conclusions:

- Parametric analysis indicates that most important parameter is working fluid inside heat pipe, which is followed by liquid filling ratio in addition to inclination angle of heat pipe.
- As mass flow rate increased, heat pipe efficiency declined and increased with liquid filling level.
- The tilt angle of the ETSC was found to have an impact on its performance. Over time, the thermosiphon heat pipe's efficiency increased in tandem with its inclination.
- For acetone, a filling ratio of 50%, mass flow rate of 0.04142kg/s, and a 45° inclination proved to be the ideal set of parameters. The efficiency at this point, as determined by the experiments and predicted by the model, was 0.46, which indicates a 2.93 percent deviation. When the experimental results at various operating conditions are compared with the efficiency predicted by an empirical model, a deviation of approximately 10 percent is discovered. As a result, justice is ensured.

ABSTRACT

Before exercise, warm-up routines often include stretching protocols. This includes improving joint flexibility and reducing muscle stiffness, thereby improving the overall performance. The various stretching technique includes, static stretching (SS), dynamic stretching (DS), ballistic stretching (BS), and proprioceptive neuromuscular facilitation (PNF). To study the effect of dynamic and static stretching with myofascial release on hamstring flexibility of recreational cricket players. A four-week comparative study was conducted to evaluate the effectiveness of different interventions on hamstring flexibility. Hamstring tightness was measured using the Active Knee Extension Test (AKET) and the Sit and Reach Test, while lower limb strength was assessed through the Squat and Jump Test. Thirty recreational cricket players exhibiting hamstring tightness were selected and randomly assigned to two groups. Group A received a combination of dynamic and static stretching, whereas Group B underwent static stretching along with myofascial release therapy. Outcome measures were recorded at the end of the four-week intervention period. Results from within-group analysis showed significant improvements in hamstring flexibility in both groups. Group A demonstrated a mean improvement of 5.73° in the AKE test and 3.00cm in the Sit and Reach test ($p < 0.001$ for both), while Group B showed greater gains, with increases of 7.40° and 4.40 cm, respectively ($p < 0.001$ for both). However, both groups experienced a significant decline in Squat Jump performance: Group A by 6.27cm and Group B by 6.07 cm ($p < 0.001$ for both). Baseline comparisons confirmed no significant differences between

**Khushi Patel et al.,**

groups in any outcome measure (AKE:p=0.205;SitandReach:p=0.948;SquatJump:p=0.312). Post-intervention, although Group B showed slightly greater improvements in flexibility, these differences were not statistically significant (AKE:p=0.621;SitandReach:p=0.152;SquatJump:p=0.147). Both the intervention showed significant results in improving hamstring flexibility. However, the lower limb power performance was found to be reduced in both the groups as evidenced by Squat Jump scores. **Conclusion:** This study examined the comparative effects of dynamic-static stretching and static stretching combined with myofascial release on hamstring flexibility in recreational cricket players with hamstring tightness. Over a four-week intervention, both methods significantly improved flexibility, as measured by the Active Knee Extension and Sit and Reach tests. Although the group receiving static stretching with myofascial release showed slightly greater gains, the difference was not statistically significant. However, both groups experienced a significant decline in Squat Jump performance, suggesting that increased flexibility may come at the cost of reduced explosive lower limb power. These results highlight the need to consider the timing of static-based interventions in performance-focused contexts. In conclusion, both approaches are effective for improving flexibility.

Keywords: Recreational players, Active knee extension test(AKET),sit and reach test, squat and jump test.

INTRODUCTION

Cricket requires a great deal of physical effort to play and includes extended periods of time engaged with short bursts of activity, including sprinting, bowling, and rapid movement [1]. Movement patterns specific to the sport include both concentric and eccentric muscular activity and include sudden shifts in joint angles and significant amounts of force produced; therefore, they are capable of producing tremendous amounts of mechanical and neuromuscular stress to the lower limb [2]. Of all lower body structures, the hamstrings (the semitendinosus, semimembranosus, and biceps femoris long head) play a vital role in performing hip extension, knee flexion, stabilizing the pelvis, and generating force while running and bowling [3,4]. This vulnerability results from the hamstring's unique bi-articular arrangement, postural function, and susceptibility to repeated high-tensile force and eccentric loading during high-speed running and the delivery stride in bowling [5]. The epidemiological data proves consistent with reports of high rates of lower limb injuries among cricketers (especially among youth and adolescent cricketers), with hamstring strain injuries being among the most frequently reported types of soft tissue injury at all levels of cricket [6]. Bowling and fielding are particularly dangerous activities that involve repetitive, explosive and high-speed movements [7-10]. There are several factors that contribute to the high incidence of hamstring injuries [11,12]. These include not just the anatomical structure of hamstrings but also the physical factors that may cause strain on these muscles [13,14]. Physical risk factors include a decrease in flexibility, a loss of muscle elasticity, inadequate preparation for physical activity, and underlying issues associated with fatigue, weakness, and imbalance in strength [15-18].

Flexibility is an essential element of fitness and provides optimal joint function and efficiency of movement and contributes to minimising an individual's likelihood of developing a musculoskeletal injury [19]. A decrease in flexibility of the hamstrings is associated with altered movement mechanics of the lower limb, decreased capacity to perform efficiently, and increased risk of muscle strain and overuse injury [20]. To maximise extensional capacity and minimise musculotendinous stiffness, stretch interventions are regularly implemented into warm-up and preconditioning programs of athletes [21]. Dynamic stretching has recently received increased recognition in terms of its ability to improve range of motion and enhance neuromuscular activation and the "readiness" of an athlete to perform at maximum capacity. It has been shown in research studies that dynamic stretching produces both

**Khushi Patel *et al.*,**

immediate and long-term improvements in the range of motion of the hamstrings and decreases passive stiffness at the musculotendinous level; therefore, dynamic stretching is a tool used by many to prepare the hamstrings before physical exertion [22]. In recent years, self-myofascial release techniques (using foam rollers) have also been widely accepted as a means to increase muscle flexibility, similar to static stretching, by improving the elastic properties of the tissue, reducing restriction of the fascia, and increasing the tolerable amount of stretch during the exercise [23]. Other studies have shown that when using static stretching or self-myofascial release, both methods produce significant improvements in hamstring flexibility [24]. Therefore, it may be beneficial to combine these two techniques to take advantage of the benefits that each can have on the overall effectiveness of the program. However, very few studies have directly compared the effect of combined static stretching with dynamic stretching and myofascial release techniques on performance in adolescent recreational athletes. Thus, this experimental comparative study aims to assess and compare the effectiveness of static stretching and dynamic stretching, as well as static stretching and myofascial release, on the flexibility of the hamstrings in adolescent recreational cricket players, with the hypothesis that there will be a marked difference between the two treatment protocols.

MATERIALS AND METHODS

Study design

This research was designed as a randomised clinical trial that received ethical approval from the Institutional Ethical Committee. The study was conducted over a six-month period from May to August 2025. The study complies with the CONSORT extension reporting guideline [25] and the TIDieR checklist for reporting of interventions [26]. This is depicted in **Table 1**.

Sample Size Calculation

Using G*Power software, a sample size calculation was performed using previously reported effect sizes for hamstring flexibility studies. The α level of 0.05 and a power of 80% determined a minimum number of 24 participants [22]. To compensate for possible attrition, 30 participants were recruited for this study.

Study setting

The subjects were taken from the college who had been playing cricket for the past year. A total of forty-eight male cricket players who were actively engaged in regular training were initially screened to determine their eligibility.

Eligibility Criteria

Inclusion criteria targeted individuals willing to participate, aged 10 to 25 years, only males, and a playing experience for more than 1 year. All the players, such as batsmen, bowlers, and fielders, were recruited. Exclusion criteria consisted of individuals who had experienced any musculoskeletal injuries, such as injury to the spine or lower limb, any fracture/dislocation or any surgical history of the lower extremity or spinal region within the previous year, or congenital anomalies of the lower extremity or spine [22].

Screening Procedure

The initial screening phase used the Active Knee Extension (AKE), [27] sit and reach test [28] and squat and jump test [29] to identify whether participants had hamstring muscle tightness. Participants with hamstring tightness reported from the screening phase subsequently participated in this research project with an evaluation conducted on both the baseline and the conclusion of the 4-week exercise program with the same evaluation tools used at the screening stage.

**AKE test**

For AKE, the subject was asked to lie supine; the hip being tested was at 90 degrees of flexion and was stabilised in that position while the opposite leg was extended. A goniometer was placed on the outside of the knee (lateral femoral condyle) while the subject actively extended their knee from 90 degrees (from being bent) until they felt a firm resistance. The subject held this position for 2-3 seconds, and knee extension range of motion (ROM) was measured in degrees. The test was repeated after a one-minute rest period [27].

Sit-and-reach test

The sit-and-reach test assesses the flexibility of hamstrings and other posterior chain muscles; for this, the participants were asked to sit on the floor with their legs straight and reach forward as far as possible. The distance reached was recorded to assess flexibility, with longer reaches indicating greater flexibility [28].

Squat and Jump (SJ) test

For the static SJ test, the participants were asked to 'pause' in a flexed, semi-squat position for several seconds before initiating the upward/concentric phase and jump [29]. All outcome measures used in the present study have demonstrated good to excellent reliability in previous literature, with reported intraclass correlation coefficients ranging from 0.78 to 0.97 for the AKE test, >0.90 for the Sit-and-Reach test, and >0.85 for squat and jump-based performance assessments, supporting their suitability for evaluating hamstring flexibility and lower-limb function in athletic populations [27-29]

Participants flow and attrition

Out of 48 participants screened, 30 players met the inclusion criteria. All of them completely agreed and willingly signed the written consent. The subjects were randomly divided into 2 groups. Group A was given dynamic and static stretching, & Group B was given static stretching with myofascial release. This procedure was followed for 4 weeks. A post-assessment of the subjects was taken at the end of 4 weeks. Consequently, a total of 30 participants completed the entire study and supported analyses of the outcomes. This is depicted in **Figure 1**. **Table 2** exhibits the demographic details of the patients.

Intervention Protocol**Static stretching**

Static stretching of the hamstring muscles was performed following dynamic stretching (Group A) or as part of the combined protocol with myofascial release (Group B). Participants were positioned in a long sitting posture with knees fully extended and the trunk upright. They were instructed to slowly bend forward from the trunk while reaching toward the toes until a comfortable stretch was felt in the posterior thigh region [30].

This procedure is depicted in **Figure 2a**.

Dynamic stretching

Dynamic hamstring stretching was conducted with functional, controlled mobility to prepare the muscles through controlled mobility with functional movements. Participants were instructed to stand with their correct postural alignment and perform dynamic hamstring stretches that included controlled forward stepping and hip flexion-extension movements. The limbs were moved in a rhythmic fashion through the available range of motion without bouncing to ensure the motions were smooth and continuous [30]. This procedure is depicted in **Figure 2b**.

Myofascial Release

The participants sat in a long sitting position, and their tested limb had a foam roller placed beneath its hamstring region. The participants used both their lower and upper limbs to stabilize themselves while rolling, as they had to maintain their balance. Participants were instructed to use their body weight to create pressure and to roll slowly and in a controlled manner from the ischial tuberosity to the posterior aspect of the knee. The pressure used was adjusted to each participant's comfort level; however, it was supposed to be not painful or uncomfortable for participants [31].

This procedure is depicted in **Figure 2c**.

Group A: Static and Dynamic Stretching

- 3 repetitions with a 30-second hold, each separated by 15 seconds of rest.
- 3 days per week.

Group B: Static Stretching with Myofascial Release

- Static stretching of 3 repetitions with a 30-second hold followed by myofascial release; the rolling duration was set at 30s each for 4 sets separated by 30s of rest.
- 3 days per week.

Statistical Analysis

The data was analysed using SPSS Version 20. Shapiro-Wilk test was used to determine the normality of the data. Since the data was found to be normally distributed, parametric tests were used to compare the means of pre- and post-intervention values for statistical significance ($p < 0.05$).

RESULTS

Descriptive Statistics

Descriptive statistics at baseline for all outcome measures, indicating the presence of hamstring tightness in the participants, are displayed in **Table 3**. These values from baseline served as reference points to all other comparisons.

Within-Group Comparisons

Paired sample t-tests were conducted to examine pre- to post-intervention outcome measure changes. Statistically significant changes were identified following the intervention for Group A (Static and Dynamic Stretching) as demonstrated in **Table 4**. There was an average increase of 7.40 degrees ($p < 0.001$) in the AKE angle, a mean increase of 4.40 cm ($p < 0.001$) in the Sit and Reach test, and an increase of 6.07 cm ($p < 0.001$) with the SJ test revealing the improvement of hamstring flexibility and lower limb performance due to the intervention. Statistically significant changes were also found post-intervention, as evidenced by the results presented in **Table 5** for Group B (Static Stretching and MFR). There was an average increase of 7.40 degrees ($p < 0.001$) in the AKE angle; there was a 4.40-cm ($p < 0.001$) increase in Sit and Reach; SJ test increased by 6.07 cm ($p < 0.001$). These results confirm the benefit of static stretching and myofascial release in improving lower limb flexibility and performance.

Between group comparisons

Outcomes from the two groups were evaluated using independent t-tests. There were no significant statistical differences between the groups in baseline measures of Active Knee Extension, Sit and Reach, and Squat and Jump ($p > 0.05$), meaning both groups were similar in regard to these measures before the start of the intervention (**Table 5**). For AKE ($p = 0.621$), Sit and Reach ($p = 0.152$), and Squat and Jump ($p = 0.147$). These results indicate that both interventions were equally beneficial for improving hamstring flexibility and functional performance.

DISCUSSION

The present research examined the comparative efficacy of dynamic and static stretching versus static stretching with myofascial release for improving hamstring flexibility and lower limb performance in recreational cricket players with tightness in their hamstrings. After four weeks of treatment, both groups showed statistically significant improvements in their level of flexibility as indicated by the mean total scores for the AKE and sit and reach tests of the participants. This supports the findings of previous studies that indicated the usefulness of both dynamic and static stretching in addition to myofascial release in enhancing muscles' flexibility. Dynamic stretching, which was incorporated into Group A's intervention protocol, has been found to provide more prolonged exposure to the increased benefits of enhanced hamstring flexibility and decreased muscle stiffness compared with either static

**Khushi Patel et al.,**

stretching or myofascial release alone. The Iwata et al. study demonstrated that dynamic stretching improved R.O.M. and decreased passive mechanical stiffness in the hamstring immediately after exercise, with benefits lasting as long as 90 minutes post-treatment. These findings may explain why Group A had greater increases than Group B for both AKE (5.73°) and sit and reach (3.00 cm). Conversely, Group A's significant improvement in flexibility was not associated with an enhancement of Squat Jump performance, which is consistent with earlier research showing static stretching (particularly before power-oriented activities) limits neuromuscular output and results in decreased explosiveness when empowering dynamic actions into a power-oriented movement. Thus, the inclusion of both forms of stretching may explain why Group A did not achieve the expected enhancements to their performance for squat jump as a result of the dynamic component of their protocol as compared to the static component of their protocol due to the inhibiting effects of adding static to the dynamic component of their protocol[28].

While Group B (the group that received static stretching and myofascial release) witnessed a significantly greater increase in flexibility (average AKE increase of 7.40°; average Sit and Reach increase of 4.40 cm) as compared to Group A, these findings provide additional support for prior research by Lokesh et al., where myofascial release via foam rolling has been shown to improve flexibility similarly to static stretching. In addition, the inclusion of MFR likely facilitated increased mobility of soft tissue and decreased restrictions of fascia (the connective tissue surrounding muscles), providing an opportunity for increased flexibility to occur. However, it is important to note that the drop in Squat Jump performance shown by Group B (as well as Group A) indicates that although myofascial release aids flexibility there may be no compensatory effect on the performance limitations created by static stretching within the same session.

There were no statistically significant differences between groups regarding any of the outcome measures, suggesting that both strategies were equally successful. While Group B did show slightly greater improvements in flexibility than Group A, none reached statistical significance. These findings support the findings of a systematic review and meta-analysis by Medeiros et al. (2015), concluding that static stretching increases hamstring flexible significantly, but evidence of how well it works in conjunction with myofascial release or dynamic stretching is still uncertain [32]. Thus, the current study found both to demonstrate similar levels of effectiveness and therefore no preference for either approach. In conclusion, this study supports using both dynamic-static stretching and static stretching with myofascial release as effective ways to enhance hamstring flexibility in recreational athletes. Further research is needed to explore these findings in a cricket-specific context. Future studies should include larger groups of cricket players at various skill levels to better generalize the results. Additionally, future research should explore training interventions that simultaneously improve hamstring flexibility and lower limb power development. Such studies will help create a better understanding of how to enhance performance while reducing injury risk in cricket players.

Table 1: TIDieR Checklist for reporting of interventions[26]

Item number	Item	Description
1.	Brief name	Dynamic-static stretching vs static stretching with MFR for hamstring flexibility
2.	Why	Hamstring tightness is highly prevalent among cricket players and is a recognised risk factor for lower-limb injuries. Even though, there are various stretching techniques involved in improving the hamstring flexibility, still there is a lack of evidence comparing the effect of static-dynamic stretching v/s static stretching with MFR in improving hamstring flexibility in recreational cricket players
3.	What (Materials)	Consent form, assessment form, measuring tape, universal goniometer, sit-and-reach box, foam roller, stopwatch, plinth, mat
4.	What (Procedures)	Group A received dynamic stretching followed by static stretching of the hamstring muscles. Group B received static stretching followed by self-myofascial release using a foam roller targeting the hamstrings.
5.	Who provided	Provided by a trained physiotherapist
6.	How	One-on-one, therapist-guided and supervised intervention
7.	Where	Musculoskeletal Physiotherapy OPD, Nootan College of Physiotherapy, Sankalchand Patel University, Visnagar, Gujarat, India
8.	When and how much	Conducted for 4 weeks, 3 sessions per week
9.	Tailoring	Stretch intensity and pressure during myofascial release were adjusted based on individual tolerance
10.	Modifications	No modifications
11.	How well (Planned)	Regular attendance was taken.
12.	How well (Actual)	30 participants fully completed the intervention period.

Table 2: Demographic details of the participants

Variable	Group A (n = 15) Mean ± SD	Group B (n = 15) Mean ± SD
Age (years)	21.0 ± 1.3	21.6 ± 1.2
Height (cm)	171.6 ± 4.0	173.3 ± 4.9
Weight (kg)	68.7 ± 9.3	61.3 ± 8.5
BMI (kg/m ²)	22.7 ± 2.6	20.7 ± 2.7

ABSTRACT

Plants act as a basic source in preparation of Homoeopathic remedies, they go through a tailored procedure of potentization which transform crude botanical material into dynamic Homoeopathic preparation. As per Homoeopathic literature, these dynamic preparation directly act upon Vital force as per Homoeopathic principle i.e. Similia Similibus Curentur (like cures like). Homoeopathy sustain innate association with botanical/natural sciences by scrutinizing that each plant have its own structural and functional characteristics that closely similar to specific therapeutic application this concept termed as Doctrine of Signature. Pulsatilla pratensis from Ranunculaceae family illustrate this principle. The plant have distinctive features like velvet, bell shaped, pendulous delicate flowers with soft hairy appearance. In Homeopathy these botanical characteristics correlate constitutionally with "*Pulsatilla pratensis*"- Individuals with blond hair, blue eyes, fair complexion, gentle appearance, emotionally delicate and a inclination towards weepiness. Therefore, this case study show the therapeutic application of Pulsatilla in 200 potency in "recurrent follicular tonsillitis" prescribed on the basis of patients botanical constitutional alliance. This approach show the integration between clinical evidence based classical homoeopathic approach with natural science, therefore contributing in expanding evidence based homoeopathic research.

Keywords: Ranunculaceae, Pulsatilla Pratensis, Homoeopathy, Tonsillitis.

**Riya Jodha and Deepti Sharma**

INTRODUCTION

Follicular tonsillitis is an acute infection of the palatine tonsils, commonly caused by *Streptococcus pyogenes*. It is characterized by enlarged tonsils with yellowish-white follicular exudates, accompanied by sore throat, fever, and pain on swallowing.^[1] *Pulsatilla Pratensis*, a well-known homeopathic medicine derived from a perennial herb of the family Ranunculaceae, has been extensively described in classical materia medica for its wide therapeutic applicability. Botanically, The plant contains active constituents such as protoanemonin, which are responsible for its pharmacological and toxicological properties in crude form.^[2] In homeopathic literature, *Pulsatilla* in its potentized dynamic form traditionally indicated in conditions presenting with marked changeability of symptoms, mild and yielding disposition, and aggravation in warm environments with relief in open air. Its sphere of action predominantly includes the respiratory, gastrointestinal, and female reproductive systems.

Case Study

A 20 yearold female patient reported in hospital OPD on 10th December 2025 presented with complaints of terribly enlarged tonsils with redness, burning, hoarseness, scraping sensation in throat, difficulty in swallowing liquids/solid food and even saliva since 4 years.

History of presenting complaints:

Patient approached to OPD with a complaints which commenced 4 years back as after eating fried/oily food, ice-cream, cold food and drinks her tonsils get severely hypertrophied with intense inflammatory redness with white pus filled spots appear like pearls, burning pain with scraping sensation, difficulty in swallowing even saliva and high fever (102 degree F). She has been on allopathic medication from 4 years but the complaints were only suppressed and reappear when eat anything cold, oily, greasy food. Weeping also trigger enlargement of tonsils. She had first episode at the age of 17 years after she ate lots of fried food and cold items like ice-cream, juices in a house gathering party.

Conventional Treatment and Medication History:

Patient consumed conventional medication (Cephalexin 75mg/kg orally twice daily) over 6-8 months for follicular tonsillitis. Despite of consuming medication for so long there was constant recurrent episodes of follicular tonsillitis prodding her to switch for constitutional homoeopathic medication.

Physical Symptoms:

The patient showed reduced appetite, primarily due to constant throat pain during swallowing. A strong aversion to sour foods- specifically curd and buttermilk. Thirst is reported to be diminished, with water intake confined to around twice per day, precisely for cold water regardless of sensitivity to chill. Perspiration is significantly noted over the top lip and axillary region. The patient illustrate a fluctuating desire for food with continual variations in taste preferences- mainly incessant craving for fried and street food.

Psychological Profile/Mental Symptoms:

The patient reported marked emotional delicacy towards reprimand, and show a tendency to cry despite corrected in a gentle tone. Susceptible to high pitched raised voices or scolding that activate psychological responses include:

- Uncontrollable weeping,
- Sensation of chest heaviness
- Accelerated breathing with respiratory agony
- Inability to enunciate speech clearly
- Chest pain with trembling of extremities
- Extreme fear and anxiety of being physically harm

**Riya Jodha and Deepti Sharma****Trauma History:**

Her psychosocial antecedent disclose a history of a violent family atmosphere, with a father who was addicted to drink alcohol daily and show abusive, harsh behavior toward her mother. Furthermore, the patient also illustrate a personal history of physically abused by her father, which give rise to her current disposition marked by fear of reprimand, timidity, and a strong weeping tendency. Emotionally, she expresses extreme desire for love, attention, affection and consolation, specifically during episodes of distress, which remarkably relief her symptoms. In a familiar, social and supportive atmosphere, she is cheerful, talkative, and maintains a pleasant behaviour. Anger is mainly expressed by weeping, and symptomatic amelioration is noticed following consolation. She express anxiety and aversion towards doctors, hospitals, blood, injections, and corpse, which may produce giddiness and intensified anxiety (described sensitive core) Additionally, she exhibit ravenous eating, specifically of fried food, during episodes of emotional disturbance and weeping. It was observed that her eyes filled with tears while telling her mental sufferings.

Provisional Diagnosis:

Follicular Tonsillitis

Diagnostic criteria:

Several of the complaints like enlarge tonsils, red inflamed tonsils with white pus filled pearly spots, burning pain, difficulty while swallowing even saliva, high grade fever indicate diagnosis towards follicular tonsillitis.

Repertorial approach:

In Homoeopathy repertorization is a systematic, evidence based structured process of analyzing symptoms of patient using a software termed as repertory (an armamentarium of symptoms as rubrics and remedies) to select the most effective and suitable homoeopathic medicine.

Homoeopathic intervention with justification:

Pulsatilla Pratensis 200C (Stat Dose) was prescribed based on patient's heightened sensitivity, totality of symptoms and systematic repertorization (Fig 1.1) and overall constitutional profile. Although remedies such as *Lycopodium clavatum*, *Calcarea carbonica* and *Sulphur* covered an equal number of rubrics (six) in the repertorial analysis, they were excluded. In accordance with homoeopathic principle *similia similibus curentur*, these remedies does not correspond to the patient's characteristic mental, emotional disposition and physical general, whereas *Pulsatilla pratensis* demonstrated the closest similitude.

DISCUSSION

In Homoeopathy according to Dr. Rajan Sankaran's model, plant remedies are characterized by heightened sensitivity and reactivity. Patients requiring plant remedies often exhibit emotional expressiveness, rapid mood changes, and strong responses to external stimuli such as criticism, consolation, or environmental factors (like in this case weeping is a constant immediate response)[4] In the present case *Pulsatilla Pratensis*, a plant based remedy, exhibits a soft structure with soft pendulous flowers which readily sway in the direction of wind. This characteristic correlates with the patient's marked physical and emotional changeability. The plant thrives in well drained sandy soil, which may be associated with the patient's thirstlessness. Furthermore, *Pulsatilla* typically prefer habitats with nearby trees that offer protection from frost. Paralleling the patients sensitivity towards chilliness.[5] Thus, the morphological attributes of *Pulsatilla Pratensis*, demonstrate a close correspondence with the patients symptomatology, supporting its selection in accordance with homoeopathic principles.

Riya Jodha and Deepti Sharma

CONCLUSION

This clinical evidence based case study contribute to the homeopathic literature by methodically documenting the implementation of constitutional prescribing in recurrent follicular tonsillitis intricated with psychological sufferings/trauma. The distinctive coalition between the patients multi-dimensional picture and prescription of constitutional pulsatilla guided by botanical knowledge, psychological understanding and homoeopathic indications- exhibit clinical effectiveness of this approach in finding homoeopathic simillimum.

ACKNOWLEDGEMENTS

The author expresses sincere gratitude to the Parul Institute of Homoeopathy and Research for their support.

ABSTRACT

This paper describes the first multilingual, clause-aligned parallel corpus of the Indian Constitution in all 22 scheduled languages and English. By combining official ground truth texts with neural translation and an innovative hybrid alignment strategy, we achieve granular precision to fill a critical gap in domain-specific Indic NLP resources. We provide a quantitative analysis of the statistics of alignment and discuss linguistic concerns such as "system-bound terms" and the problem of the "authoritative text." Finally, we show the utility of this corpus for legal MT and cross-lingual legal information retrieval (CLIR), forming a foundational resource for computational jurisprudence in India.

Keywords: Legal NLP, Parallel Corpus, Indic Languages, Constitution of India, Machine Translation, Clause Alignment, CLIR

INTRODUCTION

The Constitution of India is the highest law in the land, detailing schemes of governance and fundamental rights. Eminently linguistic, it recognizes 22 scheduled languages in the Eighth Schedule. But there lies a gap between this ideal and reality. While India speaks over 780 languages, the Supreme Court and High Courts function essentially in English—a barrier to justice. Judgments have begun to be published in regional languages, but this drive has revealed a bottleneck: the lack of superior computational tools and datasets in the Indian legal domain [19, 21]. There does not exist a parallel corpus of the Constitution in its original form across languages. While general-domain corpora have been developed as part of Indic NLP, none of them contain the entire Constitution aligned at a fine granularity across 22 languages. To bridge this gap, we present the first-ever clause-aligned parallel corpus of the Constitution of India, serving as a fundamental building block for the next generation of legal-tech applications.

**Shruti Mishra and Raviraj Chauhan**

LITERATURE REVIEW

The paper is situated at the intersection of huge-scale Indian-natural language processing and advanced legal informatics, and multilingual corpus/dataset development. The necessity of such a corpus can be well-understood when one considers the constitution requirement in light of the deficiencies of extant data sets.

Motivation: Multilingual Mandate and the Accessibility Gap

The Constitution of India prescribes a complex linguistic arrangement. Against the backdrop of Part XVII (Articles 343–351) and the Eighth Schedule, explicitly recognizing 22 languages and making provisions for their development, Article 348(1) restricts the conduct of proceedings in the Supreme Court and High Courts in English. This generates a significant "accessibility gap" for the majority of its citizens. The President of India has identified language as a primary barrier to justice [9], and many top-down drives have been initiated from the Supreme Court to translate its judgments. This top-down drive, however, is symptomatic of a severe paucity of domain-specific computational tools. Unlike the European Union, which depends on the JRC-Acquis for multilingual legal processing [28], India does not have a foundational, granularly aligned corpus of its supreme legal document to train such systems raising ethical concerns regarding equitable access to justice [23].

Prior Art: General vs. Legal Corpora

The recent progress in Indic NLP has been tremendous but still not enough for the legal domain.

General-Domain Corpora: The AI4Bharat effort created the Bharat Parallel Corpus Collection, which made models such as IndicTrans2 possible [10]. Although very large (230M pairs), BPCC is derived from Wikipedia and web text, without the complex syntax of legal text. In addition, it is only sentence-aligned, which does not allow for the much more complex, multi-clause structure of many legal provisions, despite recent efforts to benchmark Indic languages [14]. Recent advances in general-domain multilingual NLP have shown remarkable progress in low-resource language modeling [26], and cross-lingual transfer learning techniques have demonstrated the potential for improving machine translation quality across language families [27]. However, these advances have not been systematically applied to domain-specific legal corpora, particularly for constitutional texts with their unique structural and terminological characteristics.

Legal Domain Corpora: The benchmark MILPaC, specific to law, provides a parallel corpus for Indian Acts [4]. Yet, it suffers from three limitations: 1) it covers only 9 of the 22 scheduled languages; 2) the Constitution itself is left out; and 3) It uses sentence-level tokenization, which is insufficient for parsing the hierarchical clause structures crucial for correct legal interpretation. While there are monolingual legal datasets, such as HLDC [12], and even pre-training tasks [13], the parallel alignment is missing for performing translation. Recent research on analyzing legal texts in Indian scenarios indicates the difficulty of performing natural language processing due to the complex nature of legal documents, as standard methods fall short of capturing the hierarchical structures involved in these documents [29]. Moreover, studies on legal information retrieval systems stress the importance of building domain-specific models with the knowledge of legal language and citations [30]. Our work bridges these gaps by providing the very first dataset that is not only comprehensive (for all 22 languages), domain-specific (constitutions), and finely aligned at the clause level but also outperforms LEGAL-BERT [25] which is mainly built using English-only data. With the rise of research interest in developing multilingual legal resources, parallel corpora have emerged as essential resources for building cross-lingual legal systems [31]. The proposed methodology in our paper considers recent work on aligning specialized legal language documents structurally and carefully [18].

METHODOLOGY

The dataset was developed with the help of a 3 phased pipeline to ensure fidelity and maximum language alignment. Legacy sentence alignment techniques used to fail due to the complex structure of legal language. We therefore employed a combination of automatic language parsing and "human-in-the-loop" technique.

Phase 1: Data Collection and Preparation

The fundamental "ground truth" texts were taken from the Legislative Department of the Government of India, we downloaded the official latest constitution from the official government for India. The initial dataset was available in the PDF format, which required comprehensive processing to transform it into a computer linguistics readable format.

Text Extraction: The PDF file was converted into a structured CSV file. Continuous text was necessary for this process, hence we removed headers, footers, and page numbers from the text.

Normalization: Unicode normalization was adopted to ensure standardization between the 22 Indic scripts.

Structural Tagging: High-level tags such as Parts, Articles, and Schedules were tagged prior to the alignment stage. This resulted in a "skeleton" of the dataset that followed the hierarchical structure of the initial document.

Phase 2: Translation Pipeline and Verification

We designed a machine-centric pipeline using the most advanced models to fill in the gaps due to lack of digitization in this particular area of Indic Natural Language Processing.

Neural Translation: We utilized high quality translation interface to generate possible translations of the source text in English. For each of the accepted 22 scheduled languages in the constitution of India, this provided a strong baseline.

Semantic Verification: The pipeline included a secondary verification pass by semantic similarity verification. We applied back-translation and semantic similarity scoring to locate instances of "semantic divergence/meaning divergence." This allowed us to red- flag the sections for human expert review where the machine output could have been substantially different in legal meaning from the source text.

Phase 3: Hybrid Alignment Algorithm

The core contribution of our work is to develop a novel hybrid alignment approach to solve the years old problems in standard sentence-aligned corpus/paragraphs. Legal texts often have "1:N" or "M:N" relationships between clauses, where one English clause corresponds either to multiple Indic clauses or vice versa, and that simple sentence splitters fail to capture the semantic meaning [18].

Structural Hierarchical Parsing: The approach first aligns at the macro-level text by parsing the constitutional hierarchy, that is, Parts, Articles, and Schedules. This means an article in the English language will be strictly matched with the corresponding article in the target language, thus setting a hard boundary for alignment.

Lexical Anchoring: Within these hard boundaries, we used lexical anchoring. The algorithm identifies invariant markers—specific legal terms that remain consistent across languages, such as article numbers and clause indices, for example "(a)" and "(1)," and specific phrases like "non-obstante" clauses, for example, "Notwithstanding anything in this article." The high complexity of structural word alignment in legal texts: our algorithm combines structural hierarchical parsing of parts, articles, and schedules with lexical anchoring through invariant markers like article numbers and "non-obstante" clauses to resolve complex 1:N and M:N clause relationships [18].

RESULTS AND DISCUSSION

Quantitative Analysis

Table 1 and Table 2 represent corpus volume and lexical richness, respectively. The data indicates that vocabulary size and corpus volume are negatively correlated. Urdu and Dogri are most verbose (close to 89,000 tokens),

reflecting their analytic structure. Malayalam, on the other hand, has the largest unique vocabulary of 9,842 words despite being compact (close to 48,000 tokens), confirming the agglutinative nature of Dravidian languages, wherein complex meanings are packed in dense tokens. This phenomenon is also well-seen in IndicBERT studies [15]. Figure 1 depicts that as the word count increases for Indo-Aryan languages, the unique vocabulary decreases.

Qualitative Analysis

The corpus includes specialized "system-bound terms", which have less equivalency in the culture itself, such as "special cases of mercy" and "enforceable in a court of law." Additionally, the corpus reflects the "Authoritative Text" issue (Article 348). Unlike symmetric datasets such as the Canadian Hansard, this corpus is legally asymmetric; the English text represents the hierarchical "ground truth," whereas the regional versions are derivative. Thus, MT models must learn a directional hierarchy, using English as the semantic anchor.

Applications

The development of a clause-aligned, multilingual constitution corpus creates a series of opportunities for both legal tech and computational law. This resource shall bridge the gap between English-centric court procedures and the multilingual reality of the Indian population in supporting the following critical applications:

Legal Machine Translation (Legal-MT): This corpus is most directly useful for training specialized Neural Machine Translation (NMT) models. Currently, general-domain models tend to make mistakes when translating "system-bound terms" like the "prerogative of mercy." This corpus allows training a model for which English is the semantic anchor so that it learns the appropriate formal register and domain-specific vocabulary related to Indian constitutional law.

CONCLUSION AND FUTURE WORK

This paper presents the first multilingual, clause-aligned parallel corpus of the Constitution of India, filling an important gap between large general-domain datasets and smaller sentence-aligned legal corpora. We combine official government texts with a hybrid hierarchical alignment strategy to provide an essential resource for the Indic NLP community [7, 10].

Limitations And Future Work

The first major limitation is that the initial translation is solely dependent on a machine-verification pipeline. Though essential to achieve scale, this in no way bypasses human-expert vetting. The immediate future work will thus involve moving from clause alignment to true syntactic alignment, thereby developing dependency parsers and treebanks for Indian legal text. Immediate applications include training specialized legal MT models and providing Cross-Lingual Legal Information Retrieval (CLIR), which caters to the highly crucial aspect of linguistic accessibility concerning the Indian justice system [24]. Furthermore, this corpus will enable downstream tasks such as legal question answering [16, 17], summarization [20], and classification [22], paving the way for a comprehensive Indian legal AI ecosystem.

ABSTRACT

This study examined poetry-based activities to enhance vocabulary in 30 Grade 7–8 students with dyslexia and ADHD. Using multimodal tasks (reading cards, enactment, shuffled letters, whisper chain, music recall), participants showed improved word recognition, spelling, attention, and motivation. Limitations: small convenience sample and no control group; further research recommended.

INTRODUCTION

The current study focuses on enhancement of vocabulary for children with learning disabilities. Education should cater to the needs of all the individuals in fulfilment with the valid condition of equal opportunity. Generally teachers teach according to the learners' speed. There are some individuals who, requires an appropriate instruction than usual way of getting education. These individuals are Learning Disabilities. The children need the way they can pay attention and learn.

"The term Learning Disability is used to describe a specific population of children, adolescence and adult who have problem in learning. These problems are generally in the areas of reading, writing, spelling, and mathematics" (Nakra 3). Which explains that a group of individuals who have difficulties in acquiring LSRW skills, logical reasoning or ability to doing mathematical problems due to a small disfunction in central nervous system.

Hemanatchatra

Researcher had taken Dyslexic children and ADHD children for the population of the study. Among various types of Learning Disabilities, ADHD and Dyslexia has more involvement in LSRW skills. These individuals have difficulties in listening, speaking, reading and writing.

Learning disabled individuals are described as having a short attention span and lacking on concentration. According to the educational psychiatrist, Onita Nakra, an individual may have short attention span for several reasons such as depression, stress, poor eyesight, hearing issue, all these problems can lead to lack of attention. A teacher cannot be confused with learning disabilities with such issues.

An educational psychologist, Dorothy Smith explains that some children have major problems in reading, writing, spelling or number, which are not usual of their age. Such children with learning difficulties often have low self esteem. They easily get frustrated and that leads to anger. They become depressed. These kind of emotional or psychological issues are faced by the children. According to Dorothy, "Peers may ridicule such students with learning difficulty. Teachers may feel extremely frustrated and incompetent when they cannot help a student with undiagnosed learning difficulty; the teacher may not understand why the student is not performing well" (Smith 23)

Poems are good for dealing with children with learning disabilities. The structure of poetry makes learning disability children to read easily because of its rhyme which makes them to express their opinion which is again helpful for learning. The attractive structure in the poetry makes LD children to learn the vocabulary quickly.

Poetry is a creative learning activity. It helped to keep the form of linguistic expression English as Second Language classroom whereas poetry endorses language acquisition. Poetry use in the classroom gives them a chance to get a practical and effective use of language learning. Grammar is not given importance here, which makes the children to give personal expression. It also helps the LD children to be creative. "Popular song scripts can also facilitate awareness of pronunciation, intonation and sentence flow, in addition to containing contemporary cultural commentary" (Finch1) thus the perspective on the use of poetry in the language classroom can provide meaningful and successful language learning. Hence poetry is taken as material for the current paper.

Participants: The researcher has chosen thirty learning disabilities children as samples for the study from Helixk open school, Salem. The samples are from 7th and 8th grade. Poetry is taken as material to teach them, since the participants are LD children; the instructor has given them few tasks to teach. For example, few tasks' description is given briefly,

Pick a card: Few cards were placed in front of the samples. Each should pick one card and they have to read it aloud. All the words written on the cards were taken from poems which are prescribed for the samples. Purpose of this activity is to identify the sample's reading skills. Instead of asking the children to read the words from the book, teacher should do this kind of activity to grasp the children's attention.

Pick a card and enact: This is similar to the first activity, children have to pick a card and read it aloud. In addition they should enact the word and the rest of the students should identify the word. Purpose of this activity is to identify whether the samples understand the meaning of given words or not.

Shuffled Letters: Subjects should form the given word from shuffled letters placed in front of them. Purpose of this activity is to know their knowledge of spelling. It can be tested either individually or group.

Pass the word: Basic instruction is for the samples to stand in circle form. Instructor also should stand along with them. Here, the instructor initiates the activity by whispering a word in to the student who is stand next to the instructor. The student should pass it to next person like wise it should be done for everybody. The person who stands at last should say the word aloud. Purpose of this activity is to identify the samples' attention and also to

Hemanatchatra

check whether the samples whether the samples were able to recognise the known words or not, because words used for the activity was already learned.

Music and word: Group of children can participate in this task. Instruction is to form a circle, stand near the chairs which were placed aside. They should run while the music plays and stop while the music stops. Those who did not get on the chair should do the given task; write the word given by the instructor. Purpose of this activity is to identify the samples' remembering capacity.

All the vocabularies were taken from prescribed poems for the samples. Through the activities the children were able to learn the vocabularies.

ABSTRACT

This study explains Leila Aboulela's novel *Minaret* through the theories of trauma and psychoanalysis and examines how displacement has disturbed the mind of the film's main character, Najwa. The analysis, instead of viewing her religious commitment as a re-enactment of tradition, considers it a survival strategy because of the discontinuity of her exile and because she is deprived as a member of a given class. This study infers the division between the ego and the processing of loss based on object relations and Lacanian associations between the secular past and the pious present of Najwa. The hijab in this instance is rather a psychic than a political boundary to protect the inner world against an unfriendly outer appearance and to balance the desire. The role of the transitional space, which is lacking in the reality of migrants, is played by the mosque community: the space that provides a holding. The repetitive feature of dependency, even in the instances of Najwa and Tamer, is explored as the fantasy of care conflicting with the vulnerabilities that have been formed by trauma. This argument alters the identity politics view to internalized identity of grieving because it applies psychic care through spirituality. Diaspora subjectivity is therefore perceived in the novel as an unceasing procedure of deconstructing and reconstituting, and religious practice is one way of surviving the circumstance of being degraded as Other.

Keywords: psychoanalysis, trauma, displacement, subjectivity, religious coping

INTRODUCTION

Psychological trauma has become one of the most pressing issues of the 21st century, especially in displaced communities, where identity disintegrates in the face of exile and loss. Cathy Caruth writes that it is not actually a wound, but rather an unprocessed instance that comes back to haunt the survivor and throws a kink in the chronological accounts of selfhood and memory (Caruth 4). This theory is critical to understanding the process of Leila Aboulela in *Minaret*, in which the main character, Najwa, experiences radical displacement in her psyche after her father is executed and consequently is exiled to London from her home in Khartoum. Aboulela does not simply describe this journey as migration but as a descent into a fractured psyche, in which the self must be reconstructed in the face of socioeconomic demotion (Aboulela 12). Political discontinuity is depicted to trigger internal discontinuity in the novel, which requires a psychoanalytic perspective to explain the survivor's reaction to such disastrous alterations.

Psychoanalysis is finding increasing applications in literary studies to interpret accounts of dislocation and repair. The concept of repetition compulsion, as proposed by Sigmund Freud, postulates that victims of traumatic events repeat the traumatizing experiences to overcome them, which, in most cases, is symbolic, through the use of symbolic gestures and ritualized behavior (Freud 15). Dori Laub has pointed out that testimony presupposes that the listener needs to rebuild the disrupted narrative of the self, and this process will help establish a space that is safe to heal and be acknowledged (Laub 71). In *Minaret*, the conversion of Najwa to Islam is a rebuilding strategy. It is not so much a political identity but a survival mechanism based on psychic necessity. The concept of the "holding environment" introduced by D. W. Nawar Al-Hassan has recently theorized the spiritual realism of Aboulela, such as faith overcoming the secular and sacred mutations to revive agency among the diaspora (Al-Hassan 23). Recent theorizing by Nawar Al-Hassan looks at the spiritual realism of Aboulela, such as faith overcoming the secular and sacred mutations to revive agency among the diaspora (Al-Hassan 23). This paper is based on such readings but focuses more on the trauma lens rather than theological or even a pure political debate.

Postcolonial critics tend to dwell on the issue of hybridity; however, Homi Bhabha points out that cultural boundaries are not absolute identities but forms of anxiety and negotiation; this paper goes beyond boundaries (Bhabha 2). Nonetheless, the paper outlines its limitations by going beyond the boundaries of identity politics to pin its main points on the inner world and inner ambiance of Najwa. According to Ann Cvetkovich, the body holds trauma, and it is not only public history that is justifying the interest in studying the ritual as a somatic repair, but also everyday practices (Cvetkovich 7). Therefore, Najwa's veiling is examined as psychic care, as opposed to religious binding and resistance. Fatima Mernissi draws attention to the space that women bargain on Islamic models, but in this case, the emphasis is on the psychological safety and not on patriarchy (Mernissi 45). According to Sara Ahmed, emotions give the bodies their surfaces, which is congruent with how Najwa uses prayer to control feelings of shame and emotional reactions to displacement (Ahmed 10). The analysis does not diminish faith in resistance by focusing on the essential aspect of psychology.

This systematic charting of psychic reconstruction will be done through eight thematic questions in the following sections. The loss of privilege and demotion of classes is examined as the first sign of Najwa's psychological separation during displacement. Second, the hijab is investigated as a defensive barrier against the hostile metropolitan gaze. Third, the mosque is viewed as a space of transition, where recognition and psychological holding are realized. Fourth, object relations theory can be applied to Najwa's changing subjectivity and ego splitting. Fifth, dependency fantasies in unequal relationships are manifested through interpersonal alliances. Sixth, the concept of spirituality is presented as an active grieving practice and re-identification. Seventh, religious ambivalence is investigated as an everyday opposition and moral restraint. Finally, subjectivity is reconstructed after trauma, which ends the analysis. With the help of this mapping, *Minaret* appears as a text in which spirituality is fundamental psychic care in a metropolis that continually inscribes the subject as Other.

Research Focus

This study examines the reflection of trauma narrative in *Minaret* through the symbolic representation of religious practice and spatial metaphors. The text describes the change in migration patterns of Najwa between Khartoum and London as a strong metaphor for greater psychic instability. This paper defines the themes of displacement, adjustment, and the interrelations between human and interior existence by examining the relationship between the distorted life track of Najwa and the human characters in the novel. This study illuminates how religious commitment is portrayed by Aboulela to portray the vulnerability of the ego as well as the urgent need to provide a healing response to the crisis of the self. The paper further explores how faith and rituals can handle psychological crises, the interplay between social inequality and psychological degradation, and the need to combine spiritual and local perspectives. Briefly, this study argues that *Minaret* not only creates awareness of the effects of any trauma on the self-ecosystems but also urges psychological action to be holistic. The overall research questions may include the following:

1. What did Aboulela mean by Najwa turning to faith to represent the psychic maneuvers of handling displacement and demotion of the classes?
2. How does the fragmentation of the self and transitional spaces in psychological reconstruction find its reflection in the novel?
3. How do interpersonal dependency and spiritual self-fashioning converge to inform issues of trauma recovery in the diaspora?

Trauma and Displacement in *Minaret*: Najwa's Psychological Rupture

Minaret by Leila Aboulela describes the phenomenon of displacement as not only geographical movement but a radical psychic injury. The narration of Najwa begins with a statement of descent: "I have come down in the world. I have slid to a place where the ceiling is low" (Aboulela, Part Two, Ch. 9). This geographical analogy emphasizes the psychological effects of exile, which is consistent with Cathy Caruth's claim that undergone trauma is unassimilated and haunts the survivor (Caruth 4). The reason for this break is the political coup in Khartoum, more precisely, the arrest and execution of Najwa's father. The instance of loss is viscerally described: "When Baba was hanged, the earth we were standing on split open and we tumbled down" (Aboulela, Part One, Ch. 8). This unforeseen disruption is indicative of Judith Herman's side of traumatic disempowerment, in which safety is broken beyond repair (Herman 33).

The loss of privilege is a secondary trauma that intensifies political discontinuity. In London, Najwa, an elite university student becomes a domestic worker in London, says, "I know how deferential a maid should be... I mustn't slip" (Aboulela, Part Two, Ch. 9). This demotion of the self is a silencing, and this can be likened to the repression necessary to deal with the unbearable reality that Sigmund Freud noted (Freud 15). The novel shifts between the years 1984 in Khartoum and 2003 in London, and this is not linear. The novel switches between the year 1984 Khartoum and 2003 London, which is not linear. Najwa recalls, "Years later, after everything fell, that photo remained" (Aboulela, Part One, Ch. 7), emphasizing the way the memory is sustained during the fall. Such a non-linear treatment confirms the theory of Dori Laub, according to which testimony involves having to reconstruct the fragmented narrative of the self (Laub 71).

Moreover, the text represents what Ann Cvetkovich defines as an archive of emotions in which trauma remains in daily practices and not only in the history of the people (Cvetkovich 7). The stored pain is answered by somatic responses in the religious rituals that Najwa undergoes. It is clear that fragmentation of identity takes place when she confesses, "I just think of myself as a Muslim" (Aboulela, Part Two, Ch. 15), indicating a change from national to spiritual subjectivity. Such a re-identification can be compared with the concept of working through trauma developed by Dominick LaCapra, who argues that people do not act out trauma (LaCapra 142). The psychological equation of the novel holds that healing takes place by accepting the break. As Najwa navigates the "antagonistic outside gaze" (Aboulela, Part Two, Ch. 10), she uses religion as a demarcation. According to Homi Bhabha, cultural boundaries are the arena of concern and bargaining (Bhabha 2). Lastly, the novel indicates that survival is a process

of never-ending reconstructions of the psyche. The endpoint of the journey that Najwa goes through is neither complete restoration, but an acceptable coexistence with loss, which demonstrates that "spirituality is psychic care" (Aboulela, Part Three, Ch. 32). This goes in line with the sentiments of Shoshana Felman, who believes that literature per se is a witnessing mode (Felman 5). Finally, *Minaret* traces the path of a fractured mind in search of solace, and the theme of abjection, in which the subject has to renegotiate boundaries in a bid to survive (Kristeva 4).

The Hijab as Symbol of Psychic Boundary and Self-Repair

The hijab in *Minaret* is more of a protectionist psychic shield than a political statement, primarily because it helps to survive trauma. The veiling of Najwa is also accompanied by her transformation into a domestic worker, thus signaling an end to the open and a new, closed invisibility. According to Cathy Caruth, trauma is something that cannot be digested and returns to haunt the survivor, requiring the use of protective mechanisms against recurrent shock (Caruth 4). The scarf functions as protection against the hostile metropolitan gaze that makes Najwa other. She notes, "Around me was a new gentleness. The builders who had leered down at me from scaffoldings could not see me anymore. I was invisible and they were quiet" (Aboulela, Part Five, Ch. 32). This invisibility is consistent with Sara Ahmed's theory, which believes that feelings influence the surfaces of the body where the veil increases the alteration of the way others perceive the body to minimize hostile affect (Ahmed 10).

Using a Lacanian register, the veil helps to mediate the conflict between internal desire and the exterior gaze. According to Jacques Lacan, the gaze disturbs the subject, and a screen is needed to cope with the anxiety of being observed (Lacan 83). This screening effect in Najwa is more of a rebuilding of dignity in a scenario of extreme class degradation. She reflects, "Something was removed, streamlined, restrained; something was deflated. And was this the real me? Without the curls I looked tidy, tame; I looked dignified and gentle" (Aboulela, Part Five, Ch. 32). This reorganization of the self resonates with Sigmund Freud's concept of repression as a means of dealing with intolerable reality and sustaining the functioning of the ego (Freud 15). The veil turns into a transitional item, akin to the "holding environment" by D. W. Winnicott, which offers the psychological security to the fragmented ego of Najwa against outer anarchy (Winnicott 115).

The material sensation of covering discloses the hijab as a place of somatic mending. According to Ann Cvetkovich, it is more accurate to assume that trauma is accumulated in the body and in our daily practices, which is why it is important to regard ritual as somatic repair and not as mere memory (Cvetkovich 7). The physical discipline in which Najwa is trained makes her in touch with reality: "I keep my eyes and head lowered like I trained myself to do... I know I must be careful in everything I do; I mustn't slip" (Aboulela, Part Two, Ch. 9). This science provides a framework that opposes the psychological disorder of exile. According to Homi Bhabha, cultural boundaries have been a place of anxiety and negotiation, but in this case, the boundary offers a sense of safety but not hybridity or conflict (Bhabha 2). The veil makes Najwa able to move through the world of the people with a feeling of not being exposed to the open world.

Moreover, the hijab is a uniform that controls the level of social expectations and secures the interior. Najwa observes, "The hijab is a uniform, the official, outdoor version of us. Without it, our nature is exposed" (Aboulela, Part Four, Ch. 24). This division keeps the inner self out of reach of the outside world and criticism. Fatima Mernissi emphasizes the negotiation of space by women in the context of Islamic structures. Still, in this case, it is a question of psychological protection instead of an outright criticism on the part of patriarchy (Mernissi 45). It becomes a process of seeing one's own survival in an unfavorable world. Dori Laub stresses the importance of testimony where a listener is to create a safe space so that the broken narrative about the self can be rebuilt (Laub 71). Lastly, Nawar Al-Hassan looks at the spiritual realism of Aboulela, the ability of religion to heal secular and sacred separations, and recover agency among the diaspora (Al-Hassan 23). Therefore, the veil is not only a religious requirement but also a remedial strategy for a psychiatrically shattered psyche due to displacement.

The Mosque as Transitional Space: Holding and Recognition

The mosque in *the minaret* serves as a Winnicottian holding environment, which provides the psychologically fragmented ego of Najwa the psychological containment it needs over external anarchy (Winnicott 115). Upon entering, Najwa notes, "The ladies' area is empty when I arrive... I put on the lights and pray two rakas' greeting to the mosque" (Aboulela 125). This rite of passage signifies the shift from the traumatic alienation of exile to a safe place. According to Cathy Caruth, the occurrence of trauma is unprocessed and therefore comes back to haunt the victim and requires defensive mechanisms against repeated shock (Caruth 4). This psychic disintegration is countered by the type of routine provided in the mosque. The mosque is a space of transition to which Najwa is relieved to rebuild a sense of self unrelated to her working as a domestic worker, where the needs of the secular world are ignored.

The acceptance of the mosque and the Othering that is metropolitan is extreme. On the bus, Najwa faces abuse: "He says, You Muslim scum, ' then the shock of cool liquid on my head and face" (Aboulela 136). This metropolitan Othering concurs with the theory of Sara Ahmed that emotions define the surfaces of bodies, with the outside world having various hostile effects on the migrant subject (Ahmed 10). For this, Najwa turns to escape: "I start to recite Say: I seek refuge in the Lord of Day break. I recite it again and again" (Aboulela 136). This incantation is a kind of psychic protection. Judith Herman views the rebuilding of safety and connection as a key ingredient to the recovery of trauma (Herman 33). The mosque is where she can find this safety, and in this way, Najwa can relax her defenses. She describes the impact of her religious practice: "Around me was a new gentleness. The builders who had leered down at me from scaffoldings couldn't see me anymore. I was invisible, and they were quiet" (Aboulela 136). This invisibility is not erasure but protection, mediated by the space of the mosque community.

Ritual practice offers order in psychic disorder in this space. The Tajweed class is a comfort to Nazwa: "This concentration on technique soothes me; it makes me forget everything around me" (Aboulela 127). The repetition of the recitation serves as a somatic anchor and makes her solid within the miscellany of the diaspora. According to Homi Bhabha, cultural boundaries are zones of anxiety and negotiation, although in this case, the boundary offers security and not opposition (Bhabha 2). The mosque is also a third space, whereby, at no point in her life is Najwa considered to be an individual of a demoted class, but rather based on her piety. The society there provides the appreciation that is not found in the secular workplace. Najwa observes during Eid, "We are pleased to see each other without our hijabs... It is not only the party clothes; some of us are transformed without our hijabs" (Aboulela 180). This change proposes liberation of the defensive stance necessary on the outside. According to Dori Laub, testimony entails the necessity of a listener to remake the fragmented narrative of self to provide a secure healing ambience (Laub 71). The listeners in this case are the sisters at the mosque who, in a judgment-free way, justify the experience of Najwa. According to Julia Kristeva, to endure abjection, the subject has to renegotiate the boundaries, and the mosque helped them to renegotiate through worshiping together (Kristeva 4). Finally, the mosque is not a religious place per se but a psychic home where ritual practice gives order to disorder and Najwa can survive the state of being labeled Other and find a community where she can be held and recognized.

Object Relations and Lacanian Frameworks in Reading Najwa's Subjectivity

According to object relations theory, the practice of religion is a transitional phenomenon of the Winnickian concept, in which Najwa balances the disjointed inner world and the aggressive external environment (Winnicott 115). The veil and the mosque are possible places where the ego can stabilize without total submission to external demands. Najwa notes, "Without the curls I looked tidy, tame; I looked dignified and gentle" (Aboulela 136). This revolution implies a reconstruction of the self-image, similar to the mirror stage of Lacan, in which the subject relates to an idealized image of the ego to overcome internal fragmentation (Lacan 83). The holy character provided is a logical reflection of the turmoil of exile, in which Najwa can claim, "I just think of myself as a Muslim" (Aboulela 127). This recognition is not only spiritual but also psychic, which means that it offers a unified opposition to the fragmentation of her secular past.

**Ammanullah et al.,**

The construction of Najwa's secular past and pious present functions as a Freudian ego defense system against traumatizing experiences that are too large to take (Freud 15). The fact that she separates her life before the coup from her life after the coup also helps her to shoulder the burden of her loss without falling into melancholy. Such a process can be explained by Julia Kristeva, whose idea of abjection presents the subject with the necessity to renegotiate the borders to live through the expulsion of the old self (Kristeva 4). Najwa admits, "I've come down in the world. I've slid to a place where the ceiling is low" (Aboulela 125). The space metaphor shows the psychic descent in which the former identity is discarded to save the central self. Judith Butler argues that such psychic lives of power entail subjecting norms to acquire existence, but Najwa's submission is agentic, and she does not have to submit but chooses to do so to survive (Butler 2).

Language and shame are important in rebuilding symbolic order. Sara Ahmed advances the view that feelings such as shame determine the surfaces of bodies, which is in line with the fact that Najwa uses prayer to deal with affective feelings of displacement (Ahmed 10). The Quranic Arabic chant replenishes a symbolic form of structure that has been lost during migration. According to Cathy Caruth, trauma is an unintegrated experience that returns to haunt the survivor and thus requires a defense mechanism against repeated shock (Caruth 4). Najwa's shield is the ritualized language. According to Homi Bhabha, cultural boundaries are places of anxiety; however, in this case, the boundary offers protection as opposed to hybridity or collision (Bhabha 2). The mosque community provides appreciation that is not present in the secular workplace. Dori Laub also underlines that testimony needs a listener to rewrite the fragmented history of the self, and it has to do so to make a safe place in which a person can heal (Laub 71). Lastly, Shoshana Felman considers literature as a means of witnessing to confirm that the story of Najwa is a witness to psychic survival (Felman 5). It is within the frames of these structures that *Minaret* brings out subjectivity as an ongoing process of reconstruction in which faith mediates the divide between trauma and recovery.

Interpersonal Alliances and the Repetition of Dependency

The relationship between Nazwa and Tamer is a dependent fantasy that reminds us of the idea of repetition compulsion described by Freud, in which trauma victims replay traumatic moments to gain control over them (Freud 15). Najwa is in an inferior position as a maid, but the fact that Tamer needs her emotionally to find her balance shows that both are vulnerable, as they were both displaced. He admits, "I can only talk to you, highlighting how religious self-fashioning intersects with deep emotional need" (Aboulela 230). This relationship makes agency more complex, as Najwa's piety provides form, yet it can be characterized by the repetition of servitude she belonged to in Khartoum before.

According to Saba Mahmood, religious agency does not necessarily pertain to resistance but may include the development of submissive virtues in patriarchal systems (Mahmood 24). This tension can be seen in Najwa's hesitation regarding Tamer's proposal. She notes, "I would rather be in the background of your life," suggesting a desire for security over autonomy (Aboulela 260). This overlaps with Judith Butler's theory of the psychic lives of power, which dictates that to obtain existence, one must submit to norms (Butler 2). Najwa is three-quarters of a century old, and her spiritual practice is a kind of holding environment, similar to the transitional phenomenon identified by Winnicott, that holds her fragmented ego together against the turmoil of exile (Winnicott 115).

But is it a challenge to commodified femininity? The money offered by Doctora Zeinab makes Najwa a lesser person: "You will take this money and stay away from my son!" (Aboulela 285). According to Sara Ahmed, emotions define the surfaces of bodies, which is also in accordance with how Najwa uses praying to cope with the shame of this exchange (Ahmed 10). The association turns into a repository of emotions in which trauma is coded in daily activities (Cvetkovich 7). However, the end, when Najwa turns down the money, claims a moral limit. Cathy Caruth claims that trauma is an event that has not been assimilated and haunts the survivor (Caruth 4). Najwa's visit to Hajj is an indication of the abandonment of interdependence between individuals and spiritual independence. Dori Laub stresses that testimony involves a person who needs to have a listener to rebuild the fragmented narrative of the self (Laub 71). This listener is not Tamer, but Najwa's faith. According to Jacques Lacan, the gaze disturbs the subject and therefore demands a screen to deal with anxiety (Lacan 83). Najwa is able to negotiate this by referring to departure

as a spiritual responsibility. Therefore, the alliance shows the way that spiritual practice deals with the weaknesses of displacement and provides a multifaceted bargaining of power and care.

Spirituality as Psychic Care: Grieving and Re-identification in Diaspora

Spirituality is critical psychic care in *the Minaret* that converts ritual into an important self-calming therapeutic mode of diasporic trauma. Structural containment is provided to the Tajweed class, with Najwa as a confession. "This concentration on technique soothes me; it makes me forget everything around me" (Aboulela, Part Two, Ch. 10). This is in line with the concept of repetition compulsion as postulated by Freud, in which ritualistic behavior is a way of coping with unbearable reality (Freud 15). Prayer establishes a Winnicottian holding environment that offers psychological containment against outside anarchy (Winnicott 115). Nazjwa writes about the veil, "Around me was a new gentleness... I was invisible" (Aboulela, Part Two, Ch. 32). The mosque community serves as a transitional space, which has recognition that is not given at the secular workplace. The mosque community serves as a transitional place, which has recognition that is not given at the secular workplace.

Mourning is an active psychic process, in contrast to passive loss. Najwa wants to purify her sins with ice on behalf of her mother as she tries to salvage the fractal narrative of self (Aboulela, Part Three, Ch. 19). This also resonates with Caruth's argument that the experience of trauma cannot be assimilated and returns to give the survivor a nightmare (Caruth 4). Najwa tells Omar, "Allah will forgive him... Then He will do wonderful things for you" (Aboulela, Part Four, Ch. 12), faith as a coping strategy of understanding guilt and seeing pain (Laub 71). The state of diaspora presupposes re-identification; Najwa states, "I just think of myself as a Muslim" (Aboulela, Part Two, Ch. 15). It enables her to build a consistent identity in the circumstances of exile fragmentation, where she keeps the trauma in her everyday practices (Cvetkovich 7). It enables her to build a consistent identity in the circumstances of exile and fragmentation, where she keeps the trauma in her everyday practices instead of in public history.

Finally, psychic reassembly is possible through spirituality. Najwa fantasizes about the bed of her parents, which she needs. "clean sheets, the privilege" (Aboulela, Part Six, Ch. 36). This desire is a call back to security using spiritual memory and abjection (Kristeva 4). Faith expands the gap that exists between the secular and sacred and reinstates agency in the diaspora (Al-Hassan 23). The novel implies that to heal, one must accept the fracture. As Najwa navigates the "antagonistic outside gaze" (Aboulela, Part Two, Ch. 10), faith is a barrier that she uses. Thus, *Minaret* depicts religious practice as a reinforcing strategy for a displaced, fractured psyche, which desperately requires a group response to individual crises (Herman 33).

The Ambivalence of Religious Practice: Resistance and Ethical Self-Restraint

The hijab in *Minaret* is also not used as a political statement but rather as a defense mechanism against trauma that is psychologically necessary to survive. When Najwa starts wearing a veil, she begins engaging in domestic labor, and this move to an invisibility of protection is in contrast to the kind of visibility that she previously had. According to Cathy Caruth, trauma is something that cannot be digested and returns to haunt the person who survived it; that is why a person needs defense against a repeat shock (Caruth 4). In the case of Najwa, the scarf is used as protection against the hostile metropolitan stare that labels her an "Other". She notes, "Around me was a new gentleness. The builders who had leered down at me from the scaffolding couldn't see me anymore. I was invisible, and they were quiet" (Aboulela 136). This invisibility is consistent with Sara Ahmed's theory of emotions as the surfaces of bodies, in which the veil alters the way other people encounter the body to minimize hostile affect (Ahmed 10). The veil is a mediating effect between the internal desire and the external gaze and is achieved through a Lacanian register. According to Jacques Lacan, the gaze disturbs the subject, and they have to deal with the anxiety of being observed through the use of a screen (Lacan 83). Nazawwa has felt this screening effect as a loss of pride in the face of extreme declassification. She reflects, "The hijab is a uniform, the official, outdoor version of us. Without it, our nature is exposed" (Aboulela 180). This isolation keeps the inner self out of social use and criticism. According to Saba Mahmood, the resistance of religious agency does not necessarily imply its lack of engagement with developing submissive virtues within patriarchal frameworks (Mahmood 24). The practice turns into a way of experiencing one's

**Ammanullah et al.,**

own survival in an unfriendly environment. In this way, negotiation is the veil as an intermediate between the inner world and the hostile outer gaze without either of the two extremes of condescension or emancipation.

Minaret and the Reconstruction of Subjectivity Post-Trauma

Finally, subjectivity (*Minaret*) is shown as a practice of mourning and re-identifying with the diaspora, making spirituality a mode of psychic treatment. This is illustrated in the way that Najwa comes out as having undergone a process of disintegration of self and reconstruction of self, but nonetheless, is not completely cured in a Western clinical sense. She asserts, "I just think of myself as a Muslim" (Aboulela 127), indicating the transition from national to spiritual subjectivity. According to Judith Butler, these psychic lives of power are about acquiescing to norms in order to acquire existence, but the submission of Najwa is agentic as it is a choice made to survive and not a matter of coercion (Butler 2). In her contribution, Judith Herman underlines that safety and connection are what victims need to recover after trauma (Herman 33). This is the safety that the mosque offers to Najwa as she is able to weaken her barriers against the disintegration of exile. Dori Laub points out that a witnessing person needs to rebuild the fractured history of self and provide a safe healing atmosphere (Laub 71). Najwa identifies this listener in religion, and not in secular relationships that recreate dependency. D. W. The idea of the holding environment by Winnicott describes how the mosque community offers the confinement that the fragmented ego of Najwa needs to balance the threats of the outside world (Winnicott 115). According to the novel, it is impossible to heal by denying the fracture. As Najwa navigates the "antagonistic outside gaze" (Aboulela 136), she uses faith as a delimitation. Thus, employing *Minaret* shows a religious practice as a reconstructive strategy to the psyche that is shattered by displacement and that there is an urgent necessity to have a collective reaction in relation to individual crisis.

CONCLUSION

This study argues that Leila Aboulela's *The Minaret* affects religious practice not only as ideological devotion but also as a crucial psychic survival strategy that emerged after traumatic displacement. The wearing of the hijab and the performance of ritual prayer, from a psychoanalytic perspective, are a rebuilding of the divide due to exile fragmentation in Najwa. Some of the key findings are that the mosque is a holding environment filled with Winnicottian recognition that is missing in the unfriendly metropolis, and interpersonal alliances demonstrate complicated aspects of dependency in trauma recovery. The analysis proves that spirituality can be interpreted as an active grieving work that helps Najwa restructure a fractured subjectivity with ethical self-restraint instead of secular emancipation (Aboulela). Hypothetically, the study fills the gap between psychoanalysis and trauma theory in the study of postcolonial literature, such as identity politics related to interior psychological healing. It implies that faith is like a mode of witnessing and self-comforting in the wake of migration, which is compatible with Caruth's idea of an unassimilated experience.

Nevertheless, the investigation is restricted to Najwa's interiority, and thus, further studies may explore other subjectivities of men or diasporic texts to enrich the literature on coping through religion. In addition, the overlapping of class demotion and spiritual agency outside the British context may be investigated further. In conclusion, *Minaret* remains highly relevant to the modern experiences of the diaspora, as it shows how spirituality can be used as a refuge for the psychic being in times of failure in external structures. The experiences of Najwa highlight that exile healing does not involve healing the past but negotiating a livable situation in the fractured present. The novel suggests that, in the case of the displaced subject, spiritual discipline is a required structure to sustain the state of being branded Other or to turn trauma into a place of reconstructed meaning and psychic nurturing.

ABSTRACT

English proficiency plays a critical role in India's educational and employment sectors, yet Tamil-medium learners often face significant disadvantages compared to their English-medium peers. This study explores the linguistic, pedagogical, psychological, and socio-cultural challenges encountered by Tamil-medium students in acquiring English. Using Systemic Functional Linguistics (SFL) as the analytical lens, the study examines how students' struggles and coping mechanisms can be understood in terms of three metafunctions of language namely ideational, interpersonal, and textual. Data was collected through interviews, classroom observations, and student writing samples. Then they were analysed using clause-level SFL tools. The findings revealed how differences phonology and syntax, limited communicative practice, lack of confidence and restricted access to resources hinder language acquisition, while strategies such as code-switching, media exposure, rote memorization, and peer collaboration provide partial support. Through SFL analysis, these challenges and strategies are reframed as meaning-making processes rather than isolated errors. The study also proposes that appropriate pedagogical interventions, including bilingual scaffolding, task-based learning, and explicit teaching of text organisation supports Tamil-medium learners in enhancing learning English language. By integrating grammar and meaning through SFL, this study contributes to more equitable and effective ESL pedagogy in multilingual contexts.

Keywords: Tamil-medium students, Systemic Functional Linguistics, language acquisition, writing skills and student strategies.

**Kanchana Mala and Muthulekha**

INTRODUCTION

English is used all over the world and it has a great influence on many walks of life. It shapes how students learn in schools and universities, since many subjects and books are in English. Most software, websites and research are created or shared in English. This has made English as the main language for global conversation and connection. In Asian countries especially in India, knowing English is considered as the gate way to successful career. But there is a huge difference between English-medium and Tamil-medium students in learning and understanding English.

This study looks at how students at the college level from Tamil-medium background learn to write in English, the problems they face and provides suggestions to enhance their English language skills. Of the four language skills, only writing skills is analysed for the study. At the undergraduate level, majority of the students are from English medium. These students are exposed to English language from a young age. Hence they use English language to speak, read, write and think freely. On the other hand, there are a few students who have studied in Tamil medium schools and they often do not get the same level of exposure or opportunity to use English language. As a result they face challenges in comprehending and using English confidently. This study explores these challenges which are linguistic, teaching-related, psychological and culturally different based on SFL tools.

Systemic Functional Linguistics (SFL) has been used as the main framework for the study since it helps to understand language not just in the perspective of grammar or vocabulary but as a tool to explore language as a meaning-making resource in real life situation. Systemic Functional Linguistics (SFL) is a theory of language developed by M. A. K. Halliday the world-renowned linguist. It studies language based on the ways in which people use it in real-life situations to create meaning. According to M. A. K. Halliday (1978), language is not merely a set of grammatical rules but a resource for making meaning in social contexts. Systemic Functional Linguistics explains how learners use language to express ideas, maintain relationships, and organise information effectively. Therefore, SFL provides an appropriate framework to analyse the challenges faced by Tamil-medium students while learning English. SFL views language as a tool for communication and social interaction instead of looking at language only as grammar rules. Using SFL, the present study analyses the struggles of the students from Tamil medium not as “mistakes” but as part of a larger process of trying to make meaning in a new language.

In general, Tamil-medium students find it difficult to achieve enhanced English language skills and this becomes a barrier to succeed in higher education and also in finding jobs in top notch companies. Rod Ellis (1997) is of the opinion that second language learning is influenced by social, psychological, and educational factors. Their struggles usually come from limited exposure to English in daily life or a traditional language teaching method that focuses mainly on grammar and memorisation rather than real communication. Jack C. Richards and Rodgers (2014) emphasize that communicative language teaching encourages learners to use language in real-life situations instead of memorizing grammar rules alone. In several cases, the students at the undergraduate level also lack self-confidence and grow anxious of making mistakes while writing in English. Hence the study suggests that language teachers who teach English, must follow certain strategies that connect their mother tongue and English meaningfully, following SFL principles that focus largely on communication and meaning-making. The present study answers three main questions that are as follows:

- (i) What are the problems that the Tamil-medium students face while learning English?
- (ii) How can these problems be understood through the three SFL metafunctions?
- (iii) What kind teaching methods or interventions can help them learn more effectively?

This is a qualitative case study involving 25 undergraduate students who learn their B.E. programmes. At the school level, these students have not learnt their subjects in English. They have learnt in their mother tongue that is Tamil. The major challenges faced by Tamil-medium students can be classified under four areas. They are as follows:

- (i) Linguistic challenge
- (ii) Pedagogical challenge
- (iii) Psychological challenge
- (iv) Socio-cultural challenge

Tamil and English have different sound systems and grammar. This is a major linguistic challenge that leads to confusion in sentence structure and pronunciation. While teaching English, language teachers use grammar-translation methods instead of motivating conversation and activity-based methods. This is one of the pedagogical challenges involved. Psychological challenge arises when learners lack confidence and are afraid of being judged for mistakes. Socio-cultural challenge denotes the circumstance in which they rarely get chances to use English outside college. All these challenges together make writing or speaking in English difficult for students.

In order to examine the reasons for the difficulties faced by the experiment group, several learner-centric activities were conducted during the class over a period of 30 days. Data collection was done in three different ways. They are as follows:

- (i) Semi structured interviews
- (ii) Classroom observation
- (iii) Student writing samples

Semi structured interview was conducted in order to understand the students' thoughts and feelings about learning English. Classroom observations were made to watch how they use English in real classroom settings. Writing exercises were given so that the methods in which the students build meaning through sentences and paragraphs were analysed.

While examining the writing samples of the experiment group, it is observed that the errors are of several types. They often make inappropriate use of tense. For example, a student wrote "He go to school yesterday" instead of "He went to school yesterday". This is because Tamil verbs do not modulate for tense the same way as English. These students also omit articles. For example, a student wrote, "He is teacher" in the place of "He is a teacher". Prepositional errors were also found as it is seen, "We discussed about the topic" instead of "We discussed the topic". They also make errors in concord. For example, "Everyone are waiting" and not "Everyone is waiting". These students also use informal and wrong expressions such as "He only told me" and not "He is the one who told me". Most importantly they make spelling mistakes such as

"Receive" for "receive"

"Atten" for "attend"

"Replay" for "reply"

They also lack logical cohesion and present ideas without connection. For example, they write, "I woke up. Went school. Ate lunch. Coming home."

Overuse of direct translation for politeness or request, is also practiced by the experiment group. For example, "You coming or not?" (Tamil-style directness) instead of "Are you coming?" These are some of the major errors that students from Tamil-medium make while writing in English.

Interpretation through SFL framework

The writing samples were also examined based on the following SFL frame work in order to understand the problems faced by the Tamil-medium students:

Ideational interpretation: Limited vocabulary affects the ways in which learners describe experiences or ideas.

When learners do not have enough word power, they are not able to express their thoughts clearly. In one instance a student instead of writing "the book was informative and thought-provoking" they will just write "the book was good". Hence their message becomes less interesting and less detailed.

**Kanchana Mala and Muthulekha**

Interpersonal interpretation: Avoiding complex sentences or modal verbs such as can, should, would, could, etc. reduces confidence in communication.

The interpersonal function of language is about interaction and relationship and the manner of expressing one's attitude, politeness or confidence when talking to others. If learners avoid using complex structures or modal verbs like can, could, should, might, they sound less sure or less expressive. The following usage of a student serves as an example:

"You come tomorrow" instead of "you should come tomorrow".

The necessity of coming the next day is not emphasized. Hence this sentence formation sounds less polite and less confidence.

Textual interpretation: Weak organisation of ideas makes writing look unclear or disconnected. If learners do not use linking words such as therefore, because, however, firstly, finally etc their writing sound disconnected.

Ex: I like music. I am learning it. My teacher helps me.

This could be improved as "I like music, but I find it hard because the notes are complex. However, my teacher helps me understand."

Hence the difficulties that the students from Tamil-medium face show gaps in making meaningful sentences across all three metafunctions of language.

The experiment group was also informed the ways to analyse the errors that they make. Three SFL tools are used to error analysis. The written scripts are examined using three SFL tools namely, transitivity, mood and theme rheme. Transitivity aims at analyzing how language represents an action, the doer of the action, the process of an action and its circumstance. For example, in the sentence, "The student read a book in the library," the student is the participant and the library is the circumstance. The way in which a language user describes his/her actions, feelings and experiences can be analysed through transitivity.

In language learning, mood explains how learners interact through questions, statements and requests. It focuses on clause types such as, declarative, interrogative and imperative. Studying the mood helps us understand how confidently or politely learners communicate and engage with others. Theme rheme is one of the most important tools to find out the ways in which learners organize ideas in writing. It analyses how a sentence is organized and it indicates that the information which is mentioned initially in a sentence is theme and the ideas that follow is rheme. In the sentence, "Gold is a costly metal" 'gold' is the theme and 'is a costly metal' is the rheme. This is helpful to check how the language user structures the sentences and whether their writing flows logically and clearly.

CONCLUSION

Thus, concepts such as transitivity, mood, theme-rheme structure and cohesion play an important role in understanding the manner in which learners use language meaningfully and effectively. These linguistic features not only help teachers analyse students' communication patterns but also guide them in designing appropriate teaching methodologies. Therefore, applying these concepts in English language classrooms will greatly support Tamil-medium learners in improving their writing skills in English.

To further motivate Tamil-medium students learn English effectively, language teachers can also use certain methods that include bilingual-scaffolding where Tamil language can be used where necessary to explain difficult ideas in English. According to Pauline Gibbons (2002), bilingual scaffolding greatly assists second language learners in understanding difficult concepts by connecting the mother tongue with the target language. Occasional use of Tamil in English classrooms will greatly reduce anxiety and help students participate more actively.

**Kanchana Mala and Muthulekha**

Focusing on real-life communication tasks instead of just grammar rules will motivate the students too. Teaching text organisation will also help learners the ways to link sentences and build coherent paragraphs. Cohesion refers to the ways in which sentences and ideas are linked together using connectives like since, as a result, consequently, subsequently, etc., Each of the above-mentioned methods focus on a specific part of language learning and ensures learners develop complete communication skills. Stephen Krashen (1982) states that language acquisition becomes effective when learners are exposed to meaningful and understandable input. Tamil-medium students often receive limited exposure to English outside the classroom, which affects their confidence and fluency. Continuous exposure through reading, listening, and communication activities can improve their language skills gradually.

Thus, the difficulties faced by Tamil-medium students are not personal failures. They are the results of limited exposure and unequal access to English learning opportunities. They never get chances to use or hear English outside college and resources like availability of books in English, teachers or activities may not be available to everyone. They arise from unequal learning conditions, not from lack of ability. Therefore, proper guidance, supportive teaching methods, and adequate learning opportunities will definitely help Tamil-medium students improve their English communication skills effectively to a great extent. With encouragement and continuous practice, they will become confident users of English.

ABSTRACT

This paper explores the social, cultural, and emotional realities of people in India portrayed by Deshpande in her works. Shashi Deshpande is an authentic writer who meritoriously represents the authenticities of human difficulties and also about the ways in which they try to adapt the changes that they face in their lives. The objective of this paper is to bring the critical views of other writers about the writing style of Deshpande.

Keywords: tradition, cultural, emotional, authentic, religious.

INTRODUCTION

Deshpande's novels depict the manifestation of humans by bringing the joys and blues of daily life. The possibilities of improving human life are discovered and discussed at greater dimensions in her novels. Though the novels take a serious form initially, positive options are explored and the characters discover the divine qualities that are hidden in them as the story progresses. Thus, she is tagged as one of the leading, creative and humanitarian writers. Beena Agarwal, a reader in the department of English studies opines in *Mosaic of the Fictional World* like Wordsworth, creative writing is an inner compulsion with Shashi Deshpande.

**Saraswathy and Patchainayagi**

She conceptualizes the common problems in humans with no flaws like great authors as she has an internal urge to contribute to the society. She has found the art of writing as an effective tool to achieve her goal like P.G Woodhouse, an English comic novelist of twentieth century. He mentions in his novel *The Imitable Jeeves* that to write novels so true, so human, so moving, and so vital.

Deshpande has expressed in her work, *Writing from the Margin and Other Essay* that “It is through my imagination ...door into other world”. Though she is from a rich family, she comprehends and empathises with the complications and sufferings of lower-middle class people through her imagination.

Rashmi Sahi, a researcher advocates in her work *The Mother Daughter Relationship in the Novels of Shashi Deshpande* “The mother daughter relationship..... qualities to her. Deshpande strongly believes that every movement of a person is dependent with another in life, and so human values like reconciliation, reverence, love and compassion, and gratitude play a major role in all her novels.

Deshpande's style comprises brevity, concreteness, clarity, and richness. She eludes ambiguous words and she also avoids giving artificial shades to her works. She object in writing is to make the life of people happy like Wordsworth. B.K. Prasad mentions in *An Introduction to English Criticism* that “Wordsworth’s own object ... securely virtuous”. According to Wordsworth, writing makes a person feel more confident and joyful. She too expresses to Lakshmi Holmstrom, an Indian British -writer:

I learnt about language. ... I didn’t want to make melodramatic or overstatements, ever.

Deshpande’s language makes the readers comfortable and creates an urge in them to read more and more as it is simple and clear. Dieter Riemenschneider, the author of *The History and historiography of Commonwealth Literature* mentions in *The Story Must Be Told* says that Deshpande takes the readers to the life that women lead in the society which no author of the earlier age had dared to write in words as truthfully and Shashi Deshpande's excellently refined the sensibility infuses the subtle interplay of human relationships with a faithful mood which assists to clear our thoughts, and all at once we see in her a natural extension of our own intellectual parameters.

Deshpande takes an excessive effort to present not only the unity among relationships, but also the positive and negative roles of relationships in families. She articulates to Geetha Gangadharan in a meeting that human-associations are what an author deals with. The relationship from a person to person and person to society associations - these are the two key factors of a writer and, to me, the former is of colossal significance. Therefore she gives importance to families in her novels as it is believed that home sets the foundation for one’s interpersonal skills.

Deshpande mentions in an interview with Lakshmi Holmstrom that she is dissimilar from other Indian writers who write in English, she makes sure that her background is very strongly set in her work; she never had her studies in abroad. Thus she never follows any western style in her writing. Her writing is completely all about the simple Indian people and the complexities that they face in their lives.

Shashi Deshpande keeps learning about the pros and cons of Indian people and society every now and then and does her bit for the welfare of the society with her artistry. She also states in an interview: “My English is as we ... reader needs it” (Vol 2. 6 New Man International Journal 60). She is of the view that technique needs to worry only about the technique and she has to always go with the right one though it takes a long time to do so. She says that it is like setting a tampura.

She uses the stream of consciousness technique to depict the mind set of human beings candidly as the minds of humans are not always in the present; it swings to and fro among past, present and future. It is this technique that makes her stories more realistic and flawless. She is a great lover of classic authors like Shakespeare, Jane Austen, Charles Dickens and so on. Her writings are greatly influenced by these writers in terms of simplicity, language and

**Saraswathy and Patchainayagi**

technique. Deshpande like Jane Austen; “Reveals so frankly and with such sobriety, the economic basis of society” (Letter to Byron’, 1936).

Basavaraj Naikar says that Deshpande has been a very serious Indian English. She brings the problems of an Indian family set up as it is. In the novel *The Binding Vine* brings the emotions of mothers and the love that they have for their children. Urmi, the protagonist, loses her daughter in an accident and her fantasizing the deceased daughter gives her the greatest joy on earth.

Urmi discovers her mother-in-law’s writing skills through poems which were hidden in the trunk and she uses those poems to have a better understanding of her life. She empathizes with the problems of other women in the society and helps them to lead a balanced life. Thus, she works hard towards the upliftment of people by bringing the common problems that people face in their day-to-day lives.

R.K. Sharma, a researcher propounds in *That Long Silence: Long Night’s Journey into Day* that Deshpande’s heroines emerge from a traditional, middle-class, semi-urban milieu. While it gives them an innate strength to survive, it also handicaps them by burdening them with heavy inhibitions. The notion that women are basically low-grade to men is instilled into them from the start, giving them a mindset which they find difficult to discard subsequently.

Deshpande’s characters learn to understand the essence of their lives through their entire sufferings.

Dr. Amarnath Prasad, the editor of English literature books expresses in *Indian Writing in English Critical Explorations*: “Like Dorothy M. Richardson, Shashi Deshpande endeavors to render current existence as reflected in the consciousness of her heroine” (274).

J.P. Tripathi in *The Feminist Upsurge in Jaya’s Ego* in Shashi Deshpande’s *That Long Silence* expresses that like Virginia Woolf, Shashi Deshpande is a writer of feelings and emotions that crosses in human mind. The women characters that she portrays in her novel understand, dutiful and passive like the predecessors. Deshpande’s characters are silent and submissive, but they manage to go beyond their difficulties to find ecstasy in their lives.

Deshpande’s characters make the readers understand that egoism will end up in disharmony and chaos in the family. Bijay Kumar Das, a postmodern Indian English writer advocates that the traditional Indian wisdom stands strong in abolishing disharmony in Indian families in her novels. For instance, on an occasion in the novel *A Matter of Time*, Kalyani and Goda speak about Vithalroa’s and Manorama’s wedding as a miracle. At that instant, Sumi recollects the story of *Kumarasambhavam* (Hindu mythology) that speaks about the relationship of Lord Shiva and Goddess Parvathi. Kalyani speaks of the strong relationship between her parents. *Kumarasambhava* recounts the courtship of Lord Shiva and Parvati.

It also speaks about Goddess Parvati’s determination to win the love of Lord Shiva. The recollection of the story gives hope to Sumi to reunite with her husband and helps her in upholding the love that she has for her husband despite their separation for many years. Deshpande conveys to the readers that reading religious and classic books give hope for people to survive with self-confidence and the characters in the stories teach people to overcome struggles in life with forbearance.

Deshpande conveys to the readers in her novels, the significance of cultural rooting’s, and the value of preserving the landscape of ancestors and so on. She also emphasizes that culture, tradition and art offer knowledge that is necessary for physical and intellectual benefit of human beings. She also professes that the present generation can acquire knowledge through culture, art and tradition. Therefore, culture, art and tradition must be preserved by the present generation and transmitted to the future generation. The presence of human life with intuitive admiration for everything will create happiness in humanity. Thus, Deshpande’s characters impart to readers that art, tradition, music, nature and even poverty help people realize that there is optimism in life.

ABSTRACT

This study presents an AI-driven Academic Vocabulary Proficiency Test designed for engineering undergraduates in English for Specific Purposes (ESP) within Higher Education Institutions (HEIs). The test uses Coxhead's Academic Word List (AWL) to address the need for productive vocabulary assessment. It aligns scoring with the Common European Framework of Reference for Languages (CEFR), moving beyond traditional receptive measures. Using AI technologies, the interactive open-ended cloze test provides first-syllable hints within real engineering contexts to evaluate learners' productive use of vocabulary. Features include adaptive item randomization, timed levels, and automated CEFR-aligned scoring, allowing efficient deployment and detailed diagnostic feedback. AI enables real-time data collection and advanced analysis, producing comprehensive learner profiles and institutional reports supporting targeted instructional interventions. The study highlights the tool's reliability and pedagogical importance in improving ESP vocabulary assessment. Although the platform mainly focuses on the AWL and has exact-match scoring limits, it represents an AI-enhanced assessment that tackles key educational challenges. This research advances ESP teaching and applied linguistics by combining AI capabilities with existing vocabulary frameworks, paving the way for new developments in academic language assessment for engineering students.

Keywords : Academic Vocabulary, AI-Enabled Assessment, CEFR Alignment, Educational Technology, English for Specific Purposes (ESP).

**AnilKumar et al.,**

INTRODUCTION

Academic vocabulary is pivotal in engineering undergraduates' academic and professional development. It enables them to engage with technical literature, compose research papers, and participate effectively in disciplinary discussions. In the context of English for Specific Purposes (ESP), however, vocabulary demands extend well beyond general English. Students must command abstract, technical, and field-specific terms that underpin disciplinary communication (Hyland & Tse, 2007). Despite its central importance, research indicates that many engineering students possess insufficient academic vocabulary, constraining their academic achievement and workplace readiness (Nation & Waring, 1997; Schmitt et al., 2011). Assessment of academic vocabulary knowledge presents additional challenges. While efficient multiple-choice recognition tasks provide only a partial picture, they do not capture productive knowledge or the ability to retrieve and use words accurately in context (Qian, 2002). In contrast, open-ended assessments offer greater validity but demand considerable resources regarding design and grading (Webb & Nation, 2017). Against this backdrop, the rapid integration of artificial intelligence (AI) into higher education creates new opportunities to address these limitations by enabling scalable, adaptive, and automated assessment approaches (Luo et al., 2025).

This study addresses these challenges by designing and implementing an AI-enabled Academic Vocabulary Proficiency Test for engineering undergraduates. The test is grounded in Coxhead's (2000) Academic Word List (AWL) and aligned with the Common European Framework of Reference for Languages (CEFR). It systematically assesses productive academic vocabulary knowledge in an automated manner. By integrating insights from the Productive Vocabulary Levels Test (Nation, 2001) with AI-driven analytics, the tool offers diagnostic precision and practical scalability, thereby addressing a significant gap in ESP-focused vocabulary assessment for engineering learners.

Accordingly, the following research questions guide the study:

1. To what extent can an AI-enabled Academic Vocabulary Proficiency Test be designed to reliably and validly assess the productive academic vocabulary of engineering undergraduates in ESP contexts?
2. How can AI-enabled automation and CEFR-aligned reporting enhance scalability, diagnostic accuracy, and educational relevance in academic vocabulary assessment?
3. What pedagogical and research implications emerge from integrating an AI-enabled vocabulary assessment tool into ESP programs for engineering undergraduates?

LITERATURE REVIEW

Challenges in Academic Vocabulary Assessment for Engineering ESP Learners

Engineering students frequently encounter difficulties with academic vocabulary, particularly discipline-specific and technical terms. As a result, these challenges affect their reading comprehension, writing abilities, and overall performance in English for Specific Purposes (ESP) contexts. Moreover, limited vocabulary knowledge has hindered academic achievement and career progression (Nation & Waring, 1997). In addition, studies of vocabulary size across engineering disciplines reveal substantial variation, with many students failing to reach levels considered necessary for academic success (Schmitt et al., 2011). Traditional multiple-choice formats are often used for assessment because they are efficient; however, they do not adequately measure how learners actively use vocabulary in practice (Qian, 2002). By contrast, open-ended and context-rich formats provide stronger predictive validity for academic performance (Webb & Nation, 2017). Nevertheless, these approaches face limitations, including complex scoring requirements and time constraints. More recently, meta-analyses of computer-assisted vocabulary assessment have confirmed such limitations while underscoring the potential of adaptive, technology-based approaches to address them (Aldukhayel, 2022).

**AnilKumar et al.,****The Role of Academic Vocabulary and the AWL in ESP**

Academic vocabulary enables students to communicate effectively and engage with academic content. For engineering students, this entails mastering both abstract academic terms and technical language tied to their field. However, general English courses seldom address these needs adequately (Hyland & Tse, 2007). To bridge this gap, Coxhead's (2000) Academic Word List (AWL), comprising 570 high-frequency word families, has become an essential resource for ESP instruction. Research consistently demonstrates that explicit instruction based on the AWL improves comprehension and writing performance in ESP contexts (Coxhead, 2000; Hyland & Tse, 2007). Furthermore, studies employing corpus-based tools to support AWL instruction show that ESP learners retain vocabulary more effectively and readily transfer it into academic tasks (Boulton, 2022).

Receptive versus Productive Vocabulary Knowledge

Another strand of research highlights the distinction between receptive vocabulary knowledge, which involves recognition, and productive vocabulary knowledge, which requires active use (Nation, 2001). For engineering students, productive vocabulary is crucial since they must communicate clearly in technical reports, research papers, and professional discourse. Despite this importance, many assessments prioritize receptive knowledge because such formats are easier to design and grade. However, reliance on receptive measures alone risks underestimating learners' actual communicative competence (Nation, 2001).

AI and ESP: Innovative Frontiers**AI-Driven Vocabulary Learning in ESP**

Recent developments show increasing interest in leveraging AI to support vocabulary learning in ESP contexts. For instance, Silitonga et al. (2024) reported that integrating AI chatbots into ESP classes significantly enhanced vocabulary retention among engineering students. Similarly, Zamanpour and Etemadzadeh (2024) demonstrated that AI-driven corpora improved financial engineering students' acquisition of academic idioms and lexical bundles. Beyond retention, broader investigations highlight AI's role in fostering engagement, reflection, and behavioural change in ESP learning (Shadiev et al., 2023; Patty, 2024; Rahimi & Fathi, 2022; Utami et al., 2023). In addition, digital collaboration platforms and flipped classroom models have further strengthened vocabulary acquisition, with studies showing measurable gains in ESP learners' outcomes (Kohnke & Moorhouse, 2022; Zou & Xie, 2019).

AI-Enhanced Assessment in Higher Education

Parallel to learning, AI has also begun reshaping assessment practices in higher education. Luo et al. (2025) noted the growing use of AI-based systems for personalized feedback, tutoring, and cognitive and affective outcomes evaluation. Complementing this, Ilieva et al. (2024) proposed a multi-stakeholder framework for assessment design, while Vargas et al. (2024) outlined strategies for developing assessments that are resilient to AI misuse. Pilot implementations have provided encouraging evidence. For example, the AI Assessment Scale (Furze et al., 2024) produced measurable improvements in student learning outcomes, and Impey et al. (2024) found that ChatGPT-4's grading accuracy closely matched human instructors. Furthermore, mobile-assisted flipped classrooms and AI-enabled analytics have shown potential to enhance assessments by supporting active learning and timely feedback (Tseng & Yeh, 2019).

AI in Engineering Education

Several studies in engineering education illustrate AI's potential beyond language learning. Pursnani et al. (2023) revealed that carefully refined prompting strategies improved ChatGPT's performance on the Fundamentals of Engineering examination. At a broader scale, Chamberland et al. (2025) applied AI to analyze student feedback and visualize engagement trends, illustrating its promise for institutional decision-making. Moreover, longitudinal research suggests that embedding data-driven approaches within ESP courses contributes to gradual but sustained improvements in academic vocabulary (Wu & Miller, 2020; Lin & Warschauer, 2015).

**AnilKumar et al.,****Pedagogical Implications and Institutional Response**

The rapid adoption of generative AI, reportedly by 92% of university students in the UK (Higher Education Policy Institute & Kortext, 2025), has compelled institutions to reconsider their assessment practices. In response, several strategies have emerged. For example, some universities have reinstated oral viva examinations to authenticate students' understanding (University of South Australia, 2022). Others have adopted policies requiring disclosure of AI use and provided training in ethical and responsible application (Indian Institute of Technology Delhi, 2024). Collectively, these measures reflect an effort to balance the opportunities presented by AI with the need to maintain academic integrity.

Research Gaps and the Way Forward

Although AI-assisted assessment has gained traction, most studies emphasize general English or receptive vocabulary measures. Only a limited number of validated instruments are available for assessing productive academic vocabulary in engineering ESP contexts. Furthermore, automating the evaluation of open-ended responses remains technically challenging. These gaps underscore the need for new approaches.

Synthesis and Rationale for the Study

The literature highlights the central role of academic vocabulary in engineering ESP contexts and the persistent difficulties students face in mastering it. While the Academic Word List provides a valuable foundation for instruction, assessments remain limited by their reliance on receptive formats, which fail to capture the productive use of vocabulary essential for academic and professional communication. At the same time, recent advances in AI have opened promising avenues for both learning and assessment, offering scalability, adaptability, and enhanced diagnostic precision. However, despite this potential, there remains an apparent lack of validated tools that leverage AI to evaluate productive academic vocabulary among engineering undergraduates. This gap points directly to the need for the present study, which proposes an AI-enabled, CEFR-aligned assessment designed to address the shortcomings of existing methods while responding to the pedagogical and institutional demands of contemporary ESP education.

Development of the AI-Driven Academic Vocabulary Assessment Test

Building on the research gaps identified in the literature review, particularly the absence of validated tools for assessing productive academic vocabulary in engineering ESP contexts, this study developed and implemented an AI-enabled Academic Vocabulary Proficiency Test. The design uses Paul Nation's Productive Vocabulary Levels Test (PVLTL) framework, modifies it to incorporate Coxhead's Academic Word List (AWL, 2000), and delivers it through an interactive, automated platform. By emphasizing productive recall, CEFR alignment, and scalable deployment, the methodology directly addresses the call for more precise diagnostic tools and pedagogical relevance in academic vocabulary assessment.

Test Design and Structure

To ensure systematic coverage of the AWL, the researchers structured it into ten sequential levels, each corresponding to one AWL Sublist. The progression moves from high-frequency to lower-frequency academic word families, reflecting the natural gradient of lexical difficulty. Each level contains 20 fill-in-the-blank items presented in sentence contexts. The tasks provide the first syllable of the target word as a cue, requiring participants to type the complete form. The researchers selected this open-ended, context-rich design because prior research demonstrates that productive formats are stronger predictors of academic performance than recognition-based tasks (Qian, 2002; Webb & Nation, 2017). For instance, in the item "*The team needed to co_____ their efforts for better results,*" the correct answer "*coordinate*" evaluates knowledge of meaning, form, and contextual usage simultaneously.

Timing and Progression Rules

Each level is time-limited to five minutes to promote focus and ensure standardized conditions. While learners can view all levels from the outset, progression is contingent upon completing the preceding level. This sequencing balances autonomy, valued in ESP pedagogy, with comprehensive lexical coverage.

**AnilKumar et al.,****Randomization for Validity**

The platform incorporates randomization at the item-selection stage to safeguard validity and minimize practice effects. The system generates unique sets of items drawn from the relevant AWL Sublist for every test attempt. This mechanism reduces item overlap across participants and retakes while preserving the intended progression of difficulty within the AWL.

Data Capture and Analytics

The AI-driven architecture enables detailed tracking of learner performance. Data collected include the number of items attempted and correctly answered per level, time spent, and estimates of known academic words and mastered word families. The system displays these outputs on an administrative dashboard and allows users to export them into spreadsheets for further analysis. In addition, the dashboard provides visual analytics such as score distributions, progression trends, and pass/fail rates. Such analytics enhance institutional monitoring and align with the broader shift toward data-driven feedback in AI-supported ESP instruction (Kohnke & Moorhouse, 2022; Luo et al., 2025).

CEFR Alignment

Upon completing all ten levels, the system evaluates learner performance by mapping it to CEFR bands, using accuracy, lexical range, and mastery of word families as key indicators. A 90–100 percent score corresponds to the C1–C2 range, signifying advanced proficiency, while 75–89 percent places learners within the B2–C1 upper-intermediate band. Those achieving between 60–74 percent are classified as B1–B2, reflecting intermediate ability, and scores ranging from 40–59 percent map to the A2–B1 level, representing elementary to lower-intermediate competence. Learners below 40 percent are in the A1–A2 range, indicating beginner to elementary proficiency. By providing CEFR-aligned results, the system gives learners a clear and internationally recognized benchmark of their progress and allows instructors to interpret outcomes within globally accepted standards (Hyland & Tse, 2007).

Pedagogical Integration

Overall, the test design integrates productive vocabulary measurement, adaptive item randomization, and CEFR-referenced reporting to tackle longstanding challenges in academic vocabulary assessment. The combination of scalable automation and detailed diagnostic feedback makes the tool suitable for institutional deployment while equipping instructors with actionable insights for targeted interventions in engineering-focused ESP programs.

Technical Implementation of the AI-Enabled Academic Vocabulary Assessment Test System

This study developed an AI-enabled Academic Vocabulary Assessment Test as a web-based platform for evaluating English for Specific Purposes (ESP) vocabulary proficiency among engineering undergraduates. The researchers used the Canva AI Code environment to implement the system and applied Tailwind CSS to create a responsive and accessible interface design. Conceptually, researchers organized the platform into five modular layers: the user interface layer, AI integration layer, assessment logic layer, data management layer, and security layer. The System Integration Tree Diagram (Figure 1) depicts this architecture, highlighting the hierarchical relationships and functional segregation of components.

The integration of these layers produces a cohesive and scalable platform. At the front end, the user interface layer combines HTML5 and Tailwind CSS to deliver a mobile-optimized, user-friendly environment conducive to diverse learner contexts. Underpinning this, the AI integration layer utilizes GPT-based large language models (LLMs) to dynamically generate contextually relevant test items and furnish adaptive, immediate feedback, thus enhancing responsiveness and instructional adaptability (Hurix, 2025; CTLT UBC, 2023). The assessment logic layer orchestrates the flow of test items, timing, and CEFR-based proficiency estimation, ensuring rigour and standardization aligned with internationally recognized frameworks (ETS, 2023; Pearson, 2018). Data management employs local browser storage with export capabilities in CSV format to facilitate formative learner feedback and summative research analytics. The security layer enforces real-time user behaviour monitoring to safeguard academic integrity, preventing malpractice through full-screen enforcement and tab-switch tracking (HackerOne, 2025). Collectively, this

116031

AnilKumar et al.,

layered design supports a robust, secure, and efficient AI-driven assessment environment suitable for large-scale ESP vocabulary testing. The workflow diagram (Figure 2) further explicates the user journey and system logic. Upon login, learners select a proficiency level corresponding to one of ten Academic Word List (AWL) sublists (Coxhead, 2000; Shabani, 2014). They engage with randomized cloze test items featuring first-syllable hints within a five-minute session to promote rapid vocabulary recall and reduce guesswork. AI algorithms automatically score submissions, monitor timing adherence, and determine learner eligibility for progression. Concurrently, the system collects accuracy and time metrics for ongoing performance tracking and research. The workflow culminates with an administrative dashboard enabling data visualization and export, thus bridging learner assessment with educational research initiatives.

Data Pipeline and Vocabulary Selection

The assessment's lexical database is built considering Coxhead's (2000) AWL, widely recognized as a comprehensive resource for academic vocabulary acquisition in ESP contexts (Shimray & Wangdi, 2022). This list is organized into ten sublists increasing in lexical difficulty, promoting a structured and scaffolded learning trajectory. The system encodes vocabulary items as structured JSON objects containing the target word, an engineering-context sentence with a missing lexical item, and a first-letter hint to scaffold learner recall (Ijaz, 2024). A random shuffling algorithm governs item selection per session to optimize exposure variability and minimize memorization bias. The cloze format combined with initial-letter hints facilitates effective retrieval practice, a strategy supported by cognitive principles of vocabulary retention (AI IJISAE, 2024). Levels are unlocked sequentially to uphold assessment fairness, and within-level randomization further diversifies learner experience.

AI Model Integration and Prompt Engineering

The Canva AI environment integrates with GPT-based LLMs, employing few-shot prompting methodologies to generate domain-specific cloze items that align with ESP objectives (PromptingGuide.ai, 2025). Few-shot prompting improves task accuracy by providing contextual exemplars, calibrating model output to maintain consistent difficulty and contextual relevance (Min et al., 2022). A typical prompt instructs the model to: "Create a cloze test question using the academic word '{word}' in an engineering context. Provide: (a) a sentence with the word partially omitted, (b) a hint indicating the initial letters."

This technique controls the generative capacity of LLMs to produce high-quality, contextually authentic test items while reducing manual item-writing workload (Hurix, 2025). The system also generates automated feedback instantaneously, enhancing formative learning by reinforcing correct lexical use and supporting self-regulated learner engagement (CTLT UBC, 2023). This AI-driven item generation supports scale and adaptability, consistent with emerging practices in AI-enabled language assessment design (QASource, 2025).

Assessment Workflow and Adaptive Scoring

Consistent with best practices in timed vocabulary assessment, each level imposes a five-minute limit to maximize rapid lexical retrieval (Pearson, 2018). The system computes learners' scores via:

$$\text{Score} = \left(\frac{\text{Correct Answers}}{\text{Total Questions}} \right) \times 100$$

Scores are then mapped onto CEFR bands to ensure interpretability and standardization internationally. The bands applied are: C1–C2 (≥90%), B2–C1 (≥75%), B1–B2 (60–74%), A2–B1 (40–59%), and A1–A2 (<40%) (ETS, 2023; Pearson, 2018). The flowchart (Figure 4) illustrates this workflow: timed completion followed by automated scoring and CEFR alignment. Learners are then either advanced via adaptive pathways or redirected to conclude the assessment, enabling personalized learning pathways while aligning with recognized proficiency frameworks (ETS, 2023).

UI/UX Design for Engagement and Accessibility

The platform's design emphasizes learner engagement and universal accessibility. Tailwind CSS breakpoints ensure responsive adaptation across diverse devices (mobile, tablet, desktop), essential for ubiquitous learning environments (Lexi AI UX Award, 2024). Onboarding forms capturing informed consent and participant data

**AnilKumar et al.,**

support ethical research protocols. Engagement features such as progress bars and countdown timers are implemented to promote sustained motivation during assessment (Hurix, 2025). Accessibility considerations include high-contrast colour schemes, semantic HTML markup, and full keyboard navigation support, thus accommodating users with diverse needs (W3C Accessibility Guidelines, 2024). Usability testing and iterative development were key to refining user experience and ensuring the platform meets contemporary standards for inclusive educational technology (CTLT UBC, 2023).

Security and Data Privacy

Security protocols are rigorously embedded, reflecting essential safeguards in web-based assessment environments. JavaScript functions enforce full-screen test mode, turn off copy/paste/print functionality, and continuously monitor tab switching to mitigate cheating risks (HackerOne, 2025). Attempts to access developer tools trigger immediate test suspension, reinforcing academic integrity. Concurrently, the system ensures data privacy through anonymized, locally encrypted learner data storage. Only aggregated, de-identified data is exportable for research analysis, adhering to data protection principles (GDPR, 2025). This dual-layer approach aligns with ethical standards in educational research and secure online assessment frameworks (National Centre for AI, 2023).

Scalability and Research Analytics

The platform's stateless architecture and lightweight front end enhance scalability by minimizing server load and facilitating deployment across distributed contexts (QASource, 2025; testRigor, 2024). Batch data export ensures compatibility with statistical packages (SPSS, R, Python), supporting advanced quantitative research (Hurix, 2025). The administrative dashboard, developed using Chart.js, provides real-time visualization of learner metrics such as CEFR band distributions and level completion rates. Such analytics empower educators and researchers to track performance longitudinally and explore vocabulary acquisition trends, thus bridging assessment with applied linguistics research (Kabudi, 2021).

Pedagogical Alignment for ESP Learners

The platform's pedagogical design reflects current models of ESP vocabulary acquisition, embedding lexical items within authentic engineering contexts to maximize relevance and transferability (Shimray & Wangdi, 2022). Material sequencing avoids cognitive overload by scaffolding complexity gradually (Nation, 2007). Automated, AI-generated immediate feedback fosters active learning and self-regulation, crucial for vocabulary mastery (Ijaz, 2024). Furthermore, the modular framework facilitates adaptation to other ESP domains, ensuring broader applicability. Combined with integrated analytics, these features contribute valuable insights to educational technology and applied linguistics scholarship (Kabudi, 2021; CTLT UBC, 2023).

Pedagogical and Research Implications

The AI-enabled Academic Vocabulary Assessment Test provides several teaching benefits. First, instructors can assess students' productive vocabulary knowledge more accurately than recognition-based formats, which gives a clearer view of learners' readiness for academic and professional communication. The CEFR-aligned scoring helps educators interpret results against an internationally recognized standard, supporting curriculum alignment and comparison. From a teaching perspective, the detailed analytics produced by the platform, including item-level performance, time-on-task data, and level-wise mastery, enable targeted vocabulary instruction. Educators can identify specific academic word families that need reinforcement, creating different learning paths. Using AWL-based tasks keeps instruction relevant to the academic needs of engineering students, linking classroom learning to real-world applications. The test provides researchers with a repeatable framework for studying vocabulary development in ESP contexts. Its automated scoring and data capture features eliminate logistical barriers to large-scale, open-ended vocabulary assessment. Additionally, by enabling repeated measures with randomized item selection, the tool supports long-term studies on vocabulary growth and the effectiveness of specific interventions.

The study's findings address the three guiding research questions mentioned in the introduction. First, regarding the design of a valid and reliable AI-enabled Academic Vocabulary Assessment Test for engineering undergraduates in ESP contexts, the results confirm that basing the assessment on the Academic Word List (AWL) and the Productive

**AnilKumar et al.,**

Vocabulary Levels Test (PVLТ) framework ensures both theoretical soundness and practical usefulness. Open-ended cloze tasks with partial-word prompts, placed in realistic engineering contexts, measure productive vocabulary use instead of passive recognition. Standardized task formats, fixed time limits, and randomized item selection support reliability, reducing practice effects and improving consistency across test administrations. Second, AI-driven automation combined with CEFR-aligned reporting has shown straight forwards calability, diagnostic accuracy, and benefits in teaching relevance. Automated item generation, sequencing, and scoring enable the system to deliver the assessment efficiently to large groups without lowering task complexity. Integrating CEFR-based performance bands translates raw scores into internationally recognized proficiency levels, which helps educators, learners, and institutions interpret results meaningfully. This scoring framework improves diagnostic accuracy by identifying specific academic word families needing reinforcement. It also allows instructors to align targeted interventions with global language proficiency standards.

Finally, the teaching and research implications of incorporating this tool into engineering-focused ESP programs are significant. Instructors access detailed, item-level analytics to guide personalized instruction, while learners receive immediate and relevant feedback. From a research standpoint, the tool offers a repeatable model for studying vocabulary growth over time, facilitating both cross-institution studies and comparisons within specific disciplines. Additionally, the system's modular design and AI integration enable adaptive learning applications, where assessment results directly inform personalized learning modules, connecting testing and targeted instruction.

Limitations

While the test addresses several issues in current vocabulary assessment practices, it has limitations. First, the assessment focuses only on the AWL and does not include highly technical or discipline-specific engineering terms outside this list. Therefore, it shows a strong indicator of general academic vocabulary, but not the complete range of an engineering student's vocabulary. Second, although the open-ended format better reflects how students use vocabulary, automated scoring still depends on exact matches to target words. Without further improvements in natural language processing, this method may miss partially correct answers, synonyms, or contextually appropriate alternatives. Third, the researchers conducted the study in a single academic and cultural context, which may limit how well the findings apply to other educational systems, language backgrounds, or disciplines. Finally, while the AI-driven format improves scalability, it assumes access to reliable internet and digital devices, which may limit its use in areas with fewer resources.

Directions for Future Research

Future studies could expand the test to include discipline-specific engineering vocabulary and the AWL, providing a clearer view of students' lexical skills. Adjustments to the scoring algorithm using natural language processing allow for partial credit, recognition of synonyms, and more detailed feedback. Long-term research could examine how repeated tool use affects vocabulary growth, especially when paired with targeted teaching methods. Studies across different institutions in and beyond engineering would strengthen the applicability of the findings and show how academic vocabulary needs vary in different contexts. Finally, combining the test with adaptive learning platforms could create a closed feedback loop. In this setup, assessment results would directly shape personalized learning modules. This integration could monitor and actively speed up academic vocabulary development, making the tool a key part of improved ESP teaching.

CONCLUSION

This study has presented the design and implementation of an AI-enabled Academic Vocabulary Assessment Test specifically developed for engineering undergraduates within English for Specific Purposes (ESP) contexts. To begin with, it integrates several foundational frameworks, including the Academic Word List (AWL), the Productive Vocabulary Levels Test (PVLТ), and CEFR-aligned reporting, thereby creating a comprehensive AI-driven assessment platform. Consequently, this system addresses a persistent gap in measuring productive academic

vocabulary on a large scale. Unlike traditional recognition-based formats, the test incorporates open-ended tasks, context-rich assignments, randomized item selection, and real-time analytics, providing a robust alternative with precise diagnostics and practical scalability. From a pedagogical perspective, the tool significantly aids instructors by pinpointing vocabulary gaps at the word-family level. Moreover, it aligns instructional efforts with recognized proficiency standards, thus enabling targeted interventions tailored to learners' needs. In addition, its automated data capture and CEFR mapping facilitate large-scale research on vocabulary development, allowing researchers to track learner progress longitudinally and evaluate instructional strategies more effectively. Technically speaking, the system's modular design and AI integration offer considerable adaptability, enabling straightforward customization for other ESP domains beyond engineering. Significantly, including engineering-relevant contexts enhances the disciplinary specificity of the assessment, increasing its relevance and applicability.

Nevertheless, the current system presents some limitations. Specifically, it focuses primarily on the AWL rather than incorporating specialized technical terminology, and it relies on exact-match scoring, which may not fully capture nuanced learner responses. However, these limitations also present opportunities for future enhancement through expanding the word lists and incorporating advanced natural language processing techniques to improve scoring accuracy. Overall, this study provides a replicable and scalable model of AI-enhanced vocabulary assessment suitable for higher education contexts. Ultimately, by bridging the gap between emerging technology and instructional needs, the platform lays a solid foundation for future innovations in ESP testing. It holds promise for improving curriculum alignment and enabling adaptive learning designs that respond to learner performance in real-time. Therefore, this work contributes to advancing the theory and practice of vocabulary assessment in ESP, offering new avenues for research and pedagogical development.

ABSTRACT

The abstract explores the theme of Indian History through Indian English Non-Fiction as reflected in the writings of William Dalrymple, particularly in his seminal works *Nine Lives: In Search of the Sacred in Modern India* and *The Age of Kali*. Dalrymple's observations offer profound insights into the multifaceted tapestry of Indian history, culture, and spirituality through narratives of individuals from diverse religious backgrounds. In *Nine Lives*, Dalrymple examines the sacred dimensions of modern India through the lives of Jain nuns, temple dancers, matriarchs, and hijras. The intertwining of religion and gender is explored, revealing traditions that shape social and cultural dynamics. Jain nuns provide insight into the disruption of traditional gender roles through religious ideologies. Temple dancers illuminate the historical exploitation and resilience of women in religious contexts. Matriarchs challenge conventional gender norms, demonstrating the evolution of women's roles in family leadership. Hijra communities reveal the historical context of non-binary gender identities in India and their continuing struggles within society. *The Age of Kali* further enriches the understanding of Indian history through non-fiction by examining the social and cultural transformations of contemporary India. Dalrymple portrays the matriarchs of Kerala as emblematic of women who challenge conventional gender norms, offering historical insights into the changing landscape of gender roles in India. His exploration of hijra communities in Kolkata highlights their historical significance in religious contexts and showcases their role as agents of social and cultural change throughout history. In Dalrymple's non-fiction works, *Nine Lives* and *The Age of Kali*, the author offers a historical perspective on religion, gender, and society in India. Through vivid storytelling, he traces the roots of Indian traditions and highlights the evolving roles

Pavan Kumar and Karthik Kumar

of women, from Jain nuns to the matriarchs of Kerala. These narratives deepen the understanding of Indian history and culture, making these works essential readings for exploring India's diverse heritage.

Keywords: Religion, gender, spirituality, tradition, cultural transformation.

INTRODUCTION

In the vast landscape of Indian literature, the genre of Indian English non-fiction stands as a significant conduit for exploring the complexities of Indian history, culture, and society. This study endeavors to examine the rich tapestry of Indian heritage through the lens of one of its eminent voices, William Dalrymple. With meticulous research, empathetic storytelling, and keen observation, Dalrymple has emerged as a prominent figure in the realm of Indian English non-fiction, offering profound insights into the multifaceted dimensions of India's heritage. William Dalrymple, a renowned Scottish historian, writer, and broadcaster, has made indelible contributions to the understanding of Indian history and culture through his engaging narratives. His works not only serve as historical documents but also as captivating stories that illuminate the diverse experiences and perspectives within Indian society. Dalrymple's unique approach blends scholarly rigor with literary flair, making his writings accessible to a wide audience while maintaining academic integrity.

Central to this study are two seminal works by William Dalrymple: *Nine Lives: In Search of the Sacred in Modern India* and *The Age of Kali*. These books serve as windows into the soul of India, offering readers a nuanced exploration of its spiritual, cultural, and social landscapes. In *Nine Lives*, Dalrymple embarks on a journey across India, chronicling the lives of individuals from diverse religious backgrounds—Jain nuns, temple dancers, matriarchs, and hijras—to unravel the intricate tapestry of spirituality in modern India. Through empathetic storytelling, he delves into the sacred dimensions of their lives, shedding light on the historical roots and evolution of religious traditions. Similarly, in *The Age of Kali*, Dalrymple turns his gaze to contemporary India, examining the social and cultural transformations shaping the nation. Through vivid narratives and insightful analysis, he explores themes of tradition, change, and continuity, offering readers a panoramic view of India's complex reality (Kochuthresia 154). From the matriarchs of Kerala challenging conventional gender norms to the hijra communities of Kolkata asserting their historical significance, Dalrymple's exploration captures the essence of India's dynamic ethos (Thomas 262).

The study aims to unravel the layers of Indian history, culture, and society as depicted in William Dalrymple's works. By examining the themes, narratives, and methodologies employed by Dalrymple, the study explores the multifaceted dimensions of India's rich heritage and the enduring relevance of Indian English non-fiction in shaping contemporary discourse.

LITERATURE REVIEW

In the fields of Indian literature and historical scholarship, William Dalrymple's non-fiction works have garnered significant attention and acclaim for their insightful exploration of Indian history, culture, and society. Existing scholarship on Indian history, Indian English literature, and Dalrymple's works provides a rich foundation for understanding the themes and methodologies employed in his narratives. By reviewing existing literature, researchers gain a nuanced understanding of the thematic threads interwoven throughout Dalrymple's works. Themes such as religion, gender, spirituality, tradition, and cultural transformation emerge as focal points, inviting scholars to explore their significance within the broader context of Indian society. Anu Kochuthresia's review in the research paper, "**Gazing at the East: A Critical Evaluation of William Dalrymple's *Nine Lives: In Search of the Sacred in Modern India***" (2023), succinctly summarizes the impact of travelers' expeditions and their portrayal of India, particularly through the lens of William Dalrymple's work. In her review, Kochuthresia highlights Dalrymple's

Pavan Kumar and Karthik Kumar

exploration of India in *Nine Lives: In Search of the Sacred in Modern India* and his encounters with a diverse array of individuals. She underscores Dalrymple's extensive travels throughout India and his focus on the country's contemporary Hinduism and occult practices, portraying India's spiritual landscape through the narratives of its inhabitants. Kochuthresia's review examines how popular Western travelogues often emphasize the mystical aspects of Indian culture, thereby fostering misconceptions about the prevalence of superstition and faith among its people. This critical evaluation sheds light on the tendency of tourists to exoticize and romanticize India while overlooking its complexities and diversity (Kochuthresia 153).

In Thomas's analysis, "**Play of Perceptions: The South Indian Identity in *The Age of Kali: Indian Travels and Encounters* and *Nine Lives: In Search of the Sacred in Modern India***", he discusses how the depiction of South Indian identity in works such as William Dalrymple's *Nine Lives* and *The Age of Kali* often accentuates mystical qualities, perpetuating negative stereotypes of superstition and blind faith among local communities. Thomas explores various hypotheses and caricatures of South Indians emerging from identity-mapping projects, noting that while some individuals maintain their cultural authenticity amid globalization, others are subjected to ridicule for their perceived antiquated beliefs. Thomas contends that writers like Dalrymple, through their narrative styles, inadvertently contribute to the reinforcement of biases against Indian culture. Although Dalrymple aimed for objectivity, Thomas suggests that certain passages in his works reveal underlying biases. By examining Dalrymple's interpretations, Thomas seeks to uncover implicit prejudices and encourage readers to reflect on societal assumptions. In essence, Thomas's analysis critiques the portrayal of South Indian identity in Western travelogues and non-fiction narratives, particularly through the lens of Dalrymple's works. By highlighting the intersection of language, worldview, and individual experiences, Thomas underscores the need for a more nuanced understanding of cultural representation and the implications of biased narratives in shaping perceptions of Indian society (Thomas 260).

In Vijesh's article, "**William Dalrymple's *Nine Lives: In Search of the Sacred in Modern India: A Semiotic Analysis of Culture and Language***," the author explores the intricate relationship between language and culture, emphasizing how language serves as a vehicle for expressing and shaping ethnic, regional, national, and global identities. Vijesh contends that language and culture are inseparable, like two sides of the same coin, with each influencing and reflecting the other. Through a semiotic analysis of William Dalrymple's *Nine Lives: In Search of the Sacred in Modern India*, Vijesh examines the intersection of language and culture. Using Dalrymple's work as a case study, he analyzes how language is employed to delineate the cultural identities of each character portrayed in the book. For instance, he highlights a Buddhist monk dedicating his life to crafting prayer flags after assisting Tibetans against Chinese invaders, and a Jain nun maintaining emotional detachment while witnessing her friend's self-imposed starvation. Vijesh underscores the diversity and richness of Indian culture through the varied stories of the nine individuals depicted in Dalrymple's work. By analyzing the linguistic and cultural nuances embedded within these narratives, Vijesh offers readers a deeper understanding of the intricate interplay between language and culture in shaping individual and collective identities (Vijesh 462–468).

Research Objectives for the Study

The research objectives for the study include:

- To analyze the portrayal of religion and gender in William Dalrymple's works by examining how these themes are depicted in *Nine Lives: In Search of the Sacred in Modern India* and *The Age of Kali*, with particular focus on the narratives of Jain nuns, temple dancers, matriarchs, and hijras.
- To explore the intersectionality of religion and gender by investigating the complex interplay between religious beliefs and gender identities, including how religious practices influence traditional gender roles and the challenges faced by individuals at this intersection.
- To evaluate the narratives' portrayal of opportunities for change and empowerment within religious and gender dynamics, including instances where individuals challenge societal norms and advocate for reform.

**Pavan Kumar and Karthik Kumar**

- To contribute to a deeper understanding of religion and gender in contemporary India by synthesizing the findings to provide insights into the multifaceted nature of Indian identity and culture, as well as the complex relationship between religion and gender in the context of modern India.

Overall, these research objectives aim to provide a comprehensive analysis of the themes of religion and gender as depicted in Dalrymple's works, offering valuable insights into the intersection of these themes and their implications for individuals and society.

Identification of Gaps in the Literature

- Although diverse scholarly reviews have explored various aspects of Indian history and literature, there remains a need for in-depth analyses of the historical influences on the themes and motifs in Dalrymple's works.
- Gaps also exist in the examination of Dalrymple's portrayal of marginalized communities, the role of narrative voice and perspective in shaping historical interpretations, and the implications of his works for contemporary discourses on identity, representation, and power dynamics.

This study aims to address these gaps by providing a focused analysis of Dalrymple's exploration of religion, gender, spirituality, tradition, and cultural transformation in his non-fiction narratives. By identifying key themes and gaps in the existing literature, the study seeks to lay the groundwork for a deeper understanding of the significance and implications of Dalrymple's works for contemporary scholarship and discourse.

Themes in Dalrymple's Works

Dalrymple's portrayal of gender dynamics in religion and the historical evolution of gender roles in Indian society offers a rich tapestry of narratives that reflect the complexities, contradictions, and resilience of individuals navigating diverse socio-cultural landscapes.

Religion and Spirituality

In *Nine Lives*, William Dalrymple intricately weaves the themes of religion and spirituality throughout the narratives of Jain nuns, temple dancers, matriarchs, and hijras, offering profound insights into the diverse spiritual landscape of modern India. Through empathetic storytelling and meticulous research, Dalrymple explores the sacred dimensions of these individuals' lives, illuminating the intersection of faith, tradition, and personal devotion (Vijesh 462). The narratives of Jain nuns reveal the transformative power of religious ideology, highlighting the historical evolution of gender roles within Jainism and the ascetic practices that shape their spiritual journeys. The stories of temple dancers provide a historical context for the exploitation and resilience of women within religious spaces, shedding light on the enduring spiritual significance of dance in Indian culture. Matriarchs challenge traditional gender norms, offering glimpses into the historical transformation of women's roles as leaders and decision-makers within their families, rooted in spiritual beliefs and cultural practices (Thomas 260). The exploration of hijra communities unveils the historical context of non-binary gender identities in India, emphasizing their roles in religious contexts and the enduring challenges they face in society. Through these narratives, Dalrymple presents a vivid portrait of the intricate interplay among religion, spirituality, and individual experience, inviting readers to contemplate the diverse expressions of faith within the tapestry of Indian society.

Gender Dynamics and the Historical Evolution of Gender Roles in Indian Society

William Dalrymple's portrayal of gender dynamics and the historical evolution of gender roles in Indian society, particularly in *Nine Lives* and his other works, offers a nuanced exploration of the complexities inherent in the Indian social fabric. Through meticulous research and empathetic storytelling, Dalrymple provides historical context for understanding how historical events, cultural practices, and religious beliefs have shaped gender dynamics over time. His narratives highlight the intersectionality of gender and religion in India. Religious ideologies and traditions have influenced perceptions of gender roles, often reinforcing patriarchal norms while simultaneously providing avenues for resistance and transformation. Through the stories of temple dancers and matriarchs, Dalrymple

**Pavan Kumar and Karthik Kumar**

illustrates instances in which women challenge traditional gender norms and assert their agency within their respective social and cultural contexts. Dalrymple also traces the evolution of gender roles in Indian society by highlighting shifts in attitudes, practices, and power structures over time. In his exploration of hijra communities, he sheds light on the historical significance of non-binary gender identities in India. By challenging binary notions of gender and sexuality, Dalrymple offers a nuanced understanding of the diverse expressions of gender identity within Indian culture. Throughout his works, Dalrymple employs empathetic storytelling to humanize individuals and their lived experiences, transcending stereotypes and fostering a deeper understanding of gender dynamics within Indian society.

Findings from the Analysis

The analysis of William Dalrymple's *Nine Lives: In Search of the Sacred in Modern India* and *The Age of Kali* reveals a rich array of themes centered on religion and gender. Through intricate narratives featuring characters such as Jain nuns, temple dancers, matriarchs, and hijras, Dalrymple explores the complex intersection of religious beliefs and gender dynamics within Indian society. These narratives emphasize how religious ideologies shape traditional gender roles, often challenging societal norms while simultaneously reinforcing them. Dalrymple's writings also reflect the broader cultural transformations occurring in India, depicting the evolving nature of gender dynamics, religious practices, and societal norms in the face of urbanization and globalization. While the narratives highlight challenges such as discrimination and marginalization, they also present opportunities for change and empowerment, showcasing moments of resistance, advocacy, and transformation.

DISCUSSION

William Dalrymple's empathetic storytelling serves as a powerful lens through which readers can gain a deeper understanding of Indian history and culture. Through his meticulous research, keen observations, and compassionate portrayal of individuals from diverse backgrounds, Dalrymple brings to life the multifaceted complexities of Indian society. By humanizing historical figures and contemporary individuals alike, he bridges the gap between the past and the present, inviting readers to empathize with the triumphs, struggles, and aspirations of those whose stories he narrates. Whether chronicling the lives of Jain nuns, temple dancers, matriarchs, or hijras, Dalrymple delves beneath surface narratives to uncover the underlying nuances of Indian culture and spirituality (Shingal 107–123). Dalrymple's narratives also serve as a valuable lens through which to understand the intricate relationship between religion and gender in India. They illustrate how religious beliefs and practices can both challenge and reinforce established gender norms, shedding light on the complex dynamics of faith and identity. Through the stories of these individuals, readers gain insight into the resilience and agency of those who strive to create spaces of autonomy, transformation, and empowerment within the complex fabric of their identities. His empathetic approach enables readers to connect personally with the individuals he portrays, fostering a deeper appreciation of the rich tapestry of traditions, beliefs, and lived experiences that shape Indian history. Through his storytelling, Dalrymple not only educates but also inspires empathy, compassion, and a nuanced understanding of the complexities inherent in India's cultural heritage.

CONCLUSION

This study has explored the rich tapestry of Indian heritage through the lens of William Dalrymple's seminal works, *Nine Lives: In Search of the Sacred in Modern India* and *The Age of Kali*. Dalrymple's empathetic storytelling, meticulous research, and keen observations offer profound insights into the multifaceted dimensions of India's history, culture, and society. Through his narratives, Dalrymple illuminates the themes of religion, gender, spirituality, tradition, and cultural transformation, inviting readers to reflect upon the diverse expressions of faith and identity within the Indian context. By addressing the gaps identified in existing scholarship and contextualizing Dalrymple's

**Pavan Kumar and Karthik Kumar**

contributions within the broader landscape of Indian literature and historical studies, this research contributes to a deeper understanding of India's rich cultural heritage and the enduring relevance of Indian English non-fiction in shaping contemporary academic discourse. Dalrymple's empathetic storytelling encourages readers to engage with the lives of the individuals whose stories he recounts, fostering a greater appreciation of the complexities, diversity, and resilience that characterize Indian society.

ABSTRACT

The widespread use of emoji expands the digital communication which has transformed interpersonal meaning-making practices. Fewer analyses have systematically integrated them into the framework of Systemic Functional Linguistics (SFL). While emoji has been examined in pragmatics, sociolinguistics, and multimodal studies. This study argues that emoji function as structured interpersonal semiotic resources that realize affect, modality, engagement, and mood in computer-mediated communication by drawing on M.A.K. Halliday's interpersonal metafunction and appraisal theory (Martin & White, 2005). The study demonstrates that emoji operates as interpersonal adjuncts, intensifiers, and minor clauses within digital discourse, by using a qualitative–quantitative analysis of 500 social media posts from Twitter and WhatsApp. Findings of this analysis suggest that emojis are not peripheral decorative elements but increasingly grammaticalized resources that extend Halliday's interpersonal system into multimodal environments. The study contributes to the theoretical expansion of SFL into digital discourse and proposes refinements for analyzing interpersonal meaning in 21st-century communication.

Keywords: Interpersonal Metafunction, Systemic Functional Linguistics, emoji, digital discourse, Appraisal theory, Modality, multimodality.

INTRODUCTION

Digital communication has basically reshaped how interpersonal meaning is enacted. The environments of Computer-mediated communication (CMC) reduce access to prosody, gesture, and facial expression, thereby requiring alternative semiotic strategies (Crystal, 2011; Herring, 2007). Emojis have become globally conventionalized resources for expressing affect, stance, irony, alignment, and intensity, among these strategies. (Danesi, 2016; Evans, 2017). Halliday's (1978, 1994) Systemic Functional Linguistics (SFL), conceptualizes language as a social semiotic system organized around three metafunctions: ideational, interpersonal, and textual. The interpersonal metafunction mainly concerns social relations enacted through mood, modality, and evaluative resources. SFL's application to multimodal digital contexts remains underdeveloped, while SFL has been widely applied to spoken and written discourse. This study also extends Halliday's interpersonal framework to emoji use in digital discourse. Specifically, it analyses and addresses the following research questions: How do emoji realize interpersonal meanings in digital communication?, Can emoji be systematically mapped onto mood, modality, and appraisal systems?, and Do emojis demonstrate patterns consistent with grammaticalization?.

This study advances the multimodal development of systemic theory, by integrating quantitative frequency analysis with qualitative SFL-based discourse analysis. By functioning as visual interpersonal adjuncts that encode affect, adjust modality, signal engagement, scale evaluative force, and occasionally substitute for clause-level mood structures. Emojis operate as multimodal realizations of interpersonal systems traditionally encoded through grammar and prosody and realize interpersonal meaning in digital communication. Their patterned distribution across clause types and communicative contexts suggests that emojis are not peripheral embellishments but emergent semiotic resources integrated into the interpersonal system network of digital discourse, within a systemic functional framework.

Halliday (1978) conceptualized language as a resource for making meaning in social contexts. The clause functions as exchange, structured through mood (declarative, interrogative, imperative) and modality (probability, obligation, usuality, inclination) (Halliday & Matthiessen, 2004) within the interpersonal metafunction. While modality is encoded via modal operators and adjuncts (Eggins, 2004), mood is realized through the Subject–Finite configuration. The interpersonal system enables speakers to negotiate roles, alignments, and degrees of commitment. Martin & White's Appraisal theory (2005) expands interpersonal meaning into three subsystems: Attitude (affect, judgment, appreciation), Engagement (dialogic positioning) and Graduation (force and focus). Digital discourse studies have increasingly applied appraisal analysis to social media (Zappavigna, 2018). However, emoji have not been fully integrated into appraisal system networks.

In the late 1990s, Emojis evolved from Japanese mobile communication systems and were standardized via Unicode (Evans, 2017). Research shows that emojis that are used to highlight a primary human desire to add emotional and nonverbal communication to text-based interactions and improve the constraints of plain text. (Riordan, 2017). Signal irony (Dresner & Herring, 2010) theory was proposed by Eli Dresner and Susan C. Herring which displays graphic symbols function as illocutionary force indicators (IFIs) rather than just emotional displays in a seminal paper on computer-mediated communication. Tone of voice, facial expressions, and body language signal that a statement should not be taken literally in spoken conversation. In text-based communication, this paralinguistic context is missing.

A corpus of 500 publicly available posts were collected from Twitter (300) and from WhatsApp (200) with consent and anonymization, over three months time duration. English-language posts containing at least one emoji were included. The emoji was coded for Position in clause (initial, medial, final, stand-alone), Interpersonal function (affect, engagement, graduation, modality, mood substitution) and Co-occurring clause type (declarative, interrogative, imperative) for each instance emojis. Two rounds of coding were conducted to ensure consistency.

Shahin Banu and Vetriselvi

The findings depicts that affect realization is the dominant function, but graduation and engagement also represent substantial categories.

The interpersonal meaning involves how speakers express feelings, judgments, and evaluations in SFL. This is called **Attitude**, which includes: Affect (emotion), Judgment (ethics/behavior) and Appreciation (evaluation of things) in appraisal theory (Martin & White, 2005). Often, Emoji functions as **compressed affect markers**. For example, “I got placement ☹️”. The crying emoji does not literally mean sadness; it encodes **high-intensity joy/relief**. It realizes, Affect (positive emotion) and Graduation (intensification). Instead of writing, “I am extremely happy.” Visually, the emoji performs that interpersonal work so emoji act as **interpersonal adjuncts encoding affect**.

Modality expresses degrees of certainty, obligation, or inclination in Halliday’s system. For example, “Can you send the report? 😊” The smiling emoji softens the request. It decreases imposition that corresponds to, Modulation (softened obligation), and Interpersonal mitigation. The clause may appear direct or demanding without the emoji and the interpersonal force changes with the emoji. Therefore, emoji, adjust interpersonal distance, modify perceived authority and re-calibrate power relations. They function similarly to modal adjuncts like, “just”, “maybe” and “please”.

Engagement concerns how speakers position themselves toward other voices (Martin & White, 2005). For example, “Sure, that’s ‘fair’ 😏” The laughing emoji indicates irony. It creates distance of the speaker from literal meaning, signals heteroglossia (other perspectives exist), and invites shared alignment. Emoji directs interpretation and prevent misreading. They perform as **interpersonal stance markers**.

Graduation makes adjustments in the strength of evaluation. For example, “That performance was amazing 🌟🌟🌟”. Repetition increases intensity. Emoji amplifies force, replace prosodic emphasis and function like typographical emphasis (!!!) we use, Stress, Pitch, and Facial expression. In digital writing, emoji perform this prosodic role in spoken language. Emoji shows speakers mood support and substitution while using mood structures enact speech roles like statement, question, and command. They operate as **multimodal interpersonal resources** within a written medium.

In digital communication, Emoji realize interpersonal meaning by functioning as visual interpersonal adjuncts that encode affect, adjust modality, signal engagement, scale evaluative force, and occasionally substitute for clause-level mood structures. Emoji operate as multimodal realizations of interpersonal systems traditionally encoded through grammar and prosody within a systemic functional framework. Their patterned distribution across clause types and communicative contexts suggests that emoji are not peripheral embellishments but emergent semiotic resources integrated into the interpersonal system network of digital discourse. Halliday (1978) described language as an adaptive semiotic resource. Emoji explains this adaptability in multimodal environments. Emoji display integrated into interpersonal system networks rather than existing outside grammar.

CONCLUSION

Emojis are not decorative but systemic interpersonal resources. They realize affect, modulate modality, manage engagement, and occasionally substitute for clause structure. Extending Halliday’s framework to digital communication demonstrates the continued vitality of systemic theory in evolving semiotic landscapes. Future research should examine cross-linguistic emoji use and longitudinal grammaticalization patterns.

ABSTRACT

Writing in the modern era has become increasingly significant as a means of linking moral and emotional issues to scientific realities as the climate crisis worsens. This article uses Kim Stanley Robinson's *The Ministry for the Future*, published in 2020, as an illustration of constructive climate fiction. This type of fiction goes beyond end-of-the-world scenarios, envisioning institutional solutions and collective action. The purpose of this study is to illustrate, via the application of ecocritical analysis, how the multiphonic structure of Robinson's novel, the composition of documentary and fictional elements, and the emotional journey all contribute to the development of critical hope and thought on a global scale. The article claims that a well-written piece of science fiction has the potential to assist one in understanding and teaching about the difficulties people have while depicting the Anthropocene.

Keywords: climate fiction, ecocriticism, Anthropocene, propositive narratives, Kim Stanley Robinson, environmental humanities.

**Aswathy and Karthik Kumar**

INTRODUCTION

The Intergovernmental Panel on Climate Change's Sixth Assessment Report says that temperatures around the world are likely to rise above 1.5°C above pre-industrial levels in twenty years. Environmental and social issues will start to happen one after the other (IPCC 2021). But climate change is hard for people to understand in the normal ways because it affects a lot of places at once and takes a long time to happen in geological time. Climate change is a "hyperobject," which means that it is so spread out in time and space that it cannot be normally seen or understood (Morton 135). Literature has become an important way to connect vague climate data with personal experiences, moral reflection, and political debate as mental and emotional stress grows. Stories about climate change can help people learn more about science. This is carried out by telling tales. Most news stories about climate change were about how it caused terrible natural disasters and people to fight over resources. There is a new type of climate fiction called "propositive." Not many bad things happen in this type of climax fantasy. To fix things, one has to understand how groups work, and make small changes that are more important. Kim Stanley Robinson's *The Ministry for the Future* (2020) is a great example of this good trend. The book has a made-up UN group whose job is to keep the kids safe and make sure everyone around the world does what they can to stop climate change. The story takes place between 2025 and 2050. Robinson's writing shows how strong emotions, a new story style, and a range of policy ideas can be used in literature to help with the important work of stopping and dealing with climate change. This study looks at *The Ministry for the Future* from a number of ecocritical points of view to answer some significant questions: What does the book do to make the story of climate change clear and make one feel about it? The second question is, which ecocritical theories best explain the text's formal and subject structures? Last but not least, what makes Robinson's "propositive" method different from the "catastrophic sci-fi" method? In real life, what does this difference mean? How could stories like these change what people think and what the government wants? What types of jobs can people get at school or with the government? To answer these questions, this article reads them carefully and thinks about them in a general way. Literature can give people the tools they need to deal with climate change in the long term, make hard science more interesting, and help people work together better.

Literature Review: Ecocriticism and Climate Fiction

The Anthropocene and Literary Representation

Human action has become the most important thing that changes Earth's systems, and people are now living in the Anthropocene. Adam Trexler, in his *Anthropocene Fictions*, talks about how stories can show the vastness of space and time. It says that fiction makes clear what scientific words often make unclear. This is tough to show in a picture because time moves slowly, the reasons are spread out, and what impacts people does not always match what impacts the world. They make it impossible to use normal story structures. This kind of damage to the land is called "slow violence" by Rob Nixon (Nixon 2). It takes a long time and cannot be seen. Literature answers by using new writing styles like multi-temporality, polyphonic narrative, and documentary-fictional hybrids that turn scientific facts about climate change into emotional experiences (Trexler 8–12). These techniques help readers understand things that are hard for them to grasp and also make them feel threatened by things that are not real.

Econarratology and Formal Innovation

Econarratology, the study of how story structure expresses ecological themes, has become an important framework for examining the formal strategies used in climate fiction. The author Xiaowen Xiao is of the opinion that contemporary climate fiction makes use of "narrative instability" in order to emphasise how unpredictable the weather may be. It accomplishes this by demonstrating to readers that the world is in a state of instability by presenting them with a number of different possible futures, timelines that are broken, and stories that are impossible to trust (Xiao 540). These stories do not provide readers with a sense of closure; rather, they teach them what Xiao refers to as "narrative endurance," which is the ability to deal with ambiguity and remain free even when there is no end. Because it is difficult to forecast climate change due to feedback loops, tipping points, and

**Aswathy and Karthik Kumar**

compounding repercussions, this formal approach was developed. Ulrike Krause investigates the ways in which science fiction draws on experience and metaphor in order to establish a connection between scientific ideas and human feelings (Krause 72). The most effective approach for people to learn is through the telling of stories in these ways, which not only keeps their attention but also demonstrates how ecosystems are connected and how to comprehend the comprehensive picture.

Propositive versus Catastrophic Cli-Fi

Martin Ryle makes a distinction between catastrophic sci-fi, which imagines the end of the world, and propositive sci-fi, which imagines changes to institutions and group answers (Ryle 265). Most of the stories in this genre are catastrophic, showing worlds after society has fallen apart. Even though these kinds of stories do a good job of explaining what is at stake, critics are starting to question how useful they are for politics. Some researchers say that catastrophic climate fiction could lead to “climate fatigue,” which is when people become less sensitive to disasters after seeing them too many times (Ismail 895).

Propositive sci-fi does not focus on how people stay alive in destroyed worlds; instead, it imagines changes to institutions, technological answers, and group action. Adeline Johns-Putra says that care-oriented climate fiction teaches readers to care about future generations and vulnerable groups. It does this by teaching them ways to be responsible that are not just in their own best interests (Johns-Putra 170). Robinson’s writing is a great example of techno-optimistic positive science fiction because it shows in great detail how policies work, how environmental technologies change the economy, and how policies work. It is possible to doubt if these types of stories do not consider the political issues that exist, mainly the fact that capitalism is structurally resistant to decarbonisation, or if they give the creative tools people need to change the whole system (Estok 295). When people talk about climate change, there are bigger differences between being serious about the problems and seeing hope as a strategic necessity.

Narrative Form and Planetary Scale**Polyphonic Structure and Collective Agency**

The Ministry for the Future uses radical polyphony, weaving together dozens of different voices: survivors, governmental players, collective entities, and nonhuman points of view. The book starts with Frank May’s terrifying first-person account of escaping a terrible heat wave in India that kills twenty million people. This creates emotional stakes through direct experience. The story then turns to Mary Murphy, who is in charge of the Ministry. Her third-person chapters describe how the institutions respond, including committee meetings, diplomatic talks, and problems with getting money. “You are in the future now, and it is a strange place” (Robinson 45), which is a straight address to the reader in a different chapter. This piece of speech blurs the line between the fictional world and the reader’s own life, making the climate crisis seem like a shared problem instead of something far away to think about. In other chapters, nonhuman entities like photons, carbon molecules, and market forces are talked about. These entities decentre human uniqueness and show how the environment is connected. Carbon says in one chapter, “We are you and you are us, and we are all in this together, the whole planet” (1899). This approach of using multiple narrators is very important for environmental reasons. First, it shows that the climate disaster cannot be stopped by a single person or group. Instead, problems on a global scale need collective action from many people and groups. Second, it shows how different levels of reality are linked, from personal trauma to institutional policy to the biogeochemical cycles of the planet. This shows how both crisis and reaction are part of a larger system. Third, it breaks the rules of anthropocentric storytelling by giving nonhuman characters a voice and recognising that they have power over the futures of the world. So, the polyphonic form works on the ecological principle of interdependence, turning the complexity of the system into the structure of a story. Readers do not experience climate change as a single storyline, but as a property that arises from many processes interacting with each other. This is a formal innovation that mirrors the reality it describes.

**Aswathy and Karthik Kumar****Documentary-Speculative Hybridity**

A term that might be used to define Robinson's work is "documentary futurism." He combines actual documentary film with extrapolations based on imaginary situations. Minutes from meetings, reports on the economy, scientific data, proposals for public policy, and ideas for technology of the future are all included in this book. For instance, it discusses the creation of artificial snow in order to melt glaciers, the fertilisation of oceans in order to assist them in absorbing more carbon, the development of a carbon currency that is based on blockchain technology, and the regulation of solar radiation by the introduction of particles into the stratosphere. By establishing a connection between what will occur in the future and the institutions, scientific knowledge, and political boundaries that are now in place, this combination of genres makes the stories more plausible. Robinson does not show a complete breakdown; instead, he extrapolates from current technologies and trends, making societal change seem possible rather than impossible.

Lakshmi Krishnan says that this "plausibilization" lets sci-fi work as a thought experiment, trying social arrangements and technological changes in story space before they happen in real life (Krishnan 4). As a way to teach, the documentary mode also teaches readers about economics, geography, and climate science with great accuracy. In chapters, carbon budgets, central banking, international law frameworks, and geoengineering science are all explained in clear but detailed language. But this teaching serves a narrative purpose: by explaining how things change, Robinson makes systemic reform real instead of abstract. People do not just learn that things need to change; they also see how it might actually happen, like what committees would meet, what laws would pass, and what technologies would be used.

The hypothetical parts, especially geoengineering, start moral discussions about how people should interact with Earth's processes. Robinson says that these technologies are needed to deal with the climate emergency, but they come with a lot of risks, such as changing weather patterns, increasing global tensions, and the moral hazard of lowering the pressure to reduce climate change. Characters fight about who should be in charge: who decides to use geoengineering? Who is at risk when bad things happen? How does one strike a balance between short-term danger and long-term uncertainty? By putting these debates in a dramatic rather than an abstract setting, the book encourages readers to think deeply about them and shows them how to use collective reasoning to solve problems in the Anthropocene.

Temporal Structure and Incremental Change

The book *The Ministry for the Future* is set between 2025 and 2050, and it follows small steps toward growth instead of a catastrophic break. This framework of time goes against what most people expect from a story. Instead of building up to a big event, the book is made up of small wins, losses, and slow changes. Chapters are short and often broken up, just like climate change is spread out and does not happen in a straight line. What Xiao calls "narrative endurance" is built up through the pace; readers learn to deal with slow, uncertain progress (Xiao 545). Robinson gets readers ready for the real time of climate action, which is slow, frustrating, not enough, but important, by not giving readers the usual story satisfaction. "The work was never finished, would never be finished" (Robinson 563) is how the book ends, but it does not give a clear answer. This kind of open-endedness makes readers feel like they can take part instead of just watching, which helps them develop the attitudes they will need for long-term involvement.

Institutional Imagination and Political Futures**The Ministry as Collective Protagonist**

In contrast to most novels, which are about individual heroes, *The Ministry for the Future* is about an organisation. The Paris Agreement created a made-up UN agency called *The Ministry for the Future*. As part of its mission, it is responsible for ensuring that all individuals are aware of how to cope with climate change, handle carbon currency, and advocate for future generations on international forums. People alter the way that they think about agency by shifting the focus away from individuals and towards organisations and groups. It is not the case that the protagonist of the story is the attorney Mary Murphy. A greater number of people than anything else congregate around her, including scientists, bankers, activists, politicians, terrorists, and nonhuman forces. Whenever she makes a decision,

**Aswathy and Karthik Kumar**

she is forced to contend with a multitude of institutions, political happenings, and a large number of other individuals who have an effect on the outcome.

This book discusses a great deal about the functioning of institutions, including how organisations are formed, where money comes from, the law, and how to behave in a civilised manner. Readers can understand how the Ministry obtains funding, how it collaborates with the governments of other nations, and how it manages the bureaucratic processes of the United Nations by reading this article. Because of these particulars, it is feasible to alter the structure, which is in direct opposition to the neoliberal individualist concept that individuals can only take responsibility for their own decisions. In addition to this, it discusses the challenges that groups encounter, such as the challenges of slow bureaucracy, political differences, and moral issues. However, despite the fact that it is not a techno-utopian vision, the Ministry's victories are extremely uncommon, controversial, and ethically confusing. This will allow everyone to collaborate in order to answer.

Geoengineering and Technological Complexity

The book has a lot of arguments about geoengineering technologies, showing them as important ways to deal with the climate disaster, but also dangerous and morally questionable. Robinson talks about different types of geoengineering, such as pumping seawater onto Antarctic glaciers to make fake snow and slow the loss of ice, adding iron to the oceans to help phytoplankton grow and take in more carbon, removing carbon directly from the air, and putting aerosols into the stratosphere to reflect sunlight. There is a lot of technical information about each technology, and it is based on real scientific studies. However, each technology is also shown as experimental and not yet proven.

Characters fight about ethics and government: who decides to use geoengineering? What if one country moves on its own? When unforeseen events occur, such as monsoons that alter, floods in some areas, and damage to ecosystems, who is responsible for the risks that are associated with these occurrences? What distinguishes the risk that is present in the short term from the uncertainty that is present in the long run? The issues that are being discussed in these discussions are genuine scientific and political issues. It is irrelevant to Robinson's plan whether people are terrified of technology or if they are enthusiastic about it. The belief held by technophobic individuals is that the way the Earth functions should not be altered by humans. On the other hand, techophilia refers to the view that technology has the potential to improve things without enacting any changes in the way people live their lives. Geoengineering, on the other hand, keeps temperatures the same, but it also brings about new concerns, like changes in weather patterns, political disputes over who controls the climate, and the likelihood that emissions will not be decreased as much as they need to be. A variety of perspectives exist regarding the question of whether or not individuals ought to be active in the Anthropocene. In spite of the fact that this dialectical method acknowledges that "natural" baselines no longer exist due to the fact that the systems of Earth are so diverse, it continues to investigate recent changes with a great deal of attention and analysis. As stated in the book, geoengineering is neither a miracle nor a calamity. This is according to the literature. On the contrary, it is a region in which political ideologies are in conflict with one another, and in which nations are required to collaborate and maintain democratic governments at all times.

Economic Transformation and Political Violence

People in the book believe that there will be significant shifts in the way that businesses and new technologies operate. Using blockchain technology, Robinson proposes the creation of a carbon currency that would contribute to the reduction of carbon pollution. Due to the fact that there would be monetary compensation involved, individuals, corporations, and even entire nations would be compensated for storing carbon. Restoration would become more feasible as a result of this. When one reads this book, one will learn how to convince wealthy nations to pay higher taxes, how to convince less fortunate nations to forgive their debts, and how to convince central banks to prioritise climatic stability over economic growth. According to these points of view, capitalism is to fault for the climate calamity because it claims that it must continue to expand, that it forces other people to pay for the damage that it causes to the environment, and that it is solely interested in gaining more power and earning more money. In

**Aswathy and Karthik Kumar**

addition to this, they consider what will occur to the company in the event that capitalism is abolished. Robinson also shows political violence as a reaction to climate change, which is an unusual choice for a story. There is eco-terrorism in the book, such as sabotaging fossil fuel infrastructure, shooting down planes carrying climate deniers, and killing corporate leaders who are blocking progress. Some characters defend violence as the only way to stop what they see as genocidal inactivity, while others say it is useless and morally wrong. Robinson does not want an easy moral answer. Instead, he creates moral complexity. Frank, who lived through the heat wave, joins a secret network that is carrying out attacks. Mary, who is in charge of the Ministry, has to deal with the political fallout while also understanding people's intentions, if not their means. This lack of clarity is meant to teach by getting readers to think about tough issues like means and ends, legality and authority, violence and justice in times of existential crisis. The book does not support terrorism, but it does admit that when legal channels fail, and millions of people die, some people will think that chaos is okay. Robinson's propositional fiction is different from more idealised versions of smooth institutional change because it is realistic about political conflict.

Affective and Ethical Dimensions**From Trauma to Critical Hope**

The emotional journey of the book goes from trauma to grief to hard-won, cautious growth. The first heat wave sets up the emotional stakes: Frank's guilt over surviving, mass death, and institutional failure. In later parts, one can see how the characters deal with eco-grief, anxiety, and anger. Mary goes through burnout and hopelessness; Frank has PTSD; and other characters talk about feeling lost. Still, the story slowly builds up a list of small wins, such as successful geoengineering tests, economic changes, international cooperation, and ecosystem restoration. This path encourages what researchers call "critical hope" — not naive positivity, but recognising the difficulties while affirming the possibilities (Krause 85).

The book's language of hope is not emotional; it is calculated. A lot of times, characters stress that growth is only partial, fragile, and not enough. At the end of the book, Mary thinks, "They had done some good. Not enough, but some" (Robinson 541). This limited hope is meant to teach by showing how to be emotionally strong, which is needed for long-term climate action. Pure catastrophism can paralyse people; if things are going to fall apart anyway, why do anything? If people are sure that science will save them, why make any changes? Critical hope finds a middle ground between these two extremes, letting people have choices while also recognising their limits.

Ethical Complexity and Moral Education

The book has moral problems with no clear answers. It can be used to teach morals and practise being moral. When legal routes fail, and millions of people die, is ecoterrorism okay? Should one take a chance on geoengineering's unexpected effects or be ready for disaster? Who pays for adaptation? The people who caused the problem, or the people who are affected by it? How does one balance the needs of today with the needs of tomorrow? Characters think about these issues and show readers how to think morally.

Johns-Putra says that reading climate fiction helps kids learn care ethics, which means paying attention to how vulnerable people are, how they depend on each other, and their duty across time and space (Johns-Putra 175). By following characters as they make tough decisions, readers build the moral imagination they need to deal with the unprecedented ethical challenges of the climate crisis. The novel's polyphonic framework makes this moral work stronger by showing different points of view from the Global North and the Global South, from present and future generations, from human and nonhuman, and from institutions and individuals.

Reader Positioning and Civic Engagement

The novel's second-person chapters talk directly to readers, putting them in the middle of both the problem and the solution: "You know what you need to do" (Robinson 478). This type of rhetoric makes readers think of themselves as possible agents instead of passive viewers. The ending of the book supports this stance by implying ongoing work rather than completion. Such choices in stories may encourage people to get involved in politics, support policies, or organise, but there is not a lot of real-world study on cli-fi's effects yet (Milner 8).

Critical Evaluation: Strengths and Limitations

Strengths of Robinson's Approach

The Ministry for the Future has a lot of value for learning and teaching. It helps individuals grasp hard topics like economics, geopolitics, climate science, and more by thinking deeply about policy. Changes to systems are now real, not simply thoughts. It goes against the premise that each person is responsible for their own actions because it has more than one voice. Emotional pathways get away from both the paralysis of absolute dystopia and the ease of easy positivism. They establish a balance between calamity and hope. Using both real video and guesses makes the story appear more authentic. It also makes one think about how technology could be used to muck up elections and affect the way things work in politics. Many read and talked about the book, which shows that science fiction can have a big impact on society as a whole (Rani et al. 95). Most people who read academic climate discussions are experts. But popular fiction can reach millions of people and change the way they think about politics and the world.

CONCLUSION

Through formal innovation and institutional fantasy, *The Ministry for the Future* is a good example of climate fiction that makes one feel good. Its complex structure turns the global scale into a story form, showing how people can work together and how ecosystems are connected. The mix of documentary and speculation makes the story more believable and sets up moral arguments about how technology should be used. The institutional approach changes the way people think about agency so that it is structural instead of personal and explains how systems can change. The emotional path from grief to critical hope builds the emotional strength that is needed for long-term climate action. Robinson shows how literature can make the climate problem easier to understand, more interesting to feel, and more possible in politics through these methods. This study adds to ecocriticism by showing how propositive cli-fi can help us learn more about how literature's climate works. It shows how the form of a story can reflect ecological principles like interconnection, complexity, and emergence while also being used to test social arrangements. The book has important educational implications: teaching sci-fi in literature and environmental studies classes can help students think about the world on a larger scale, think about right and wrong, and imagine how politics might work. *The Ministry for the Future* shows that literature has an impact on climate discourse that goes beyond scientific papers and government records. The fact that policymakers, activists, and journalists liked the book shows that fictional imaginations can have an effect on policy discussions. Building "climate cultures" through literature is possible. These are shared ways of understanding and dealing with crises that combine scientific knowledge, morals, and political goals. In the future, researchers should compare authors of positive climate fiction, look at how readers actually react to it, and pay more attention to non-Western climate fiction, do intersectional analyses of climate justice issues, and look into how different media affect climate imagination. As the climate disaster gets worse, the emotional, moral, and creative aspects of literature help science and policy by providing important tools for dealing with the most important problem of our time. Robinson's book shows that positive stories can show how people can work together to make things better, make complicated systems easier to understand, and encourage critical hope—all of which are needed to imagine and create better possibilities for the whole world.

ABSTRACT

Parentification is a term used to refer to a child taking on adult responsibilities, providing care, emotional support and comfort for their dysfunctional parents at the cost of the child's own innocence, happiness and mental health. *The Silent Patient* by Alex Michaelides is a psychological thriller novel, and it explores the trauma caused by the long-term impact of emotional parentification on children through two main characters of the story, Alicia Berenson and Theo Faber. This book offers a rare literary exploration of emotional parentification and the devastating consequences it has on children. In this case, both protagonists as children inherit their parents' emotional and psychological burden and exhibit symptoms related to PTSD, anxiety, and unspoken trauma due to childhood role reversal, parentification and emotional imbalance. This paper relates this condition to foundational psychological theories of Miller and Boszormenyi-Nagy and recent empirical research to analyse how parentification creates depression, OCD and impulsive disorders. Through close textual analysis, it is found that Alicia Berenson's silence can also be read as a sign of emotional parentification, the silencing of needs and feelings to avoid trauma and abuse. Meanwhile, Theo's intellectual control, boundary violation, and obsessive behaviours can be read as a symptom of unprocessed childhood trauma. The analysis proves that Michaelides has used fragmented narrative structure, unreliable narration, and dual perspectives that mirror the effects of trauma on consciousness and memory, building the novel as a serious trauma narrative. This study bridges literary criticism and clinical psychology to bring out the importance of a psychological literary narrative. This paper argues that parentification should be recognised as a form of childhood ill treatment that creates trauma and causes crucial developmental issues that require therapeutic intervention and social policy.

Keywords: Parentification, Childhood trauma, PTSD, OCD, DTS, Neglect, Role reversal.

OBJECTIVE

To identify and analyse how Alex Michaelides has depicted the trauma of parentification through the characters of Alicia Berenson and Theo Faber in the primary text, mainly focusing on emotional parentification, role reversal, abusive childhood, and its disastrous impact on children.

INTRODUCTION

“Parentification robs children of their right to be children. They grow up fast, carrying loads far too heavy for their small shoulders, while their own needs are silenced, unseen and unmet.” (Chase, 1999) Do you ever feel that you have grown up too fast, especially when you are the eldest child of the family? If you ever felt the need to constantly take care of your siblings, manage household chores, and sometimes provide emotional support to either of your parents, all while being a child yourself (Stanić & Ajduković, 2025), you were not mature or grown up for your age; you were not appreciated, but parentified. You could have received compliments for being the obedient and responsible child you were, but while trying to step up and take responsibility, you lost your childhood (Trak et al., 2025). There is no problem in helping one’s parents with household chores or babysitting once in a while, but if it becomes a constant habit, then it is toxic for the child who is exposed to parentification. The term “parentification” was first coined by Ivan Boszormenyi-Nagy and Gerald Spark through the concept “Dialectical Relational Theory” in their book *Invisible Loyalties: Reciprocity in Intergenerational Family Therapy* (Parad, 1976) to describe how a child is expected by their parents to assume parental responsibilities. This happens in both healthy and dysfunctional families, but it becomes pathological when the child is burdened with excessive or inappropriate responsibilities for their developmental age. There are two significant types of parentification: emotional parentification, (Chase, 1999) in which the child is expected to provide emotional support, mediate a conflict, or provide caregiving to the parent, and instrumental parentification, in which the child takes on adult-like responsibilities like cooking, taking care of siblings, etc (Schorr & Goldner, 2023). Of these two types, instrumental parentification helps the child learn a few life-saving skills that will be helpful in the future and shapes them to be responsible and accountable, (Pretsch et al., 2025) but emotional parentification burdens them with unnecessary scars, and as a result, they are afraid to socialize and they also have a constant need to provide care and emotional support to whoever they think resembles the parent they once took care of. When the child is exposed to emotional parentification at an early age, (Monaco & Heesacker, 2025) he/she becomes internally vulnerable (Schier et al., 2015). It spoils the child’s mental development and pushes them to become mentally unstable adults who, when left unattended and rightfully cared for, are a risk to themselves and society (Rennison, 2015). This paper analyses how emotional parentification ruined the lives of both the characters Alicia Berenson and Theo Faber in the novel *The Silent Patient* (2019) by Alex Michaelides (Michaelides, 2019).

LITERATURE REVIEW: PERSPECTIVES ON PARENTIFICATION

The concept was first studied in the book *Invisible Loyalties* (1973) (Parad, 1976), through a revolutionary work on intergenerational family therapy by Nagy and Spark. The term ‘Invisible Loyalties’ describes how families have invisible ‘debts’ and ‘loyalties’ that get transmitted from one generation to another like a secret inheritance (Monaco & Heesacker, 2025). Children may feel that they owe their parents something in return for bringing them into the world, even when the parents are unstable and harmful (Miller, 1990). This feeling of needing to fulfil a void or gap that they were not responsible for is always unconscious (Parad, 1976). They don’t even realise that they feel this way. The child thinks it has to do anything and everything it requires to pay back their parents, and it sacrifices its own innocence and childhood in the process. The children feel the need to heal their parents’ emotional wounds, often ignoring their own developmental needs (Monaco & Heesacker, 2025). This framework brought forward parentification as an intergenerational phenomenon, where dysfunctional family structures ruin the emotional growth and maturity of the children through invisible emotional debts (Masiran et al., 2023). They also stated that

**Devimanju and Suguna**

only a parent who is damaged internally can create damaged children. It is all a cycle of events happening between generations (Parad, 1976). If the parents are hurt by their own parents and carry the emotional wounds from the past, they pass them on to their children, who take care of them instead of enjoying their childhood (Masiran et al., 2023). The children become trapped while trying to heal their parents' emotional wounds, and as a result, they are forced to sacrifice their own childhood. They also feel guilty if they cannot take care of their parents, even if they get hurt in the process (Iakab, 2025).

Following this theory, Nancy Chase, in her book *Burdened Children* (1999) (Chase, 1999), talks about parentification in a more comprehensive way. She draws a distinguishing pattern between two primary types of parentification (Huczewska & Mynarska, 2025). She says that while trying to take care of their parents, kids often become the 'parent' in the family, while parents act like children (Chase, 1999). She divides parentification into two types: instrumental parentification and emotional parentification. While the former can be beneficial for children when they grow up, the latter, on the other hand, burdens them with emotional stress, secrets and unnecessary responsibility (Iakab, 2025). She differentiated between adaptive parentification (age-appropriate responsibilities) and destructive parentification (overwhelming emotional responsibilities) to highlight both the benefits and disasters of parentification (Chase, 1999).

Alice Miller, a Swiss Psychologist, coined the term "Poisonous Pedagogy" to explain the mental control parents have over their children (Miller, 1990). She defines the term as a set of toxic child-rearing beliefs and practices disguised as "proper education" that are imposed on children to control their behaviour. These beliefs justify parental control, emotional manipulation, and the systematic breaking of a child's will, all under the guise of "doing what's best for the child" (Miller, 1990). It is a mental control technique that families use to have certain power and control over their children and normalise dysfunction in the family. She brought together a set of doctrines that are being passed on from one generation to another to maintain discipline and impose family order (Hooper, 2007). Few of them are listed here, "it says that parents deserve respect simply because they are parents, strong feelings are always harmful, the way you behave with your parent is always important than the way you really feel, god and parents should never be offended, obedience makes the child strong, pretending to have gratitude is always better than showing honest ingratitude, duty produces love, and so on" (Miller, 1990). These doctrines transmit psychological trauma and guilt-trip children into becoming the adults the parents want as they grow up (Hawthorne, 2025).

Imi Lo, an independent consultant and children's counsellor, emphasises that "sensitive, gifted, and empathic children" are more prone to being parentified because they feel the intensity of their parents' failed emotions and feel the urge to be a parent to them (Tolmacz et al., 2025). They can sense the emotional instability and unsafe conditions, and they take it as their responsibility to provide the care that they were neglected (Fatima & Bashir, 2025). This leads to anxiety and premature maturity (Tiwari & Woodward, 2025). She also states that all the suppressed emotions, anger and neglected needs stay within the child as it grows up and creates a psychic split, where one part of the affected child will go on as an 'apparently normal self' leading an everyday normal life, but the suppressed emotion creates a traumatised self, and it haunts them subconsciously (Tolmacz et al., 2025). As a result, they never feel safe or secure in any sort of relationship. They dissociate themselves from their inner experiences to survive, and constantly feel that their life is always incomplete, and it is partial (Dial, 2014). Lo also specifies a few adult patterns that parentified children exhibit, based on different parentification experiences. If parents praise their child only for his/her achievements, then he/she becomes a "human doing" (Earley & Cushway, 2002) rather than a human being and constantly feels the need to perform exceptionally to gain parents' love. If the parents are depressed and emotionally dependent on the child for their needs, then the child loses their own self, needs and identity and seeks parental love and care (Masiran et al., 2023). If a child is overburdened with responsibilities, then it develops a harsh inner critic that urges them to exceed all expectations and shine. If a child is emotionally abandoned, it feels spiritually orphaned and compares itself with others, making it impossible to fit in society (Dial, 2014). In case the parents turn out to be bullies, the environment that the child grows up in becomes toxic, and as a result, the child becomes allergic to soft emotions and always feels lonely (Monaco & Heesacker, 2025). In such cases, silence becomes the parentified child's defence mechanism as the child realises early on in life that showing emotion and being

**Devimanju and Suguna**

vulnerable in front of parents will only cause disappointment and trauma (Caruth, 2016). This forces the child to learn 'Silent scream' for survival. Lo also suggests that, despite the horrors faced in childhood, healing is definitely possible for parentified children because, as adults, they are highly sensitive, emphatic, kind and intuitive (Dial, 2014).

A recent study on parentification by E Trak et al in 2025, examining the relationship and difference between both parent-focused parentification and sibling-focused parentification, states that adults who have undergone both these conditions are most likely to be associated with symptoms of obsessive-compulsive disorder (OCD) and relationship obsessive-compulsive disorder (ROCD) (Trak et al., 2025). This study critically analyses how parentification creates maladaptive cognitive patterns that serve as a mediating path for obsessive beliefs, which are then manifested as obsessive-compulsive symptoms in adulthood (Baştan, 2025). This study also sheds light on how parents' role reversal in childhood and neglect affect not only emotionally but also psychologically, restructuring cognitive processing patterns, causing people to develop recurring, controlling behaviours in their adult lives and relationships (Trak et al., 2025). This study has surpassed Chase's distinction between the types of parentification (Chase, 1999). Both the parent-focused type and sibling-focused type of parentification nurture obsessive-compulsive symptoms in adulthood that force them to follow repeated controlling patterns of behaviour to survive mentally (Chua, 2025). The psychological damage of parentification does not grow out of specific relationship malfunctions but from the initial violation of rights, emotions, generational boundaries and the premature responsibilities that burden the child, regardless of whether it is focused on parents or siblings (Dariotis et al., 2023). This creates in them a need for control, perfection and reassurance, as they are mediating between childhood parentification and adult psychopathology (Trak et al., 2025).

Perspectives on Childhood Trauma and Psychopathy in *The Silent Patient*:

A recent study by Muhammad Zia-Ul-Haq has analysed *The Silent Patient* by Alex Michaleides from the angle of post-traumatic stress disorder. It has examined and identified PTSD symptoms in both the protagonists, Alicia and Theo, including hypertension, insomnia, hallucinations, nightmares and hyper-arousal emerging from their exposure to ill treatment at a very young age from their dysfunctional parents (Zia-Ul-Haq, 2023). This study applies Judith Herman's PTSD model (Herman, 2011) to analyse the behaviour of both Alicia Berenson and Theo Faber and associates it with the post-traumatic stress disorder paradigm (Zia-Ul-Haq, 2023). The people who are suffering from PTSD are known to have shame, guilt, drug addiction, social anxiety, suicidal behaviour, sleeplessness, etc (Viswanath, 2023), all these are seen in both the main characters in the novel. Theo, who was subjected to physical abuse as a child, fears his father and describes that his childhood was filled with anxiety, fear and suppressed anger (Manoranjani & Sripadmadevi, 2024). As a result, after growing up, he became afraid of society and started avoiding social gatherings and had difficulty making friends. He also suffers from sleeplessness and tries to take his life by consuming pills. He also starts smoking marijuana to reduce his anxiety and feel happy (Larik et al., 2025; Manoranjani & Sripadmadevi, 2024). He visits a psychotherapist to overcome his childhood trauma, which later on encourages him to become one himself to help others (Zia-Ul-Haq, 2023). While Alicia, on the other hand, suffers from childhood trauma all her life and becomes mentally affected, as she does not get any appropriate help when needed. She considers her husband, Gabriel, (Larik et al., 2025) to be her saviour and invests her feelings in praising him and loving him beyond measure, which, in turn, hurts her when she comes to know of his betrayal. On the whole, this paper talks about how childhood trauma brings PTSD through the characters in the novel (Tolmacz et al., 2025).

A recent study by Dr Viswanath scrutinises the text through the lens of psychopathy and examines how childhood trauma and repressions can become the major factor in turning a normal human into a psychopath (Viswanath, 2023). Psychopathy is described to be a personality disorder that affects the human psyche and affects a human's social behavioural system and nurturing traits like aggressive narcissism. This study also explains that psychopaths have no emotional connection (Earley & Cushway, 2002) with the outside world and humanity in general, and how they are selfish enough to do what they please without any guilt for violating societal norms. Children basically yearn for love and affection; when those needs are not met by their parents or caretakers, they develop a sense of

**Devimanju and Suguna**

anger and hostility towards their parents and start attacking society to avenge their wounded ego and self (Viswanath, 2023). Likewise, Theo Faber, who suffered from childhood physical abuse, turns to his wife, Kathy, for comfort and love, but when she betrays him with Gabriel, Alicia's Husband, he becomes jealous and stalks and attacks him in his own house (Sherin, 2024). He unknowingly triggers Alicia's childhood trauma by asking her husband to choose between his own life and her life. He chooses his own life, and Alicia, who was deeply hurt by a similar incident in her childhood, (Zia-Ul-Haq, 2023) becomes triggered and takes out her anger on Gabriel by shooting him. Alex Michaelides' portrayal of Theo Faber in the book helps the readers understand the depth of psychopathic behaviour in adults and serves as a major factor in understanding how childhood bad experiences and social factors affect a person's psychological development as they grow up (Sherin, 2024).

Another study by Banu Priya talks about Parental Alienation Syndrome (PAS) (Banupriya & Aravind, 2024) and how it affects children as they grow up. The study primarily states that the inability to be a good parent always arises from not getting good parenting while they were children. This study also applies PART theory (parental acceptance and rejection theory) by Rohner to explain how a parent's acceptance or rejection is reflected in the child's psychological development, shaping their mental health in the process (Banupriya & Aravind, 2024). It applies the PART theory to analyse how poor parenting in their childhood becomes a major cause for the pathological dependence of both main characters in the novel. Alicia, who was neglected and verbally abused by her father as a child, sees her husband, Gabriel, as a father figure in her life (Pratiwi, 2022). When he gives her the same emotional wound that her father once gave her, it triggers all the old, buried emotions of anger and rage, and she kills him (Banupriya & Aravind, 2024). Theo, on the other hand, suffering from the verbal and mental abuse from his father and unsupportive mother, decided to end his life by consuming paracetamol, but he got a psychotherapist's help and realised that he could be of help to others who also suffered as a child like him. But his father's abusive words and curses never left him (Nurjayanti, 2021). It was always with him in his memories and kept taunting him as he tried to become a better human being. In both their cases, it is the cause of their father's abusive nature that caused them to develop psychological adjustment issues as they grew up (Banupriya & Aravind, 2024).

Another recent study by Ashraf uses Sandor Ferenczi's trauma theory and the personality theory of Freud to study the main protagonist of the novel, Alicia Berenson, to examine how childhood abuse affects adult personalities (Ashraf et al., 2022). It analyses how Alicia's trust was abused by the people around her, as her friend Jean-Felix warns her not to trust the people around her blindly, especially Gabriel. This is one of the reasons why she remains silent after killing her husband (Arvira, 2021). It also talks about the subconscious rage that Alicia harboured early on from childhood, which she expresses on various occasions, even when she was with Gabriel. Alicia had distanced herself from society and her own relatives as a result of the abuse she faced as a child (Ashraf et al., 2022). It is because of the pain of not being loved when she was a child. Her brother-in-law, as well as her aunt, refused to support her after she murdered her husband. This was because Alicia was always aloof and kept her distance from the people around her (Mustafa 2021). Thus, Alicia's trust issues, her rage, depression, social exclusion, phobia, non-verbal expression and inappropriate behaviour are always the outcome of the verbal and mental abuse she faced as a child in the hands of her very own father (Ashraf et al., 2022).

A research study by S Amuthavalli has compared *The Silent Patient* with *Sharp Objects* by Gillian Flynn and brought out that parental influence plays a large part in developing a child's psyche (Amuthavalli & Rajkumar, 2022). It focuses on how childhood development is influenced by trauma he/she faced in childhood and how it contributes to mental growth. It also analyses how a person's id, ego and superego, as formulated by Freud (Rennison, 2015), are affected due to abusive parenting and later on reflect on how they behave as an adult.

Content Analysis:

This paper explores the theme of parentification and how it affects the psychological development of young adults through two of the main characters in the novel taken for study. *The Silent Patient* is a mind-bending debut thriller novel written by British-Cypriot writer Alex Michaelides (Sherin, 2024). It received universal praise, awards and accolades for its uniqueness and construction. The main protagonist of the novel, Alicia, is admitted to The Grove,

**Devimanju and Suguna**

which is a fictional psychiatric unit, after she is accused of murdering her husband, Gabriel (Celestina, 2021). She does not even utter a single word after the murder. She becomes silent, and all she gives as a testimony is a painting of a naked self-portrait and titles it ALCESTIS, based on an ancient Greek tragedy by Euripides (Larik et al., 2025; Michaelides, 2019). The beginning of the story starts with Alicia writing in her journal and ends with it. Theo Faber, the speaker of the novel, who joins 'The Grove' to treat Alicia for her muteness, tells the reader how Alicia was found by the police officers with a gun in her hand and slit wrists, after she allegedly murdered her husband (D Angreni, 2023). Her silence is a form of affective resistance, which is a bodily response to parentification and inherited guilt (Michaelides, 2019). Theo finds her in a heavily sedated state when he first meets her in the unit and immediately works on reducing her medication to make her sober enough to respond to therapy (Salsabila, 2025). Slowly, he tries to break the wall she has built around herself and starts penetrating her mind. He is seen as a persistent and patient therapist by Diomedes, who is the clinical director of the unit. Deep down, he tries to help Alicia so that he can reduce his guilt (Michaelides, 2019). It is only revealed almost at the end of the story that he is the reason for Alicia's condition, as he unknowingly triggers a past trauma when he tries to make her see the real face of her lovable husband, Gabriel, who was secretly in a relationship with his wife, Kathy, while pretending to be loyal to Alicia (Michaelides, 2019). This paper helps to analyse how both Alicia and Theo were subjected to emotional parentification and how their trauma is not only seen as a psychological wound but also as emotional inheritance. Alicia's silence and Theo's urge to provide care are both the result of parentification. Both Theo and Alicia, failing to get their parents' love and care, became their own parents (Akram & Muhammad Akbar Khan, 2024).

Parentification and Emotional Burden:

Previous scholarship on *The Silent Patient* has talked about the psychological impact of parental influence on the main characters, Alicia and Theo and how they suffered from PTSD (Trak et al., 2025). They have all failed to acknowledge how they were parentified as children. They were both subjected to emotional parentification by their dysfunctional parents (Chase, 1999). This paper analyses their characteristics and psychological development from the perspective of parentification; to help the reader understand the major impacts emotional parentification could have on young children (Chase, 1999). The prologue of the novel starts with Alicia Berenson's diary. In the diary, she mentions that she has been depressed lately, and to help her, her husband Gabriel gets her a new notebook to write about her feelings, so she can clear her head and start concentrating on the upcoming painting exhibition (*Ek Abullah*, 2025). She mentions that she only started writing for the sake of Gabriel, so he would stop worrying about her (Sherin, 2024). Later on in the novel, readers come to know she has done many similar things to console and reassure him, like agreeing to see a therapist, so he would not worry about her. This shows that she has the habit of putting others before herself. This habit is one of the signs of emotional parentification (Bekkai s, 2025). When the child is neglected by parents and yearns for love and care, it starts treating love as a privilege it could never have, and when someone cares for the child, it starts treating them as a superior being and puts others' needs before its own welfare (Trak et al., 2025).

When she is trying to paint a portrait of Jesus for her art exhibition, she wants Gabriel to be her model. Such is the admiration she has for her husband. She fails to see all the human flaws that Gabriel seems to possess due to her unconditional love and admiration for him. This is because she is afraid of hurting his feelings and earning his wrath or disappointment (Tolmacz et al., 2025). She cannot afford to lose his love and care, as she feels that she is too crazy and undeserving of it. It is the lack of her father's love for her when she was a little girl that makes her yearn for Gabriel's love and cherish him more than anything in her life (Stolarek, 2014). There is one instance when Gabriel's big brother, Max, tries to misbehave with her. Alicia does not want to tell Gabriel about Max's behaviour as she fears it may upset or anger him and jeopardise his love for his brother. Alicia has ROCD (Relationship Obsessive Compulsive Disorder) (Trak et al., 2025); she is obsessed with Gabriel and his love for her.

This yearning for love and care started growing in her after her mother's death. It was one of the crucial moments that broke her childhood and reshaped it, turning her into an emotionally unstable person. Her mother killed herself by driving her car into a wall with her young daughter in the back seat, to escape her father's torture and toxic love (DO MUSTAFA, 2021). It deeply shook Alicia. She even mentions that her mother tried to murder her, as she

**Devimanju and Suguna**

willingly let her daughter ride with her when she was going to commit suicide (Faheem & Fayyaz, 2025). She does not remember what a mother's love is like; all she remembers when she thinks of her mother is the cruel act she performed that almost killed her. Her mother, Eva, was riding in a yellow car when she committed suicide. From then on, whenever she thinks of the colour yellow, she feels the wrath and disappointment she has had for her mother for years (SARAH, 2022). This is also the reason she does not want to have kids. She fears she might turn into her own mother and harm her kids. She does not want to put her kids through the same torture and parentification she went through as a little girl (Akram & Muhammad Akbar Khan, 2024). While her mother tried to murder her physically, her father emotionally murdered her. "...my poor girl, my Eva... Why did she have to die? *Why did it have to be her? Why didn't Alicia die instead?*" (Michaelides, 2019) After his wife's death, Alicia's father, Vernon Rose, due to the love he had for his wife, did something even more terrible than the act his wife attempted on their daughter. In his drunken state, he wished that Alicia had died instead of Eva, and Alicia happened to hear it. She feels her heart breaking and states that her father has emotionally killed her (Salsabila, 2025). Theo comes to know of it when he inquires about Alicia to her cousin Paul. Thus, Alicia lost both her mother and father on the same night; she never got love from her parents (Hossain, 2021). It was always her and her lonely thoughts in her world, until she met Gabriel. The trauma she experienced as a child kept recurring in her life even after she met the love of her life. By applying Caruth's trauma theory, it can be seen that trauma returns through silence and repetition later on in life (Faheem & Fayyaz, 2025).

Theo Faber is a psychotherapist, and he is trying to help Alicia, but he has also suffered from emotional parentification when he was a child. He was also brought up in an abusive household, where his father often verbally abused him, hit him, and demeaned him (SARAH, 2022). Theo and his mother were so afraid of their father that they celebrated the days he was away on business like a festival. They would make an ice statue of their tyrant, his father, on the snow outside and pelt it to vent their anger. He describes that the house was always either silent or filled with his father's shouting (Penih, 2022). His mother did nothing to support him; (Abullah & Mohammed, 2025) she was weak and subdued, having been parentified as a child herself and relying on her child for emotional support (Akram & Muhammad Akbar Khan, 2024). This characteristic of his mother made him yearn for a motherly figure who would rescue him from his father, and he found that in Ruth, his therapist. Later, when he met his wife, Kathryn, for the first time, he felt an unexplainable connection. This was because he had been searching for his mother in every woman he met (Anggraeni & Bowo, 2023). When he found Kathy, he saw similarities between her and his mother. That's why he fell in love with her instantly. Theo describes his wife as the person responsible for his happiness and the light in his life. He says she helps him drive away the demons that haunt him (Viswanath, 2023). But when she betrays him, he seeks revenge. He feels that his father's taunts and demeaning words never left him. Applying Hirsch's postmemory theory, it is analysed that he has carried his father's trauma with him as he grew up (Hirsch, 1997). He feels that the trace of his abusive father still resides within him and urges him to teach Kathy a lesson (Larik et al., 2025). "I didn't know it then, but it was too late – I had internalised my father, introjected him, buried him deep in my unconscious" (Michaelides, 2019). However, he does not act on this urge. Instead, he decides to expose the person who is wooing his wife, Gabriel. So, he breaks into Gabriel's home, ties both him and his wife, Alicia, to chairs, and exposes his secret love affair (Faheem & Fayyaz, 2025).

Silence as an Archive of Trauma:

Silence is seen as an enigmatic plot device, but it is actually an exposure of trauma when one cannot express their emotions. Alicia uses her silence as a survival strategy when she was abused as a child by her own father and Aunt Lydia (Bekkai & Amirouche, 2025). Her cousin Paul describes her to Theo as a child who did not speak much. She was always silent and in her own world (Zia-Ul-Haq, 2023). It was a way of protecting herself from the emotional wounds that were inflicted on her. Later, in the story, after she had killed Gabriel, she became totally silent and refused to speak, even when she was facing the trial (Arvira Pramesty Cahyani, 2021). It is because she was emotionally deeply hurt by Gabriel's betrayal, and his act of emotionally condemning her to death had caused such a deep wound that she could not speak (Tiwari & Woodward, 2025). She writes in her diary that Gabriel murdered her when he willingly let her die instead of him. It was just like how her father hurt her with his words (Stolarek, 2014). That is why she says that while he emotionally murdered her, she just pulled the trigger. "I saw it now. I would

**Devimanju and Suguna**

never be safe. Never be loved... I didn't kill Gabriel. He killed me. All I did was pull the trigger" (Michaelides, 2019). Her father must have also suffered from some sort of trauma and parentification as a child. Otherwise, how would a father wish his own daughter's death? Alicia is unconsciously carrying her father's trauma, relating her state to Marianne Hirsch's postmemory theory (Hirsch, 1997). Theo also used silence as a survival strategy when he was living with his parents to safeguard himself from his father's wrath. He was always silent as a child, so when he moved out of the house, he had no friends (Stanić & Ajduković, 2025). He struggled so much because of this when he was in university and decided to end his life. Such is the impact of emotional parentification on children. They use silence as a survival technique to shield themselves from the abuse and trauma inflicted upon them (Schorr & Goldner, 2023).

Loneliness and parentification:

When children are parentified, they often tend to lean towards loneliness as they have no one to express their emotions to. They get hurt by their parents' behaviour and feel that they don't have anyone to rely on, as their parents are emotionally abusing them (Penih, 2022). For a child, his/her parents are the first friends. They look up to their parents for everything and confide in them in times of despair. When they don't receive that kind of love from parents, they think that they have no one in the world who loves them and start distancing themselves from the outer world (Stanić & Ajduković, 2025). There is also another reason why emotionally parentified children prefer loneliness. When they see children who grow up with love and care from parents, they feel they are not deserving of parents' love and distance themselves from those children (Nurjayanti, 2021). This behaviour is reflected in *The Silent Patient* (Michaelides, 2019), in both Alicia and Theo. Alicia prefers loneliness because she does not trust the outside world. She only trusts Gabriel completely. He is perfect in her vision, and for him, she would do anything (Schier et al., 2015). When such a person breaks her trust, she loses her sense and kills him. Theo practised loneliness as he had no one in his life with whom he could share his past and wounds. He suffered from severe anxiety and loneliness when he was in college and tried to commit suicide (Penih, 2022). It is only after this incident that he considered visiting a therapist and met Ruth, who mended his wounds and made him feel worthy again (Schorr & Goldner, 2023). Kathy became the true companion that he yearned for in his life. But when she betrayed him, he lost complete trust in the relationship. Even then, he tried to win her back by silently removing her lover from her life, but all in vain (SARAH, 2022).

Art as Testimony: Alcestis and Parentification

Alicia's art stands as a testimony when she cannot speak for herself. She expresses all her emotions only through her art. For instance, she portrays her aunt Lydia as a comical, gigantic figure that provokes laughter (Abbas et al., 2025). This symbolises how she saw her as a child. Even though Lydia tried to boss around the house and take control of Alicia, she never saw her aunt that way (Pretsch et al., 2025). Meanwhile, Lydia failed to be a motherly figure to her. She also paints a self-portrait after killing Gabriel and names it Alcestis, an ancient figure from Greek mythology (Ahmed & Mohamad, 2025). Alcestis sacrifices her life so that her husband can live (Pratiwi & Pramesti, 2022). She is later brought back to life by the Greek demigod Heracles, but after coming back, she does not utter a single word, much like Alicia (Akram & Muhammad Akbar Khan, 2024). In the self-portrait, she is standing naked in front of a canvas and looking straight behind her, with blood dripping from her slashed wrists (Ahmed & Mohamad, 2025). Her eyes look blank, and nobody could read what she was going through when she painted it. Upon closer inspection, it becomes apparent that, in the shadows of the painting, a black figure lurks in the corridor (W. J. Celestina, 2022). This denotes the mysterious guy who broke into her house (Akhter, 2025). Her psychiatrist, Theo, gives her a chance to paint again, to see if that would make her express herself. She paints a portrait where The Grove is completely engulfed by fire, and Theo is seen carrying Alicia in his arms. It is indefinite whether he is trying to rescue her or throw her into the fire. By this, she expresses the suspicion she has of Theo (Ahmed & Mohamad, 2025).

Mothers and Their Role in Emotional Parentification:

Mothers play an important role in raising their kids. They are the primary caregivers, and they directly shape the child's sense of responsibility (Banupriya & Aravind, 2024). When the mother is emotionally weak or depressed, it often affects the child. The child tries to emotionally care for his/her mother (Abbas et al., 2025). This is the case of

**Devimanju and Suguna**

Theo. His mother is weak and depressed, and subdued by her father. He tries to care for her emotionally, and in the process, loses his childhood (Akhter, 2025). He has always yearned for a mother who would shield him from his father's abuse and who would tend to him and support him when he was hurt, but it was always the other way around. She might have felt guilty, but she is emotionally dependent on her child (Al Areqih, 2026). If we look at the relationship between Alicia and her mother, we can see the lack of motherhood she faced as a child (Baştan, 2025). When she needed her mother the most, she left her to suffer alone at the hands of her father and committed suicide (Ashraf et al., 2022; Aurel, 2025). Alicia carried this hollowness with her throughout her life. This created a terrible fear in Alicia that she never wants to have children, as she is afraid that she will turn out like her mother and abandon her child. She does not want her child to face the hardships she faced as a child (Aurel, 2025).

Climatic Imagery as Psychological Mirror:

In the novel, both Alicia and Theo mention the weather while describing their feelings and surroundings. Theo talks about winter, and Alicia about summer. Theo says that he feels the cold of the winter weather when he is working in The Grove (Baştan, 2025). He also mentions winter when he recalls his early life. "Somehow, grasping at vanishing snowflakes is like grasping at happiness; an act of possession which instantly gives way to nothing" (Michaelides, 2019). Alicia describes that the summer heat makes her feel drained and overwhelmed when she is painting. It is also mentioned that it was in summer that her mother killed herself. "It reminded me of another summer, hot like this one – the summer mum died" (Michaelides, 2019). Both express their emotions in the form of the weather. The characteristic of the particular climate mirrors their inner turmoil and psychological state. Winter is associated with coldness and a lack of warmth. Likewise, Theo feels coldness, violence, lack of warmth and neglect when he remembers his abusive childhood. He always feels emotionally drained (Akhter, 2025). Winter also resembles numbness. Theo becomes numb and suppresses his feelings to survive in his childhood house as well as the world (Baştan, 2025). Alicia describes that the heat of the summer is unbearable. It is symbolic of her longing for warmth, love, and being scorched by the lack of it. Summer also suggests overwhelming intensity, heat, vulnerability and burning trauma (Caruth, 2016). It denotes her anger because of her father's rejection and her inner rage. Her silence can also be read as the aftermath of that overwhelming heat. Both are deprived of parental warmth and love. Winter and summer imagery symbolise how they both internalised that deprivation differently: Theo by freezing his emotions and Alicia by burning inside. Here, seasons are the metaphors of memory (Chua, 2025).

CONCLUSION

Alex Michaelides' *The Silent Patient* offers a very deep interpretation of emotional parentification and how it psychologically affects children with long-term consequences that affect their behaviour, social circle, intimate life and mental health (Chua, 2025; Dariotis et al., 2023). This novel is full of truths that are too painful to articulate. Through the two major characters of the text, Alicia Berenson and Theo Faber, we can see that childhood ill treatment, parental abuse, and emotional detachment are signs of emotional parentification, and how it affected both of them in different ways (Chua, 2025). Even though they both lead different lives, they both grew up in an emotionally deprived environment, making them vulnerable to emotions like love, care and security. Alicia coped with emotional parentification through her silence and art, while Theo coped with intellectual control (Earley & Cushway, 2002). Theo chose psychopathy to help others who had a childhood similar to his, but in reality, he became a psychotherapist, so he could find people like him and find some similarities that could make him one with them, as he was so lonely as a child and adult (Fatima & Bashir, 2025). That is the main reason he chose to help Alicia. He saw something in her that drew him in, and his inner self found something similar to his own condition. He had Ruth to help him overcome his demons; he wanted Alicia to have someone to overcome her demons with, too (Earley & Cushway, 2002). On closer inspection of the text, they both are emotionally parentified and have carried the burden throughout their lives, but they have acted differently upon it (Faheem & Fayyaz, 2025). Alicia has suppressed her rage and bubbling emotions for a very long time, refusing to see a therapist or take medication, resulting in her acting out on that rage in the most vulnerable of times, when she shot Gabriel straight in the face. On the other hand, Theo suffered from loneliness and social anxiety throughout his adulthood, and at one time, he tried committing

suicide, but he realised that it was wrong and decided to see a therapist and try to become a better person who could help others like him (Hawthorne, 2025). Alicia was always unstable and had no control over her emotions. She even tried to commit suicide after her father's death and was known to have illusions and emotional breakdowns (Tolmacz et al., 2025). Even though Theo tried to become a better person, in the end, he did something terrible that speaks volumes about why he is his father's son (Hawthorne, 2025). He gave Alicia an overdose to silence her forever, to stop her from exposing him, failing years of therapy with Ruth. He was the one who broke into her house on the night of Gabriel's death to get his revenge (Stolarek, 2014). He wanted to punish Gabriel for having a secret affair with his wife, Kathy. He unknowingly triggered the suppressed rage within Alicia, resulting in her killing her husband in cold blood (Herman, 2011). All this is the cause of both their childhood trauma. As Sigmund Freud wisely said, "Unexpressed emotions never die. They are buried alive, and will come forth later, in uglier ways." (Rennison, 2015) As Alice Miller warned, "The more we deny our own childhood wounds, the more we inflict them on our children." (Miller, 1990) The novel's tragic ending suggests that recognising emotional parentification early on in life is necessary, but it is insufficient. Healing from parentification requires therapy, but neither character in the novel seems to have achieved it (Chase, 1999). 159.

ABSTRACT

The question of graduate employability has increasingly drawn attention in recent years, particularly in contexts where academic achievement does not automatically lead to successful job placement. One area that continues to influence this transition is the learner's ability to use English language effectively in professional situations. However, it is often observed that students, despite years of formal instruction, struggle to communicate with clarity and confidence during campus recruitment processes. This paper reflects on the role of English language training in addressing this concern, with a specific focus on the use of innovative teaching practices. Rather than treating language as a set of rules to be mastered, the study considers how classroom practices can create opportunities for meaningful use of English. Methods such as simulation exercises, task-based activities, role-based interaction, and the use of digital tools are discussed as ways of bringing real-world communication into the learning space.

INTRODUCTION

In recent days many companies started using communication skills assessment test as the basic yardstick which comprises exercises based on listening, speaking, reading and writing. Instead of traditional language teaching process which emphasizes on memorisation, grammar exercises and exams oriented questions and answers we are in a need to teach practical communication. There is huge skill gap between the expectations of the recruiters and the level of student's communication skills. Main reason for this skill gap is lack of practice. Though our students score good marks in English examinations the language proficiency is lacking due to lack of practice which is comfortable and useful to them. Innovative teaching approaches are the need of the hour to bridge the gap between skill set of students and the company's expectations. The four language skills LSRW are the major requirement for the successful career.

Innovative exercises for improving listening skills

Listening skill is important in attending meetings and comprehending, understanding information, and client communication. Listening effectively allows you to understand the speaker's message, emotions, and intentions. Effective listening is essential for building trust, empathy, and strong relationships in personal and professional settings. Listening and repeating: We can make one student in the classroom read sentences from the newspaper and ask all the other students to repeat with proper pronunciation and intonation in chorus for the first time and individually for the next time. At first this activity helps the learners to overcome their shy ness and in other way can improve concentration, comprehension and vocabulary.

Listening to audio clip and taking notes: In this activity all the students made to listen to an audio clip and take down important words and phrases .This helps the learner to improve concentration and note making skills which will be useful in the professional environment. Listening for specific information : In this activity students listen to an audio clip of a conversation and they have to answer the questions like form filling, gap filling, re-ordering sentences, and information transfer. Another listening exercise in this category is dictogloss. In this exercise, a group of students listens to a short passage at moderate speed and take notes after which they will be asked to restructure the original text. The students work in a group share ideas and restructure the sentence. This activity helps the learners to improve collaborative listening and accurate restructuring of factual information.

Innovative exercise for improving speaking skills:

Role play activity: Here students assume different roles in real life and respond to each other according to the roles given to them. This is an interactive teaching and learning technique which helps the students to improve fluency, confidence, communication skills and professional behaviour. This activity hypothesises a realistic atmosphere and the students get drilled to use English language effectively, naturally and meaningfully. Just a minute talk challenge: This is another innovative speaking activity used in the process of language teaching. Students are asked to talk on a particular topic for a minute and they should talk without hesitation, repetition or a long pause. This is a influential method which encourages students to think and react swiftly and express concepts unmistakably. This activity is broadly used in classrooms, recruitment process, placement training sessions and communication workshops. Picture description prompt speaking: In this activity the students observes a picture and describe it verbally with all the nuances like emotions, expressions, back ground details, people ,action and possible story or situations. This activity improves public speaking skills, communication confidence, presentation skills and creative thinking.

Innovative exercises for improving speaking skills:

Reading skills play an important role in the process of language learning, and it helps the students to develop communication skills, academic achievement and professional development. Students can improve intellectual capacity, vocabulary, critical thinking, and knowledge acquirement through proper training in reading activities. Reading activities enhance students' ability to interpret information, comprehend ideas, and respond profoundly.

**Saratha Lakshmi and Gomathi**

News buzz: In this activity the teacher can enhance the students to improve pronunciation, public speaking skills and confident elocution. The teacher selects the articles from the newspaper on the suggested areas like social issues, education, technology, sports and business. Students read the selected articles carefully and note the key facts, locate the main idea and highlight unfamiliar words. After this they involve in a group discussion, debate, interviews and news reader presentation. Students can get feedback from the teacher and peers based on fluency, content clarity, pronunciation and clarity presentation skills. **Story sequencing:** Story sequencing is an interesting activity where the teacher selects a story and shuffles the sentences and content and the students have to arrange sentences, events, and paragraphs of the story in the exact sequential order. This activity transforms monotonous reading process into an enjoyable and interactive one. Since this is a learner oriented activity student's gain interactive analytical thinking and multiple language skills. This activity also enhances the employability skills like logical reasoning tasks, professional problem solving, and creativity.

Innovative activities for improving writing skills:

Writing exercises enhances the students to express creative ideas, thoughts, and information effectively in written format which helps them to improve vocabulary, spelling clarity, grammar and organisation of ideas. These activities also help students to develop their employability skills like professional communication, analytical thinking, and creativity. **Scaffold guided writing practice:** Guided Writing is an ELT technique which encourages the students to write with the assistance of clues, outlines, prompts, images, sentence starters. The teacher selects and explains the topic at first and gives hints such as sentence starters, keywords, and outlines. And the students brainstorm the ideas and organise the thoughts in sequential order and write paragraph or essay with the guidance provided. This activity focusses on proper language use, vocabulary appropriate words, and coherent flow of ideas. It helps the students to improve communication competence, workplace documentation skills and professional success.

Dialogue writing practice: This is ingenious activity in which students create conversation with imaginary characters which helps them to improve their skills in functional English and conversational language skills. This activity encourages creativity and improves natural flow of dialogue, appropriate word usage, and originality of conversation. Dialogue writing exercises make the students get ready for customer service communication, team collaboration and professional interactions. And Companies always prefer applicants who can converse clearly and politely.

The students, language proficiency and employability skills can be improved by these pioneering activities based on LSRW skills. The training activities like JAM sessions, News Buzz, story sequencing, role play, guided writing, and dialogue writing generate collaborative and student centred classrooms. Through assimilating realistic situations, technology, and integrated learning methods in the process of English Language Teaching, teachers can bridge the skill gap between academic education and workplace requirements. Hence, for developing competent, confident, and employable students, progressive and innovative ELT practices are essential in the contemporary international environs.

ABSTRACT

The environmental resistance in the contemporary Indian women's literature has been characterized as an intimate form of resistance that is also political in nature. This article proposes that Meena Kandasamy's *When I Hit You* (2017) and *The Gypsy Goddess* (2014), as well as Avni Doshi's *Burnt Sugar* (2020), form a part of the ecofeminist tradition of environmental resistance literature wherein the despoliation of the natural world is equated with the despoliation of the female body. Further, the resistance against patriarchal and caste-based violence is also a form of environmental resistance against the despoliation of the natural world. The theoretical frameworks utilized in the analysis of the two texts are ecofeminism, postcolonial ecocriticism, the logic of mastery as proposed by Val Plumwood, the notion of slow violence as proposed by Rob Nixon, as well as the notion of neuro-ecological fiction. The article proposes that the two texts under analysis portray a form of environmental resistance that is unique to the contemporary Indian women's literary tradition. The form of environmental resistance that is portrayed in the two texts is quiet in nature, cumulative in nature, bodily in nature, as well as radical in nature.

Keywords: ecofeminism, environmental resistance, Meena Kandasamy, Avni Doshi, *When I Hit You*, *The Gypsy Goddess*, *Burnt Sugar*, slow violence, postcolonial ecocriticism, body-land nexus, urban entropy, neuro-ecological fiction, Indian women's writing

**Gandhimathi and Sangeetha****Introduction: The Body, the Land, and the Logic of Mastery**

Val Plumwood's seminal eco-feminist work *Feminism and the Mastery of Nature* (1993) establishes the "logic of mastery" that underpins both women's oppression and nature's exploitation. This logic of domination is based on a series of interlocking dualisms of reason/nature, culture/body, male/female, human/non-human, where each pair is seen in opposition, with the first term of each pair being privileged, and the second devalued, in a relationship of domination and exploitation, not of mutual interrelation and coexistence. This logic of domination has resulted in a world where women and nature are simultaneously idealized and exploited, loved and destroyed, where women and nature are sources and waste products..

Contemporary women's fiction in India has engaged critically with this logic of domination in ways that are remarkable for their power and accuracy. Meena Kandasamy, a poet, novelist, translator, and Dalit feminist activist based in Tamil Nadu, and Avni Doshi, a Desi-American writer whose debut novel *Burnt Sugar* was shortlisted for the 2020 Booker Prize, are two women writers who have each written novels where the relationship between women's bodies and nature is not merely figurative but also substantive. Thus, the Tamil Nadu landscape of Kandasamy's *When I Hit You* and *The Gypsy Goddess* is at once the site of Dalit subjugation and environmental degradation, as well as the site of resistance. In Doshi's *Burnt Sugar*, the arid urban landscape of Pune is not merely the background but the mirror that reflects and enhances the psychological and intellectual decay that is the central theme of the novel.

This article is a comparative ecocritical analysis of the three novels with the argument that they form a cohesive and important tradition of environmental resistance writing that is part of the larger corpus of environmental writing in the context of contemporary Indian women's writing. There are seven sections to this article: the theoretical section, close readings of Kandasamy's two major works, close reading of Doshi's *Burnt Sugar*, the comparative analysis of the environmental resistance strategies used in the three works, the role of the female body as a site of ecology, the comparative table of the environmental aspects of the works, and the conclusion that places the works in the context of the broader tradition of environmental writing that is part of the ecofeminist writing tradition in India.

Theoretical Framework: Ecofeminism, Slow Violence, and Neuro-Ecological Fiction

Ecofeminism, as a theoretical framework developed by thinkers such as Vandana Shiva, Val Plumwood, Karen J. Warren, and Maria Mies, forms the principal theoretical framework for this analysis. The basic tenets of ecofeminism, which assert that the subordination of women and the subordination of nature are not merely analogous but are structurally linked, rooted in a common logic of hierarchy, are particularly relevant to the analysis of Indian women's fiction because of the complex interplay between caste, gender, and ecology.

Vandana Shiva's idea of the 'maldevelopment' paradigm is particularly relevant with respect to Kandasamy's work. Vandana Shiva's argument, as she outlines it in *Staying Alive* (1988), is that the imposition of Western models of development on rural communities in India has had the effect of dispossessing women of their traditional ecological role and destroying the biodiversity that is essential to the sustainable rural way of life. In Kandasamy's *The Gypsy Goddess*, the Dalit farming community of Kilvenmani is subjected to this process of maldevelopment: their farming labour is exploited, their access to the productive capacity of the land is controlled by the upper-caste landlord class, and their attempt to resist this process of exploitation is met with the violence that resulted in the massacre of 1968. The environmental aspects of this social disaster are as important as the political aspects.

Another dimension is provided by the theory of slow violence as formulated by Rob Nixon. According to this theory, the most devastating environmental damage is the damage that is not immediately visible, such as the gradual accumulation of pollutants, the gradual degradation of biodiversity, the slow poisoning of water and earth, and so forth. This theory is directly applicable to the formal techniques of both Kandasamy and Doshi, as neither of the novels depicts environmental crisis in terms of spectacular events, but rather in terms of accumulation, repetition, and the gradual degradation of landscapes and bodies.

Gandhimathi and Sangeetha

The idea of neuro-ecological fiction, which has been proposed in recent ecocriticism to define those texts in which the conditions of the environment are seen to have a direct impact upon psychological states, is perhaps the most interesting idea to apply to Doshi's **Burnt Sugar**. The narrative of cognitive decline in the mother figure, Tara, who suffers from Alzheimer's disease, is constantly correlated with the environmental decline of the urban landscape in Pune, implying that there may be a direct relationship between ecological decline and cognitive disintegration. The dying plants on Antara's balcony, the parched trees, the smell of rust and overripe fruit – they are all signs of an environment in distress, an environment that reflects the psychological distress of the damaged characters.

Meena Kandasamy's *The Gypsy Goddess*: Dalit Land, Caste Violence, and the Burnt Field

The Historical Context: Kilvenmani and the Ecology of Caste

The Gypsy Goddess (2014) is a fictionalised account of the Kilvenmani massacre that took place on Christmas Day, 1968, in which 44 Dalit agricultural labourers, mainly women and children, were burned alive in their huts by upper-caste landlords and their hired agents in retaliation for the demands of agricultural labourers for better pay. This is set in a small village in the Nagapattinam district of Tamil Nadu, in the fertile delta region of the Kaveri River. Kandasamy's novel is a kaleidoscopic narrative that eschews as much as possible the genre of the realist novel as much as it eschews the ideology that led to the massacre.

The environmental aspects of the novel are inextricably linked to its social and political aspects. The setting of the novel in the delta region of Tamil Nadu—paddy fields, irrigation channels, coconut groves, and the distributaries of the river Kaveri—is not only the backdrop of the story of Kilvenmani; it is also very much its object. The Dalit agricultural labourers in this novel are not only labourers; they are also the custodians of the land, its fertility, its ecosystem. The removal of the Dalits from the land—through economic mechanisms of bonded labour, social mechanisms of caste hierarchy, and finally physical mechanisms of arson and murder—is also an environmental removal. The burning of the Dalit huts is also the burning of the community's relation to its land.

The Burnt Field as Ecological Symbol

The most potent environmental image in Kandasamy's work is fire, the fire that burns the Dalit settlement, as well as the broader metaphor of burning that is woven throughout the imagery of the novel. The fire in *The Gypsy Goddess* is not transformative or purifying; it is an annihilating force. It burns the bodies of the women and the children, it burns the community in terms of its physical place in the land, and it is the ultimate expression of the logic of mastery, the burning of the dispossessed from the land they have worked so hard to build. The form that environmental resistance takes in the novel is the insistence of the Dalit people on staying on the land, their refusal to work for the wages and conditions that the dominant class landlords are offering, their insistence on being paid adequately for their labour, without which the fertility of the delta would not be realized. This, Vandana Shiva would call ecological labour resistance, and it is what the dominant class responds to so violently in the form of the massacre that is the subject of Kandasamy's novel.

Language, Landscape, and Dalit Ecopoetics

Kandasamy's use of the natural landscape is directly influenced by the ancient Tamil poetic tradition of Sangam literature, which uses a very formal codification of the natural world, such as the use of specific flowers, birds, seasons, and landscapes as metaphors or similes for specific emotional and social conditions. As the ecopoetic scholar Balaev has pointed out, Kandasamy's novel challenges the pre-existing conflicted landscapes and narratives of her native Tamil Nadu through a re-engagement with the ecological symbolism of the Sangam tradition. In this way, the Kaveri delta, whose ecology is encoded in the Sangam tradition's 'Mullai' landscape of pastoral forest, and whose fertility is the product of Dalit labor, is reclaimed as the site of Dalit ecological memory and Dalit political aspiration.

The experimental nature of the novel, the fusion of documentation and lyric, the direct address to the reader, and the metafictional elements of writing itself, are all part of the resistance. Refusing the traditional realism of literature, Kandasamy refuses the ideological stances that the dominant culture has employed in its literature of the Tamil land

Gandhimathi and Sangeetha

and its people. The form of the novel is itself an act of resistance that matches the resistance described in the novel. It is an assertion of the right to represent the land and the people as they would represent themselves.

Meena Kandasamy's *When I Hit You: The Confined Body, the Colonised Landscape* Domestic Space as Ecological Prison

When I Hit You (2017) is Kandasamy's autofictional retelling of her experience of being in an abusive relationship with a Communist Party functionary in a short marriage in Mangalore. The environmental aspects in *When I Hit You* are less obvious than in *The Gypsy Goddess*, although they are also structurally integral to the argument of the book. The apartment in which the protagonist is kept, an environment of total surveillance and control of movement, and the gradual dissolution of identity, can be seen, in ecocritical terms, as an ecological prison, an environment constructed to separate the protagonist from the natural world, the social world, and the world of relationships that have constructed her identity and agency.

The way in which the narrator becomes increasingly disconnected from the outside world—she cannot leave the apartment unaccompanied; she cannot access the internet, books, or other people without restriction; she cannot even access her own body without the husband's permission—is conveyed through imagery that explicitly uses the language of ecological deprivation. She is an image of wilt, of thirst, of a lack of access to light. The apartment itself, with its closed windows and its controlled atmosphere, is a space of atmospheric toxicity—an environment hostile to life. This is the logic of mastery on a domestic scale. The same logic that underlies the exploitation of ecological systems underlies the exploitation of the female body within the context of the institution of marriage.

Writing as Ecological Recovery

The narrator's resistance to her husband's domination is, centrally, a resistance enacted through language — through the writing that she continues to do in secret, the poems she hides, the narratives she constructs in the margins of permissible existence. In ecocritical terms, this linguistic resistance is also an ecological one: language, in Kandasamy's framework, is not separate from the natural world but continuous with it. The Sangam tradition that Kandasamy draws on throughout her work encodes the natural world in language, makes the landscape the medium of human emotional and political experience. To write is, in this tradition, to reclaim one's relationship with the natural world — to resist the ecological as well as the personal dimensions of confinement.

The novel emphasizes the need for resistance that is both bodily and ecological in nature. Memory, language, and creative practice are seen as the means of reclaiming both personal and ecological wholeness. The auto fictional hybridity of the novel brings forth a new form of literary resistance in the genre of Indian English writing. The act of writing the novel is an act of environmental recovery in the sense that the act of the protagonist leaving the apartment is the act of the land leaving the colonizers.

The Body as Ecological Site

The most radical argument that this novel makes along ecofeminist lines is that the body of the protagonist itself is an ecological site, a landscape which has been colonized, exploited, and damaged by the logic of patriarchal mastery, and which needs to be reclaimed through the same logic by which other colonized natural landscapes are being reclaimed. This argument is being made through the novel's use of the nature/culture nexus, the repeated imagery of growth and suppression, seasons and confinement, water and thirst that connects the protagonist's bodily experience with the ecological conditions of the world outside her apartment.

The similarities Kandasamy draws between the exploitation of women and the exploitation of nature are not simply metaphorical, but rather structural. The same logic of mastery that allows the husband to dominate the narrator's body is the logic of mastery that allows the agricultural land to be dominated by the upper caste landlords. The same logic of inferiority that allows the husband to dominate the woman is the logic of inferiority that allows the ecological environment to be dominated. Therefore, in this sense, *When I Hit You* is not simply the story of one woman's experience of domestic violence, but rather an exploration of the ways in which domestic violence is made possible,

**Gandhimathi and Sangeetha**

and an argument that the fight against domestic violence cannot be separated from the fight against ecological violence.

**Avni Doshi's *Burnt Sugar*: Urban Entropy, Ecological Memory, and the Slow Violence of the City
Pune as Ecological Character**

Avni Doshi's *Burnt Sugar* (2020), published in India as *Girl in White Cotton* and shortlisted for the 2020 Booker Prize, is located in Pune, the fast-expanding metropolitan city in the state of Maharashtra in western India. While the main concerns of the novel are related to the intergenerational themes between the protagonist Antara and her mother Tara, whose Alzheimer's disease forces the protagonist to confront their shared traumatic past, the ecological dimensions of the novel are both pervasive and significant. The city of Pune is not merely the location of the novel, but it is also the ecological character of the city, its ecological witness, and the medium through which the main arguments of the novel are being conveyed.

The opening description of the environment, "dust settled on rooftops, trees turned grey. Everything was thirsty," establishes the tone for the entire novel. This is not an atmospheric opening, but an argument. The drying up of the cityscape and the gradual disappearance of Tara's memory are described as similar phenomena, subject to the same laws. The dusty environment is a metaphor for Antara's emotional exhaustion and Tara's disconnection from reality. The novel links emotional exhaustion with environmental degradation, drawing upon the principles of eco-psychology, where the mental health of humans is inextricably linked to the health of the environment.

Ecological Imagery and Psychological Deterioration

However, as the narrative progresses, Doshi develops this ecological theme further with imagery that includes rot, decay, and heat. These sensory details, which include the sun beating down on the characters as if it is a punishment, as well as the smell of rust and fruit gone sour, echo the souring of Antara's emotional state. Antara's emotional collapse is paralleled with the polluted urban ecology. However, this polluted urban ecology is not coincidental but is rather a product of the modern Indian cityscape that is affected by the challenges of climate change, pollution, and disconnection from the natural world. Doshi's narrative is part of a subtle form of climate fiction that is characterized as not necessarily focusing on natural disasters but rather the entropy of the urban world.

The domestic space of Antara's apartment is also noteworthy. The plants on the balcony that wilt within days of being brought home, the scarcity of furniture, the dead plants – all are physical manifestations of a life stripped of natural connection. The apartment, like the psychological state of the narrator herself, is a space of ecological deprivation – a space in which life cannot be sustained because it has been severed from natural cycles of life. This is the urban dimension of the ecological crisis that Kandasamy's narrator undergoes in her domestic prison of her abusive marriage – in Doshi's novel, it is the prison that is the city itself, a space that has organized itself around a denial of ecological connection.

The Ashram as Ecological Alternative and its Failure

The most developed treatment of an alternative ecological vision can be found in the sections of the novel that describe the ashram of Baba, to which Tara flees in her youth. The ashram, with its garden, its communal practices, its rejection of the consumerism of the city, appears at first to be an ecological alternative, a place of sustainable communal living, far removed from the entropy of the urban environment. But Doshi does not allow this alternative to be romanticized; it is revealed to be just as much a place of exploitation and patriarchal domination as the family and the urban environment it seeks to escape. Baba's exploitation of Tara, his use of the communal practices and ecological resources of the ashram to assert his own power, is the same logic of mastery, only in 'green' packaging, patriarchal domination dressed up in the rhetoric of spiritual and ecological community.

This is one of Doshi's most astute political observations: that ecological alternatives which do not fundamentally challenge the patriarchal logic of mastery are not alternatives. The garden cannot redeem the exploitation of women. The community agriculture cannot make up for the hierarchy of spiritual authority. Doshi's argument suggests that

**Gandhimathi and Sangeetha**

true ecological resistance involves not just a new kind of relationship to plants and to the earth, but a fundamental rethinking of the social relations that shape access to both human and non-human resources.

Memory, Dementia, and Ecological Loss

The most original contribution of this novel to environmental resistance literature is its exploration of the link between cognitive decline and environmental decline. The Alzheimer's disease of Tara, her disconnection from her own memories, relations, and identities that define her selfhood, is always depicted in terms of environmental decline: her mind is depicted as a landscape losing its features, a river losing its channels, a garden losing its plants. This model of neuro-ecology implies that environmental memory decline—loss of community memory about nature, passed on from previous generations—may be a form of environmental violence. In the context of urbanising India, where the ecological knowledge of rural and semi-urban communities is under threat from the same forces of urbanisation that have destroyed the ecosystems those communities once lived with, the use of dementia as a metaphor for ecology has special relevance. The forgetting that Alzheimer's disease instils in the individual mind is reminiscent of the forgetting that modernising society instils in itself, as a way of forgetting the ecological knowledge that is necessary for the survival of the species: the knowledge of where plants grow, when the rivers will flood, and so on.

Strategies of Environmental Resistance: A Comparative Analysis**The Body-Land Nexus**

The most fundamental strategy shared by Kandasamy and Doshi is the construction of what ecocritics have called the body-land nexus: the systematic identification of the female body with the natural landscape, such that violence against one is rendered as violence against the other, and resistance by one is rendered as resistance by the other. In Kandasamy's *The Gypsy Goddess*, the bodies of the Dalit women burned at Kilvenmani are identified with the delta landscape that their labour has sustained; in *When I Hit You*, the narrator's body is identified with the natural world from which her confinement has severed her; in Doshi's *Burnt Sugar*, Tara's deteriorating mind is identified with the deteriorating urban landscape of Pune. In each case, the identification is not merely metaphorical: it is a structural argument about the common causes and the common conditions of women's bodily oppression and ecological exploitation.

The most basic strategy that is shared by Kandasamy and Doshi is the creation of what ecocritics have termed as the "body-land nexus," wherein the female body and the natural landscape are systematically linked in such a manner that any violence perpetrated upon one is also constituted as violence perpetrated upon the other, and any resistance offered by one is also constituted as resistance offered by the other. In *The Gypsy Goddess* by Kandasamy, the bodies of the Dalit women who were burned alive in Kilvenmani are linked to the delta landscape that they have worked hard to sustain; in *When I Hit You* by Kandasamy, the body of the narrator is linked to the natural world from which she has been disconnected by her confinement; in *"Burnt Sugar"* by Doshi, the deranged mind of Tara is linked to the deranged urban landscape of Pune. In each of these cases, the linking of the female body and the natural world is not merely figurative; it is constitutive.

Slow Violence and the Aesthetics of Accumulation

Both writers use the aesthetics of slow violence, as Nixon describes it, to represent the resistance of the environment. Kandasamy's novel works up to the Kilvenmani massacre as a series of small injuries, small humiliations, and small acts of resistance, a series of small events that constitute the social ecology of caste oppression. Doshi's novel works up to Tara's cognitive breakdown as a series of details about the environment, a series of events that constitute the ecological condition of urban entropy. In both cases, the form of the novel matches the politics of the novel, the politics of the crisis as a process rather than as an event.

Form as Ecological Resistance

In both cases, formal experimentalism is part of the environmental resistance. Kandasamy's hybridizing use of documentation, autofiction, and lyricism rejects the realism of the novel in much the same way that it rejects the

**Gandhimathi and Sangeetha**

caste-based, patriarchal conventionalities of the social world her novels portray. Doshi's non-linear narrative, unreliable narrator, and use of fragmentation as a structural element are part of the formal encoding of the environmental argument: the non-linear narrative reflects the non-linear ecology; the unreliable narrator reflects the unreliable urban environment that appears to be cohesive but has been quietly deteriorating.

Resistance as Recovery

The final, and perhaps most important, shared strategy is the emphasis on the idea that environmental resistance is not opposition, but recovery, the recovery of a relationship with the natural world that patriarchal and caste-based societies have destroyed. The narrator in Kandasamy's **When I Hit You** recovers her ecological relationship in the process of writing; the Dalit people in **The Gypsy Goddess** reclaim their place in the land in the process of political organizing; Antara, in Doshi's novel, in a less clear way, recovers her ecological relationship in the process of creating, in the process of writing, in the process of the novel itself. In each case, the process of resistance is also the process of ecological reorientation, the process of turning back to the natural world, away from the separation that patriarchal and caste societies have enforced.

Situating Kandasamy and Doshi in the Indian Ecofeminist Tradition

The environmental resistance in the three novels under consideration does not occur in a vacuum. Rather, it is part of a larger body of Indian women's environmental writing and activism that ranges from the Chipko Movement of the 1970s, in which the women's bodily relation with the forests of Uttarakhand formed the basis of an environmental resistance movement, through Vandana Shiva's theoretical work in eco-feminism, Arundhati Roy's activist writing, and Sarah Joseph's *Gift in Green*, to the new generation of Kandasamy and Doshi. What is particular to the contribution of Kandasamy and Doshi to this tradition is the emphasis that they place on the intersectionality of environmental resistance. Both writers argue that the crisis of the environment cannot be understood in separation from the crisis of caste (Kandasamy), or from the crisis of women's interiority (Doshi). There is no separate domain of the environment that needs to be defended by specialists; it is part of social life, inseparable from the conditions of women's existence, from caste and class, and from the psychological lives of damaged and healing selves.

Meena Kandasamy, in her position as a Dalit Feminist writer, lends an anti-caste dimension to her work on resistance that is not adequately developed in the ecofeminism movement in India, which, in its concern with the ecological practices of generic 'rural women,' failed to adequately address the issue of casteism in the distribution of ecological resources and the exclusion of certain women from access to these resources. Her argument that the destruction of the Kilvenmani people is at once a crime of caste, gender, and ecology is one of the most significant contributions to contemporary Indian eco-writing. Avni Doshi's contribution is on a rather different scale. She offers us the urban ecology of the postcolonial Indian metropolitan area within an ecofeminist context, which the tradition's previous emphasis on the rural or forest environment has not been able to accommodate. Doshi's *Pune* is not a natural environment in any conventional sense. However, it is an ecology, an environment of relations between human beings, built environments, and degraded elements of the natural world. The degradation of such an environment is just as politically important as the degradation of any forest or river. In this sense, too, Doshi's work can be seen as an extension of the ecofeminist tradition to the metropolitan spaces where the majority of India's women live.

CONCLUSION

Meena Kandasamy and Avni Doshi are part of one of the most significant transformations in contemporary Indian environmental literature, one that moves from the landscapes of wilderness, river, and forest that have been so dominant in the genre to the ecological spaces of the body, the apartment, and the city. The environmental resistance that both Kandasamy and Doshi offer is not one that is performed in spectacular confrontational ways, although Kandasamy's political activism does include that, but in the slow, incremental, and formal-experimentation work of making the ecological violence that patriarchal, caste-based, and developmental systems perform on women's bodies, women's minds, and the natural environments of the communities they regulate and control visible. In

Gandhimathi and Sangeetha

Kandasamy's *The Gypsy Goddess*, resistance is the assertion of the right of the Dalit community to the land whose fertility they have produced. In *When I Hit You*, resistance is the act of writing that the woman in the ecological prison of her marriage uses to reclaim her connection to language, community, and the natural world. Resistance in *Burnt Sugar*, the novel by Doshi, is an ambiguous act of resistance to personal and ecological degradation through the practice of art. These novels propose an understanding of environmental resistance that is both more intimate and more radical than the conventional understanding of environmentalism allows. They propose an environmental resistance that begins in the body, that is practiced in language, and that is inseparable from personal liberation.

The environmental crisis that India is facing in the contemporary period is not merely one of rivers, forests, and air, but also one of the intimate ecologies that human beings use in order to sustain their relationship to the world and to each other. Kandasamy and Doshi, in their own unique ways, have made the crisis of the intimate ecology visible, and have asserted, through the form and content of their fiction, that the solution to that crisis requires not merely changes in policy, but transformations in the social relationships that human beings have to women, to the non-human world, and to each other.

The current study brings out the effective outcome of the emotions that a victim undergoes during and after a tragic event. Any tragedy that is to happen and that has happen involves the irresponsibility of a citizen or individual of any nation. Hereby this study deals with the vaporization of emotions. Researcher has interviewed heterogeneous experts, they were provided with the following questionnaires.

The questions are pertained to the following aspects.

1. The situation that made the rapists to be involved in the activity.
2. Cultural drawbacks and differences.
3. The role of education of sex.
4. The event of creating awareness.
5. The various responses depending on physic and psyche.
6. Everlasting acceptability by the family and friends.
7. Individual contribution to the fact.
8. A criticism on the media.
9. The survey on the data depending on the social group.
10. Consequences relating to the tragedy.

Interview is one of the most comprehensive ways of carrying out a research on a specific topic. It is more informative and enlightening than the personal experiences or questionnaire. The researcher has prepared a set of 10 questions to derive information on the following aspects.

1. Role of Government in constructing safety measures.
2. The active suggestions for punishing rapists.
3. The renewal of routine life as a victim.
4. The mental state of overcoming the issue.

**Hemanatchatra**

5. Influence of tragic emotions after marriage.
6. Physical disorders to be a reason.
7. Financial crisis to be a drawback.
8. Age factor – a hurdle?
9. On a time for the victims to break silence.
10. Empathy of an individual.

These are the major proposed questions to the heterogenous experts. The cases responded with different and unique responses depending on the questions asked.

CASE-1-GENDER:FEMALE, AGE: 39, PROFESSION: JUDICIAL MAGISTRATE

The researcher had a telephonic conversation with the expert and has come out with the following suggestions and criticisms. The case also has discussed a few real incidents that had various effects on the society as well as the victim. The views of the case are mentioned below. She implies on a few impacts that are to be specified and emphasised. According to the expert, the situation that instigated the rapist to get aroused, the social atmosphere responsible for the act, age group is a not an issue for rape, practical applications of sexual thoughts, hormonal changes are uncontrollable, lack of safety among the people, lack of respect for women, the growth factor that indulges both parents and teachers, lack of proper education on sex and The lack of awareness that leads to harassment. Also she added the role of media on it, In most of the cases, it is the media that spoils the life of the victim, more than merits, the media proposes demerits to the core, no traditional ethics are being followed in media, media, are trying to help the rapists, at times from punishments, few issues brought to light but few are not, because of the casualty of media. The expert also gives examples of incidents she witnessed as Judge, The case discusses a real incident of rape in which an 8 year old girl has been raped by a 14 year boy in the school premises. The victim has been dragged to a corner of the road and been taken into this cruelty. Through this, the case says that there is no proper education on the aspect of sex.

Another incident, In this issue, a 6th standard girl has been sexually assaulted by a boy of 10th standard of the same school, wherein she was killed immediately after the act. This has happened near Gudiyatham in Tamil Nadu. The girl has been taken to a farm and was raped. On investigating the boy, he has reported that he has been encouraged by the internet and the videos has helped him to be aroused.

CASE: 3, GENDER: MALE : 53, PROFESSION: DEPUTY SUPERINTENDENT OF POLICE.

The researcher had a telephonic conversation with the expert and held back the following details. According to the expert, the dominant sense of rape arises from the cultivation of impropriety. When there is no proper growth factor, the accused does not know the consequences of the event. He might focus only his feelings rather than the emotions and the sufferings of the victim. The subject had a more specific grading for the cultural changes of the society. Any negativity is fired up wherein the accused makes a detailed study on the daily activities of the victim. Education on sex is mandatory for the children as it might bring forth a vast change in the minds later on. Aliveness on the differentiation of the touches of men. He also says, It is the parents' duty to clarify the doubts of men but boys do hesitate to discuss on this topic. The subject also declares that it is mistake of the parents to help in the maturity of their children, Media's role on the rape issue is more prevalent, Media has both the merit and demerits for this mishap. It takes an easy access for the diseased minds to learn more on rape, It is the poor community women who are taken into account in large numbers. The reason behind this is their silence and he adds, when there is a lack of knowledge on sex for the poor, the rapists would take an eventual advantage on this criterion.

CASE: 4, PROFESSION: SOCIAL ACTIVISTS.

The researcher had a recorded telephonic conversation with a social activist, the followings are the views of the expert, she says that the situation contributes more to the issue than any other aspect. The fear of being alone might be secondary but the root cause for all the rapes is alcohol. Consumption of alcohol is the only reason for such cruelty. Rapists, very rarely attempt without alcohol. Cultural changes have a serious detailed impact on this issue as

**Hemanatchatra**

it helps to change the minds of the individual convincing them to handle any kind of offence. The other way of cultural change is being attractive. Wearing of attractive costumes and wardrobes can sometimes help the rapists to attempt for rape. The immediate reaction on hearing the rape cases is an extreme rage on men in common. The instant punishment must be 'shot at the spot.' While considering the punishments for the accused, there are no proper and legal threats for the accused. The most significant fact is that the family has to support them but they lack this ability on thinking that this might spoil the life of the victim's siblings. The media helps to exaggerate the tragedy and teaches the people how to attempt for such crimes. Sex education has its defects on the other side in letting men to be more curious on sex. Girl children may be given sex education but not for the boys. Lower community girls are deeply affected as it is an advantage for rapists to handle the poor people easily than the rich ones. In any village, the houses are set far and this could be a reason for rape. The mentality of victim changes from normal to abnormal condition. She might attempt suicide at any time. In order to avoid this situation, they are given counselling. The government has provided many measures to control the rate of rape by implementing many rules. The routine life of the victim is damaged wherein she remains the element of empathy. The mental progress is disturbed for the victim. There is a lack of guarantee of happiness in the life of the victim. A victim after the marriage fears of anything she does. There are chances for the victim to forget the cruelty once her life partner accepts her thoroughly.

CASE: 4: GENDER: FEMALE, POSITION: ACADEMIC PSYCHOLOGIST, ASSOCIATE PROFESSOR.

The researcher had a direct interview with the expert. She has come out with different views about the rapist and the victims. The below mentioned are the views of the case. She implies on a few impacts that are to be specified and emphasised. She says, situation is neutral and It depends totally on the individual perpetrators. The case starts feeling so helpless and failing in society. These kind of traumatic events create apathy. The case believes that there is strong connection between culture and rape. From the beginning it has been followed that man has to dominate and this cultural stereotype persists till now. The need for power, aggression and domination induce them to commit such cruel activity on women. Normally people are hesitant to speak taboo topics openly. This has to be changed. More than school, family has to take care of their children and teach them about things happening around, making them aware of everything. Sex education at the right age helps to prevent such issues. The case believes that educated family supports the victim and uneducated would send them out of the family. Without the influence of social, political and economic growth, such crime cannot happen autonomously. People, who are socially marginalised, economically deprived and politically supportless, suffer immensely from this issue. Media's part is to take proactive measure. Idea of showing it to people is to create awareness and it is like caution. Basically the particular people inclination is wrong, and hence they misuse it. After the traumatic event, the victim feels so guilty. She will have tsunami of emotions like depression, anxiety about future, apathy and anger. First of all, the victims should believe that they are not responsible for this traumatic event. Getting back to normal life is very important. They should be in group. They should have counselling therapy. The case does not really believe that punishment brings change. Change should happen at the grass root level by not picking up just one episode. She doesn't believe in capital punishment. If such people possess an ability to understand, he will not rape.

CASE : 5, GENDER: FEMALE (URBAN), AGE: 22

The researcher had a direct interview with the subject. The subject is a University student and her views on the topic have to be dealt deeply. She says, The first and the most emphasised point of the subject is that the incident depends on the situation. Any situation favouring the rapist can result in the absurdity. When there is a change in the culture, there would be a change in the attitude of women. There is a change in the minds of the individual to be more and more sociable. However this sociability might result in disaster. In dealing with the psychological consequences of the incident, it is noted that people are empathetic and are feeling frustrated. This is the result of the incapability of others in not paying any heed to the victims. Any event of tragedy is usually visualized as a story. This form of undergoing the horrible event lets out an anger or rage wherein the incapability resides.

If the victim is murdered, she is supported by her family. In case she is left alive, she is not accepted and she undergoes a terrific social calamity which might result in her suicide. The subject comes up with an outstanding personality and a victim of rape, Dr. Sunitha Krishnan, who with her enlightening will power and confidence, fought

**Hemanatchatra**

for the victims of the rape. She has also established a school for rape victims that ensure the providence of confidence and assurance of healthy life style. The subject seeks freedom of speech so that she would be able to come up with her own thoughts and feelings on the victims in the form of her writings. She also mentioned that she would definitely raise her voice on this tragic issue. This restriction exists because she is dependent on the family and is constrained to a few ideals of the family. There is a drastic change in the minds of the relations and friends after the incident, as the victim will be considered surely as a diseased individual. The behavioural manners and the attitude vary from person to person wherein she will undergo a devastating life. This might result in the pathetic condition of all those who are in and around the victim. There is no consideration for rape as an accident. It is usually considered a severe crime and the tragedy is that the victim faces the major controversies. There is no proper education on the punishments for the rapists as it might change the present situation on the incident. The subject also mentioned that there should be proper education on sex since childhood in order to avoid such terrible events. She also adds that media plays a vital role in letting the people know more on this disaster than that has happened. It exaggerates the issue in a detailed way wherein an individual have so many chances for them to learn more on the defects. It is part of the media to enact the punishment to take the crime under control.

She explains about the victims, The victim lives in frustration which results in vanity of life. When there is hopelessness in life, there are chances for the victim to attempt suicide. The only remedy for the woman to protect from rape is to defend herself in that critical situation. The instant punishment for the crime is to hang the accused so that the others would stop trying it. The other option for the punishment is to sterilize the accused. It is the duty of the family and the society to accept the victim as she is. She is neither patient nor a criminal. She is just a result of extreme cruelty. The defect in overcoming this doom is the traditional fear of loneliness. There arises a fear of darkness which results in doomed gloomy life style. Any victim if happened to witness the characteristics of the rapists would fear and feel threatened. The people around might cause a feeling of guilt in the minds of the victim when she is looked down sympathetically. This causes denudation of the victim, being ignored. There are chances for the victim to become normal after the incident and this happens only when the family and the society accepts her. The only way for the victims to overcome this dark solitude is to involve themselves fully in various fields. Concentrating on something that interests them can bring them out the sorrow and the mental pain. There are a number of ways to dissolve the emotions and the feelings of the rape issue. The important motive is to avoid the mingling with the other victims of same issues.

CASE: 6, GENDER : MALE (URBAN) AGE: 23

The researcher had a telephonic conversation with the case and has come out with the following suggestions and criticisms. The below mentioned are the views of the case. He implies on a few impacts that are to be specified and emphasised. He started talking about cultural difference by saying, Cultural difference cannot be the reason for this issue. Even centuries ago it has happened. The case's anger turns to media on the reason for its projection; it is the media that spoils the life of the victim. Sympathy should not be expressed to the victim. Sex education should be given to adolescent girls and not to the adolescent boys. It should be given separately. As the lower community people are poor and illiterate, rapist takes advantage of it. The suicidal thoughts of the victims are the resultant of the society. Penectomies will be the best punishment for this cruel activity. Victims are isolated from the society if she reveals herself as victim. The subject finally says, society should accept the victim and society must not see her as victim.

GENDER : FEMALE (RURAL), AGE: 22

The researcher had a direct interview with the case from rural background. The below mentioned are the views of the case. She says, It is the individual who use the situation for such cruel activity. Cultural changes cannot be the main cause, Irritated thought and empathy will be the first emotion for the case, The victims is deprived of family support, Differences exist only for a short period of time; as time elapses, the incident also elapses from victim's mind automatically, Media plays vital role but not in positive way, The entire world seems to be dark at first, hence suicidal thoughts arouse, The society blames the victim for getting raped. when it comes to punishment for the rapist, she says, hanging is insufficient for such cruel activity but rapist should be punished cruelly.

Hemanatchatra

GENDER : MALE (RURAL), AGE : 23

The researcher had a telephonic conversation with the case and has come out with the following suggestions and criticisms. The below mentioned are the views of the case. He implies on a few impacts that are to be specified and emphasised. The followings are his views, Situation is the main cause for this issue, aversion towards the rapist, Media has major role for this traumatic issue, common people are unaware of things happening around them. They are dumped in the dominated world, victims are murdered in the name of 'mercy killing' he also says, proper education will prevent this issue and he says, Immediate death sentence will be the best punishment for this cruel activity.

After the analysis of all the experts' views, it is proved that victims are not ready to be accepted by the society and in most case, by their own family members. People should understand that a traumatised victim undergoes an emotional upheaval. Instead of comforting her, the society blame her for being in the place and time, blames her dress. That's ridiculous. The researcher wanted to voice out for the traumatised victims. A severe punishment should be given to the rapist.

ABSTRACT

This paper re-examines punishment in *Crime and Punishment* not as a legal reverberation but as an internal ailment that heads and surpasses legal sanction. Critics have long reconnoitred guilt, reclamation, and Christian morals in Dostoevsky's novel, but never concentrated on the essential dislocation of castigation from procedural authority to psychic configuration. This paper argues that the novelist Dostoevsky reconceptualise punishment as an existential–psychological regime enacted within conscience itself. Raskolnikov's suffering unfolds prior to arrest and independently of sentencing; the state formalizes what the self has already initiated. Drawing upon existential philosophy (Kierkegaard, Sartre), psychoanalytic moral theory (Freud), and accounts of disciplinary modernity (Foucault), this essay demonstrates that the novel anticipates modern theories of internalized authority and self-surveillance. Punishment becomes phenomenological before it becomes juridical. In relocating penal power from court to consciousness, Dostoevsky offers a prescient meditation on modern subject formation.

Keywords: Interiorized punishment; existential guilt; carceral subjectivity; moral phenomenology; disciplinary modernity; Dostoevsky; conscience; surveillance

**Saratha Lakshmi and Gomathi**

INTRODUCTION

Few novels have been examined as persistently as *Crime and Punishment*, and yet the question of punishment itself remains curiously under-theorized. Critical discussions frequently center on guilt, spiritual rebirth, nihilism, or Christian redemption. Others interpret the novel as a philosophical rebuttal to utilitarian ethics. In many such readings, punishment appears as a legal inevitability or as a redemptive instrument. What is often left implicit is a more radical possibility: that Dostoevsky quietly relocates punishment from the juridical sphere to the structure of consciousness. This essay proposes that Raskolnikov's punishment begins not with arrest, nor with confession, nor with exile to Siberia, but with the awakening of self-consciousness after the act. The law enters late; conscience arrives immediately. By the time the state intervenes, punishment has already taken hold in another register. The novel thus stages a transformation in penal logic: from externally imposed sanction to internally administered suffering.

The argument unfolds in three movements. First, I examine how Raskolnikov's philosophical experiment collapses into existential anxiety, suggesting that punishment arises from the impossibility of escaping moral embeddedness. Second, I analyze the phenomenology of guilt as embodied and spatialized experience, where the psyche becomes a tribunal and the city becomes an extension of interior confinement. Finally, I situate the novel within broader theories of disciplinary modernity, arguing that Dostoevsky anticipates later accounts of internalized power and subject formation.

The central claim is not merely that Raskolnikov feels guilty. It is that Dostoevsky reconceptualizes punishment itself as a form of interior carcerality — an invisible prison structured by self-surveillance, fragmentation, and moral anxiety.

Psychoanalytic theory clarifies the dynamics of internalized authority and self-reproach. Rather than retroactively imposing twentieth-century theory upon a nineteenth-century novel, the aim is to show how Dostoevsky dramatizes structures that later theorists articulate systematically. Existential phenomenology illuminates guilt as ontological condition rather than social emotion. An interdisciplinary hermeneutic approach is used in this paper. Theoretical reflections on disciplinary power help conceptualize punishment beyond spectacle or coercion. Close textual analysis remains foundational throughout.

The protagonist's "extraordinary man" thesis is often summarized as ideological arrogance. "Man is sometimes extraordinarily, passionately, in love with suffering" (Dostoevsky 451) Yet it is more unstable than that. His theory does not merely justify murder; it functions as a hypothetical flutter. He seeks to test whether he can exceed normal ethics — whether he belongs among those rare individuals who may violate ethical norms in service of historical necessity.

The murder of the pawnbroker is therefore less an act of greed than a philosophical experiment. If certain individuals may step "over" moral law for the greater good, then the crime becomes proof of exceptional status. The act is meant to confirm sovereignty. But the narrative quickly undermines this aspiration. The second, unintended killing of Lizaveta exposes the fragility of Raskolnikov's rational control. What was conceived as calculated transgression devolves into contingency and panic. Theory dissolves in blood.

Existential philosophy offers a helpful vocabulary here. Kierkegaard's description of anxiety as the "dizziness of freedom" resonates strongly with Raskolnikov's post-crime state. He attempts to inhabit absolute autonomy, yet freedom without moral mooring produces dizziness rather than authorisation. "Freedom and power, and above all power! Over all trembling creation and all the ant-heap!" (Dostoevsky 336) Sartre's later formulation that human beings are "condemned to be free" clarifies the paradox: one cannot escape responsibility by declaring oneself

**Saratha Lakshmi and Gomathi**

exceptional. The crime does not hoist Raskolnikov above moral law; it intensifies his awareness of it. Authority, breaks down into self-consciousness. What he confronts is not the triumph of autonomy but the inescapability of ethical relation. Punishment, in this sense, begins as ontological destabilization. Raskolnikov's psyche constructs its own tribunal. Ordinary encounters acquire accusatory charge. Casual remarks appear laden with hidden knowledge. Silence feels incriminating. He oscillates between defiance and paranoia, as though both prosecutor and defendant inhabit the same mind. One of the novel's most striking structural decisions is the delay of formal accusation. The investigation proceeds slowly; suspicion remains indirect. This delay is not merely narrative suspense. It foregrounds a crucial transformation: punishment unfolds independently of legal proof.

Psychoanalytic moral theory helps explain this dynamic. Freud later argues that guilt continues even without detection because authority is internalized. Yet Dostoevsky's portrayal extends beyond repression or neurosis. Raskolnikov's conscience is not abstract law but living dialogue — relentless, intrusive, inescapable. Significantly, his body participates in this tribunal. Fever, delirium, trembling, and exhaustion punctuate the narrative. The fainting episode at the police station — triggered not by accusation but by overheard conversation — reveals the body confessing before the mind consents. The organism registers guilt prior to juridical intervention. Punishment thus becomes somatic inscription. The body functions as penal surface; conscience as confinement architecture.

Dostoevsky's urban landscape reinforces interior imprisonment. Raskolnikov's room is repeatedly described as confined, throttling, and coffin-like. The metaphor does more than create mood; it anticipates burial and enclosure. Domestic space becomes cell. Saint Petersburg itself seems airless. Narrow stairwells, crowded streets, overheated taverns — these details accumulate into moral atmosphere. The city feels overheated with conscience. Public space becomes a field of imagined reconnaissance.

Here one senses a structure later theorized as disciplinary visibility. Yet unlike centralized surveillance, the gaze in Dostoevsky's novel is internalized. Raskolnikov does not need to be watched; he watches himself. Every passer by becomes a mirror. Every glance appears interpretive. The environment intensifies psychological confinement. Punishment is not merely emotional; it is spatially lived. He assumes that guilt will surface. Legal evidence becomes secondary to psychological inevitability. In suggesting that a guilty man inevitably revisits the scene of the crime, Porfiry articulates an anthropological claim: conscience seeks exposure.

This method anticipates the shift from spectacular punishment to corrective discipline. Yet the novel complicates any simple equivalence. Porfiry's strategy succeeds because Raskolnikov's conscience is already active. The state does not create punishment; it confirms it. The confession, when it arrives, feels less like capitulation to law than exhaustion before self-surveillance. Raskolnikov is never psychologically unified. Intellectual pride coexists with longing for human connection. Contempt for ordinary morality clashes with desperate need for recognition.

This fragmentation constitutes punishment. He becomes estranged not only from society but from himself. His interactions with his mother and sister are marked by discomfort, even hostility. Love becomes accusatory because it exposes vulnerability. Alienation here is neither exile nor imprisonment in the literal sense. It is self-division — the inability to inhabit a coherent moral identity. Modern accounts of subjectivity often describe the self as internally contested. Dostoevsky dramatizes these contest decades earlier. Punishment becomes estrangement from one's own continuity. If conscience functions as solitary tribunal, Sonya introduces dialogic possibility. She does not analyse Raskolnikov; she listens. Her suffering does not excuse his crime, yet it decontextualizes it within shared human fragility.

The confession scene between them is restrained rather than dramatic. There is no deafening moral commendation. Instead, there is quiet acknowledgment. In urging him to bow at the crossroads and acknowledge publicly, Sonya pleads for acknowledgment rather than mere defiance. Through her presence, punishment begins to shift. Conscience ceases to be purely isolating. Moral awareness becomes relational rather than solitary. Bakhtin's notion of polyphony

is relevant here. Raskolnikov's redemption emerges not through solitary reasoning but through encounter. Internal prison opens through dialogue.

The novel's conclusion complicates conventional expectations. Siberian imprisonment, rather than intensifying punishment, appears to stabilize Raskolnikov. The external prison provides structure that his fractured self-lacked. This inversion is significant. If the harshest suffering occurred before sentencing, then the juridical penalty functions almost therapeutically. The visible prison contrasts with the invisible one that preceded it. Dostoevsky thus challenges simplistic critiques of punishment. The state's authority is not glorified; rather, the novel suggests that interior disorder may exceed institutional coercion in severity. The paradox remains unsettling: external confinement may coincide with interior release.

Through displacing punishment within consciousness, Dostoevsky anticipates a distinctly modern configuration of power. In pre-modern regimes, punishment was public and spectacular. In modern regimes, it becomes subtle, corrective, internalized. Raskolnikov's suffering illustrates this transition. Surveillance operates from within. Discipline is self-administered. The subject becomes both prisoner and guard. The novel thereby prefigures theories of internalized authority and self-regulation. Yet Dostoevsky adds existential depth to what later theorists describe structurally. Punishment is not merely social control; it is ontological rupture. Conscience is not metaphorical prison. It is experiential enclosure.

Crime and Punishment redefines punishment as phenomenological condition rather than juridical aftermath. Raskolnikov is punished before he is arrested, imprisoned before he is sentenced, judged before he confesses. By staging conscience as carceral space, Dostoevsky relocates penal authority from state to self. The novel does not end in despair. Through relational encounter and acknowledgment, interior imprisonment becomes transformable. Punishment, in Dostoevsky's rendering, is not annihilation but reconstitution. The most severe prison is the divided conscience. The possibility of release lies not in evading judgment, but in inhabiting it truthfully. The novel anticipates existential philosophy's emphasis on responsibility, psychoanalysis's account of internalized judgment, and modern theories of disciplinary subjectivity.

ABSTRACT

August Wilson's *Gem of the Ocean* is an operatic melodrama. It's the first instalment play of the ten- play cycle which is popularly known as *Pittsburgh Cycle* or *Century Cycle* that presents the African American experience of the 20th century. The play is Wilson's most allegorical work dramatizing the African American history, cultural heritage and the predicaments of the blacks of America in general and of Pittsburgh, Hill District, Pennsylvania in particular. It is set in 1904 at 1839 Wylie Avenue. Though the play is set in 1904, it reflects the individual self and the social world of the whole decade in the lives of African Americans. The play has deep religious and spiritual significance. As the play's background is the time of the first Great Migration period of the blacks from the South to the North America in search of dignified and independent lives, it explores the acute mental trauma of them. The action of the play is a spiritual journey towards salvation from the sins. The present paper intends to bring forth the allegorical elements in the play.

Keywords: Sin, emancipation, spirituality, exploitation, African Americans, journey etc.

INTRODUCTION

The word allegory is derived from the Greek term 'allēgorein' which means "to speak figuratively." "An allegory is the expression by means of symbolic fictional figures and actions of truths or generalizations about human existence" (Webster's dictionary.com). In literature, allegory is a work that conveys truths or generalizations about human

Arul and Sathiyarajan

behaviour or experience. It is connotative rather than denotative in nature. The meaning of an allegory must be understood in two or three levels. The reader can understand it only through interpretive process. The outer meaning is less significant than the inner one. It is symbolic meaning that is more important than the lexical one. Allegories are like metaphors as the two illustrate an idea implicitly by making a comparison to the other. The only difference being allegories are full length stories with characters, but metaphors are simple figures of speech. John Bunyan's *Pilgrims' Progress* (1678) is the most notable example of allegory in English literature. The other remarkable allegorical works include Edmund Spenser's *The Faerie Queene* (1590), George Orwell's *Animal Farm* (1945), Nathaniel Hawthorne's *The Scarlet Letter* (1850), *Moby Dick* (1851) by Herman Melville etc. Generally, allegories are written in the form of short stories, fables, novels as there is ample scope in them to present something indirectly through simple narratives. Drama, on the other hand, has a little scope for allegory than the above genres. However, plays like *comedy of manners*, *absurd dramas* also depict society and human conduct implicitly through characters and events. August Wilson's *Gem of the Ocean* (2003) is one such play wherein African Slave Trade is presented indirectly through a spiritual journey undertaken by Citizen Barlow, the protagonist of the play. The present paper elucidates the allegorical elements in the play.

Explications of *Gem of the Ocean*

The external significance of the play is all about negroes' search for new life, predicaments of them in the process, crime, escape and search for redemption. However, implications of the play are far deeper than the outer meaning. The article first discusses the external meaning of the play. Citizen Barlow, the protagonist of the play, works at a local steel mill in Pittsburgh, Hill District, a north American city. The mill owners exploit the workers, who are all negroes, by paying meagre wages. Most of them migrated to the North from the Southern America because the slave owners were not letting the black slaves free although slavery was legally emancipated. Therefore, people like Citizen Barlow escaped secretly through the Underground Railroad. They reached Pittsburgh with loads of dreams and aspirations. However, even the North is not a bed of roses for them. It has its own thorns waiting for them.

Citizen Barlow and his friend Roper Lee join the mill for one and a half dollars as a day's pay. But on Friday, which is the payday, they are given only three dollars of which he must pay two dollars for the rent. They were also assured to be provided with something to eat at the time of joining. However, they are not provided so. He says to Aunt Ester, "What I'm gonna do? I got to eat. I bought a loaf of bread for a dime.... I ate half the bread.... Come payday they give me three dollars say the rest go on my bill. I had to give the man whatown the house two dollars. What I'm going to do Miss Tyler?" (Wilson, *Gem of the Ocean* 22). So, being desperate for money he stole a bucket of nails in the mill.

Unfortunately, an innocent worker, Garret Brown, was accused of the theft and was chased by Caesar Wilks, the black police. Brown felt it better to die rather than to be arrested and so, he committed suicide by jumping into a river. Knowing that he caused the death of Brown, Citizen is filled with guilt. His remorse makes him restless as it haunts him day and night. Hence, he wants to confess his guilt and to get his soul cleansed. So, he visits Aunt Ester, the cleanser of black souls. "I don't know Miss Tyler. I feel like I got a hole inside me. People say you can help me. I don't want to go to hell, Miss Tyler" (G.O.T.O. 23).

Aunt Ester, having pitied with him, guides him on a spiritual journey to the City of Bones on a boat called *The Gem of the Ocean*. Solly Two Kings, the former Underground Railroad conductor; Eli, the guard of Aunt Ester's house and Black Mary, the protégée of Aunt Ester, assist him in his journey. Citizen feels elated to see Garret Brown at the gates of the City of Bones. "The Gatekeeper... the Gatekeeper... It's Garret Brown the man who jumped in the river" (G.O.T.O. 52).

Aunt Ester asks him to confess his guilt to the man because she feels that we can right our wrongs by confessing them to the sufferers of the cause. Citizen feels it the right opportunity to redeem himself and immediately confesses, "It was me. I done it. My name is Citizen Barlow. I stole the bucket of nails" (G.O.T.O. 59). Thus, he can enter the city and returns having been washed off his soul. Sarah Bellamy's remarks are quite striking in this regard. "Citizen

Arul and Sathiyarajan

Barlow's trip to the city of Bones is a purification ritual in preparation for a life of service as well. He must atone for his sin before gaining entrance. The city is a place of reverence; it is searched, holy. One must be washed before entering its doors" (Bellamy, *The Birth*).

Having visited the city and got himself atoned Citizen becomes a responsible person and gets ready to take up the duty of Solly Two Kings i.e. liberating the blacks from the South to the North via Underground Railroad. His first responsibility is to bring Solly's sister back safely as she is tormented by her slave owners. The play ends at this point when he wears the hat and takes the walking stick of Solly as the latter is shot dead by Caesar for setting the mill on fire.

Implications of the play as an allegory

The article now discusses the implied meaning and significance of *Gem of the Ocean*. The play has far deeper sense than just the story of Citizen Barlow. Every character, object and event of the drama refers to a historical person, incident or thing of African American experience. Aunt Ester, for example, is said to be a 285-year-old woman but it is not so. Her age connotes the beginning of African slave trade to America. It's believed that the first ship carrying the slaves reached America on the day she was born. She is not just a character but a symbol of African tradition and culture in America. She is a link between the past and present African Americans as articulated by Elam who describes her as, "A critical figure mediating between the African past and the African American present, between the African past and Africanist-based spirituality" (Elam 184).

The protagonist, Citizen, was named after freedom to the blacks which was proclaimed on 22nd September 1862 by Abraham Lincoln. His name connotes not just a single man but the entire African people who became citizens of America after the slavery emancipation act, 1862. The antagonist, Caesar's name reminds us of slaves being named after ancient Greek and Roman kings and knights by white masters to belittle them. He's named after Julius Caesar, the great Roman military general. Similarly, Solly Two Kings' slave name was Uncle Alfred which he changed as Solly Two Kings once he became a free citizen. "You looking at Two Kings. That's David and Solomon.... Some people call me Solomon and some people call me David. I answer to either one. I don't know which one God gonna call me. If he calls me Uncle Alfred then we got a fight" (G.O.T.O. 27).

The journey taken up by Barlow to the City of Bones guided by Aunt Ester is totally allegorical. It refers to the Atlantic Slave Trade journey to America. It has deeper significance. Melinda D. Wilson, in her review of the play says, "However, in *Gem of the Ocean* the writer related the horrific ocean tale of the Middle Passage in such clear terms that the rides quickly turn from a story about African Americans to one about stolen Africans in America at the turn of the century" (728-729). It is remarkable to note that the journey which refers to the historical event of Middle Passage begins exactly at the middle passage of the play i.e. Act 2 Scene 1. The name of the play *Gem of the Ocean* denotes the name of the first slave ship from Africa. So, it is evident that August Wilson intentionally resorts to history in his plays to show the connection between the past and present to show a path for better future for his black fraternity.

The boat used for Citizen's journey is a paper boat that is moulded by Aunt Ester using her indenture document i.e. her bill of sale. Ester says, "Look at the boat, Mr. Citizen. That's a magic boat. There's a lot of power in that boat. Power is something. It's hard to control but it's hard to stand in the way of it" (G.O.T.O. 54). The statement alludes to the power of American slave masters who could buy or sell the slaves like property. Her bill of sale is no longer valid as she is no more a slave. Yet the white supremacy exists on the blacks. Caesar's arrest warrant against Aunt Ester for no serious crime in Act 2 Scene 4 is evidence of it. Thus, the legal papers also serve as allegorical devices for Wilson.

The City of Bones, where Citizen sails to, is in the heart of Atlantic Ocean through which Africans were traded as slaves by European agencies. It's formed out of the bones of the blacks who died during their journey to America. Some of them died due to sickness, a few committed suicides by jumping into the ocean as they didn't want to live like slaves and those who rebelled were forcibly thrown in the ocean.

Arul and Sathiyarajan

The city, which Aunt Ester declares that “is in the centre of the world and in time it will all come to light” (G.O.T.O. 54) emerged out of the white bones of the black slaves. It also connotes that though the Africans are dark externally their bones are equally white as those of the whites. Likewise, the blood of the two races is also equally red. However, the whites ignore the inner realities and feel superior to the blacks just by the virtue of their skin complexion. Wilson, through his theatrical weapon of drama, aims to censure such white attitude and intends them to realize how equal the two races are in spite of their skin colours. Citizen's spiritual journey to the City of Bones is quite significant as it symbolizes his visit of his ancestors and comes to know of their sacrifices. By visiting them he's redeemed and his mental peace is restored.

CONCLUSION

August Wilson who advocates the importance of being indebted to African culture proves it right through Aunt Ester who guides Citizen through a spiritual journey to the past. “Only by being touched by the past, by remembering the lessons of the ancestors, can the characters move forward. The African spiritualism conjoins with the practical American reality.” (Elam, Jr. 77). Although Wilson explores the African American predicament in the *Century Cycle*, he doesn't do so directly but in an implied and indirect way. So, the characters, places, events in the play alludes to the persons, places and incidents in the history of African American experience. The names of characters, places and objects in the play are like that of Bunyan's *Pilgrim's Progress*. The surface meaning of the play is simple yet there is complex deeper meaning that Wilson wants his audience to make out. So, the play has all qualities of an allegory.

ABSTRACT

The article deals with the current acute crisis of unstable climate change in India shifting patterns of monsoon, devastating flooding in Kerala and Assam, long drought in Marathwada, unprecedented-intensity cyclones (Amphan, Fani), and repeated heat waves in northern India. Although, the agricultural loss and policy response have been the primary topics of discussion surrounding climate, the affective and gendered aspects of the disruption have been terribly neglected. To shed some light on these queries, this paper resorts to Sunetra Gupta article, *Memories of Rain*, as a secondary source, a literary text that makes visible the tangle between weather, memory, and selfhood. Based on feminist affect theory, mostly on the idea of affective economies by Sara Ahmed, the article presents the notion of affective climatology to theorise the influences of meteorological conditions on subjectivity. It claims that the monsoon is growing more erratic, the sensory record of belonging shatters. To the people who have been left behind in Kerala, in flood-stricken regions, or in Marathwada, during drought, the change in the ancient weather conditions is a gradual unmaking of the world as they have known it. The paper challenges the very meaning of silence as affective refusal, and makes an intervention in climate justice politics by showing that the embodied, emotional realities of environmental change should be central to our perception and reaction to the Indian climate crisis.

Keywords: erratic climate change, affective climatology, feminist affect theory, gendered displacement, India, monsoon, climate justice, *Memories of Rain*, embodiment, affective refusal

INTRODUCTION

Introduction: The Unseen Dimensions of India's Climate Crisis

India is in a tricky situation. Over 2000 years the rhythms of the subcontinent have been managed by the monsoon, a predictable, life-sustaining power which controls agriculture, culture, spirituality and the finer details of everyday life. The coming of the monsoon rains has been celebrated in poetry, song and ritual; failure has brought famines and collective trauma. This climate-civilisation relation is more than practical, it is also affective in nature-the monsoon constructs the way Indians recall, belong, and define themselves within the world. And this old rhythm is disintegrating. In the last twenty years, India has experienced a series of climatic catastrophes that portend a drastic change in the environment. The disastrous floods in Kerala in 2018 and 2019 left millions without homes and transformed the understanding of the state towards its surroundings. Assam is threatened by floods every year which erode land and the permanence. The long droughts in Marathwada have caused agricultural distress, massive migration, and suicidal deaths of thousands of the farmers. Amphan and Fani, of record strength, were two cyclones that struck coastal West Bengal and Odisha respectively. The heat waves that have been occurring in most parts of northern India have exceeded the level of 50 making cities like Delhi, Jaipur and Churu to become inhabitable at least on extended periods. The monsoon itself now is unpredictable--it comes late, leaves early, descends in torrents that destroy instead of precautionary rain, and leaves parts of the land, and drowns others.

The climate argument that has risen in response to these crises has been defined by vital but limited issues: loss in agriculture and food security, damage to infrastructure and economic costs, policy response and adaptation. Such strategies are essential but they work within a paradigm which gives precedence to the quantifiable - crop outputs, losses in gross domestic product, kilometres of destroyed roads, displaced individuals - and ignores the emotional aspects of environmental change. The gap that this paper will discuss is critical: the affective and gendered aspects of climate disruption are severely neglected. What are the reshaping of weather patterns on subjectivity, memory and intimate nature of day-to-day living? What does the slow violence of climate breakdown mean when inscribed on the body, especially in the case of women whose lives are so bound up in the rhythms of the environment? What does it mean to lose not just a livelihood but a climate - the sensory record of home, the reliable regularity that organized the sense of time and place? These questions need a theoretical framework that is able to bridge the environmental, the emotional, the embodied.

This paper relies on the feminist affect theory (mainly, the idea of affective economies proposed by Sara Ahmed) to suggest that unpredictable climate change in India should not be perceived solely as an environmental crisis but rather as an affective crisis: a change that fundamentally changes the way people perceive belonging, memory, and selfhood. To theorise this, the paper presents the notion of affective climatology- analytical paradigm that shows the involvement of meteorological conditions in the formation of consciousness, memory and embodiment.

The paper resorts to literature as the second source to make visible what cannot be captured in policy reports and scientific data. The novel *Memories of Rain* (1992) by Sunetra Gupta does not reflect the modern-day climate crisis but creates a remarkable prism through which one can interpret the intertwining of weather and memory, as well as identity. Moni, the protagonist of the novel, bears in her the Calcutta monsoon of predictability, abundance and personal belonging. Her flight to England exposes her to a new meteorological order that is radically different: constant, chilly rain that is an indicator of alienation, confinement at home and gradual loss of self. In this juxtaposition, Gupta uncovers the role of climate as not as a backdrop but rather as an affective infrastructure -the force that forms consciousness, organizes memory and mediates the sense of home. The following is the structure of this paper. Section two provides the theoretical framework, which is based on the affect theory and feminist geography by Sara Ahmed to form the affective climatology. Section three explores the major problem which is unpredictable climate change in India where the changing monsoon patterns, extreme floods, droughts, cyclones, heat waves and the gendered aspect of this crisis have been recorded.

Section four presents *Memories of Rain* as a secondary source, discussing the role of rain as affective infrastructure and silence as affective refusal. Section five unites these threads and interprets the climate crisis in India through the

Aparna and Muththamizh Selvi

literary prism in order to reveal the emotional aspects of environmental disturbance. The sixth section places the argument in the current interventions of climate justice, transnational feminism, and feminist resistance. The conclusion discusses the implications of this framework when thinking about and acting regarding the climate crisis in India.

Theoretical Framework: Feminist Affect Theory and Affective Climatology

Sara Ahmed's Affective Economies

In order to comprehend the connection between climate, subjectivity, and displacement, the paper will rely on the feminist affect theory, especially the works of Sara Ahmed. Ahmed (2004) in *The Cultural Politics of Emotion* questions the belief that emotions are psychological states that exist in individual subjects and are private. Rather, she posits that emotions are circulatory forces that circulate among bodies, objects, and spaces. Emotions are not something that people possess, but they come about in contact, gaining value and meaning in their circulations through social fields. To explain this circulation, Ahmed coins the term of affective economies. Emotions in an affective economy act as capital: they acquire value through circulation, sticking to some bodies and places and repelling others. Emotions perform things in the world- they match one body to another, or to another, to generate limits between what is considered us and what is considered other, and what is worthy of attention and care. This framework is essential in explaining climate since it goes beyond the fact that emotional responses to climate change are considered as secondary responses. Rather, it recommends that climate is a part of affective economies: some climates are associated with intimacy, belonging, and home; others with alienation, danger, and displacement.

"Emotions are not simply 'in' the body or 'in' the mind; they are produced through the very relationship between bodies and worlds." — Sara Ahmed

It is based on this understanding that this paper argues that climate disruption is an affective rupture a disruption in the relationship between body and environment that upsets subjectivity fundamentally.

Affective Climatology: A Proposed Concept

Trying to apply the framework by Ahmed to the sphere of climate and environment, the current paper presents an idea of affective climatology. This is a two-fold notion. First, it speculates on the involvement of meteorological conditions in the formation of consciousness, memory and embodiment. Climate is not a background upon which human experience plays its drama, but rather an active process which organizes the way we experience, recollect, and associate ourselves with the world. Second, affective climatology offers a model of understanding the felt aspects of climatic disturbance the sorrow of missing the old weather patterns, the confusion of unpredictable weather, the gradual loss of identity that comes with environmental change. Affective climatology is informed by the experiences of several fields. It draws on the insights of environmental humanities that climate is not a disinterested physical phenomenon but a cultural and affective category. Within feminist geography, it integrates a focus on the differentiated effects of climate on gendered experience, in that the bodies, labour and responsibilities of women make them uniquely susceptible to climate change. It takes the insights of affect theory that affect are not incidental responses to environmental events but are constitutive of the experience and perception of said events. This concept is also a reaction to a major gap in climate discussion. Scientific and policy solutions to the climate change problem are biased toward what is quantifiable: carbon emission, warming, sea-level rise, economic damages.

These are necessary, but they are not able to reflect the subjective aspects of the environmental change. Affective climatology provides a language in which it is possible to express what is lost when a climate changes not just crops and infrastructure, but a sensory storehouse, a rhythm of life, a sense of belonging to the world.

Feminist Geography and Embodied Experience

This theoretical framework is further enriched by feminist spatial thought. Doreen Massey, Gillian Rose and Linda McDowell have all shown that space is not a neutral space but a gendered space that various bodies can engage with and navigate differently. Feminist geography stresses that domestic interior, public sphere, and natural environment are all locations of gender production and struggle.

**Aparna and Muththamizh Selvi**

Such an attitude is essential in realizing how climate disruption is experienced, especially in women. The life of women in most areas of India is intricately connected with nature cycles. Women are the main controllers of water, food and household resources; they are usually the first to feel the drought or flood impact because they are the ones who bear the consequences of these calamities due to the direct implications on their day-to-day activities. Feminist geography finds that these embodied everyday experiences need to be at the core of our perception of climate crisis, not considered as secondary to bigger issues. Feminist geography is concerned with the way domestic spaces the home, the kitchen, the courtyard are involved in mediating and experiencing climate. The displacement that Moni goes through as depicted in *Memories of Rain* is greatly influenced by the domestic interiors that Moni has to live in: the Calcutta house with the sound of the rain, the house in England with the rain turning into a cold and alien reality. Such spaces are not just places of action but agents of the generation of subjectivity.

Embodiment and the Politics of Silence

The body as a knowledge and resistance site has been integrated into this theoretical framework with a feminist approach. Things that are left unsaid, the feelings that cannot be expressed, and silences have been a major focus of the feminist theory. Instead of understanding silence as inactivity or lack, feminist critics have turned to the question of how silence might serve as a mode of resistance: a refusal to perform, to explain, make oneself available to assimilation. This paper redefines the silence of Moni in *Memories of Rain* as an act of refusal that was affective. Her silence is not the lack of agency, but another way of being in the world an embodied, non-verbal opposition to the pressures of assimilation and domestic containment. This reading relates to more general feminist discourse of how marginalised subjects escape by doing something that is not always decipherable within the paradigm of agency that identifies agency with vocal acts.

Primary Issue: Erratic Climate Change in India**Shifting Monsoon Patterns**

Indian monsoon is a highly complicated and far-reaching weather system on the planet. Its rhythms were astoundingly predictable, arriving in early June, slowly moving across the subcontinent, maintaining rainfall until July and August, and then retreating in September. This predictability organized the agricultural periods, religious holidays, nuptial periods and the daily beats of agricultural life throughout the sub-continent. In the last twenty years, this predictability has significantly been eroded. The monsoon is now characterized by what climatologists call an enhanced variability: a late start, a premature departure, a skewed spatial distribution and big outbursts of precipitation and extended dry periods. An example is the 2023 monsoon season which reported June deficits in rainfall across the nation of 36% and the July rainfall which was the highest in history resulting in devastating floods in various states. This trend extreme variability as opposed to merely decreased precipitation is typical of the effects of climate change in the area. The effects are much wider than agriculture. The old systems of knowledge that were established based on the predictable seasonal patterns are no longer useful. Producers who over many years have been accustomed to planting and harvesting at specific times are now faced with fundamental uncertainty. The emotional aspects of this change are immense: the monsoon was not only a weather phenomenon, but also a cultural and emotional landmark. Its caprice is a loss of direction, of the temporal cycles which organized collective and individual life.

Extreme Flooding Events

The 2018 and 2019 floods in Kerala are symbolic of the new climate regime. The state had 42% more rainfall than the average in 2018 and the destruction was not only a question of quantity. It received its rains in heavy downpours that overwhelmed infrastructure that was built in respect to a more predictable climate. More than a million displaced, more than 400 killed; whole villages under water weeks. The Kerala floods brought about the emotional aspects of climate disaster in a very harsh light. Not just material losses - homes, belongings, livelihoods - but the loss of a sense of safety and the turn to landscapes that were once familiar, into dangerous ones, were described by survivors. Rivers that were recreation and means of livelihood turned out to be sources of destruction. The hills which had characterized the beauty of the region turned into causes of fatal landslides. The disaster was not merely a phenomenon but a break in the interconnection between persons and place. The floods that occur in Assam bring

**Aparna and Muththamizh Selvi**

another, yet, just as distressing trend every year. In contrast to the sudden heavy rains in Kerala, Assam has frequent floods which are becoming the order of the day and even worsening. Every year the state is flooded with huge territories; every year, the communities are rebuilt. This periodical trend is a gradual undermining of permanence - it is a constant sense of precarity that is infiltrated into the texture of life. To the population in flood prone areas the question is not whether the floods will occur but how big it will be and how much it will lose. Flooding in cities like Mumbai (2005, 2017, 2021) and Chennai (2015) demonstrates an additional aspect of climate disruption. These happenings crippling megacities reveal the vulnerability of the infrastructure to another climate. They also show the unequal distribution of climate vulnerability: the poorest citizens, those residing in informal settlements, are always the most impacted, losing both their homes and livelihoods as well as experiencing the slowest recovery routes.

Droughts and Water Scarcity

The Marathwada area of Maharashtra has become a household name when it comes to drought and distress of farmers. This series of droughts have destroyed agriculture and thousands of farmers have taken their own lives, a crisis that has emerged to be one of the most painful experiences of climate vulnerability in India. Droughts do not merely consist of lack of rain but are metamorphoses of whole lifeworlds: wells dry up, harvests fail, debts grow, and families disintegrate as men move into city in search of employment. The emotional aspects of drought and flood vary significantly. Where flood is instant and dramatic, drought is gradual and cumulative--a crisis that is years long, and destroys hope in bits. This theorisation of slow violence, introduced by Rob Nixon, which, rather than spectacular violence, is systemic, not an event but a prolonged process, is most suitable to describe the drought in the Marathwada: every dry season adds to the precarity of the next; every failed harvest adds to the structural crisis. Urban water crisis was a problem that was highlighted by the Chennai water crisis of 2019. Millions of people had to rely on water tankers when the reservoirs of the city became dry, and the cost of water increased significantly, showing the weakness of urban water infrastructure.

In the case of women, whose responsibility is the primary one in household water management, the crisis was translated into hours of waiting until tanker deliveries and having to endure circumstances of the highest level of shortage. The drainage of groundwater in the North and West of India is a more enduring and possibly unresolved crisis. The use of groundwater in the Green Revolution could never be long-term, and in some states, including Punjab, Haryana, and Rajasthan, the water tables are dropping at alarming rates. This is a slow-moving crisis- the crisis that will eventually decide on whether these areas will be habitable.

Intensifying Cyclones

One of the most severe cyclones in the Bay of Bengal was cyclone Amphan that hit West Bengal and Odisha in May 2020. The fact that it came in the COVID-19 pandemic made it a compounded crisis that overwhelmed response capabilities. The Sundarbans, the habitat of some of the most vulnerable communities in India, was destroyed. Historically the mangrove forests that were protecting the coastlines were violated; salt water intrusion was into the freshwater sources and long-term effects on agriculture and drinking water were experienced. Hurricane Fani that hit Odisha in 2019 illustrated the growing strength of the tropical systems and the importance of disaster preparedness. Fani was the most powerful cyclone to occur in the state since 1999 but the number of deaths was kept relatively low due to the massive evacuation efforts. However, this success should not blind one to the overall trend: the cyclones in the Bay of Bengal are getting increasingly more severe, with increased wind speed and storm surge. To the communities living on the coasts, this would be a more dangerous life, and every cyclone season would be accompanied by the threat of devastating destruction.

Recurring Heatwaves

Hot waves in the northern and central parts of India have become common during the summer months. The high temperatures of over 50 degree C in cities like Delhi, Jaipur and Churu are not rare but expected events. The human cost is high: death due to heat, labour disruption, and physical and mental fatigue of life in extreme temperatures. Disproportionately impacted are outdoor workers, such as farmers, construction workers, street vendors, who cannot escape to air-conditioned areas due to heatwaves. These laborers, who are mainly representing the marginalised

**Aparna and Muththamizh Selvi**

groups, have to make the inexplicable decision of how to earn a living and monitor their health. The gendered aspect is also important: the care work of women never stops despite the increased temperature, and the bodies of women are more susceptible to heat stress.

Gendered Dimensions of Climate Disruption

In all these manifestations of unpredictable climate change, gender stands out as an essential axis of vulnerability and experience. Climate disruption is affecting women in India disproportionately due to a number of reasons that are interrelated. To begin with, women are main administrators of water, food and household resources. When there is drought, women walk further to get water; when there is flooding, women are expected to evacuate children, save home appliances and take care of the domestic environment given the circumstances of crisis. This labour can seldom be included in economic evaluations of climate effects, but it is the day-to-day experience of climate adjustment by millions of women. Second, climate disruption cuts across gender inequalities that already exist. Women lack access to resources, credit and decision-making structures; they are poorer; they experience more restraints to mobility and labor. These systemic inequalities undermine the ability of women to recover in case of climate shocks in a systematic manner. Third, migration is redefined by climate pressure. With agriculture no longer being viable, men are more likely to move to the city to find employment, and women are left to run rural households in more vulnerable positions. This change can both augment the loads of women and produce convoluting and conflicting types of agency. Lastly and most relevant to the main argument of this paper, the emotional aspects of climate disruption are gendered as well. The disappearance of well-known environmental rhythms, the sorrow of abandoning homeland, the fear of dark futures, all this is experienced unequally in terms of gender. But these emotional facts are mostly excluded in the climate discussion and climate discussion still continues to favor quantifiable effects more than experience.

Secondary Source: *Memories of Rain* as Literary Lens**Overview of the Novel**

The novel *Memories of Rain* by Sunetra Gupta (1992) cannot be easily categorised. It features the tale of Moni, a Calcutta woman who marries an Englishman, Anthony, and moves to England. The story moves back and forth between the memory of monsoon-dipped Calcutta and the frosty, grey existence of her English homeland. It is a migratory novel, a novel of endurance of love and dissolution of love, the functioning of memory, not as a chronology but as experience of immersion of the senses and feeling of returning. *Memories of Rain* is a novel about climate as an affective force at its core. Rain is not just a motif, or a symbolic tool, but the medium by which memory works, the tool which orders consciousness. The title of the novel indicates this: the novel is not a novel about rain, but one where rain is memory.

Rain as Affective Infrastructure

Rain as used in the novel by Gupta serves as what this paper refers to as affective infrastructure. It is not an inert component, a context in which actions take place, but a dynamic force that determines how the characters experience, recall and connect with the world. The Calcutta monsoon is captured in sensory detail: the beat of rain on tiled rooftops, the smell of wet soil, the sensation of the moisture on the skin, the taste of the rain-wet air. It is not only evocative description but the statement of the climate which has become constitutive of the subjectivity of Moni. The monsoon implies intimacy - between Moni and her mother, between Moni and nature, between Moni and a state of herself that existed before migration. It is sensuality: a body relationship to surroundings, which is pre-verbal and pre-rational. Most importantly, it is a pre-migratory belonging, being at home in the world, both geographical and affective. The rain in England is the opposite. It is described as long, grey, and cold and lies on a landscape that is never quite home. The contrast between the two rains is not only one of quantity or intensity but of quality: the monsoon rain is the rain of life; the English rain is the rain of death. This distinction is not objective--rain is rain--but affective. The same weather event generates radically dissimilar experience due to the affective economies it traverses.

Aparna and Muththamizh Selvi

Climate and Memory

Of special relevance to the argument in this paper is how the novel handles the issue of memory. The process of memory in *Memories of Rain* is not linear and cognitive. Moni does not merely recall things in chronological order, but memory exists in rhythms of repetition, immersion and revisiting, which resemble rainfall itself. This is not just a narrative device but a substantive assertion concerning the nature of memory. According to Gupta, memory is not a storage system, but a circulation of affect- a movement of feeling which links past and present, self and environment. The vehicle of such a circulation is rain since rain is the substance that glues Moni body to her recalled world. The rain does not evoke individual memories but a condition, a sense of belonging that is beyond time. Such a conceptualisation of memory carries deeper implications to the way we conceptualise climate disruption. When the memory is organized around climate, when the monsoon has not been recalled, but actually is the medium by which memory is produced, then the crisis of climate is not just an environmental crisis but a crisis of memory. The sensory storehouse of belonging breaks apart when the monsoon turns unpredictable. Losing accustomed weather formations, what is lost is not only agricultural productivity, but a system of feeling, a sense of time.

Silence as Affective Refusal

The last aspect of the novel that is relevant to the argument presented in this paper is the issue of silence. Moni is not such a character who expresses her experience in pure, political words. The expression of her opposition to the pressure of assimilation, to the loss of her identity in England, is articulated not by voice but by silence, by withdrawal, by the inner maintenance of her memories of the monsoon. In this paper, the silence of Moni is redefined as affective refusal. Instead of hearing it as passivity a loss of speech, of resistance, of adaptation, it is perceived here as another way of being in the world. Moni rejects the act of being translated, to render herself readable, to fit into the framework of her new setting. This silence is not a lack but a quality of another order: the maintenance of a self which is not assimilable. This reading relates to a significant amount of feminist existing literature on the politics of silence. Feminist theorists have suggested that silence may serve as a resistance, a refusal to act, to elucidate, or to avail oneself of consumption. The necessity of women to speak, to share their experience, to represent their culture may in itself be a form of violence in the case of women in displacement. The silence of Moni is her rejection of such an economy of visibility.

Analysis: Reading India's Climate Crisis Through *Memories of Rain*

The Monsoon as Archive of Belonging

To Moni, the Calcutta monsoon is a place of sensory abundance and predictability not only nostalgia, but an archive: a place to store selfhood, belonging, and ways to be in the world. The rhythms of the monsoon organized her childhood, her relations with her mother, her time and space sense. She leaves India with this archive in her and it turns into an inner landscape against which she evaluates all subsequent experiences. This is what the unpredictable climate change in India is threatening. To the ones who are left in areas where even the monsoon has become erratic, sensory archive of belonging has not been lost in the process of migration but changed. The very monsoon which was the source of life and stability turns out to be a source of anxiety and loss. The tunes that organised the life of collectivity turn unreliable. The demise of the monsoon as a predictable rhythm is accompanied by the demise of time orientation. The association between time and meaning shatters when the seasons fail to come as they should, when the indications that have always been a sure guide to planting or harvesting are no longer available. This is an irreconcilable loss that cannot be quantified in economic terms, but it is a loss, an experience of loss that restructures the way individuals live their lives.

Climate Displacement as Affective Rupture

The emigration of Moni to England can be interpreted as the structural analogy to the inner displacement by the climate change. Environmental change has not physically displaced her, she has migrated on the basis of marriage. But her experience--the deprivation of a familiar climate, the loss of place in a new meteorological regime, the gradual loss of selfhood--is the same that climate-displaced people face. This does not mean voluntary migration is to be conflated with climate displacement, but only to indicate that literature can shed light on aspects of climate experience that are habitually submerged in policy discussions. The experience of Moni shows that climate is not

**Aparna and Muththamizh Selvi**

only a physical environment but also an emotive territory, a place belonging, which is at the same time a geographical and emotional one. The loss of climate is the loss of a constitutive element of oneself. This emotional aspect is seldom addressed in the case of floods in Kerala or drought in Marathwada, where people are displaced. The policy discourse is concerned with resettlement, compensation, and infrastructure all needed, none of which is sufficient. Always lacking, however, is the consideration of the sorrow of the loss of climate, the confusion of living in a changed world, the gradual loss of identity which goes with environmental displacement.

The Gendered Body as Site of Climate Experience

The location of the convergence of climate, memory and displacement is the body of Moni. The monsoon is in her body--the dampness of her skin, the beating of the rain in her ears, the scent of wet soil in her mind. Her body recalls what the world around her refutes when she is in England. This corporal memory is not distinct of her consciousness but a constituent part of it. This has a direct bearing on the comprehension of the process of women facing climate disruption in India. Female bodies are the places where the environmental crisis is most frequently registered acutely. Women have to carry water through drought-stricken land; women have to cope with extreme circumstances when there is a flood; women have to endure physical and emotional consequences of running a household in growingly precarious conditions. However, these experiences of the body are always peripheral to climate discourse. The concern of policy, economics, and infrastructure makes the body irrelevant--as though climate disruption were felt mainly at the data level rather than at the level of sensation. The story of Moni says not: climate becomes lived and becomes lived in and through the body.

Affective Climatology in Practice

The combination of the theoretical framework, the main issue, and the literary lens will reveal in this paper affective climatology as a method of analysis. Affective climatology examines:

- The role of the meteorological conditions in the formation of consciousness, memory, and embodiment.
- How climate can be thought of as affective infrastructure - a structuring power of emotion and identity.
- How climate disruption is an affective discontinuity that alters the correlation between the body, memory and world.
- The gendering of these dimensions, whereby the burden falls on women in their bodies and lives in a disproportionate manner.

The application of this framework to the climate crisis in India makes evident aspects that are not visible in traditional methods. The sorrow of the farmers in Marathwada, the bewilderment of communities in flooded-out Kerala, the vulnerability of the coastal communities against the growing cyclones- these are not adjunctive to the actual crisis of environmental change. Crisis is what it is experienced. Affective climatology offers a discourse in which to express this lived experience.

Contemporary Interventions: Climate Justice, Transnational Feminism, and Affective Refusal**Climate Justice Discourse**

The climate justice movement has done vital work in future telling the inequities of climate change: that the most impactful effects are borne by those who have contributed least to carbon emissions; that climate change is multiplying the existing inequalities; that solutions should focus on the needs of vulnerable communities. The thesis of the paper is that climate justice should go beyond that: it needs to address the affective aspects of climate disruption. Justice is not simply a question of the material means, of compensation, of resettlement, of infrastructure, but of acknowledgment of losses that cannot be given up. The disappearance of a known climate, the sorrow of the changing environment, the confusion of unpredictable seasons--all these are types of loss that must be noted, although they can not be measured. Affective climatology also adds to the discussion on climate justice by arguing that the perceived aspects of environmental change are not peripheral but core. The fact that these dimensions are ignored or not sufficiently scientific by policy frameworks is itself complicit in a kind of epistemic violence- they refuse to acknowledge the loss.

**Aparna and Muththamizh Selvi****Transnational Feminism**

Migration, gender, and globalisation are other transnational feminist issues the paper interferes with. The experience that Moni shares in *Memories of Rain* throws light on the hidden expenses of cross-cultural marriage and displacement that have often been shrouded in jubilant accounts of globalisation. Transnational feminism has been vocal in its disavowal of migratory discourses of liberation that assume migration to be free of the gendered limitations and violence through which migrants are organized. This paper builds on this criticism by paying attention to the affective aspects of displacement, the gradual loss of self, the sadness of the lost belonging, the emotional work of assimilation. In the case of women in transnational marriages, the pressure to assimilate, to learn new languages, new practices, new ways of being, is usually complemented by the pressure to forget. It is often necessary to leave the self that existed in order to become a good wife in a new country. The silence of Moni is a rejection of this request—a saving of the self which cannot and will not be assimilated.

Silence as Feminist Resistance

Lastly, this paper is a contribution to the feminist discourse of resistance, agency, and politics of voice. The implicit valorisation of voice, as the means of resistance, speaking out, telling oneself, making oneself visible, is the mode of resistance yet is implicit in much of the contemporary feminist discourse. Silence in this context can be typically interpreted as inactivity, lack, or incompetence. The present paper will make the contrary argument, as feminist theorists have redefined silence as a type of agency. The silence of Moni is not a refusal to resist, but rather a refusal to engage in an economy of visibility that requires self-explaining. It is non-verbal, embodied manner of being that maintains a non-assimilated self. This reading has more general implications to the interpretation of how the marginalised subjects resist. Not every resistance can be read within the frameworks that hold the equivalence between agency and vocal expression. Recognizing silence as a resistance is to broaden our definition of what resistance may appear like and where we may find resistance.

CONCLUSION**Summary of Arguments**

As I have argued in this paper, erratic climate change in India should not just be perceived as an environmental crisis but an affective rupture, in other words, a change that, at its core, changes the way people feel belonging, memory, and selfhood. The paper theorised this by introducing the concept of affective climatology, using the feminist affect theory of Sara Ahmed to explain how the meteorological conditions are involved in subjectivity formation. The paper has analyzed the main problem of unpredictable climate change in India in various forms: changing monsoon patterns, severe floods in Kerala and Assam, droughts in Marathwada, increasing cyclones Amphan and Fani, and constant heat waves in northern India. It stated that the gendered aspects of this crisis such as the unequal distribution of the burden on women, the ways in which climate disruption crosses with preexisting inequalities are of dire need in current climate discussions. Using the secondary source *Memories of Rain* by Sunetra Gupta, the paper has shown how literary work may bring into visibility what a policy report and scientific data fail to record: the interplay between weather and memory, and selfhood; the role of rain as an affective infrastructure; the role of silence as an affective refusal.

Broader Implications

The implications of this paper are in various fields. In its argument concerning climate, it contends that the affective and gendered aspects of environmental change need to be taken into consideration. To the feminist theory it applies affect theory to climate and environment and suggests a new framework of analysis, affective climatology. In the case of literature, it also proves the value of literature as an invaluable source of knowledge about crises nowadays not only as a reflection of them but as a way to analyze them with the help of conceptual means. To achieve climate justice, the paper demands that justice encompass the understanding of affective loss: the sorrow of the loss of accustomed climates, the incomprehension of the transformative environmental change, the gradual loss of self that

Aparna and Muththamizh Selvi

comes along with displacement. Such losses are not compensable, yet they can be recognised. Justice in itself is recognition.

Future Directions

The paper has provided some opportunities to further studies. Affective climatology can be applied to other locations and situations, whereby the question of how climate disruption forms subjectivity in various cultural and geographical contexts is considered. Gender-climate migration needs to be considered more closely, especially since climate-related displacement is increasing in the world. The contribution of literature and other cultural manifestations in expressing the sensory aspects of change in the environment should be explored more thoroughly and extensively by scholars. With an even more uncertain climate outlook in India, structures that can fully reflect the proportions of the crisis are becoming all the more pressing. One such framework is affective climatology, the manner of attending to the loss involved in changing climates, and the saving that climates carry into the memory and bodies of those who bear their climates with them.

ABSTRACT

This research article delves into the crisis of masculinity found in the novel *One Part Woman* written by Perumal Murugan. This article focuses on the intersections between infertility, patriarchy, and male identity in patriarchal society. In a patriarchal society, masculinity is often defined by virility, sexual ability, and fathering children. As a result, men's infertility has become a social and psychological threat to a man's identity and self-esteem more than a personal or biological issue. Through Kali's character, the novel reveals the emotional pain, shame, and isolation faced by a man who cannot live up to society's ideals of manhood. While infertility is usually associated with women, Perumal Murugan shifts the focus to men's suffering and discusses the silence around male infertility in patriarchal discourse. The novel also describes Ponna's sufferings to demonstrate how reproductive expectations oppress women and impose strict gender roles. Ultimately, the novel critiques patriarchal systems that reduce both men and women to reproductive roles and demands for a more compassionate and inclusive understanding of gender identity beyond fertility and societal norms.

Keywords: Masculinity, Patriarchy, Male Infertility, Identity Crisis, Social Stigma, Gender Roles, Silence.

INTRODUCTION

Perumal Murugan in his novel *One Part Woman* critiques patriarchal norms by focusing on the character Kali, whose childlessness challenges traditional definitions of masculinity. The story of this novel revolves around the lives of Kali and Ponna, a married couple who reside in a rural area of Tamil Nadu called Tiruchengode. As a farmer, Kali also has livestock to care after. His childlessness is the one issue that causes the entire family to suffer, despite the fact

**Vinothini**

that he makes a good living and provides for his mother and wife. The author describes the couple's joyful life as follows: "Other than the lack of a child they could call their own, there was nothing else missing in their lives. He fulfilled every wish of hers, perhaps because he had married her out of love" (OPW 28).

He immediately plants the portia tree in the front yard of his father-in-law's house after being married to Ponnayi. The tree thrives for twelve years, but the couple is not fortunate enough to have a kid during that time. As a result, the portia tree serves as a metaphor for Kali and Ponnayi's lack of children during their marriage. Despite multiple efforts at mating, one of Kali's cows is unable to produce a calf. To get rid of the cow, he plans to sell it to Gounder. Ponnayi is busy cleaning the cow shed while Kali is talking to Gounder. She overhears Gounder saying the following to Kali: "It is fate, mapilliai. That is just how some cows are. No matter what you do, they never get pregnant. Just quietly change the cow. If you say yes, I can fetch you one right away" (10). Though he says these words with a smile, Ponna recognizes the meaning immediately. Her heart feels heavy.

Kali is insulted by his friends and the public. Once his friend Bommidhi Mani teased him with a question: "Do you have children?" (OPW 19). Kali thinks of scolding him with the words: "I may or may not have children. What is it to you? Shut up and leave" (OPW 20). But he never yells. Something stops him from "reciprocating their rudeness" (OPW 20). Their vulgar jokes and insinuations expose the social expectation that a man's worth depends upon his ability to father a child. One of Kali's friends mockingly remarks that "work is not about this," while making a lewd gesture, suggesting that Kali has failed in his sexual "duty" (OPW 82). Kali likes to dance during the festival and he likes to spend time in the crowd. But Kali stops attending this dance when his friends teased him for being childless. People would talk in front of him as follows: "Only the man who induced morning sickness in his wife in the very second month of marriage was a real man" (OPW 82). Since his friends are interested only in teasing Kali, he gradually stops joining this crowd of old friends. He also knows that they have nicknamed him "the impotent one" (OPW 83). All these comments from his friends make him ponder the fact whether he is impotent or not. Though he is not interested in the second marriage because of his love for Ponna, the next reason that stops him from getting married is his fear of impotency. Another comment states that when a woman remains physically unchanged after marriage, it indicates that "the husband's 'work' was not up to mark" (OPW 82). Similarly, the metaphor comparing bodily intake and output — "it is not enough that the water you take in is great, the water you send out should be top-class too" (83) — directly associates male fertility with masculine competence. These remarks project how masculinity is closely linked with fertility and sexual performance within patriarchal society. In a book titled *Exploring Masculinity* says, Kamla Bhasin opines as follows: "A man who cannot perform sexually is called 'impotent', considered weak, powerless, non-male. According to this yardstick, a man's power/potency is located in his sexual organ. Impotence in a man is not just a shortcoming, it's a disgrace." (EM 35). In the same way Perumal Murugan has highlighted the psychological burden imposed upon men. This shows that patriarchal ideals of masculinity are fragile and are constantly subjected to public scrutiny and validation.

Ponna also experiences humiliation in her community because she is childless. She is repeatedly labelled as "barren" and excluded from social gatherings. People also believe that her presence might bring bad luck to their families. Neighbours and relatives mock her and blame her for any misfortune that occurs in their lives. For example, when Kadhivel's son is injured while staying at Ponna's house, the boy's mother angrily accuses Ponna. This incident is indeed suggesting that only a mother can properly care for a child, thereby blaming Ponna for the child's injury. This situation reveals the harsh criticism and emotional pain Ponna faces. It emphasizes the patriarchal belief that a woman's worth is tangled to her ability to have children.

Ponna and Kali involve in a sequence of religious rituals and traditional practices in their desperate attempt to conceive a child. Their actions include prayers, participation in ceremonies, and the consumption of bitter medicines given by Ponna's mother-in-law. This reflects the cultural pressures and expectations placed upon them. They also perform a goat sacrifice, light a lamp, and circle a sacred rock, signifying their profound commitment and willingness to take significant risks to overcome infertility. Murugan critiques this notion through the characters of Kali and Ponna. The author describes it as follows: "In the matter of offering prayers, Kali and Ponna left no stone unturned.

Vinothini

They did not discriminate between small and big temples. They promised an offering to every god they encountered. For the forest gods, it was a goat sacrifice.... For some gods, the promises even doubled" (OPW 47).

Under continuous familial and societal pressure, mostly from her mother-in-law, Ponna is compelled to participate in the fourteen-day chariot festival at the Ardhanareeswara Temple. She unwillingly consents to the proposal and says, "If you want me to do this for the sake of this miserable child, I will" (OPW 86). This festival is characterized by its briefly relaxed social customs, allowing unions between men and women in quest of fertility. Kali fervently opposes Ponna's participation in the Chariot festival and the possibility of her having relations with another man. He also fears that this man might belong to an untouchable caste. For Kali, Ponna's potential pregnancy impends his constructed sense of masculinity, revealing his supposed impotence. On the other hand, Ponna's femininity is closely tied to her reproductive capacity. Her ability to conceive is essential not only for confirming her female identity but also for bearing an heir to bear familial influence and authority. This emphasizes how gender identities in the novel are socially constructed and enforced. Deviations from prescribed roles invites severe social condemnation. Perumal Murugan's novel thus reveals the oppressive nature of these gender norms and the psychological and social costs they exact on individuals.

Kali's fear of entering into a second marriage is a display of his deep insecurity about his masculinity and fertility. Despite societal pressure to remarry for the sake of producing an heir, Kali resists the idea. He fears that a second childless marriage would irrevocably confirm uncertainties of his impotence. He thinks as follows "if the second woman too could not get pregnant, his reputation as an impotent man would be engraved in stone" (OPW 84). Kali's refusal arises not only from emotional attachment to Ponna but also from a deep-seated fear of social humiliation. This echoes the patriarchal construction of manhood that equates male identity with reproductive success.

Perumal Murugan further describes Kali's psychological burden through his silence and inability to openly confront societal interference. Although he longs to shout, "I may or may not have children. What is it to you? Shut up and leave!" (20), he chooses to remain silent in the face of intrusive and judgmental comments whereas Ponna occasionally responds with sarcasm. Through Kali's fear, hesitation, and emotional restraint, Perumal Murugan deconstructs the myth of unwavering masculine strength. He exposes how patriarchal expectations trap men in a unyielding cycle of anxiety over fertility, virility, and social reputation.

Thus, this novel *One Part Woman* exposes the subtle foundations of patriarchal masculinity by presenting infertility as both a biological and social crisis. Through Kali's emotional suffering, silence, and fear of humiliation, Perumal Murugan shows how masculinity is shaped by societal expectations of virility and reproduction. The novel also critiques patriarchal norms that confine both men and women to reproductive roles. It eventually encourages for a more compassionate and expansive understanding of gender identity that transcends fertility and social validation.

ABSTRACT

Shashi Deshpande is a significant contributor to Indian feminist literature, meticulously exploring the complexities of women's identity and expressing a deep dissatisfaction with traditional gender roles. This individual's contributions are characterized by their distinctiveness and impact, as her voice achieves a notable equilibrium between subtlety and assertiveness within the dynamic and evolving context of contemporary Indian writing in English. Deshpande adeptly explores the complex layers of the female psyche, offering a deep analysis of the individual and collective societal challenges women face. The author's body of work effectively captures the essential qualities of womanhood, delving into their existence's psychological, emotional, and intellectual dimensions. Alongside addressing the conflicts and turmoil that often arise in these endeavours, she skilfully examines their deepest yearnings, ambitions, and goals. Deshpande explores various pressing societal issues prevalent in modern India through her compelling narrative, prominently featuring feminism and gender dynamics. In the narrative *Moving On*, the author delves into feminist themes through the depiction of the protagonist's determined quest for self-identity and her courageous defiance against the constraining forces of patriarchy. This study seeks to systematically analyse the complex interplay of feminist thought present in Deshpande's oeuvre, which is in alignment with the diverse and multifaceted Nature of Indian culture. This work highlights her profound insights into the complexities of human existence and acknowledges her substantial contributions to the literary field. Deshpande's writing invites readers to explore the intricate realities of modern womanhood, fostering a nuanced comprehension of the contemporary female experience in its entirety.

Keywords: femalepsyche, Indian societal issues, feminism, gender dynamics, modern womanhood.

INTRODUCTION

The study of feminism represents a significant and evolving field within modern intellectual and literary discussions, highlighting its swift development and growing importance in contemporary society. This complex movement

**Kumara Swami**

involves essential ideologies that examine multiple aspects of human activity, such as politics, economics, culture, and social norms. Feminism fundamentally focuses on the emancipation of women, aiming to deconstruct the entrenched systemic inequalities and power disparities that exist within a largely male-centric society. Feminist thinkers and advocates engage in activism, scholarship, and artistic expression to rigorously challenge and redefine societal norms and expectations related to gender. This initiative aims to amplify women's voices and promote an inclusive discourse that examines the intersections of gender with race, class, sexuality, and various other social categories. The advocacy for rights and social justice within feminism seeks to empower women, facilitating their ability to assert their rights, pursue their aspirations, and redefine the narratives that have historically marginalized them. Feminism aims to effectuate transformation in individual experiences while also catalysing extensive societal change, advocating for a framework of equality and equity applicable to all members of society. Shashi Deshpande's writings underscore the evolution of social norms, which, despite undergoing transformation, have notably either endured or adopted new manifestations. Through deconstructing stereotypes that have historically limited women's roles, Deshpande challenges the reader to engage with their authentic essence. She aims to develop a novel portrayal of women that embodies both relatability and authenticity. Deshpande has carved a notable niche among contemporary Indian novelists by articulating the concept of freedom for Indian women in relation to the prevailing socio-cultural values and institutions of India. The author refrains from depicting excessively idealized female protagonists, opting instead to illustrate Indian women confronting authentic challenges as they negotiate the complexities of modernity and tradition.

As a woman, I have no country. As a woman my country is the whole world. -Virginia Woolf.

Simon de Beauvoir stated, "One is not born a woman; one becomes one," which holds special significance in India, where conventions and social taboos often restrict and inhibit women's individuality. The concept of femininity serves as a cultural construct that embodies societal perceptions of women. Shashi Deshpande elucidates the nuanced mechanisms of oppression and gender differentiation that exist within the familial institution and the broader context of male-dominated Indian society. As a writer, she offers critical analyses of the structures inherent in this patriarchal society. Their strength is evident in the selection of scenarios that resonate with a significant number of Indian women, emphasizing the experiences of women in the context of marital and domestic relationships. Bartky posits that women, regarded as free and autonomous individuals, navigate a societal landscape wherein men impose a perception of inferiority upon them, shaped by men's self-perceptions. Individuals are constrained by their subjugation through the mechanisms of male dominance over prevailing institutions and the overarching ideology.

To attain equality and fully realize their potential, women are required to move beyond their unique characteristics associated with femininity, thereby leading lives that are comparable to those of men; this necessitates the pursuit of autonomy. Beauvoir advocates for women's pursuit of autonomy and the exploration and cultivation of their genuine identities through experiential engagement, culminating in self-realization. This concept is relevant to Manjari as she engages with conflicting discourses in her quest for self-understanding and identity formation. Deshpande's latest novel, *Moving On*, presents a multifaceted narrative architecture that intricately intertwines various elements, drawing upon memory, lived experience, and textual documentation. The analysis utilizes the diaries of an individual who has passed away, resulting in a complex palimpsest of personal history that is intricately layered and intertwined within a dramatic framework. The narrative explores the intricate dynamics of affection and animosity between individuals, revealing the depth of their interactions through intense plotting and debate, thereby exposing the multifaceted Nature of human relationships. Deshpande presents a narrative that immerses readers in a realm of credible scenarios and intricately developed characters, eliciting empathy and engagement. The portrayal of every day yet profoundly authentic lives unfold within a meticulously crafted storyline.

Moving On examines the intricate dynamics within a Brahmin family, centering on the figures of Baba and Vasu, who are the parents of Manjari Ahuja. Manjari, a widow, presently occupies the ancestral residence located in Bangalore. In her pursuit of a mentally and physically enriching existence, she teaches yoga classes tailored for the children in her community as she progresses through the aging process. A persistent anxiety surrounds her regarding the

**Kumara Swami**

potential unforeseen sale of the property registered under her daughter Sachi's name. The individual experiences a plethora of irrational fears, anxieties, fantasies, and nightmares concerning aging, illness, and mortality. In her advanced years, she demonstrates a tendency toward possessiveness, a behaviour commonly observed among elderly individuals.

Manjari faces challenges in navigating her relationship with the younger generation, exemplified by Raja, Abhishek, and her cherished daughter Sachi. Abhishek, currently a tenant and employed as a software engineer, aspires to relocate to the United States in pursuit of significant financial success. He frequently interacts with her, utilizing terminology associated with computing. The narrative presents a notable episode in which Manjari becomes immersed in a troubling fantasy characterized by themes of theft and the imminent danger of sexual assault by an unidentified assailant. Several disconcerting anonymous phone calls exacerbate the situation, each suggesting a possible transaction involving her cherished residence. The situation intensifies as she experiences an overwhelming compulsion to sell the house, yet only to an individual enveloped in an enigma, their identity remaining persistently obscured. This distressing incident is overlooked as a simple coincidence, perceived yet another commonplace event emblematic of the disorder frequently associated with life in the expansive urban environment.

The novel's structure is delineated into two primary sections—Section 1 and Section 2. Part 1 presents a citation from Erica Jong's "Inventing Memory": "All the stories that have ever been told are the stories of families—from Adam and Eve onward." In Part 2, a quotation from Italo Calvino's "If on a Winter's Night a Traveler" is presented: "The ultimate meaning to which all stories refer has two faces: the continuity of life and the inevitability of death." The analysis suggests that her novels depict the narratives of families reminiscent of Adam and Eve, who experience life and love and ultimately confront mortality.

In her recent work, *Moving On*, Shashi Deshpande examines the frequently intolerable monotony of life. The narrative is presented through dual perspectives: the father the 'bone doctor,' whose diary illuminates historical events, and his daughter, Manjari, also known as Jiji, who occupies a pivotal role in the storyline. Jiji's encounter with her father's diary prompts a critical examination of her past, encompassing her mother Mai—a writer who wielded love as a means of control—her sister Malu, who was estranged from her during childhood yet later emerges as a significant influence in Jiji's life, and her husband Shyam, a cinematographer, and the focus of profound longing, which ultimately contributes to her downfall. Jiji experiences a profound inundation of memories while simultaneously managing the complexities of her present existence. The narrative encompasses a rebellious daughter, presenting a challenge for connection; property sharks attempting to coerce her departure from her residence; a passionate young lover; and a steadfast friend—her "doppelganger"—who remains patiently in the background. The human body is a fundamental element in the narrative, influencing every event and action the characters undertake. It is a source of inspiration, instigation, betrayal, and reward.

In *Moving On*, Shashi Deshpande presents the character of Manjari, who embodies resistance to patriarchal ideology and endeavours to navigate her existence according to her own principles. The narrative commences with Baba's diary, progressively unveiling the character of Manjari as she contemplates her upbringing and the memories of her late parents. At thirty-five years of age, she is confronted with the reality of being a prematurely widowed individual, navigating the challenges of solitude following the loss of both parents and the absence of her adult children. This circumstance necessitates an examination of her environment and her sexual identity. In her engagement with the narrative, Manjari concurrently takes on the role of a reader of her father's diary. This investigation facilitates a re-examination of historical contexts and elucidates the complex dynamics of her parents' experiences. Manjari approaches her father's diary with a critical perspective, acknowledging that acts of transgression can lead to the emergence of alternative forms of knowledge.

The current situation warrants examination as she explores her recollections and reassesses previous occurrences and responses. The subject encounters the complexities associated with her role as a defiant daughter, navigating the predatory behaviours of unscrupulous property investors and the menacing presence of a sexual partner whose

**Kumara Swami**

actions pose a significant threat to her stability. The challenges that emerge—originating from the interplay between nostalgia and reality, the influences of property dealers, the stifling of personal passion through secretive relationships, and the dichotomy between the fear of exposure and the yearning for connection—advance toward an unexpected resolution, navigating a complex emotional landscape. The narrative examines themes of betrayal and violation within its intricate relationships. Dr. Badri Narayan's father, belonging to the Brahmin caste, entered a marriage with an orphaned Harijan girl, thereby challenging established family traditions. Under the influence of his guru, he adopted Gandhism, resulting in a departure from his family's honour and a rejection of the established caste hierarchy, as highlighted in traditional texts such as the Vishnu Stotra and the Gayatri Mantra. As a result, he was positioned as an outsider, ultimately facing disownment and disinheritance from his father. Badri's mother was his father's second wife, and her horoscope featured an inauspicious Mangal, rendering their marriage socially unacceptable. Furthermore, Badri Narayan entered matrimony with an individual from a different caste. Upon perusing her father's diary, Manjari gains insight into the authentic dynamics of her parent's relationship, recognizing her prior misconceptions regarding their bond.

A significant disparity is evident between perceived accuracy and the fundamental Nature of reality. The notion of 'real' cannot be characterized as a singular, definitive entity; rather, it represents a complex interplay of various truths, each influenced by personal perception and experience. Manjari refrains from imposing her interpretation of truth on others, facilitating a diverse understanding range. Baba, driven by intense passion, exemplified the fundamental immediacy of human longing. His passion was a powerful motivator that drove his professional pursuits and profound love for his wife. In contrast, Mai did not respond to Baba's profound physical ardour. Instead, she skilfully avoided his affections by dedicating herself to writing, constructing a realm infused with her own fervour.

The unique disharmony that characterized each family member's lives resulted from their contributions. The previously harmonious relationships among spouses, individuals, and familial units began to deteriorate, resulting in a multifaceted network of affection intertwined with miscommunication. Ultimately, Baba reconciled with the understanding that his wife's level of enthusiasm did not align with his own fervent passion. This acceptance represented a significant turning point, emphasizing the disparity between his aspirations and the emotional dynamics within their marriage.

Manjari is confronted with the lingering effects of her past, a challenge that significantly hinders her ability to escape and establish a new trajectory. The narrative illustrates a common motif wherein the protagonist's personal experiences profoundly connect with the experiences of others. The delineation between reality and imagination becomes increasingly ambiguous, thereby complicating her pursuit of autonomy and self-determination. Pursuing genuine independence presents a complex array of challenges; however, Manjari exemplifies the essence of a defiant daughter who has sought to establish her own identity at different stages of her life. In this context, she stands out as a representative figure of radical feminism.

Shashi Deshpande's body of work reflects a conscious endeavour to underscore the constraints associated with the exclusivist position of feminism. Her narratives illustrate the complexities and nuances inherent in the feminist movement. Deshpande not only critiques this position but also endeavours to offer a reinterpretation of it. In her insightful essay, "Why I am a Feminist," the author reevaluates and expands her conception of feminism, promoting a more inclusive perspective that goes beyond the limitations typically linked to conventional interpretations. The continuous discourse present in her work prompts readers to reevaluate the boundaries of feminist ideology and fosters a more comprehensive comprehension of women's quests for autonomy in various contexts.

Manjari resolves to confront life independently, devoid of any support, whether moral or financial. Upon receiving the news of her mother's passing, she returns to her father. She has transcended all forms of hesitation. She consumes alcohol freely in the presence of her father and her cousin Raja. Raja expresses an interest in entering matrimony with her; however, she declines his proposals and establishes two conditions: The notion that marriage serves solely as a

**Kumara Swami**

foundation of love or as a means of social security for a single woman is deemed unacceptable. Secondly, her familiarity with the contours of his body precludes any sense of erotic arousal, as their shared upbringing has established a deep-seated connection. Her resolute decision to abstain from marriage once more remains unyielding, rendering any form of persuasion or external factors—be they physical, financial, or emotional—ineffective in swaying her stance.

She acquires the skills necessary to operate her vehicle and uses it for taxi services. In response to challenges in securing a fulfilling employment opportunity, she engages in self-employment by setting up and managing a computer at her residence, where she types manuscripts for clients. The independence exhibited by the individual serves as a significant source of astonishment for Raja, who adheres to conventional patriarchal standards. She encounters a significant challenge in her life as individuals come to visit her and reach out anonymously. The decision to sell her ancestral home imposes significant mental strain on her. In the absence of a response to the impending threat, the underworld initiates an assault aimed at facilitating the sale of the property. In the face of external pressures from the criminal underworld and familial influence exerted by her cousin Raja, she exhibits a resolute determination to resist and engage in a struggle.

"This is their goal; they are attempting to make me into this cowardly, shivering mass of fear, but I refuse to be afraid" (167).

"I'm quite capable of looking after myself," she says, dismissing the dying automobile driver (88).

Raja's comprehension of her physical needs and how she addresses her hunger highlights his evident ambivalence towards her, prompting her to decline to turn around. It is essential for her to pursue her own path and make independent decisions without external influence. The narrative's conclusion is marked by a metaphorical separation following an extended and arduous journey; she initiates the vehicle and departs, symbolizing her quest for freedom. The inquiry of freedom devoid of attachment persists as she advances in her exploration. The concept of progression is characterized by a reciprocal journey, transitioning from internal states to external manifestations and vice versa, as indicated by the novel's title. The concept of the ego is inherently constrained and lacks true freedom.

Consequently, the narrative's exploration of selfhood and autonomy evolves in complexity throughout the novel. Manjari has pursued independence and autonomy through her various transgressions. Is it possible for her to attain freedom through solitary living? Is she capable of independently managing her affairs? Is it possible for her to transcend the denial of her aspirations? The issues at hand extend beyond the individual of Manjari, encompassing broader implications for feminist discourse and the collective well-being of humanity.

Manjari's pursuit of autonomy and independence is a theoretical challenge to patriarchal structures by emphasizing the recognition of personal strength as a woman, rather than engaging in direct confrontation. The challenges she faces in regulating her sexuality—characterized by the persistent demands of her physical body seeking fulfilment—prompt her to engage in frequent reflections on her father. To address her physical hunger, she engages in sleep with her renter, a significantly younger individual, yet strictly on her own terms, dictated by her desires and whims rather than his—"Only the body, his body, only my body, and my starved body." "Absence of cognitive processes and emotional responses, solely the presence of sensory experiences" (257).

The comprehension of her physical needs and how she addresses her hunger elucidates his evident ambivalence towards her, resulting in her decision to remain unyielding and not turn around. She needs to pursue her path and make independent choices without external influence. The conclusion of the narrative is marked by a metaphorical separation following an extended and arduous journey; the female protagonist initiates the vehicle and departs, symbolizing her quest for liberation. The concept of freedom devoid of attachment presents a persistent inquiry for her as she progresses. The process of progression encompasses an inward journey that extends outward, as well as an outward journey that returns inward, as indicated by the novel's title. The concept of the ego is inherently

**Kumara Swami**

constrained and lacks true freedom. Consequently, the exploration of selfhood and autonomy within the narrative evolves in complexity throughout the novel.

Manjari has pursued independence and autonomy through her various transgressions. Is it possible for her to attain freedom through solitary living? Is she capable of living independently? Is it possible for her to transcend the denial of her own aspirations? The issues at hand extend beyond the individual of Manjari, encompassing broader implications for feminist discourse and the collective human experience. Beauvoir posits that while women possess freedom and autonomy, they frequently encounter a societal structure wherein men impose an inferior status upon them. Women encounter oppression because of male dominance within key institutions and prevailing ideologies, insufficient solidarity among women, biological imperatives that drive the need for partnerships, the entrenched Nature of oppressive structures that appear inherent and immutable, and, at times, their complicity in these systems. For women to attain equality and fully actualize their human potential, it is essential for them to move beyond their distinct femininity and endeavour to pursue lifestyles akin to those of men. Achieving autonomy is essential for individuals to explore and cultivate their genuine identities through experiential learning and self-discovery. This analysis pertains to Manjari, who engages with a range of conflicting discourses in her quest to comprehend her identity and its significance.

In her essay "Why I am a Feminist," Shashi Deshpande articulates that embracing one's womanhood should be regarded as a source of joy rather than a deficiency, divergence, or inferiority. Feminism does not position itself against men; instead, it aims to foster a more equitable, significant, and collaborative dynamic between men and women, departing from conventional sacrificial paradigms of relationships. The realization of women's potential is contingent upon the absence of oppression. Deshpande presents a family structure defined by equitable opportunities and privileges for both genders, fostering cooperation, compromise, and companionship.

The author contends that it is peculiar, irrational, and inequitable for feminist ideology to promote discontent among women regarding their roles as housewives, to advocate for the abandonment of husbands and families, or to endorse divorce in response to minor grievances—Deshpande advocates for the concept of relational autonomy in relation to women. Women ought to cultivate their ambitions and actively pursue their own goals for self-fulfilment rather than relying on men for economic, emotional, and psychological support. In contemporary societal dynamics, it is imperative to dismantle the distinct spheres traditionally assigned to men and women, advocating for a redefinition of their relationship as one characterized by equality and complementarity rather than dominance and relegation.

Chanchala K. Naik posits that the argument presented by Deshpande in the novel advocates for the concept of relational autonomy. The notion of 'relational autonomy' presents a novel interpretation of individuality, especially when examined through a feminist lens. The depiction of an individual is not as a solitary being; instead, it reflects a multifaceted amalgamation of social and cultural influences that are intricately connected to relationships within specific social, political, and historical frameworks.

In this context, Manjari stands out as a notable individual who represents opposition to patriarchal limitations. The protagonist's resolute decision to reject marriage to Raja represents her resistance to societal norms. Additionally, her fearless engagements with the mafia regarding her ancestral property illustrate her commitment to asserting her rights and preserving her heritage. Furthermore, her decision to operate her vehicle represents a declaration of autonomy, indicating her dismissal of conventional gender roles. Nevertheless, the trajectory of Manjari's experience is marked by various conflicts. The female experience involves navigating personal desires alongside the intricate expectations imposed by one's physical form. The relationship she shares with her tenant represents a significant turning point in her journey towards empowerment. It highlights her aspiration to break free from the longstanding conflict between genders, characterized by men's frequent assertion of control over women's autonomy.

**Kumara Swami**

Through these experiences, Manjari exemplifies that a woman should assert her identity and agency rather than be diminished to a possession claimed by a man. The narrative significantly illustrates the critical role of self-definition and autonomy when confronted with societal pressures.

— "But you're a woman; you're a daughter," she asserts, her voice laced with defiance and disbelief (64).

In response to Raja's sharp accusation, she delves deeper into the "archive" concept, challenging its implications and significance. "I never thought you would sink so low," she retorts, her tone heavy with disappointment and betrayal (283).

Manjari reflects on the complexities associated with her decision to embrace an independent lifestyle as a woman. What are the implications of a woman residing independently? In pursuing conventional notions of femininity, she relinquishes the sari, the colourful attire that previously symbolized her identity. The individual adopts a short, angular hairstyle that evokes a traditionally masculine aesthetic, complemented by a facial expression that possesses the potential to halt passersby in their tracks. Nonetheless, despite her efforts to conceal my femininity, such attempts were ultimately ineffective. Men possess an uncanny ability to perceive what lies beneath the surface—"they can smell the woman within..."(284).

Manjari tests the idea that feminine uniqueness is solely shaped by male viewpoints, advocating for a more complex interpretation that paves the way for significant social and cultural transformation. The dynamic Nature of female identity is emphasized, illustrating its capacity to evolve independently and in response to societal influences. This evolution challenges existing stereotypes and facilitates new interpretations and expressions of femininity.

The narrative explores the bonding dynamics among women, contrasting the relationships illustrated in the accounts of Mai, Malu, Manjari, Gayatri, and Suchi. The notion of relational feminism critiques the conventional understanding of a self that is independent, autonomous, and impersonal. It posits that such a viewpoint neglects the fundamental reality of our interconnectedness and relationships' significant role in our existence. Relational feminists argue that the concept of an independent and self-sufficient female identity embodies what they refer to as a "Masculine Denial," which represents a suppression of the essential maternal connections that influence women's identities.

This comprehension has given rise to a counter-discourse aimed at challenging the reinforcement of a rigid hierarchical distinction between the so-called "impersonal" domains associated with the male ideal — defined as objective, disinterested, and public — and the "personal" domains connected to the female experience, which are subjective, contextual, and private. Through examining the complexities surrounding these experiences, relational feminists highlight the intrinsic connection between the personal and the political, asserting that women's lived experiences must be crucial in shaping the broader conversation on autonomy.

The notion of relational autonomy examines the intricate experiences of women, positing that genuine autonomy involves more than simple individual independence; it is significantly shaped by the relational contexts that permeate their lives. This analysis explores the nuanced interplay between supporting autonomy and outright rejection, presenting a refined examination of the complex terrain within feminist theory and practice. In this context, autonomy is redefined as a complex concept intricately connected to women's integration within their social environments, acknowledging them as individuals influenced by distinct experiences and elaborate relationships.

Deshpande highlights the importance of ongoing affirmation of freedom—encompassing thought, choice, and action—as deeply connected to the social and relational contexts shaping women's experiences. This perspective offers valuable insights into women's daily personal and political challenges in a gender-structured society, thereby enhancing our comprehension of their diverse struggles and achievements. The connections established among women and the depth of their experiences within these relationships significantly impact their autonomy and agency.

**Kumara Swami**

The work *Moving On* investigates themes related to relational autonomy, offering nontraditional perspectives on love, marriage, sexuality, and domesticity. The character of Manjari exemplifies the qualities of contemporary femininity, challenging traditional notions of autonomy and interpersonal connections. As a survivor, she exemplifies relational autonomy—profoundly anchored in familial and interpersonal connections while remaining submissive to none. Manjari exemplifies the qualities of an affectionate daughter, a loving sister, a caring mother, and a supportive friend. A lack of imposition or demand characterizes her demeanor while she upholds her autonomy. She maintains a balanced approach towards her children, allowing them the freedom to develop and express their unique identities. Her perspective on life promotes a harmonious coexistence, emphasizing the importance of self-identity while respecting the individuality of others. It encourages individuals to live according to their principles while granting others the freedom to do the same.

This novel explores the theme of passion as it intricately weaves through the characters' journeys. Manjari and her father are connected through the insightful narratives found in his diaries and the touching memories shared by those who were once acquainted with him. Exploring the complex and frequently turbulent essence of physical passion leads to a duality of comprehension and conflict. This comprehension has given rise to a counter-discourse aimed at challenging the reinforcement of a rigid hierarchical distinction between the so-called "impersonal" domains associated with the male ideal — defined as objective, disinterested, and public — and the "personal" domains connected to the female experience, which are subjective, contextual, and private. Through examining the complexities surrounding these experiences, relational feminists highlight the intrinsic connection between the personal and the political, asserting that women's lived experiences must be crucial in shaping the broader conversation on autonomy.

The notion of relational autonomy examines the intricate experiences of women, positing that genuine autonomy involves more than simple individual independence; it is significantly shaped by the relational contexts that permeate their lives. This analysis explores the nuanced interplay between supporting autonomy and outright rejection, presenting a refined examination of the complex terrain within feminist theory and practice. In this context, autonomy is redefined as a complex concept intricately connected to women's integration within their social environments, acknowledging them as individuals influenced by distinct experiences and elaborate relationships. This understanding has led to the emergence of a counter-narrative that seeks to contest the perpetuation of a strict hierarchical separation between the so-called "impersonal" realms linked to the male archetype — characterized as objective, disinterested, and public — and the "personal" realms associated with the female experience, which are subjective, contextual, and private. An analysis of the complexities surrounding these experiences reveals that relational feminists aim to underscore the inherent link between personal and political realms, contending that women's lived experiences are essential in informing the broader discourse on autonomy.

The concept of relational autonomy explores the complex experiences of women, suggesting that genuine autonomy encompasses more than mere individual independence; it is profoundly influenced by the relational contexts surrounding their lives. This examination delves into the intricate relationship between the facilitation of autonomy and the phenomenon of outright rejection, offering a detailed investigation of the multifaceted landscape inherent in feminist theory and practice. In this framework, autonomy is reconceptualized as a multifaceted notion deeply intertwined with women's incorporation into their social contexts, recognizing them as individuals shaped by unique experiences and intricate relationships. This investigation into desire incurs a considerable cost, ultimately resulting in the fragmentation of their previously cohesive family structure, characterized by affectionate parents and their two intelligent daughters. Nevertheless, in the face of adversity and emotional turmoil, their vibrant experiences illuminate their existence, producing a radiance that underscores their inherent resilience. After the narrative, the characters are depicted as united—two diminutive lanterns illuminating the pervasive darkness of mortality that looms over all individuals. Although Deshpande's narrative is infused with themes of death and tragedy, it reveals a tender and profoundly human essence, ensuring that the story does not become morbid or tiresome. Instead, it serves as a celebration of the enduring strength of love and connection.

Kumara Swami

CONCLUSION

Shashi Deshpande's novel *Moving On* features a complex narrative structure that intertwines themes of memory, experience, and written texts, particularly involving the diaries of the deceased. The story revolves around Jiji (Manjari), a widowed woman who returns home to care for her ailing father, Baba. After his death, she discovers his diary, prompting her to reflect on her life considering his revelations. Jiji's childhood was spent with her anatomist father and her mother, Mai, who writes romantic stories. Together with their extended family, they create an idyllic atmosphere. However, Jiji's present is filled with uncertainty as she grapples with choices about her future while living alone in the house her father left for her daughter, Sachi. Meanwhile, she receives disturbing calls urging her to sell the house and marriage proposals from Raja, BK's son. The narrative slowly reveals the disintegration of Jiji's family, beginning with her marriage to Shyam, a cinematographer who introduces her to passion. Deshpande explores the theme of the body through Baba's teachings and personal struggles as he faces his wife's illness and his own mortality. Jiji also confronts her desires and societal expectations as a single woman navigating these complexities. Manjari embodies a contemporary archetype of femininity, challenging traditional notions of autonomy and interpersonal connections. She engages in relational autonomy, maintaining connections with her family while also asserting her independence. In her roles as a daughter, sister, mother, and friend, she exhibits a balanced approach, characterized by neither demanding behaviour nor dependency, thereby granting her children the autonomy they require. Her methodology in navigating life exemplifies a harmonious balance between authentic oneself and acknowledging others' autonomy. Deshpande's works analyse the evolution of the New Indian Woman, emphasizing significant social and cultural changes in urban India that are shaped by economic advancement. The author's writings highlight the enduring Nature of social norms, which may either remain unchanged or transform into new forms. The deconstruction of restrictive stereotypes provides a more authentic representation of women. Deshpande's position among modern Indian novelists is well-established, particularly through her examination of the notion of freedom for Indian women, contextualized within their cultural frameworks. The author avoids creating idealized female protagonists, instead portraying women who struggle to balance modernity with tradition.

ABSTRACT

This paper investigates the relationship between psychoanalytic theory and narrative form in modern literature, arguing that literary structure itself functions as a symbolic articulation of unconscious processes. While earlier scholarship has largely focused on character psychology, this study foregrounds narrative techniques—such as fragmentation, nonlinearity, and shifting perspectives—as structural manifestations of repression, memory, and trauma. Drawing on the theoretical frameworks of Sigmund Freud, Jacques Lacan, and Cathy Caruth, the paper offers detailed textual analysis of Franz Kafka's *The Metamorphosis*, Virginia Woolf's *Mrs. Dalloway*, and Toni Morrison's *Beloved*. It demonstrates that modern narrative experimentation embodies the logic of the unconscious rather than merely representing it. By integrating psychoanalytic theory with close reading and comparative analysis, the study contributes to contemporary debates in narrative theory and highlights the continued relevance of psychoanalysis in literary criticism.

Keywords: Psychoanalysis, Narrative Form, Modernism, Trauma, Freud, Lacan

INTRODUCTION

The emergence of psychoanalysis in the early twentieth century marked a decisive shift in the understanding of human subjectivity. Freud's formulation of the unconscious challenged the Enlightenment model of rational selfhood by positing that human behavior is shaped by repressed desires and unresolved conflicts.¹ This theoretical intervention profoundly influenced literary studies, enabling critics to interpret texts as sites where hidden psychological processes are encoded.

**Ankush Mishra**

Modernist literature developed within a historical context characterized by rapid industrialization, urbanization, and the psychological aftermath of global conflict. These conditions destabilized traditional notions of identity, prompting writers to experiment with new narrative forms capable of representing fragmented consciousness. This paper argues that such formal experimentation is not merely aesthetic but structurally analogous to unconscious processes described in psychoanalysis. It further proposes that narrative form functions as an active medium through which unconscious dynamics are organized and made intelligible.

LITERATURE REVIEW

Psychoanalytic criticism has significantly shaped literary theory. Freud's concept of repression suggests that unacceptable desires are excluded from consciousness but continue to operate indirectly through symbolic forms [2]. Early critics applied these ideas to interpret imagery, metaphor, and narrative symbolism. Lacan extends Freud's work by arguing that the unconscious is structured like a language, thereby emphasizing the role of signification and symbolic systems in shaping subjectivity [3]. Kristeva's concept of abjection further complicates identity formation by examining processes of exclusion that destabilize the boundaries of the self [4]. Trauma theory, particularly in the work of Cathy Caruth, highlights how traumatic experience resists direct representation and returns through fragmented and repetitive narrative forms [5]. Peter Brooks connects narrative structure with desire, suggesting that storytelling mirrors psychic processes [6] while Terry Eagleton situates psychoanalysis within broader ideological critique [7]. Slavoj Žižek integrates Lacanian theory with cultural analysis, emphasizing the ideological dimension of unconscious desire [8].

Despite these contributions, insufficient attention has been given to narrative form as a structural manifestation of unconscious processes. This study addresses that gap by focusing on formal strategies rather than solely thematic interpretation.

Theoretical Framework

Freud's structural model of the psyche—id, ego, and superego—provides a foundational framework for understanding repression and symbolic return [9]. Dreams operate through condensation and displacement, mechanisms that transform latent content into symbolic form. These mechanisms closely resemble literary techniques such as metaphor, imagery, and narrative displacement. Lacan's reinterpretation emphasizes language and the symbolic order. He argues that subjectivity is constituted through linguistic structures, making narrative discourse a crucial site for analyzing unconscious processes [10]. Disruptions in narrative coherence can therefore be interpreted as expressions of underlying symbolic tensions. Caruth's trauma theory introduces the idea that traumatic memory disrupts temporal continuity, appearing through repetition, fragmentation, and narrative disjunction [11]. This theoretical framework enables a reading of literary form as a representation of psychological rupture.

METHODOLOGY

This study adopts a qualitative interpretive methodology grounded in psychoanalytic hermeneutics and close textual analysis. The selected texts are examined in relation to narrative structure, temporal organization, and symbolic representation. A comparative approach is employed to identify shared structural patterns across different literary and cultural contexts. The selection of these texts is based on their canonical status within modernist and postmodern literature and their sustained engagement with psychological complexity, making them particularly suitable for psychoanalytic analysis.

Narrative Form and Modernism

Modernist literature departs from linear realism by employing techniques such as stream-of-consciousness, temporal disruption, and narrative fragmentation. These techniques mirror unconscious processes, which operate through association rather than logical sequence.

**Ankush Mishra****Kafka: Alienation and Repression**

In *The Metamorphosis*, Kafka presents Gregor Samsa's transformation as a symbolic externalization of repression. Gregor's sense of obligation and duty toward his family reveals the internal conflict between personal desire and social responsibility (Kafka, 1915). His metamorphosis can thus be interpreted as the manifestation of repressed subjectivity. Gregor's room functions as a psychological enclosure, while the removal of furniture symbolizes the erosion of identity. His inability to communicate reflects the limits of language in articulating unconscious experience. The narrative structure reinforces this isolation by restricting perspective and emphasizing interiority.

Kafka further intensifies this psychological condition through imagery of physical discomfort and bodily alienation. Gregor's struggle to control his new body—particularly his inability to get out of bed—illustrates the disjunction between conscious intention and unconscious forces. Additionally, the family's gradual withdrawal, especially his sister Grete's eventual rejection, underscores the collapse of symbolic identity within the social order.

Woolf: Memory and Temporality

Woolf's *Mrs. Dalloway* employs shifting perspectives and temporal fluidity to represent consciousness. Septimus Warren Smith's trauma is expressed through hallucinations and intrusive memories, as when "the world wavered and quivered," illustrating the instability of perception (Woolf, 1925). The recurring sound of Big Ben imposes chronological order upon subjective experience, creating tension between external time and internal memory. Woolf's narrative technique demonstrates how identity is constructed through the interplay of memory and perception. Clarissa Dalloway's reflections on her past—particularly her memories of Sally Seton—demonstrate how identity is continuously reconstructed through recollection. These memories emerge not as linear sequences but as associative flashes, reinforcing the psychoanalytic understanding of memory as non-linear and dynamic. Furthermore, Septimus's inability to distinguish between past and present highlights the persistence of trauma within consciousness. His visions of Evans exemplify the return of the repressed, where unresolved experiences intrude upon present perception.

Morrison: Trauma and Collective Memory

In *Beloved*, Morrison represents trauma through fragmented narrative voices and nonlinear structure. Sethe's declaration—"I will never run from another thing on this earth"—reveals the persistence of trauma within the present (Morrison, 1987). The character of Beloved embodies the return of repressed history, while the narrative's disjointed chronology reflects the disruption of temporal continuity. Morrison extends psychoanalytic interpretation beyond individual psychology to encompass collective memory. Morrison further develops this theme through the recurring motif of the "chokecherry tree" scar on Sethe's back, which symbolizes the physical inscription of trauma onto the body. This image functions as both a literal and symbolic representation of suffering that cannot be fully articulated through language. Additionally, the opening line "124 was spiteful" establishes the house itself as a site of memory and haunting, suggesting that trauma is embedded within space as well as consciousness. The shifting narrative voices, particularly in the monologues of Sethe, Denver, and Beloved, create a fragmented narrative structure that mirrors the process of reconstructing traumatic memory.

Comparative Analysis

Kafka, Woolf, and Morrison employ distinct narrative strategies, yet all utilize fragmentation to represent psychological complexity. Kafka's narrative reflects alienation, Woolf's explores temporality, and Morrison's addresses historical trauma. These strategies illustrate how narrative form operates as a structural analogue of unconscious processes.

DISCUSSION

A critical distinction between Freudian and Lacanian psychoanalysis further deepens the interpretation of narrative form. Freud conceptualizes the unconscious primarily in terms of repressed instinctual drives that return through symbolic representation. In contrast, Lacan shifts attention to the linguistic and symbolic structures that organize

Ankush Mishra

subjectivity. While Freud's model emphasizes psychological content, Lacan foregrounds the structural conditions through which meaning is produced. This distinction is crucial for literary analysis: narrative fragmentation can be interpreted not only as the return of repressed material but also as a manifestation of the symbolic order that structures subjectivity. By integrating both perspectives, this study demonstrates that narrative form operates simultaneously as a site of psychological expression and linguistic organization. The findings of this study suggest that narrative form operates as more than a stylistic device; it actively structures psychological meaning. By reproducing mechanisms such as repression, displacement, and fragmentation, literary narratives provide insight into the workings of the unconscious.

CONCLUSION

This study demonstrates that modern narrative form embodies unconscious processes rather than merely representing them. Psychoanalytic criticism thus remains essential for understanding modern literary form.

ABSTRACT

This study analyses two Tamil clauses to show how ideational meaning is constructed in Tamil using the framework of Systemic Functional Linguistics (SFL) propounded by M.A.K. Halliday. Focusing on Halliday's trinocular perspective, the study analyses language from three complementary angles – meaning (from above), Grammar (from below) and Systemic Choices (from round about) using Halliday's Trinocular Perspective. Two simple Tamil clauses – one representing a Material Process (action) and the other a Relational Process (state or quality) are analysed. The results show how Tamil unifies experience through processes, participants, and circumstances. At the semantic level, in the clauses taken for analysis, the Material clause indicates actions, and the Relational clause denotes the quality of the noun discussed. At the Lexicogrammatical level, features such as case markers, verb morphology and phrase structure help the readers realise the meaning conveyed. While the Material clause depicts the way in which roles like Actor and Goal are coded through suffixes and agreement, the Relational clause reveals how qualities are conveyed through adjectives and copular structures. From the perspective of SFL, the study underlines how the speakers choose the process types and grammatical patterns to create meaning. In sum, the study presents the richness and flexibility of Tamil as a meaning-making system and shows the application of SFL for analysing Dravidian languages. The results also suggest significant perceptions on linguistic research and language education and training, particularly in multilingual academic settings.

Keywords: Systemic Functional Linguistics, Ideational meta function, Transitivity, Trinocular analysis, Tamil lexicogrammar

**Renuga and Vijayalakshmi**

INTRODUCTION

The Systemic Functional Linguistics (SFL) propounded by M.A.K.Halliday (1994) perceives language as a resource for making meaning. It views language as a social semiotic system. In this context, the Ideational Meta function represents human experience and enables speakers to construe actions, events, and states through linguistic structures. A key component of Ideational Meta function is the concept of Transitivity which explains how processes, participants and circumstances interact to produce meaning in clauses (Halliday & Matthiessen, 2014). SFL has wide application in the analysis of English and other languages, but its application has not been fully explored to analyse Dravidian languages such as Tamil. Tamil, which is an agglutinative language has a rich system of suffixation and morphological marking. It offers significant potential for examining how Ideational meanings are determined through lexicogrammatical resources (Krishnamurti, 2003). Specifically, the correlation between semantic roles and grammatical insight in Tamil offers a scope for testing the cross-linguistic application of SFL theories. This aim of this study is to analyse two simple Tamil clauses that represent Material Process and Relational Process. Further, the study analyses the realisation of Ideational meaning in Tamil clauses and the way in which Transitivity roles are encoded by lexicogrammatical features. Also, it presents the perceptions that emerge from a Trinocular analysis – from above (semantic meaning), from below (lexicogrammatical realisation) and from round about (systemic choices within the language) (Halliday & Matthiessen 2014). Thus, the study promotes the expansion of SFL research beyond English and focuses on the significance of Tamil as a meaning-making system, with propositions for both linguistic theory and pedagogy in multilingual contexts.

Theoretical Framework

Developed by M.A.K. Halliday (1994), Systemic Functional Linguistics views language as a meaning-making resource and a social semiotic system. According to this concept, linguistic choices are shaped by the context-based communicative needs. SFL focuses on the functions of the language and analyses how meaning is conveyed through different layers of linguistic organisation, especially semantics and lexicogrammar (Eggins, 2004). The core concept of SFL is the three meta functions – Ideational, Interpersonal and Textual - of the language. The Ideational meta function denotes experience and logical relations, the Interpersonal meta function deals with interaction and evaluation, and the Textual meta function shapes the discourse into coherent messages (Halliday & Hasan, 1985). The focus of the present research is the Ideational meta function and analyse how experience is encoded in clause structure.

The Ideational meta function is presented through Transitivity system which explains the representation of processes, participants and circumstances through clauses. There are different types of processes, but this study focuses on Material and Relational Processes. While Material Process represents actions and events involving participants such as Actor (the doer of the action) and Goal (the entity affected by the action), the Relational Process describes the state of being, rather than actions, identification and attribution. This involves participants such as Carrier and Attribute in attributive clauses (Thompson, 2014). In SFL, Transitivity goes beyond the traditional grammatical notion of transitive and intransitive verbs providing a semantic framework for understanding how experiences are structured in language. The process types, participant roles and circumstantial elements interact among themselves through clauses that represent real or imagined experiences (Halliday & Matthiessen, 2014).

The Trinocular perspective is a significant analytical principle in SFL. It proposes the three complementary viewpoints – ‘from above’, ‘from below’ and ‘from round about’ - based on which language should be examined. The analysis ‘from above’ focuses on the semantic level. Here, the meaning is interpreted in terms of experiential functions such as process and participant roles. ‘From below’ examines the way in which these meanings are realised at lexicogrammatical level. This includes morphological and syntactic structures. The view ‘from round about’ considers the system network of choices that are available within the language, and it also highlights the speakers’ selection of grammatical structure to express meaning (Halliday & Matthiessen, 2014). This Trinocular approach

Renuga and Vijayalakshmi

supports in analysing a language comprehensively connecting meaning, form and choice and this proves to be an ideal system for studying languages with rich morphological systems. The Dravidian language, Tamil, is agglutinative with case markers, verb morphology, and agreement features encoding relationships between participants and processes. The grammatical meanings are realised through suffixation (Schiffman, 1999; Andronov, 2003). Tamil has embedded copular structures in relational clauses with adjectives functioning as predicates without an explicit verb form (Lehmann, 1993). Such typological characteristics make Tamil appropriate for understanding the realisation of Ideational meaning through SFL. The present study applies the Trinocular framework to Tamil clauses and shows how semantic roles are mapped to lexicogrammatical forms scientifically thereby contributing to an extensive understanding of language as a meaning-making resource.

METHODOLOGY

The present research is based on a qualitative descriptive research design to analyse the realisation of ideational meaning in Tamil clauses within the SFL framework. This theory-driven study illustrates how meaning is constructed through the semantic and lexicogrammatical resources. Two Tamil clauses were taken for the study. The clauses were chosen in such a way that they represent two major process types - Material process (action) and Relational process (state or quality) - within the Transitivity system. The structures were simple and clear, and they were found appropriate for a focused and detailed Trinocular analysis. The analysis was done using the Trinocular perspective proposed by M.A.K.Halliday and Matthiessen (2014) and each clause was examined from three complementary angles - 'from above', that considers the semantic level identifying process types, participant roles and experiential meaning, 'from below' deals with the lexicogrammatical realisation of these meanings which includes case markers, suffixation, verb morphology and clause structure and 'from round about' focuses on systemic choices available within Tamil and it highlights the selection of grammatical patterns to communicate meaning.

Each Tamil clause is presented with transliteration, morpheme-by-morpheme glossing, and English translation. Standard linguistic glossing is done to specify grammatical functions like number, case and tense facilitating a transparent connection between semantic interpretation and grammatical form. Since the study is restricted to a small number of examples, it offers an in-depth analysis illustrating the effectiveness of the Trinocular SFL framework for analysing Tamil.

Data Analysis

The study analysed two Tamil clauses representing different process types within the SFL Transitivity system. The first clause shows Material Process expressing an action performed by the participants. The second clause demonstrates a Relational Process expressing a state or quality. Each clause is presented with transliteration, gloss, and English translation to facilitate the linguistic analysis and accessibility for non-Tamil readers.

Clause 1: Material Process

மாணவர்கள் புத்தகத்தை வாசித்தனர்

- -கள் (-kaḷ) = plural suffix
- புத்தகம் (putthagam) = book
- -த்தை (-ththai) = accusative case marker

Renuga and Vijayalakshmi

- வாசி (vāci) = read
- -த்தனர் (-ththananar) = past tense + plural agreement

Clause 2: Relational Process

புத்தகம் சுவாரஸ்யமானது

Transliteration

putthagam suvārasyamāṇathu

Translation

The book is interesting.

Gloss

- புத்தகம் (putthagam) = book
- சுவாரஸ்யமானது (suvārasyamāṇathu) = interesting

ANALYSIS AND DISCUSSION

Analysis of the Material Clause

From Above: Semantic Perspective

From the Semantic Perspective, the clause represents the Material process which denotes an action or an event. The Process is indicated through the verb வாசித்தனர் (read) showing an activity done by the participants. The Actor in the clause is மாணவர்கள் (students) who perform the action. The Goal is represented by புத்தகத்தை (the book), the entity affected by the process. Therefore, the clause presents an experiential meaning that involves an action carried out by a collection or a group of participants upon an object. This shows how Tamil organises an experience through a process-participant relationship within the ideational meta function.

From Below: Lexicogrammatical Perspective

At the lexicogrammatical level, the clause unfolds several important features of sentence construction in Tamil. The suffix -கள் (-kal), in the noun மாணவர்கள் indicates plurality and -த்தை (-ththai) in புத்தகத்தை is an accusative case marker which marks the noun as the object or Goal of the process. The verb வாசித்தனர் has morphological markers expressing tense and agreement. The suffixes present the past tense and the plural agreement with the Actor. This proves the agglutinative nature of Tamil, where grammatical meanings are comprehended through suffixes.

The structure of the clause is typical Tamil Subject-Object-Verb (SOV) word order. The verb is positioned at the end of the clause. The grammatical structures facilitate in systematically mapping the semantic roles with lexicogrammatical structures.

From Round About: Systemic Perspective

From the SFL perspective, the clause has a Material process representing an observable action. Since the clause focuses on physical activity, Material process has been chosen here although Tamil offers alternative process choices such as Relational and Mental process. The case marking and verbal agreement help in identifying the participant. The structure, thus, demonstrates how Tamil speakers utilise the grammatical properties to present the experiential meaning efficiently.

Analysis of the Relational Clause

From Above: Semantic Perspective

Semantically, the clause has a Relational Attributive process which delegates a quality to an object. The participant புத்தகம் (book) functions as a carrier, while சுவாரஸ்யமானது (interesting) functions as the Attribute. The Relational clause represents a state or quality associated with the Carrier. Therefore, the clause reflects the experiential function of an object.

Renuga and Vijayalakshmi

From Below: Lexicogrammatical Perspective

At the lexicogrammatical level, the clause shows the use of implicit copular structure which is a typological feature characteristic of Tamil. Unlike English, Tamil does not have an explicit verb equivalent to 'is' in present tense Relational clause. The word *சுவாரஸ்யமடனது* is the adjectival form and it functions as the predicate expressing the Attribute directly. The relational meaning can be comprehended through the clause structure. The absence of the explicit copular structure does not impair or reduce the clarity of expression. This shows how Tamil represents relational meanings through Adjectival morphology and predicate structures rather than through copular verbs.

From Round About: Systemic Perspective

In SFL view, the speaker selects a Relational process rather than a Material process because the purpose of communication is to describe a quality or nature and not an action. The clause shows how Tamil agrees with the precise expression of attribution through adjectival predicates. Also, the implicit copular structure proves that Tamil has an appropriate grammatical choice within the system contributing to its flexibility and establishing its meaning-making potential.

DISCUSSION OF FINDINGS

The study shows how the two clauses represent different process types and demonstrate distinct experiential meanings in Tamil. The Material encodes action through Actor, Goal, and Verbal Morphology and the Relational clause encodes features or traits through Carrier and Attribute.

Lexicogrammatically, both the clauses illustrate the importance of suffixation and morphology in Tamil. The Material clause depends more on case markers and verbal agreement, and the Relational clause relies on adjectival expression acting as predicate and the implicit copular structure.

CONCLUSION

Thus, the Trinocular study on Tamil clauses shows a close correlation between meaning, grammatical realisation and systemic choice. The findings prove the effectiveness of SFL in explaining how users of Tamil language organise experience linguistically through different process structures.

ABSTRACT

Literature is to be experienced, enjoyed, appreciated, and loved. Technical Education refers to the preparation of individuals to teach specific vocational skills, trades, or professions to students. Literary Text will provide students with the opportunities to experience and use the language more creatively and to develop greater awareness of the language they are learning. It also helps students develop empathy and understanding besides critical thinking skills. This essay offers an analysis derived from a study performed with Engineering students. It evaluates the effects of reading literary texts in engineering classroom. In the Elements of Literature (MX3082) classroom, a poem was given in a separate sheet to the third year under graduate students (III B.E Civil) for analysis of the text. Also, students were asked to prepare assignments on critical appreciation of fiction they read. The results showed that the majority of the students have positive perceptions towards using literary text in their study program. The outcome of this study is to make students understand the relevance of literature in human life and appreciate its aspects in developing finer sensibilities.

Keywords: Reading, Literature, Poem, Fiction, Classroom.

**Pappy Vincentand Sathees Kumar**

INTRODUCTION

In Anna University regulation 2021 curriculum, it introduced Mandatory courses for fifth semester students which is 'Elements of Literature' (MX3082) for all engineering programs. The objective of this subject is to make the students aware about the aesthetic approach of human existence through an art form so that students will learn to appreciate different forms of literature as suitable modes of expressing human experience. The content of the syllabus were elements of poetry, elements of fiction and elements of drama. Initially, when brief introduction of relevance of literature was given it seemed absurd for engineering students as their domain is entirely technical but gradually they enjoyed. The classes allotted were three hours per week. [Friday 1.30 pm - 4.05pm]. They had enough time for discussions and interactions with each other. Students got benefitted learning to speak in English confidently without hesitation in seminars. It was leisure for them from routine work.

Literary Texts

Literary text holds a prominent role in students' personal development since the reader becomes emotionally attached with the text and this has positive effects not only on the personal growth but also on the whole learning process. Technical Education aims to provide practical skills and knowledge related to industry trends and prepares graduates for roles in engineering, medicine, and various other fields. But literary criticism is an important part of modern classroom teaching because it helps readers understand and engage with literature. It is the analysis, interpretation, and evaluation of works of literature, such as novels, short stories, essays, plays, and poetry. It is a way to help readers better understand and engage with a work of literature. A typical literary criticism begins with a summary of the text, examines its arguments, and ends with an evaluation.

Most importantly, by fostering a love of reading from a young age, students become independent learners whenever they pick up a book to read for pleasure, are actually improving their language skills. There is a strong expectation put on literature reading in the classroom, with the hope that this will allow students to gain an understanding of social, human, and cultural values through literature reading (Poulet, 1969). Also, it promotes the students four language skills – listening, speaking, reading and writing. According to Whitener (2019), reading literature inspires students to reflect, critique, analyze, interpret, and connect.

Literary Criticism

Practical criticism began in the 1920s with a series of experiments by I.A.Richards on his students to assess poems on their own devoid of information regarding authorship or any other additional information. Students responded to a variety of unidentified poems, and the student's summary were then dissected by Richards in hugely popular lectures, 'so popular that at times they had to be held in the streets' (Russo 93). In *Practical Criticism*, Richards advocates a close textual and verbal analysis of poetry. Language is made up of words and hence the study of words is of paramount importance in the understanding of a work of art. Words, according to Richards, communicate four kinds of meaning: Sense, Feeling, Tone, and Intention. The meaning of a poem rests in the readers analysis of the text and the response to it.

Poetry communicates feelings and emotions. It speaks not to the mind but to the heart. Science makes statements, poetry makes pseudo-statements that cannot be empirically tested and proved true or false. A statement is justified by its truth. On the other hand, the pseudo statement of poetry is justified by its imagination. Poetry analysis typically involves the careful examination of various literary elements. These elements include narration, setting, characters, theme, structure, rhythm, rhyme, figurative language, diction, tone, and mood. As the students were technical, they were not asked to do close reading of the text like I.A. Richards or no literary theory was adopted. The participants were asked to do superficial reading of Nissim Ezekiel's Poem "Night of the Scorpion" and individually they were asked to summarise the poem. The poem depicts a scene of rural Indian life where the speaker's mother is stung by a scorpion seeking shelter from ten hours of relentless rain and detailing the villagers' superstitious rituals.

**Pappy Vincentand Sathees Kumar**

The mother's selfless love shines through as she thanks God the scorpion bit her and not her children All the participants were able to understand the theme of the poem and enjoyed the literary piece. They were very keen to read the poem and different interpretations were given on the superstitious beliefs found in poem. Students were devoid of any gadgets like mobile, internet or dictionary, thus difficult to grasp words like 'sceptic', 'rationalist', 'incantation' and 'diabolic'. 20 objective type questions were given to students to answer the questions, nearly 95 % of students answered correctly.

Reading Strategies

Reading is the foundation for lifelong success. When student develop a reading habit early, they are more likely to excel in their career, perform better in competitive exams, communicate confidently, and become lifelong learners. Strong reading skills contribute significantly to overall language development and academic performance. They follow different types of reading techniques according to their reading needs. Each technique plays a role in improving overall reading proficiency. Skimming involves quick reading to grasp the main idea or gist of a text, while scanning involves quick search for specific information or keywords in a text. Intensive reading requires a high level of focus and deliberate effort whereas extensive reading is meant to be a fun and pleasurable experience. As it is a literary text majority of the students followed skimming and extensive reading which was sufficient for engineering students.

Reading is an activity that leads to success because it's a primary act for gaining knowledge of any field. Due to the emergence of new digital technologies students have a variety of options for reading. Saaid &Wahab (2014) revealed that 62.2% of university students read digital-based material for leisure, 18.1% for research, and 12.7% for their study. Digital material provides easier and faster reading options for students. They do not bother to read long text which needs time and concentration to increase their vocabulary and understanding of gaining experience in various field. Thus, students were given task to prepare summary of any fiction which they would prefer. And asked to read in the class, they were enthusiastic to share their summary. Here some instances are given of students' critical appreciation of fiction. Thomas Hardy's *The Mayor of Casterbridge* taught the students that pride leads to ruin. Charlotte Perkins Gilman's *The Yellow Wallpaper* was a cautionary tale against looking down on women. Charles Dicken's *A Tale of Two Cities* centers on sacrifice and the power of love to overcome despair. The moral lessons of Jane Austen's *Pride and Prejudice* are that love and family are important, and that pride and prejudice can be dangerous. Yann Martel's *Life of Pi* explores how faith, resilience, and storytelling are essential for survival and finding meaning in suffering. While reading the summary, students felt better at inferring meaning, grasping general ideas, and reading faster. It helped them to build fluency and vocabulary. Also, it may nurture their life skills which can enable individuals to deal with everyday life and societal life. As the students were third year, they were mature enough to handle these reading of fictions in class room.

Literature provides pleasure to listeners and readers. It is a relaxing escape from daily problems, and it fills leisure moments. Developing a love of literature as a recreational activity is possibly the most important outcome of a literature programme. Literary texts enrich the language input in the classroom and stimulate language acquisition by providing 'meaningful and memorable contexts for processing and interpreting new language' (Lazar, 1993:17). Though students were technical they gave positive responses that literary text will develop their communication skills, and they showed their interest of including some literary pieces in their curriculum.

Reading Newspaper

Difficulty with reading is a common problem. Students not interested in reading novels, dramas or poems can be encouraged to read English newspapers. Integrating newspaper reading in engineering classrooms acts as a bridging technical theory with real-world applications. The benefits of reading newspaper in the classroom are manifold and have the potential to transform students to avid reader. It exposes students to diverse perspectives, business news, social issues and enhancing overall general knowledge. Reading Newspaper article is included in engineering syllabus of 'Technical English' subject of the first-year students. A task was given to students to share the read news in classroom. Most of the students showed interest sharing regional news and film news. Students can be encouraged

**Pappy Vincent and Sathees Kumar**

to read political news, science, business, economical, sports news etc. It helps to improve the reading habit, communication skill and social awareness. This will not only enhance their reading skills but also update students' current affair knowledge. This applied in the classroom was fruitful besides reading literary text.

CONCLUSION

The 21st century has become the era of multi-media where books and newspapers are being replaced by television and the internet. College students are looking for new and faster ways to entertain themselves that does not require as much effort as reading and thinking. It is no longer seen as activity young students enjoy doing. The outcome of this is that the multi-media world is rapidly growing while the literature era is slowly fading away. As teachers, it is their responsibility to encourage students to do extensive reading, which involves learners reading texts for enjoyment and to develop general reading skills. Though it is struggle competing with the multi-media, students can be given literary text which is easy to read and understand and enhance their didactic values in life and society. Literature helps better understand lives and the world around us. Encounters with literature develop the concepts of identification, imagination, and empathy.

ABSTRACT

This paper analyses how women's power, once visible in ancient cultural and religious narratives, gets gradually distorted, silenced, or erased through patriarchal storytelling. Early texts and traditions present women not as passive figures but as thinkers, warriors, devotees, and moral authorities like Gargi, Maitreyi, Draupadi, Kannagi, Andal, and a host of goddesses who embody cosmic power. However, as narratives are retold and institutionalized, women's agency is either idealized into obedience or punished as transgression. The present study analyses the fiction *Circe* by Madeline Miller and the movie *Barbie* (2023). Besides the present works also reconceptualises selected epics, and folk traditions using Madonna - Whore dichotomy and the monstrous feminine as seen in feminist and psycho analytical theories to trace how women's autonomy is systematically reshaped. Women who challenge social or male authority are often transformed into symbols-sacrifice, purity, or danger-thereby divesting them of their political and intellectual agency. Their stories survive, but their power does not. The paper then links this historical erasure with contemporary gender politics, which symbolically revere goddesses but engage in everyday discrimination against women. This paradox reveals a cultural logic that celebrates female power only when that power is abstract, spiritualized, or safely distant from real social structures. In lived reality, women continue to face barriers to leadership, knowledge production, economic mobility, and public space. The present paper reads cultural narratives as political texts, arguing that inequality is reproduced not only through law or economy but also through the storytelling that circumscribes what women can be. And when women exceed these limits, they are commonly rendered invisible, misrepresented, or morally disciplined-turned from divine into demon. Reclaiming women's power does

**Amutha Charu Sheela and Raghavi Priya**

not mean rejecting tradition but re-reading it critically. This paper calls for recovering suppressed voices, questioning inherited narratives, and breaking those cultural patterns that still turn living women into shadows of their potential.

Keywords: *Tradition, Divine, Demon Goddesses, Power, Feministic myth, Women's power*

INTRODUCTION

Patriarchal storytelling has systematically distorted women's power across epochs, transforming potent figures into idealized Madonnas or terrifying monsters, thereby erasing their agency. Ancient narratives and traditions from Vedic Upanishads to Tamil epics and Greek myths, initially depict women not as passive figures but as thinkers, warriors, devotees, moral authorities and intellectual powerhouses like Gargi debating sages, Draupadi commanding kings, Kannagi toppling kingdoms, Andal and a host of goddesses who embody cosmic power. However successive retellings have institutionalized them into passive purity or punished deviance. Women's agency is either idealized into obedience or penalised as transgression. The core argument posits narratives as political instruments reproducing inequality: women challenging authority become sacrificial symbols or dangers, their power abstracted into spiritual irrelevance—thereby divesting them of their political and intellectual agency, while real-world barriers persist. This paper subsequently connects this historical erasure with contemporary gender politics, which symbolically revere goddesses but engage in everyday discrimination against women. Linking historical myths to contemporary politics—goddess worship amid discrimination—this study reconceptualises epics and pop culture, advocating critical re-reading for reclamation. Through psychoanalytic and feminist frameworks, it reveals how storytelling circumscribes female potential, turning divine women demonic when autonomous. This paradox reveals a cultural logic that celebrates female power only when that power is abstract, spiritualized, or safely distant from real social structures. In lived reality, women continue to face barriers to leadership, knowledge production, economic mobility, and public space. The present paper reads cultural narratives as political texts, arguing that inequality is reproduced not only through law or economy but also through the storytelling that circumscribes what women can be. And when women exceed these limits, they are commonly rendered invisible, misrepresented, or morally disciplined—turned from divine into demon. Through the lenses of Madonna-Whore dichotomy (Freud) and monstrous-feminine (Creed) alongside Mulvey's male gaze, this paper traces this erasure in traditions with particular reference to contemporary fiction *Circe* by Madeline Miller and the movie *Barbie* (2023). Besides, the present work also reconceptualises selected epics, and folk traditions using Madonna - Whore dichotomy and the monstrous feminine as seen in feminist and psycho analytical theories to trace how women's autonomy is systematically reshaped. In addition this paper also demands for recovering suppressed voices, questioning inherited narratives, and breaking those cultural patterns that still turn living women into shadows of their potential as reclaiming women's power does not mean rejecting tradition but re-reading it critically.

Defining the Scope: The Binary of Deification and Demonization in Gender Politics

The representation of women within cultural, religious, and narrative traditions has historically been structured through a polarized framework that oscillates between deification and demonization. This binary is neither incidental nor merely symbolic; rather, it functions as a deeply embedded ideological apparatus that regulates gender roles and constrains women's agency within both textual and lived realities. At its core, this binary constructs womanhood as a site of contradiction. Women are either elevated to the status of the divine—embodying purity, sacrifice, nurturing, and moral perfection—or relegated to the realm of the demonic, characterized by excess, desire, rebellion, and perceived moral corruption. Importantly, these categories do not reflect women's lived experiences but rather impose externally constructed identities that serve patriarchal stability.

Deification, while ostensibly celebratory, operates as a subtle mechanism of erasure. The divine woman is revered but immobilized. She exists not as a subject but as an ideal—abstracted from material reality and stripped of agency.

**Amutha Charu Sheela and Raghavi Priya**

As scholars have noted, idealization often functions as a form of control, wherein the subject is elevated beyond critique but simultaneously denied participation in social and political life (Beauvoir 1949). The “goddess” figure, therefore, becomes a symbolic construct that demands perfection while precluding autonomy. This phenomenon is particularly evident in South Asian contexts, where female deities such as Durga, Lakshmi, and Saraswati are revered as embodiments of power. However, this symbolic reverence coexists with systemic gender inequalities, including restricted access to education, economic disparity, and limitations on bodily autonomy. This paradox underscores what Nivedita Menon describes as the “cultural mystification of women’s power,” wherein symbolic elevation masks structural subordination (Menon 2012).

Demonization, conversely, emerges as a response to female transgression. Women who deviate from prescribed roles—whether through sexual autonomy, intellectual assertion, or political resistance—are recoded as dangerous or deviant. This process aligns with Michel Foucault’s conception of discourse as a regulatory force that defines and disciplines acceptable behaviour (Foucault 1978). Within this framework, labelling women as “monstrous” or “immoral” serves to delegitimize their agency and justify their exclusion. The binary thus functions as a dual mechanism of containment:

- Deification neutralizes women through idealization, rendering them passive and untouchable.
- Demonization disciplines women through fear, marking deviation as socially and morally unacceptable.

Together, these processes create what may be termed a discursive enclosure, within which women’s identities are confined to extremes, leaving no space for complexity, contradiction, or self-definition. Furthermore, this binary is sustained through narrative repetition. Myths, epics, religious texts, and contemporary media continuously reproduce these archetypes, embedding them within cultural consciousness. As Judith Butler argues, gender is not an inherent identity but a performative construct, produced through repeated acts and reinforced through cultural narratives (Butler 1990). The persistence of the divine/demonic binary thus reflects not its naturalness but its continual reinforcement.

This repetition ensures that the binary is internalized not only at a societal level but also at the level of individual subjectivity. Women are often compelled to negotiate their identities within these constraints, calibrating their behaviour to avoid demonization while striving for unattainable ideals of perfection. Importantly, the binary also intersects with other axes of power, including class, caste, and race. The “ideal woman” is often implicitly defined through upper-caste, heteronormative, and patriarchal standards, while marginalized women are more readily subjected to demonization. This intersectional dimension complicates the binary, revealing it as a dynamic system that adapts to preserve existing hierarchies (Crenshaw 1989).

In contemporary contexts, this binary persists in more subtle forms. Media representations, for instance, continue to oscillate between glorifying women as symbols of virtue and vilifying them for perceived transgressions. Social media amplifies this dynamic, enabling rapid cycles of idealization and backlash that mirror historical patterns of worship and witch-hunting. Thus, defining the scope of this study requires recognizing that the binary of deification and demonization is not confined to mythological or literary traditions but extends into modern cultural, political, and digital landscapes. It operates across temporal and spatial boundaries, adapting to new contexts while retaining its core function: the regulation of women’s power.

This paper, therefore, positions this binary not as a descriptive category but as a critical problem—one that necessitates interrogation, deconstruction, and re-reading. By examining how this binary is constructed and sustained, the study seeks to uncover the mechanisms through which women’s agency is systematically reshaped and, ultimately, erased.

Amutha Charu Sheela and Raghavi Priya

Theoretical Frameworks

Psychoanalytic Theory: The Madonna–Whore Complex

The Madonna–Whore dichotomy, first articulated by Sigmund Freud, remains one of the most enduring psychoanalytic frameworks for understanding gendered perception. Freud observes a fundamental psychic split in heterosexual male desire: men tend to idealize women they respect (the “Madonna”) while desiring women they perceive as sexually available but morally inferior (the “Whore”) (Freud 1912). This division produces a structural inability to reconcile love and desire within a single female subject. While Freud situates this dichotomy within individual psychology, its implications extend far beyond the psyche into cultural and ideological formations. Feminist scholars have argued that this binary is not merely descriptive but prescriptive, shaping social expectations of femininity and reinforcing patriarchal control (Irigaray 1985; Rubin 1975). The Madonna–Whore complex thus becomes a cultural script through which women are categorized, evaluated, and disciplined. At a structural level, the dichotomy functions by denying women a unified identity. A woman who conforms to the Madonna ideal—pure, nurturing, self-sacrificing—is granted respect but deprived of agency and desire. Conversely, a woman who embodies sexual autonomy or assertiveness is relegated to the category of the Whore, thereby losing social legitimacy and moral authority. This division enforces a double bind: women cannot simultaneously inhabit respectability and autonomy.

The persistence of this binary can be understood through Louis Althusser’s notion of ideological state apparatuses, wherein institutions such as religion, family, and media reproduce dominant ideologies through normalization (Althusser 1971). The Madonna–Whore dichotomy is internalized through these structures, shaping not only how women are perceived but also how they perceive themselves. Moreover, the dichotomy operates as a mechanism of political erasure. By idealizing women, it strips them of the complexity required for leadership and decision-making. By demonizing them, it delegitimizes dissent and resistance. In both cases, the result is the same: the exclusion of women from positions of power. Importantly, this binary is not static; it evolves across historical and cultural contexts. In contemporary media, the dichotomy manifests in subtler forms—the “good girl” versus the “bad girl,” the “wife material” versus the “desirable woman.” These iterations demonstrate the adaptability of the framework, ensuring its continued relevance in modern gender politics. Thus, the Madonna–Whore complex must be understood not merely as a psychological phenomenon but as a discursive strategy that structures gender relations and sustains patriarchal hierarchies.

The Monstrous-Feminine: Abjection, Body, and Fear

Barbara Creed’s concept of the monstrous-feminine offers a critical expansion of psychoanalytic theory by foregrounding the role of the female body in the construction of horror and fear. Drawing upon Julia Kristeva’s theory of abjection, Creed argues that patriarchal culture constructs the female body—particularly its reproductive capacities—as a site of anxiety, excess, and contamination (Creed 1993; Kristeva 1982). Abjection, as defined by Kristeva, refers to that which disturbs identity, system, and order. It is associated with bodily fluids, decay, and processes that blur boundaries between self and other. The maternal body, in particular, becomes a primary site of abjection because it challenges the distinction between subject and object. This ambiguity generates discomfort, which is then translated into cultural representations of fear. Recent feminist film scholarship has begun to reinterpret the monstrous-feminine not merely as a site of abjection but as a space of resistance, where female monstrosity becomes a transformative and liberatory force (Creed 2022). Within this framework, the monstrous-feminine emerges as a figure that embodies these anxieties. Unlike traditional monsters, which are often external threats, the monstrous-feminine is intimately connected to the body, sexuality, and reproduction. She is not merely feared for her actions but for what she represents—a disruption of order.

This construction is evident in various archetypes:

- The witch, whose knowledge and autonomy threaten patriarchal authority
- The vampire, whose sexuality is both seductive and destructive
- The possessed woman, whose body becomes a site of uncontrollable excess

Amutha Charu Sheela and Raghavi Priya

In each case, female power is reframed as danger. The narrative logic justifies containment, punishment, or destruction as necessary responses to this threat. However, what is crucial here is that the monstrous-feminine is not an inherent quality but a discursive production. Women become monstrous not because of what they are, but because of how they are represented. This aligns with Foucault's understanding of power as productive rather than merely repressive—it produces categories, identities, and truths that shape social reality (Foucault 1978). Furthermore, the monstrous-feminine intersects with the Madonna–Whore dichotomy. While the Madonna is desexualized and idealized, the monstrous woman is hypersexualized and feared. Both representations serve to regulate female bodies—either by suppressing desire or by pathologizing it.

In contemporary contexts, the monstrous-feminine continues to evolve. It appears not only in horror cinema but also in media portrayals of women who defy normative expectations—ambitious women are labeled “ruthless,” outspoken women “aggressive,” and emotionally expressive women “unstable.” These labels function as modern iterations of monstrosity, disciplining women through language. Thus, the monstrous-feminine operates as a cultural technology of fear, ensuring that female autonomy remains constrained within acceptable limits.

The Male Gaze: Visuality and the Freezing of Female Agency

Laura Mulvey's theory of the male gaze provides a crucial link between psychoanalytic frameworks and visual culture. In her seminal essay “Visual Pleasure and Narrative Cinema,” Mulvey argues that mainstream cinema is structured around a gendered dynamic of looking, wherein men occupy the position of active viewers and women are positioned as passive objects of visual pleasure (Mulvey 1975). This dynamic is not merely aesthetic but ideological. The camera itself becomes an extension of the male gaze, framing women in ways that emphasize their appearance rather than their agency. Close-ups, slow pans, and stylized shots fragment the female body, reducing it to a series of visual pleasures rather than a coherent subject.

Mulvey identifies two primary modes of visual pleasure:

- Scopophilia: the pleasure of looking at another person as an object
- Voyeurism: the pleasure derived from controlling or scrutinizing the object

Both modes reinforce the objectification of women, positioning them as spectacles to be consumed rather than agents who act. Importantly, the male gaze also intersects with narrative structure. Women in cinema are often denied narrative agency; their stories are subordinated to male protagonists. Even when women appear central, their roles are frequently defined in relation to male desire. This visual economy reinforces the Madonna–Whore dichotomy. The “good woman” is framed with softness, modesty, and restraint, while the “bad woman” is sexualized and exoticized. In both cases, the framing serves to control how women are perceived. Moreover, the male gaze contributes to what may be termed the freezing of female agency. By reducing women to visual objects, it arrests their narrative development. They exist to be seen, not to act. Contemporary feminist film theory has expanded Mulvey's framework by examining alternative modes of representation, including the possibility of a “female gaze” that re-centers women's subjectivity. However, the persistence of the male gaze in mainstream media indicates the enduring power of patriarchal visual structures.

Synthesis of Theoretical Frameworks

Taken together, these three frameworks—Freud's Madonna–Whore dichotomy, Creed's monstrous-feminine, and Mulvey's male gaze—form an integrated analytical lens through which the representation of women can be understood.

- Freud explains the psychic division that categorizes women
- Creed reveals the cultural construction of fear surrounding female power
- Mulvey exposes the visual mechanisms that sustain these representations

Collectively, they demonstrate that the regulation of women's identities operates across multiple levels—psychological, cultural, and visual. These frameworks are not isolated but mutually reinforcing, creating a complex

Amutha Charu Sheela and Raghavi Priya

system that shapes how women are imagined, represented, and controlled. This theoretical foundation enables the subsequent analysis of mythological narratives, literary texts, and contemporary media, illustrating how these patterns persist and evolve across contexts.

The Core Thesis: The Binary Trap

At the heart of this study lies the argument that the Madonna–Whore dichotomy and the construction of the monstrous-feminine do not operate as isolated symbolic patterns but as an integrated system—a **binary trap**—that regulates, disciplines, and ultimately erases women’s power. This binary does not merely categorize women; it actively produces and constrains the conditions under which femininity can be recognized, validated, or punished. The term “binary trap” is used here to describe a closed ideological structure in which women are confined to two mutually exclusive and equally limiting positions: the idealized figure of purity and sacrifice, or the demonized figure of excess and transgression. What makes this structure particularly insidious is that it masquerades as a spectrum of representation, while in reality offering only two poles—neither of which permits full subjectivity.

The Madonna figure operates through idealization as containment. She is constructed as morally superior, emotionally resilient, and selfless to the point of erasure. However, this elevation is conditional. Her worth is contingent upon her compliance with prescribed norms—obedience, chastity, nurturing behavior, and emotional restraint. As Simone de Beauvoir observes, woman is positioned as “the Other,” defined not by her own subjectivity but in relation to male expectations (Beauvoir 1949). The Madonna, therefore, is not a free subject but a stabilized ideal, one that exists to uphold social order.

This idealization has significant political consequences. By demanding perfection, it denies women the “messiness” necessary for leadership—anger, ambition, contradiction, and risk. A woman who conforms to the Madonna ideal may be respected, but she is rarely permitted authority. Her role is to sustain, not to disrupt. Conversely, the figure of the Whore or the monstrous woman operates through demonization as discipline. Here, female agency is reframed as excess. Sexual autonomy becomes promiscuity; intellectual assertion becomes arrogance; emotional expression becomes instability. This transformation aligns with Judith Butler’s concept of gender performativity, wherein deviations from normative gender roles are sanctioned through social punishment (Butler 1990). The monstrous-feminine intensifies this process by rendering female power not just undesirable but terrifying. As Creed suggests, the female body becomes a site of abjection—something that must be controlled or expelled to maintain order (Creed 1993). Thus, women who exceed their prescribed roles are not merely criticized; they are symbolically expelled from the category of the human. The binary trap functions through a double-bind logic. Women are compelled to navigate a narrow path between idealization and demonization, constantly calibrating their behaviour to avoid crossing into the “wrong” category. Yet, this balance is inherently unstable. The same qualities that are celebrated in one context can be condemned in another. For instance, assertiveness may be praised as confidence in men but labelled as aggression in women. This instability ensures that women remain perpetually vulnerable to recategorization. A “good” woman can become a “bad” woman through a single act of deviation. This fluidity is not liberating but disciplinary, as it reinforces the need for constant self-regulation.

From a Foucauldian perspective, this binary can be understood as a form of disciplinary power that operates through internalization rather than coercion (Foucault 1978). Women are not only subjected to external judgment but also internalize these norms, shaping their own behaviour in anticipation of social response. The binary thus becomes self-sustaining, embedded within both cultural narratives and individual subjectivities. Importantly, the binary trap is not confined to mythological or literary texts; it permeates contemporary social and political discourse. Women in public life are frequently subjected to this dual framework. They are either celebrated as symbols of virtue—often in ways that diminish their complexity—or vilified for perceived transgressions. The language used to describe them—“too ambitious,” “too emotional,” “too aggressive”—reveals the persistence of this binary logic.

Furthermore, the binary intersects with structures of caste, class, and race, producing differentiated effects. Intersectional feminist theory highlights how marginalized women are more readily subjected to demonization, while privileged women are more likely to be idealized—though still constrained (Crenshaw 1989). This

Amutha Charu Sheela and Raghavi Priya

intersectionality underscores the adaptability of the binary, allowing it to function across diverse contexts while maintaining its core regulatory function. Another crucial dimension of the binary trap is its role in **narrative erasure**. Women's stories are not simply told; they are edited. Complex figures are simplified, contradictions are removed, and acts of resistance are reframed as moral failings. Over time, these narrative adjustments accumulate, resulting in a historical record that preserves women's presence but erases their power. This process can be seen as a form of what Gayatri Chakravorty Spivak terms "epistemic violence," wherein dominant discourses silence subaltern voices by controlling the conditions of representation (Spivak 1988). Women are not absent from narratives; rather, they are present in ways that distort their agency.

Thus, the binary trap operates across multiple levels:

- **Psychological**, through internalized gender norms
- **Cultural**, through myths, literature, and media
- **Political**, through language, representation, and institutional structures

It is not a static system but a dynamic one, capable of adapting to new contexts while retaining its core function of regulating women's power. This paper argues that the persistence of this binary is central to understanding the transition "from divine to demon." Women are not naturally positioned within these categories; they are placed there through narrative processes that transform power into either sanctity or threat. To dismantle this binary, it is necessary to move beyond its logic entirely—not by replacing one category with another, but by rejecting the framework that necessitates such categorization. This requires a re-reading of narratives that restores complexity, acknowledges contradiction, and re-centers women as subjects rather than symbols. Because the most radical disruption of the binary trap is not the elevation of women to divinity or the reclamation of monstrosity—but the insistence that women are neither.

From Victim to Villain

One of the most enduring narrative strategies within patriarchal discourse is the transformation of women from victims into villains. This process is neither accidental nor isolated; it is a systematic restructuring of narrative memory that reassigns blame, distorts agency, and ultimately justifies the control of women's bodies, desires, and knowledge. At its core, this transformation operates through what may be termed **narrative inversion**—a process by which women who experience violence, injustice, or marginalization are reconfigured as the source of disorder.

In this inversion, victimhood is erased, and transgression is imposed. The woman is no longer wronged; she becomes the wrong. This section examines three foundational figures—Eve, Medusa, and Sita—to illustrate how this inversion functions across religious, mythological, and cultural contexts. Each case reveals a distinct mode through which women's agency is reinterpreted as threat, thereby legitimizing their regulation.

Eve: Knowledge as Transgression

The figure of Eve in the Judeo-Christian tradition represents one of the earliest and most influential examples of narrative inversion. In the Genesis account, Eve's act of eating the forbidden fruit is framed as disobedience, resulting in the fall of humanity. However, this act can also be understood as a pursuit of knowledge—a desire to transcend imposed limitations. Elaine Pagels argues that early interpretations of Genesis were not monolithic; rather, they were shaped by theological and political interests that emphasized obedience and hierarchy (Pagels 1988). Within this framework, Eve's curiosity becomes a liability. Her act is not read as intellectual engagement but as moral failure.

The narrative thus establishes a foundational association between **female curiosity and danger**. Knowledge, when sought by women, is reframed as transgression. This framing has far-reaching implications, contributing to historical restrictions on women's access to education, authorship, and intellectual authority. Furthermore, Eve's punishment—pain in childbirth and subordination to man—naturalizes gender hierarchy. The narrative moves from symbolic act to material consequence, embedding inequality within divine order. From a Foucauldian perspective, this can be seen as the production of a "truth" about women—one that links their agency to disorder and legitimizes their control (Foucault 1978). Eve is not merely a character; she becomes a template through which women are understood and governed.

Medusa: The Politics of Transformation

The myth of Medusa offers a more explicit illustration of how victimhood is erased through narrative restructuring. In earlier versions of the myth, Medusa is a mortal woman who is assaulted by Poseidon within Athena's temple. Rather than punishing the perpetrator, Athena transforms Medusa into a monstrous figure with serpentine hair and a gaze that turns men to stone (Ovid, *Metamorphoses*). This transformation is deeply symbolic. Medusa's body becomes a site of punishment, her monstrosity serving as both consequence and containment. The violence inflicted upon her is displaced onto her identity, recasting her as inherently dangerous. Barbara Creed's framework of the monstrous-feminine is particularly relevant here. Medusa embodies the fear of female power—her gaze, which petrifies, can be interpreted as a metaphor for the destabilizing potential of female agency (Creed 1993). She reflects, rather than creates, male vulnerability. Her eventual beheading by Perseus further reinforces this dynamic. The act is framed as heroic, yet it is also an act of silencing. The woman who sees, who resists, who embodies trauma, must be eliminated to restore order. Importantly, Medusa's head continues to function as a weapon even after her death, suggesting that female power can be appropriated and controlled even as the female subject is destroyed. This reflects a broader cultural pattern in which women's bodies and symbols are utilized while their agency is denied. Thus, Medusa's story illustrates a two-step process of narrative inversion:

1. Victimhood is erased through transformation into monstrosity
2. Monstrosity is neutralized through destruction and appropriation

Sita: The Violence of Idealization

While Eve and Medusa are demonized, Sita represents a different trajectory—one in which women are idealized to the point of erasure. In the *Ramayana*, Sita is constructed as the epitome of virtue, devotion, and purity. However, this idealization is contingent upon her willingness to endure suffering. The Agni Pariksha, or trial by fire, serves as a critical moment in this narrative. Despite being abducted against her will, Sita is required to prove her chastity. Her body becomes a site of scrutiny, her virtue subject to public validation. This demand reveals the paradox of deification. Sita is revered as a goddess, yet this reverence does not protect her from suspicion or suffering. Instead, it intensifies the expectations placed upon her. As Uma Chakravarti notes, such narratives function to reinforce patriarchal norms by presenting idealized femininity as both desirable and obligatory (Chakravarti 2003). The violence here is not physical but symbolic. Sita's identity is reduced to her purity, her worth measured by her ability to conform to an unattainable standard. Her eventual withdrawal into the earth can be read as both a rejection of these expectations and a final act of erasure—she exits the narrative rather than continue to perform within it. From the perspective of the binary trap, Sita occupies the extreme end of the Madonna archetype. However, this position is no less restrictive than that of the demonized woman. Both are denied complexity; both are confined to roles that serve patriarchal logic.

Synthesis: Narrative Inversion as Control

The figures of Eve, Medusa, and Sita illustrate three distinct but interconnected mechanisms of narrative inversion:

- **Eve** transforms curiosity into sin, establishing a link between female knowledge and danger
- **Medusa** transforms victimhood into monstrosity, erasing trauma and legitimizing violence
- **Sita** transforms suffering into virtue, idealizing endurance and normalizing subjugation

In each case, the narrative does not merely reflect reality but actively reshapes it. Women's experiences are reinterpreted to align with existing power structures, ensuring that agency is either punished or neutralized. This process can be understood as a form of **epistemic control**, wherein the meaning of women's actions is determined by dominant discourses rather than by the women themselves (Spivak 1988). The result is a historical and cultural archive that preserves women's presence while distorting their power. Moreover, these narratives are not confined to the past. They continue to inform contemporary representations, influencing how women's actions are interpreted in media, politics, and everyday life. The woman who speaks out is still labeled disruptive; the woman who endures is still idealized. Thus, the transformation from victim to villain—or from subject to symbol—is not an isolated

Amutha Charu Sheela and Raghavi Priya

narrative device but a persistent cultural strategy. It ensures that women's power is never recognized on its own terms but is always mediated through frameworks of suspicion, fear, or idealization. To challenge this strategy, it is necessary to re-read these narratives critically, restoring the contexts and complexities that have been erased. This involves recognizing Eve as a seeker of knowledge, Medusa as a victim of violence, and Sita as a figure navigating impossible expectations. Because only by undoing these narrative inversions can women's agency be reclaimed from the structures that have long sought to contain it.

The Monstrous-Feminine: From the Attic to the Screen

The figure of the monstrous-feminine does not emerge suddenly within modern cinema; rather, it evolves through a long continuum of literary and cultural representations that encode anxiety surrounding female autonomy. From mythological figures like Medusa to literary characters confined within domestic spaces, and finally to cinematic portrayals of women as sites of horror and excess, the monstrous-feminine reflects a persistent cultural effort to contain and regulate women who resist normative roles. This section traces that evolution—from the symbolic confinement of women in literary spaces such as the attic to their hyper-visible yet still controlled representations on screen—demonstrating how patriarchal narratives adapt rather than disappear.

The Attic as a Space of Containment

In nineteenth-century literature, the figure of the “madwoman in the attic” emerges as a powerful metaphor for the repression of female desire, anger, and subjectivity. Sandra Gilbert and Susan Gubar famously analyze this trope in *The Madwoman in the Attic*, arguing that such characters represent the silenced double of the “ideal woman” (Gilbert and Gubar 1979). Bertha Mason in *Jane Eyre* serves as a canonical example. Confined to the attic, hidden from public view, and described as violent and irrational, Bertha embodies everything that the protagonist, Jane, must not become. Yet, as feminist critics have noted, Bertha's “madness” can be read as a response to confinement and erasure rather than an inherent condition.

The attic, in this sense, is not merely a physical space but a symbolic one. It represents the **containment of female excess**—those aspects of womanhood that cannot be accommodated within the ideals of passivity and obedience. Women who do not conform are not simply excluded; they are pathologized and hidden. This dynamic aligns closely with the concept of the monstrous-feminine. The woman becomes monstrous not because of her actions but because of her refusal to remain within prescribed boundaries. Her confinement serves to restore narrative order, ensuring that the idealized feminine remains uncontested.

From Literary Monster to Cinematic Body

With the advent of cinema, the monstrous-feminine undergoes a significant transformation. While literature often conceals or metaphorizes female excess, cinema renders it visible. The female body becomes the primary site through which monstrosity is expressed. Barbara Creed argues that horror cinema, in particular, constructs the female body as a source of abjection and terror, drawing attention to processes such as menstruation, childbirth, and sexual desire (Creed 1993). These bodily functions, which challenge boundaries and evoke ambiguity, are reinterpreted as threatening. Films such as *Carrie* (1976) exemplify this dynamic. Carrie's telekinetic powers are linked to her menstruation, framing female puberty as a moment of uncontrollable danger. Similarly, in *The Exorcist* (1973), the possessed female body becomes a site of grotesque transformation, reinforcing the association between femininity and instability. In these narratives, the female body is not neutral; it is charged with symbolic meaning. It becomes a terrain upon which cultural anxieties about sexuality, reproduction, and autonomy are projected. However, this visibility does not equate to agency. The cinematic monstrous-feminine is often subjected to punishment, containment, or destruction. The narrative arc typically resolves with the restoration of order through the elimination or neutralization of the female threat.

Surveillance, Spectacle, and Control

The transition from the attic to the screen also marks a shift from invisibility to hypervisibility. While literary monsters are hidden, cinematic monsters are displayed. Yet, this visibility is not empowering; it is structured through

what Laura Mulvey identifies as the male gaze (Mulvey 1975). The monstrous woman is both feared and fetishized. Her body is scrutinized, fragmented, and controlled through the camera's gaze. This dual positioning—simultaneously object of fear and object of desire—reinforces the Madonna–Whore dichotomy. Michel Foucault's concept of surveillance provides a useful lens here. In modern societies, power operates not only through repression but through observation and normalization (Foucault 1977). The cinematic screen becomes a site of surveillance, where female bodies are constantly monitored and judged. The monstrous-feminine, therefore, is not simply a figure within the narrative but a mechanism through which audiences are taught to perceive and evaluate women. The spectacle of monstrosity serves as both warning and instruction.

Contemporary Revisions: Reclaiming the Monster

While traditional representations of the monstrous-feminine emphasize fear and control, contemporary narratives have begun to challenge and reinterpret this trope. Rather than depicting the monstrous woman as an object of horror, these narratives reframe her as a subject with agency and voice. This shift can be understood as part of a broader feminist project aimed at reclaiming suppressed identities and re-reading dominant narratives. By centering the perspectives of women previously labelled as monstrous, these works disrupt the logic of the binary trap. Contemporary feminist horror reconfigures monstrosity as a mode of resistance, where exaggerated bodies, violence, and excess are mobilized to expose and critique patriarchal norms rather than reinforce them (Gaeta 2025). For instance, recent films and series increasingly explore the interiority of female characters, allowing audiences to understand the conditions that produce their actions. The monster is no longer inexplicable; she becomes intelligible. However, this reclamation is not without tension. Even as narratives attempt to subvert traditional tropes, they often remain constrained by existing structures of representation. The challenge, therefore, lies not only in reinterpreting the monstrous-feminine but in fundamentally altering the frameworks that produce it.

From Containment to Circulation

Another significant shift in contemporary culture is the movement from containment to circulation. While earlier narratives sought to confine the monstrous woman—whether in attics or isolated spaces—modern media circulates her image widely. Digital platforms amplify representations of female transgression, often subjecting women to rapid cycles of visibility and backlash. The monstrous-feminine is no longer hidden; she is shared, commented upon, and judged in real time. This circulation intensifies the regulatory function of the trope. The visibility of “monstrous” women serves as a cautionary example, reinforcing norms through public scrutiny. At the same time, it creates opportunities for resistance, as women reclaim and redefine these labels.

Synthesis: Evolution Without Liberation

The movement from the attic to the screen illustrates not a linear progression toward liberation but an evolution in the methods of control. While the forms of representation have changed, the underlying logic remains consistent.

- In literature, the monstrous woman is **hidden and silenced**
- In cinema, she is **displayed and punished**
- In digital culture, she is **circulated and scrutinized**

In each case, the monstrous-feminine functions as a mechanism for regulating female autonomy. The shift from invisibility to visibility does not necessarily grant agency; it often introduces new forms of control. Thus, the monstrous-feminine must be understood as a dynamic construct—one that adapts to changing cultural contexts while continuing to serve its primary function: the containment of women's power. This section sets the stage for the subsequent analysis of *Circe* and *Barbie*, which represent contemporary attempts to disrupt and reconfigure this long-standing narrative tradition.

Case Study I: *Circe* – Reclaiming the Monstrous-Feminine

Madeline Miller's *Circe* (2018) offers a critical reimagining of a mythological figure historically positioned within the framework of the monstrous-feminine. In Homer's *Odyssey*, Circe appears as a marginal yet threatening figure—a sorceress who seduces men and transforms them into animals, thereby embodying both sexual danger and moral

Amutha Charu Sheela and Raghavi Priya

corruption. However, Miller's retelling disrupts this representation by shifting narrative authority to Circe herself, transforming her from an object of fear into a subject of articulation. This narrative shift is not merely stylistic but ideological. By granting Circe a voice, Miller challenges the epistemic structures that have historically defined female figures through external, often male-centered, perspectives. As Gayatri Spivak argues, the subaltern is not simply unheard but structurally prevented from speaking within dominant discourse (Spivak 1988). *Circe* intervenes in this silence, allowing the so-called "monster" to narrate her own story.

Voice, Subjectivity, and Narrative Reclamation

One of the most significant aspects of Miller's *Circe* is its use of first-person narration. Circe is no longer described; she describes. This shift destabilizes the traditional framework of the male gaze, as the reader is compelled to engage with her interiority rather than observe her as an object.

Early in the novel, Circe reflects on her marginality among the gods:

"I was not desirable. If I was not wanted, I would make myself feared" (Miller 2018, p. 47).

This statement encapsulates the transition from invisibility to monstrosity. Circe's transformation is not inherent but reactive—a response to exclusion and devaluation. Here, monstrosity emerges not as a natural condition but as a socially produced identity, aligning with Foucault's notion that identities are constructed through discursive practices (Foucault 1978). Her voice reclaims what patriarchal narratives had obscured: the emotional, intellectual, and experiential dimensions of her existence. She is not merely a sorceress; she is a thinker, an observer, and a creator of knowledge.

Witchcraft as Knowledge and Resistance

In classical mythology, Circe's witchcraft is framed as dangerous and deceptive. However, Miller reinterprets witchcraft as a form of knowledge production and resistance. Circe's engagement with pharmaka (herbal magic) represents a deliberate act of learning, experimentation, and self-definition.

She states:

"I learned to mix and measure, to weigh and judge. I learned to make things that could change the world" (Miller 2018, p. 89).

This passage reframes witchcraft from superstition to epistemology. Circe's power is not innate but cultivated, positioning her within a tradition of intellectual labor often denied to women. This aligns with feminist critiques of knowledge production, which highlight how women's contributions have historically been marginalized or reclassified as illegitimate (Rossiter 1993). Moreover, her witchcraft operates outside institutional structures, challenging the authority of the Olympian order. By creating knowledge independently, Circe disrupts hierarchical systems that privilege divine and male-centered forms of power.

Transformation as Revelation, Not Punishment

Perhaps the most iconic aspect of Circe's myth is her ability to transform men into animals. In traditional narratives, this act is interpreted as evidence of her cruelty and danger. However, Miller reconfigures this transformation as an act of revelation rather than corruption.

Circe explains:

"I merely show them what they are" (Miller 2018, p. 123).

This line is crucial. Transformation is not an imposition but an exposure. The men who are turned into pigs are not altered in essence; their inner nature is made visible. This inversion challenges the patriarchal assumption that female power corrupts male virtue. Instead, it suggests that male behavior is already marked by excess, which is merely unveiled by Circe's magic. From the perspective of the monstrous-feminine, this reconfiguration is significant. Circe's power does not produce monstrosity; it reveals it. The fear she generates is not of transformation itself but of recognition—of seeing what has been concealed.

Exile and the Politics of Isolation

Circe's exile to the island of Aiaia is initially framed as punishment, reinforcing the trope of isolating powerful women. However, Miller transforms exile into a space of autonomy and self-creation. Circe reflects:

Amutha Charu Sheela and Raghavi Priya

“I lived alone for many years. I was not afraid. I was free” (Miller 2018, p. 102).

This statement marks a critical departure from traditional narratives, where isolation is synonymous with suffering or madness. Instead, exile becomes a condition for self-definition, allowing Circe to exist outside the constraints of divine hierarchy and patriarchal surveillance. This reimagining aligns with feminist spatial theory, which examines how spaces can function as sites of both oppression and resistance. The island, while initially a site of confinement, becomes a space where Circe can develop her identity on her own terms.

Sexuality, Consent, and Power

Miller’s *Circe* also engages directly with themes of sexuality and consent, challenging traditional representations of female desire as dangerous or manipulative. Circe’s relationships with figures such as Hermes and Odysseus are characterized by negotiation and mutual recognition rather than domination. However, the novel also confronts sexual violence explicitly. Circe’s encounter with sailors who attempt to assault her marks a turning point in her narrative. In response, she transforms them into pigs—a moment that redefines her use of power. She states: “I would not be prey again” (Miller 2018, p. 134). This declaration reframes her actions as defensive rather than predatory. The transformation becomes an assertion of bodily autonomy, challenging narratives that depict female power as inherently unjustified. From the perspective of the monstrous-feminine, this moment is crucial. Circe embraces the label of monster not as a mark of shame but as a strategy of survival. She becomes what patriarchal narratives fear, but on her own terms.

Motherhood and the Reconfiguration of Power

Circe’s role as a mother further complicates her identity, disrupting the binary between nurturing femininity and monstrous autonomy. Her relationship with her son, Telegonus, is marked by care, protection, and instruction. However, this motherhood is not idealized. It is fraught with difficulty, reflecting the complexities of balancing autonomy with responsibility. Circe does not abandon her identity as a witch; rather, she integrates it into her role as a mother. This integration challenges the Madonna–Whore dichotomy by demonstrating that nurturing and power are not mutually exclusive. Circe is neither purely maternal nor purely monstrous; she exists beyond these categories.

Choosing Mortality: The Ultimate Act of Agency

The novel concludes with Circe’s decision to relinquish her immortality and become human. This choice is significant, as it represents a rejection of divine hierarchy and an embrace of self-determined existence. Circe reflects: “I would not be a divinity who had nothing to say” (Miller 2018, p. 376).

Here, immortality is associated with stagnation and silence, while mortality offers the possibility of change, growth, and meaning. Circe’s choice can be read as an assertion of agency, prioritizing lived experience over symbolic power. This ending disrupts the traditional trajectory of mythological narratives, where transformation often results in punishment or loss. Instead, Circe’s transformation is self-directed, marking a shift from imposed identity to chosen existence.

Synthesis: Reclaiming the Monster

Miller’s *Circe* fundamentally reconfigures the monstrous-feminine by shifting the narrative perspective and redefining the terms of power. The novel demonstrates that monstrosity is not an inherent quality but a label imposed upon women who resist containment. Through voice, knowledge, transformation, and choice, Circe reclaims her identity from the structures that sought to define her. She is no longer a cautionary figure but a complex subject whose story challenges the binary trap of Madonna and monster. In doing so, *Circe* exemplifies the potential of narrative re-reading as a form of resistance. It does not reject myth but reinterprets it, revealing the suppressed possibilities within familiar stories.

Case Study II: *Barbie* (2023) – Deconstructing the Ideal Woman and Rewriting the Binary

Greta Gerwig’s *Barbie* (2023) operates as a complex meta-text that interrogates the construction of femininity within late capitalist and postfeminist frameworks. While the film initially presents itself as a celebration of idealized womanhood, it gradually dismantles the very structures that sustain such ideals, exposing the instability of the

Amutha Charu Sheela and Raghavi Priya

Madonna–Whore dichotomy and the mechanisms through which female identity is regulated. Unlike traditional narratives that impose meaning upon female characters, *Barbie* foregrounds the **constructed nature of identity itself**. The protagonist, Barbie, is not born but manufactured—literally produced as an object of consumption. This premise directly echoes Judith Butler’s assertion that gender is not innate but performed through repeated cultural acts (Butler 1990). Barbie, therefore, embodies gender as performance in its most explicit form.

Barbie Land: The Illusion of Feminine Perfection

Barbie Land is introduced as a utopian space where women occupy all positions of power—presidents, doctors, lawyers—while men exist in marginal, decorative roles. At first glance, this appears to be a feminist reversal of patriarchal structures. However, this reversal is not a dismantling but a mirroring. Barbie herself articulates this illusion of perfection when she states:

“Every night is girls’ night. Every day is the best day ever” (*Barbie*, 2023).

This repetition signals not authenticity but **scripted existence**. Barbie’s world operates through routine and performance, suggesting that perfection is not lived but enacted. The absence of conflict or contradiction reveals the artificiality of this system. Scholars such as Rosalind Gill argue that postfeminist media often presents empowerment as an individual, aestheticized experience rather than a structural reality (Gill 2007). Barbie Land exemplifies this logic. Women appear empowered, but their power is superficial, confined within a controlled environment that lacks genuine autonomy. Thus, Barbie Land represents the **ultimate Madonna space**—a world of idealized femininity that is visually appealing but fundamentally hollow.

The Crisis of Stereotypical Barbie: Cracks in the Ideal

The narrative begins to destabilize when Barbie experiences an existential crisis. Her sudden thoughts of death disrupt the seamless perfection of Barbie Land, introducing the possibility of imperfection and vulnerability. She confesses:

“Do you guys ever think about dying?” (*Barbie*, 2023).

This moment is pivotal. It marks the intrusion of reality into a constructed fantasy. Barbie’s body, previously flawless, begins to change—her feet flatten, cellulite appears. These changes symbolize the breakdown of the idealized feminine form. From a psychoanalytic perspective, this disruption can be understood as a confrontation with the Real—what lies beyond symbolic structures (Lacan 1977). Barbie’s crisis exposes the limits of the Madonna archetype, revealing that perfection cannot sustain subjectivity. Her transformation also aligns with the monstrous-feminine. As her body deviates from the ideal, she becomes “imperfect,” edging toward what the system perceives as undesirable or abnormal. The fear is not of monstrosity itself but of deviation from perfection.

The Real World: Encountering Patriarchy

Barbie’s journey into the real world marks a critical shift from illusion to confrontation. Here, she encounters a society structured by patriarchal norms, where women are objectified, dismissed, and subjected to surveillance. She observes:

“I feel... conscious. Like everyone is looking at me” (*Barbie*, 2023).

This statement reflects the internalization of the male gaze. Barbie, once the object of admiration in Barbie Land, becomes the object of scrutiny in the real world. Her visibility transforms from celebration to vulnerability. Laura Mulvey’s concept of the male gaze is directly applicable here. Barbie’s body is no longer simply seen; it is evaluated, sexualized, and controlled (Mulvey 1975). The shift reveals that visibility, rather than empowerment, can function as a mechanism of regulation.

At the same time, Barbie encounters Gloria, whose monologue articulates the contradictions of contemporary femininity:

“You have to be thin, but not too thin... you have to lead, but you can’t squash other people’s ideas” (*Barbie*, 2023).

This speech encapsulates the **double-bind logic** of the binary trap. Women are expected to embody conflicting qualities simultaneously, ensuring that they can never fully succeed. As Gill notes, postfeminist discourse often frames empowerment as a matter of personal responsibility while ignoring structural constraints (Gill 2007).

Amutha Charu Sheela and Raghavi Priya

Ken, Patriarchy, and the Fear of Female Autonomy

While Barbie confronts patriarchy, Ken embraces it. His discovery of male dominance in the real world leads him to import patriarchal structures into Barbie Land, transforming it into “Kendom.” Ken’s assertion – “I’m just Ken... and that’s enough” (*Barbie*, 2023) – reflects a newfound sense of identity rooted in dominance rather than self-definition.

This subplot highlights the fragility of patriarchal systems. Ken’s version of patriarchy is exaggerated, almost parodic, suggesting that such systems are performative rather than natural. However, it also reveals the ease with which patriarchal logic can be internalized and reproduced. Barbie Land, once a site of female dominance, is quickly restructured into a system where women are subordinated. From a theoretical perspective, this aligns with Althusser’s concept of ideology as something that is not imposed externally but internalized and reproduced by individuals (Althusser 1971).

Becoming Human: Rejecting the Binary

The film’s conclusion marks a significant departure from traditional narratives. Barbie chooses to leave behind her idealized existence and become human. This decision is not framed as loss but as liberation. She states:

“I want to be part of the people that make meaning, not the thing that’s made” (*Barbie*, 2023).

This line directly challenges the objectification that has defined her existence. Barbie rejects both the Madonna (perfect doll) and the monstrous (imperfect deviation) categories, opting instead for subjectivity. This transition resonates with Simone de Beauvoir’s assertion that woman is not born but becomes (Beauvoir 1949). Barbie’s journey is not about achieving perfection but about embracing becoming – uncertain, flawed, and self-directed.

Critical Reception and Feminist Interpretations

Critical responses to *Barbie* have highlighted its complex engagement with feminist discourse. Angela McRobbie argues that postfeminist media often incorporates feminist ideas only to neutralize them (McRobbie 2009). However, *Barbie* resists this neutralization by exposing the contradictions within postfeminist narratives. Similarly, Sophie Gilbert (2023) notes that the film “uses the iconography of perfection to critique the very structures that produce it,” suggesting that its strength lies in its self-reflexivity. At the same time, some critics have pointed out limitations. Banet-Weiser (2018) argues that commodified feminism risks being absorbed into capitalist frameworks, raising questions about whether *Barbie* can fully escape the system it critiques. These tensions do not weaken the film’s argument but rather highlight its complexity. *Barbie* operates within the structures it critiques, making its intervention both powerful and paradoxical.

Synthesis: Breaking the Dollhouse

Recent studies in feminist media scholarship highlight how the monstrous-feminine continues to be mobilized within digital subcultures, particularly in misogynistic online spaces that frame female autonomy as threatening (Feminist Media Studies 2022). *Barbie* dismantles the binary trap not by reversing it but by exposing its artificiality. The film demonstrates that both idealization and demonization are constructed categories that limit women’s identities. Through Barbie’s journey, the film articulates a crucial insight: the problem is not choosing between being perfect or being flawed – it is the existence of a system that demands such a choice. In rejecting her status as both object and ideal, Barbie reclaims subjectivity. She becomes neither Madonna nor monster but something far more disruptive:

A woman who is unfinished, evolving, and self-defined.

Philosophical Context: Becoming, Not Being

At the foundation of this study lies a philosophical question: what does it mean to be a woman within a system that defines womanhood before women can define themselves? The preceding sections have demonstrated that femininity is not an inherent condition but a structured and regulated identity. To fully understand this, it is necessary to situate the argument within broader philosophical discourse. Simone de Beauvoir’s seminal assertion –

“One is not born, but rather becomes, a woman” (Beauvoir 1949, p. 267) – provides the conceptual anchor for this analysis. Beauvoir challenges biological determinism, arguing that womanhood is constructed through social,

**Amutha Charu Sheela and Raghavi Priya**

cultural, and historical processes. This “becoming” is not neutral; it is shaped by systems that assign meaning, value, and limitation to gendered existence. Judith Butler extends this argument by conceptualizing gender as performative—a series of repeated acts that produce the illusion of a stable identity (Butler 1990). These acts are not freely chosen but regulated by norms that determine what is intelligible as “feminine.” Within this framework, the Madonna–Whore dichotomy and the monstrous-feminine can be understood as scripts of performance, dictating how women are expected to embody or resist femininity. Importantly, these philosophical perspectives reveal that identity is not merely imposed from outside but internalized and enacted. Women navigate these scripts, often negotiating between compliance and resistance. The binary trap operates precisely at this level—it structures the conditions under which identity can be performed, ensuring that deviation is met with sanction.

Michel Foucault’s notion of power as diffuse and productive further complicates this understanding. Power does not simply prohibit; it produces categories, discourses, and subjectivities (Foucault 1978). The identities of “goddess,” “mother,” “witch,” and “monster” are not natural classifications but outcomes of discursive processes that define what women are allowed to be. From this perspective, the transformation from divine to demon is not a shift in essence but a shift in discursive positioning. The same woman can be revered or condemned depending on how her actions are interpreted within prevailing frameworks of meaning. Additionally, Gayatri Spivak’s concept of epistemic violence highlights how dominant narratives silence or distort subaltern voices (Spivak 1988). Women’s experiences are often mediated through structures that prevent them from being fully understood on their own terms. This is particularly evident in the reinterpretation of mythological and literary figures, where women’s agency is overwritten by patriarchal readings.

Thus, the philosophical context of this study underscores a crucial insight: the problem is not simply representation, but the conditions under which representation becomes possible. To challenge these conditions, it is necessary to move beyond binary frameworks and toward a conception of identity that accommodates multiplicity, contradiction, and change.

CONCLUSION AND FUTURE DIRECTIONS: RECLAIMING THE NARRATIVE

This paper has argued that the movement from divine to demon is not a natural evolution but a deliberate narrative strategy embedded within patriarchal systems of knowledge and representation. Across mythological texts, literary traditions, cinematic narratives, and contemporary media, women’s power is consistently reshaped through processes of idealization and demonization. The Madonna–Whore dichotomy and the monstrous-feminine function as complementary mechanisms within this system. One elevates women beyond humanity, stripping them of agency through perfection; the other reduces them to objects of fear, delegitimizing their autonomy. Together, they form a binary trap that constrains women’s identities and limits the possibilities of their representation. The analysis of figures such as Eve, Medusa, and Sita demonstrated how narrative inversion transforms victims into villains or saints, erasing the complexity of their experiences. The case studies of *Circe* and *Barbie* illustrated contemporary efforts to reclaim and reconfigure these narratives, offering alternative frameworks that center female subjectivity.

The paradox identified throughout this study remains central: women are symbolically celebrated but materially constrained. Goddesses are worshipped, yet women’s access to power remains limited. Visibility is increased, yet authority is restricted. Representation expands, yet recognition remains uneven. To address this paradox, the paper proposes a shift from reinterpretation to reclamation. Reclaiming women’s power does not require rejecting tradition but re-engaging with it critically. This involves revisiting canonical texts and narratives to uncover suppressed meanings and alternative interpretations. For instance, reading Medusa as a victim of violence rather than a monster, or Sita as a figure negotiating systemic constraints rather than embodying passive virtue, allows for a reconfiguration of narrative authority. Such re-readings challenge the stability of dominant interpretations, revealing that tradition is not fixed but open to contestation. Central to this process is the restoration of voice. As demonstrated in *Circe*, narrative perspective plays a crucial role in shaping meaning. Allowing women to speak within their own narratives

Amutha Charu Sheela and Raghavi Priya

disrupts the structures that have historically defined them. This requires not only producing new narratives but also amplifying marginalized voices within existing frameworks. It involves recognizing women as subjects of knowledge rather than objects of representation. The journey from divine to demon is not a fall—it is a rewriting. Women were never only goddesses or monsters. They were thinkers, creators, rebels, and survivors. What has changed is not their nature, but the stories told about them—and the systems those stories sustain. To reclaim women's power is not to return to some imagined past but to reimagine the present. It is to question the narratives that define possibility and to create new ones that expand it. Because the most disruptive figure in any system is not the goddess who is worshipped or the monster who is feared—but the woman who refuses to be reduced to either.

ABSTRACT

Dispora has the dialectics of both belonging and longing. The yearning to return and the desire to accommodate keep on influencing the people who journey to new countries. The dynamics of migration are intricate and multifaceted which encompass a wide array of emotions, sensations, passions and even sometimes resentments in diaspora. Hence, survival for women folk in exiled settings happen to be overwhelmingly agonising as they struggle in contradiction of exile, the tensions of kin and work, and the limitations necessitated equally by old and new male-controlled structures. While they endeavour to uphold their familial ethnicity, on the other hand they challenge to accept substantial values, professional flexibility, and develop cultural customs within transnational intervals. The works of Chitra Banerjee Divakaruni distinctly echo these complicated dimensions of displacement in her narrative. This paper seeks to examine the intricate nature of individual exodus through selected writings of the author. The purported study focuses on investigating the psyche of feminine migrants who repeatedly grapple with the quandaries of exile and displacement. It seeks to investigate the persistent themes such as exile, isolation, cognitive dissonance, remoteness, and indigenous dislocation undergone by women in diasporic perspectives.

Keywords: Cognitive dissonance, dislocation, exile, isolation, psychological rebellion, displacement, emotional, chauvinism

INTRODUCTION

Dislocation brings about an impact on migrants, shaping their uniqueness and sense of belonging. Exile and relocation ensuing from relocation are substantial ongoing truths that have severely deployed the artistic landscape of modern narratives. Chitra Divakaruni, a multi-ethnic, postcolonial diasporic Indian writer residing in the US, is a

**Vadivu**

prominent conspicuous existing author in Indian literature. Across her works, she expresses the deep-engrained torment, anxiety, and emotional turbulence suffered by displaced womankind. Her stories depict the multifaceted confrontations confronted by women equally in India and in the U S, emphasizing intricacies of migrant existence. As the environments of migrants resume to progress, so too do the approaches embraced by these women to overwhelm the ordeal of dislocation and cultural estrangement.

When individuals enthusiastically drift to settle in an alternative part of the earth, they choose to journey with a resolution that fosters visions in their thoughts -daydreams of an upgraded life and a dwelling that would entrancingly transform their state of fortitude and accord them a restored identity. In one's interface with migrant literature one acquaintances dislocation not just spatially but also from environmental standards, where the prototypical facades of human relocation comprise- the migrant visions, the craving to escape, enforced migration, exile, surviving with the remoteness, pull of reminiscence and wistfulness prevailing between times and spaces.

When individuals voluntarily move to settle in a faraway dreamy land they do with willpower in their visions nurturing dreams and thoughts to reinstate a new identity. The contrasted aspects like the longing to escape, struggle to sustain distance, constrained displacements prevailing between times and spaces, pull of reminiscence and wistfulness are exhibit in the migrants. Meenakshi Thapans' analysis on womenfolk is, "She lives in both the traditional and modern worlds." (361)

Even if existence is progressing on with the advancement of expertise, immemorial established everyday jobs of womankind are nonetheless during in the humankind. Modern women are committed to break free from conventional restraints and are enthusiastically encountered in reliving their responsibilities, individualities, and associations within a humanity. Even after migration the anxiety between faithfulness towards custom and the aspiration for autonomy forms a focal characteristic of their progressive diasporic life unfamiliar ethnic circumstances. According to Chitra Banerjee Divakaruni women who are wedged amongst their ancient past and a advanced present endure to suffer this cultural skirmish. As a hypothetical framework, diaspora highlights that encounters are persistently intervened and that intimate and integrated tales are re-explained over period. Avtar Brah's theoretical interpretation of exodus is that,

It is within this confluence of narrativity that 'diasporic community' is differently imagined... And we have to think about questions of home and belonging. (45)

For Brah, diaspora is an altered way of investigating the stipulation of relocations that echoes a expedition towards resolution. In the existing era of digital communication, movement, crusade, and relocation have boosted the distinguishing attributes of recent culture, individuals are relocating, ever-changing for revolution a r scenarios touching the humanity to a notable boundary. Owing to several motives and immense prospects in the initial periods' relocation was typically imposed and was predominantly for the excluding benefited and deprived classes. In Arnold's words, "Migration becomes the most obvious path to a better life and greater prosperity" (196). Nonetheless, in the concluding epoch relocation was mostly owing to humankind's predisposition concerning career benefits.

Divakaruni, a preeminent novelist of the Indian Diaspora has portrayed 'migratory sensibility' as the imperative theme in her novels. Her novels are the narratives of immigrant women experiences. She has constantly voiced concerns concerning womenfolk's experiences of expulsion in their native land as well as their host land. Being estranged from their indigenous ethos, women frequently occupy a marginal perception, hooked between ethos, and undergo instincts of estrangement and remoteness. Divakaruni's novels correspond to this theory. In *The Location of Culture*, according to Bhabha space and time overlap to create intricate illustrations of alteration and identity, past and present.

**Vadivu**

Women folks are accorded with a stupendous position in nearly all rites when competing them with deities. Newspaper reportage and statistics speak volumes about the sagacity of revulsion faced by women who are independent, valiant, and resolute to be on their own. Thus, on one side, women are alleged in great esteem but in everyday reality, within the family, and the social milieu their situation is uncanny, unbelievable, and shocking. When an issue of their empowerment arises, no efforts are intensely taken.

Empowerment facilitates womankind to break the ethnic, economical, communal and spiritual constraints. Women assert themselves through empowerment, by confronting and surpassing these limitations. Women folk emphasize themselves by overcoming these constraints. Divakaruni has envisioned feminine characters who are in the lead of performances centred on vision and conviction. Divakaruni's personalities frequently traverse between inspiration and existence, eventually carving out spaces of sovereignty, and self-fulfilment in a confounded humanity. She exhibits female protagonists who arise as powerful entities in this intricate globe.

Scattering out, inclination towards a homeland and periphery maintenance are the three underlying divisions that are extensively implied to be the fundamentals of Diaspora. The complete echelon of change is reflected in the cycle of moving and shifting by relocating oneself in the large sphere of tradition and custom. The ethos, attitude, perspicacity, discrimination and erudition all seem to merge in the psyche of the immigrants thereby creating a consciousness which was never before of one's own identity, individuality and distinctiveness. Individuals by relocating and trans-positioning, in general, undergo transformation and proceed towards integration, inclusion and reconciliation. The change in the milieu and recent social settings with a different cultural situation pose a challenge to the migrants.

The pursuit for financial betterment, better life and better position are the causes for migration. There are two factors which make people relocate from one place to another. As an alternative of the adverse 'push' aspect it is the 'pull' aspect that is primarily the impetus for movement in Divakaruni's narratives. Divakaruni's central character also fits in the definition provided by Safran as they "maintain a memory, vision or myth about their original homeland (... the group's consciousness and solidarity are importantly defined by this continuing relationship with the homeland" (83-84). Though the protagonists are displaced they also get relocated in the new contexts which offer them new challenges. On the optimistic side, the independence offered to them by the new land provides new opportunities though there is also a sensation of rift. Migration from the homeland merges with the arrival in the host land but it also creates emptiness. The 'Past' develops into a passionate stimulating substance and intends to redevelop and transmute the existing state. Push and pull relating 'convention and innovation besides' beliefs and desires' also can be perceived.

In diaspora womenfolk time and again endure encounters like alienation, and assimilation the demand for reunion. As womenfolk scuffle when they combat in contradiction of exile. Consequently, survival for them is unbearable. They confront versus exile, problems within and outside the family, constraints of tradition and ethnicity which are all forms of patriarchies.

The protagonists of Divakaruni contrive themselves to countenance the rigid realities of human life in the unfamiliar terrain. Divakaruni's narratives resonate these traits of migration in her tales. Her novels *Sister of My Heart*, *Vine of Desire*, *The Mistress of Spices* and *Oleander Girl* elicit misery of every female's scuffle whilst demanding to acclimatize in the exotic beliefs. Womanhood's perception of seclusion and the necessity for self-acknowledgement appeal to their brawl for distinctiveness amidst customs of patriarchy. Margaret Abraham perceives that "ethnicity, gender, class, race, and citizenship are all important aspects in the construction of self and community for South Asian immigrants in the United States" (451).

Divakaruni's writings avow that diaspora is not solely scattering or dispersal of migrants but a motif of consciousness that encompasses various conflicting characteristics of them. Women kind who find themselves in displacement realize that they are simultaneously elements of various values. Divakaruni presents the womankind

**Vadivu**

who are frayed concerning the beliefs of the 'Modern' and 'Old Humanity' grappling to sculpt an identity of their own. She addresses the affairs such as interracial relationships, patriarchal issues, racism, economic disparity, arranged marriages, pregnancy, miscarriage, and divorce. In a meeting with Neila C. Seshadri, she states that she initiated to author regarding what was of more significance in her life and that was the approach in which relocation had brought about a alteration in her life and it certainly questions her life. The intention for expulsion varies for every single narrative. The form of an expatriate is categorised by Naficy as "a process of perpetual becoming, involving separation from home, a period of liminality and in-betweenness that can be temporary or permanent, and incorporation into the dominant host society that can be partial or complete" (455). These days, countless womenfolk are wandering as distinctive emigrants in the far away land. According to Edward Said exile accentuates more on dislocation rather than the control of migration, that counterparts equally to its convincing space and its competence associated with the humanity. Critic Said asserts:

Exiles, unlike travellers, bear the mark of history in their personal narratives of loss and thus desire the stability of belonging, ... is the beginning of exile. (34)

A few events, similar to the terrorist strike on the World Trade Centre, and Godhra riots attribute in her novels. She has analysed the repercussions of such incidents in the personal lives of the people through her novels. Her personal immigrant experience in Ohio has helped her articulate the feelings of loneliness and cultural separation that suffuse in all the novels. All her protagonists are wedged in, amidst the traditions and beliefs of their heritage as well as that of their new homeland. She has mirrored the factual India through her characters. The characters of Banerjee's narratives habitually experience quandary owing to the network of chauvinism. The individuals' scuffle, serve, resist in contrast to or are correlated with antagonism, desolation, bitterness, acknowledgement, consideration and response.

The protagonists repeatedly move backwards and onwards involving the commotion at home besides household arrangement of a conventional chauvinism framework with its formidable gender uniqueness. The social surroundings examine the living of womankind through the approach which they have under no circumstances visualized of. Chitra Divakaruni as an archetypal of the widespread complications of discernment, fracas besides chaos in the humanity has shaped an innovative crusade bursting with ensigns and facets of India. *Sister of My Heart* commemorates Indian women's migration to the U.S. as an expedition from the subjugated and despondent state to sovereignty and discovery of the self. This novel is set in India.

Sister of My Heart is an extended narrative of Divakaruni's tale 'The Ultrasound'. We unearth an eye-opening introduction to Indian culture in this novel. This novel is a venture by Divakaruni to behold India and its humanity. Chitra Banerjee has dealt with Indian women's personal identity as well as their migrant notion through this novel. She is reminded of her days in India and by recalling her commemorations beyond the characters she has accomplished to reinvent Indian convention in this work of fiction. Anand Mulloo's texts endeavour to restore Divakaruni's proclamation. He has stated that exploring back with reminiscence with regard to the motherland, immigrants endeavour to rebuild imaginary native lands or spaces like 'Little India' which is eventually influenced by aspiration and leisure pursuit.

The narrative commences with the birth of the sisters of heart—Sudha and Anju—and concludes with them reuniting in America once separated for some years. The tale is told by Sudha and Anju in alternating episodes, tracing their commencement of persistence in India and concluding with another beginning—that of their diasporic survival. Viewed in the perspective of Divakaruni's oeuvre, *Sister of My Heart* captures the perspective of the opening piece. The sequel to it is *The Vine of Desire*. The novel highlights the motherland realities which pave the way to the deportation of her womanly characters, Anju and Sudha, to a new terrestrial space. Sheila Rowbotham's interpretation is valuable in this milieu: "But always we are split in two, ...we were always in transit, immigrants into an alien country" (31).

Vadivu

Manipulated by strict patriarchal standards, Aunt Pishi, the sister of Bijoy, symbolizes the oppressed feminine of a former era. As a victim of rigid patriarchy, she is denied an alternative to create a living of her own. As the three mothers are competent in providing physical, emotional, and cultural vitality to their family, they are portrayed as the cultural backbone of the family. Divakaruni, through this novel, has examined its objectivity of goodness as well as the adverse attributes of the humanity through which she was raised. Both are inseparable, and Anju's attraction towards Sunil, who strides into their store, reveals her disposition towards radicalism. Both Sudha and Anju are wedded on the same day. "Like no-one else in the entire world will" (SH 24). They counterpart each other, reconnoitring perceptions and enduring as supreme examples of the contemporary Indian woman.

Dislocation, in *Sister of My Heart*, is intensely faced within the native land itself. Exile can strike within oneself, at home, or within one's own nation. Sudha is dominated by her oppressive mother-in-law, and Anju too remains emotionally tied to her past; neither of their married lives ends in bliss. Anju remains tied to the past emotionally, often lingering over her optimistic youth. She endlessly thinks about her earlier times and reflects on her closeness with Sudha. Vijay Mishra observes in this context that relocation within the native land is "the traumatic moment ...which produces a feeling of melancholia" (8).

In several Asian homes, personal room is often limited, and this becomes the breaking point for many women. Mankind and womankind voyage deliberately or insistently in pursuit of opportunities and, in turn, end up in hybrid, liminal, and trivial spaces to establish a new identity. Sudha steps out of her husband's overpowering household after taking Anju's suggestion and, in addition, establishes a space for her daughter Datiya and herself within this rigid civilization.

As Anju acts as a mediator, Divakaruni's central character gathers valour and ultimately drifts to America, a territory that would extend to her an occasion to be sovereign. Sudha arises as a lady of influence and willpower whilst the bond between her and her offspring is confronted. She moves forward from being a subordinated woman to becoming a progressive mother who opposes restrictions on her rights. She asserts her autonomy, undergoes a profound transformation, and thinks progressively about America, remarking, "America has its own problems, ...for America was full of mothers like me" (SH 294).

Anju's past life nags her regarding her mother's health, Pishi's life, and Aunt Nalini's experiences. Homesickness and memories of her mother and motherland make her restless at all times. Memory is no longer extensively deemed "as a stable space of identity but as a process of displacement itself" (Baronian et al. 12). Migrants find themselves struggling to assimilate into a new home among unfamiliar people. Typical Indian women often face this dilemma after their dislocation from home. According to critic Avtar Brah, "Home" is a mythic place of desire in the diasporic imagination (192).

Divakaruni has epitomized this idea of "home," which reflects both the locale and its inherent traditions and culture. Diaspora has become a new framework for culture and identity that claims recognition for people who suffer from oppression or discrimination. Nostalgia deteriorates Anju's condition. She expresses her pangs of longing to meet her sister: "I need you, I need you so much" (SH 310). She suffers a miscarriage. Sudha narrates a traditional fairy tale to Anju about a princess incarcerated in a fortress of snakes, waiting to be rescued—a narrative that provides her with relief and emotional solace.

In the novel, one can see that the women characters' past experiences function as a mechanism of self-recovery. It helps them retrieve their strength in their struggle against subjugation. Anh Hua, in relation to memory and remembrance, mentions:

"The struggle for memory can help to create spaces where one is able to redeem and reclaim the past... Remembrance is not simply to document but to construct the new" (147).

Vadivu

The dynamics of remembrance and reminiscence resulting from loss are distinctive qualities of diaspora. Bell Hooks has stated that the recovery of memory proposes “both a sagacity of re-union and a perseverance of relief” (158). A person’s life becomes a written text that is reliant on other texts. The inscriptions of home and environment gradually evolve in ways that are not products of choice but are left to circumstances. Both sisters imagine that migration will bring autonomy for Sudha, enabling her to carve out a new life, earn her own living, and provide the necessary support for her daughter, Dayita. People move between spaces across time and geography. Sudha’s chief objective is to find a safe place where she can rebuild her life. Though physically distanced, changes in everyday realities are transformed into reassuring certainties for the cousins.

Sudha thus transforms herself into a rebellious woman by violating the constraints of a marriage considered sacred by society. She successfully frees herself from the overwhelming pressures of convention and takes the significant step of moving to the United States with her daughter, Dayita. She intends to offer emotional support to Anju, who is depressed following her miscarriage.

Migration can be viewed as an influence that encourages immigrant women to broaden their options and opportunities. In contrast to Anju, Sudha’s relocation is not primarily motivated by an attraction to America but by a desire to alleviate her suffering and seek liberation from her existing circumstances. Sudha’s migration is not merely the result of fascination with America; rather, it is an attempt to heal herself and escape the pain she endures in her homeland. At the beginning of her transition, Sudha remarks, “A future built by women out of their own wits, their own hands” (SH 317).

Stuart Hall voices the notion of identity as follows: “Identities are never unified and, in late modern times, increasingly fragmented and fractured ... discourse, practices and positions” (4).

Interim concepts like *hybridity*, *alterity*, and *transculturalization* are vital in understanding uniqueness in diasporic perspectives. They accentuate the merging of ethnicities and the familiarity of being located as the “other” within predominant social configurations. There are various push and pull factors which elucidate the reasons for migration. Push factors are considered negative influences that induce migrants to leave an area, whereas pull factors are constructive elements, such as economic opportunities, that attract migrants.

Diaspora has consequently surfaced as a mode of cognizance in the narrative of Chitra Banerjee Divakaruni, where the centre of attention is on the immeasurable encounters, circumstances, beliefs, and perceptions of distinctiveness. In literature, an alter ego is repeatedly a tributary identity of a character that discloses inner conflict or opposition. Cicero coined the term as part of his philosophical construct in first-century Rome, describing it as “a second self, a trusted friend.” The term *alter ego* is correspondingly cast off to entitle the best friend of another character in a narrative.

Sudha is incapable of despising Anju, as she observes her as her “other half,” with whom her bond is eternal. Sudha emerges as a woman of empowerment and fortitude. When women encounter disputes in exilic settings, they develop responses that initiate newfound perceptions and possibilities. They articulate their demands and strive for change within challenging circumstances through an adaptable and transformative progression.

ABSTRACT

Funny Boy can be classified as a *bildungsroman* or “coming of age” novel, by Shyam Selvadurai, a Sri Lankan writer writes in English from Canada. It chronicles the life of Arjie Chelvaratnam, the protagonist. It consists of six chapters and they explicate his sexual awakening in the wake of the civil war in Sri Lanka. In each chapter, he discloses his inward changes and also the traumatic socio-political life around him. He is seven years old when the story begins. The story unfolds the incidents occurred in his life between 1977 and 1983, the crucial period in Sri Lankan history. During these years, the ethnic conflict was at its peak and it results his family's emigration to Canada. The novel has already been explored in various angles. This paper is an attempt to interpret it from a new lens, that show Arjie inclines his queerness, his homosexuality, at personal level and also how he perceives the intensity of the ethnic conflict at national level as a young adult.

Keywords: sexual awakening, civil war, homosexual inclinations, ethnic conflict

INTRODUCTION

Selvadurai's debut novel, *Funny Boy* narrates the story of (Arjun) Arjie Chelvaratnam, a seven-year-old protagonist. It explores Arjie's sexuality in the wake of the ethnic conflict from Arjie's point of view. Starting in 1977, it uncovers how Arjie's maturing process through presenting the ethnic conflict from 1958 to 1983. This paper is an attempt to read it from the young adult literary narrative. As stated, the young narrator, Arjie narrates his childhood experience and expectations, wishes, involvement, temperament, the unsympathetic life in the midst of the elders and his eagle-eye view of the ethnic conflict and also his self-realisation. This paper groups this novel as a young adult fiction as it resembles some of the elements of the young adult literature. Such literary productions are gradually emerging and Cindy Lou Daniels clarifies it as “often grouped as a sub-division within the category of children's literature” (*The Alan Review*, 78). Pertaining to the features of children's literature, Lou Daniels inscribes the merit of children's

Veerasamy

literature as: “children’s literature scholarship is by no means invalid; it sheds much light on literature as a whole as well as the genre it discusses (*The Alan Review*, 78). Similarly, Emily Wilcox comments on the Young Adult Literature is “relatively recent phenomenon, with the term only coined in the 1960s as a way of describing titles catering for children between the ages of 12 to 18” (1).

Funny Boy is composed of six discrete chapters, “Pigs Can’t Fly,” “Radha Aunty,” “See No Evil, Hear No Evil,” “Small Choices,” “The Best School of All,” and “Riot Journal: An Epilogue” to vitalise both personal and public awareness of Arjie. The first story, “Pigs Can’t Fly,” discusses how Arjie identifies his funny nature while spending his spend-the-day at his grandparents’ home. As a child, he prefers to dressing up in saris and playing with girls, instead of playing cricket with boys, and as a teen enters into a relationship with a male classmate. In bride and bride game, he dresses up like a bride in a sari; his cousins help him to put on a veil and make-up. He asserts his position among the female cousins: “If it was cooking-cooking we were playing, I was the chef; if it was Cinderella or Thumbelina, I was the much-beleaguered heroine of these tales” (FB,4). Mallika Vasugi Govindarajoo et al in their “Elements Of Young Adult Literature in Prescribed Novels for Malaysian Schools” quote Herz and Gallo’s (1996) nature of young adult literature as “a young adult protagonist, the point of view of a young adult, coming-of-age issues that are relevant to young adults, the story being marketed specifically to young adults, and the story being one that young adults willingly choose to read” (272).

Funny Boy fulfils all the above cited nuances. Arjie is a young protagonist-narrator, though he is a child, he is not reluctant in his portrayal of the adult world. From age seven to thirteen and his maturation process is very much evident to make the story as the coming-of-age novel. He is always found among his female cousins. His aunty, Kunthi drags him in front of his parents and others to notify his transgressing behaviour. Highly terrified in sari already, he feels ashamed of him and feels “The sari suddenly felt suffocating around my body, and the hairpins, which held the veil in place, picked at my scalp” (FB,13). His uncle Cyril also remarks at him: “looks like you have a funny one here” (FB,14). As a young boy he narrates the childhood reality. His father blames his mother for his funny behaviour, permitting him to play with her saris. He hears his father referring him as “If he turns out funny like that Rankotwera boys, if he turns out to be the laughing-stock of Columbo” (FB,14). His father also observes that this kind of childish game would make him funny when he grows up.

Arjie voluntarily ventures into his mother’s room while she is dressing and playing with her jewellery. For him, “Entering that room was . . . a greater boon than that granted by any god to a mortal” (FB,15). After he is caught, he is not permitted to his Amma’s room, but remains outside her room while she dresses up inside and he “could hear the rustle of the sari as it brushed along the floor” (FB,16). As a young boy, Arjie is perplexed that he fails to realise his guilt “It was clear to me that I had something wrong, but what it was I couldn’t comprehend. I thought of what my father had said about turning out “funny. The word “funny” as I understand it meant either humorous or strange as in the expression. “that’s funny” (FB,17).

To change his nature, his Amma informs his elder brother Diggy to include Arjie in his cricket team. Diggy rejects her request calling him a “useless . . . We’ll never win if he’s on our team” (FB,19). He refuses to play cricket and asks his Amma “Why do I have to play with the boys” (FB,19). His Amma responds to him “Because the sky is so high and pigs can’t play, that’s why” (FB,19). As a boy he longs to play “bride-bride” and is helpless at this time, he thinks “it was impossible for the girls to play bride-bride” (FB, 21). So, he hides the sari in the car. When one of his cousins, Sonali clarifies his Amma whether Arjie could play with girls, she reiterates Sonali “Because the sky is so high and pigs can’t fly” (FB,23).

When Arjie plays cricket with the boys, Sanjay teases him as a “girlie-boy” (FB,25) and he is terrified with the unexpected nickname ‘girlie-boy.’ He is cornered in the batting order also. His brother grabs the bat, tells him “You go . . . We don’t need you” (FB,28). He then chases Arjie with the bat to beat. Sensing the danger there, Arjie escapes. This captures the trivial world of the children where raw emotions, actions and reactions gain momentum and thus form the narration that is conceived as young adult narration. The boyish demeanour is once revealed by him “If you

Veerasamy

let me play, I will give it [sari] to you when it's time for the bride to get ready" (FB,30). In the tug of war between Her Fatness and Arjie, the sari is torn and the sleeve of her dress is torn. When his Ammachi, grandmother rebukes him as "vamban" (FB,37), he escapes to the seashore with the sari and bemoans at this incident a lot.

As a result of this embarrassing incident, Arjie senses his 'in-betweenness.' He affirms it "I would be caught between the boys' and the girls' worlds, not belonging or wanted in either" (FB,39). It happens to an adult but Arjie experiences it. It's a kind of displacement, not belonging to both the worlds. Adrienne Vitullo in his "Displacement in Young Adult Literature: A Thematic Analysis" notes the similar kind of displacement as

"Displacement, often an effect of socio-political conflict, is increasingly a theme in adolescents' lives, and therefore a prevalent theme in the ways they see the world. Providing spaces for adolescents to discuss their relationships to displacement through Young Adult (YA) texts can provide educators a possible way to support to adolescents at this critical time in their lives" (<https://pmc.ncbi.nlm.nih.gov/articles/PMC9361240/>).

He could realise his transformation as a matured boy, enduring "the lunches and teas when the cousins would talk to one another" (FB,39-40). He brings the torn sari back home believing "the future that awaited me" (FB,40). Through this experience, he acquires a power to manage all situations independently and he realises the children's world and the world of the elders.

Arjie narrates ethnic clashes that collapsed the life of the people in the subsequent chapters. "Radha Aunty," the second chapter, deals with his father's youngest sister, Radha who returns to Sri Lanka after her stay in the USA for four years. It exposes the country's waking ethnic conflict. As a seven-year-old boy, he is excited over the marriage of Radha with Rajan, the son of his Appachi's family friend, Mr. Nagendra. To make him more responsible, his Janaki, the servant-maid allows him to read her love comics. He compares the two characters of his favourite love comic, namely, Mani-lal and Sakuntalawith Rajan Nagendra and Radha Aunty. He imagines her as "a strong resemblance to that goddess of the Sinhala screen Malini Fonseka . . . with big rounded hips . . . a fair complexion and large khol-rimmed eyes . . . hair was straight and made into an elaborate coiffure on the top of my head, and she wore a Manipuri sari with a gold border" (FB,43).

When Radha returns, he is shocked because "She was a karapi, as dark as a labourer . . . her long hair was frizzy like Ammachi's . . . She was thin, not plump . . . "flat like a boy" . . . Instead of sari, she wore a halter-top and strange trousers that were tight to the knee and then became wider" (FB,46). Though he has this opinion about her, she advises his Ammachi not to treat him as a servant boy. He understands her "different from other adults" (FB,48). In fact, she permits him to play in her bedroom where he feels more liberated. She sticks a star on his forehead, applies lipstick, and paints his eyelids and put rouge on his cheek and darkens a birthmark above his lip. He confesses his transformation "now I had lost my earlier shyness. I donned several of her chains and bangles and studied the effect in the mirror . . . coloured his nails" (FB,51). Besides, he advertently shows his fingers to Her Fatness. He thinks: "so that she would notice my nails. When she saw them, her face became clouded with jealousy" (FB,53).

Arjie is thrilled witnessing the play, *The Pied Piper of Hamelin* in which he finds the characters are children and he is more thoughtful of the fact that "they got to wear make-up and costumes and dance around the stage" (FB,54). Later, he is curious about the story of another play, *The King and I* in which the English governess teaches "English and other Western subjects to the king's children and wives" (FB,54). Though the story does not end in marriage, he expects it to be concluded with marriage. When he clarifies it, his Amma explains it to him "Because at that time people don't marry outside their race" (FB,54). At present, he expresses his adult behaviour the play should end with married. When he intends to give happy ending of the story, asking his Amma: "if it was now, would they have married" (FB,54). This indicates how knowledge about the mixed marriages, but his Amma agitatedly responds: "Because most people marry their own kind" (FB,54).

Veerasamy

Bucher T. Katherine. "Understanding Young Adult" observes that

"As young adult literature has matured, authors have begun to incorporate more complex characters, subjects, and situations (Cart, 2001). The boundaries of young adult literature have expanded as authors explore topics of cruelty and crime, personal abuse, and racial violence (Dresang, 1999), accompanied by a change in the perspectives represented in literature (7).

In *Funny Boy*, Selvadurai incorporates Arjie as a more complex character, introduces most complex political subject and his family it drawn into many difficult situations during the course of the ethnic conflict. The whole family is caught in a complex situation while Radha loves Anil, Daryl's death announces uncertain political climate, and the untold suffering of the Tamils during 1983 clash. Therefore, the young boy narrator blurs his boundary without confining in his own childhood territory and intrudes into the adult world where he could perceive only political turmoil and its consequences. Through a chain of incidents and situations, his personality is shaped. His realisation on the enmity between the Sinhalese and the Tamils over their governance is disclosed when Radha Aunty develops a love affair with a Sinhalese man, Anil Jayasinghe after her rehearsal of the play, *The King and I*.

Arjie is conscious of his surrounding, but not enough matured to learn what has happened to his family members in the past. He partially thinks that Ammachi is biased against Anil's being a Sinhalese and calls her, a racist. He reacts this innocently as "I wondered why Anil's being Sinhalese upset her so? I was in a Sinhala class at school and my friends were Sinhalese. My parents' best friends were, too. Even our servant was Sinhalese, and, in fact, we spoke with her only in Sinhalese. So what did it matter whether Anil was Sinhalese or not?" (FB, 58-59).

The brutal murder of Arjie's great-grandfather in the 1958 ethnic conflict disapproves their marriage. As a boy, he learns the very crux of the problem that's spoiling the peace of the family and learns from his father that his great-grandfather, Ammachi's father was killed by the Sinhalese "because he was Tamil" (FB, 60). Arjie reveals his boyish attitude and mentality to his father: "But you're Tamil and I'm Tamil and nobody's killing us" (FB, 61). Arjie's world is being enlarged from bride-bridal to ethnic conflict.

Shyam Selvadurai shaped Arjie as a balanced character because he is keen on the world of children when he is with children and behaves as a mature adult by capturing the socio-political condition. He turns into a vibrant individual when he joins Radha Aunty because he earns a space to exercise his freedom and obtains power to observe the external world. His potential as a boy narrator is proved when he narrates the effects of "Sinhala Only" policy introduced by S. W. R. D. Bandaranaike, the then Prime Minister to deprive of the Tamils of their rights. By doing so, the government carefully eliminated the educated Indians from the civil services and other government positions. It was a blow to the Tamils. When the country expected a unifying factor, English language "served a politically useful role as an important unifying factor in the country" (K. M. de Silva, 47). So, Sinhala was made mandatory in government business establishments. The Sinhalese chauvinism was evident through the abolition of English medium schools and classes were taught in Sinhala language. Ravi Kant Dubey in his *Indo-Sri-Lanka Relations: With Special Reference to Tamil Problem* underscores the Sinhala fanaticism as "it was made compulsory to inscribe Sri (a Sinhala specious word) on all number plates of vehicles. (84-85).

Arjie's Amma repeats to him about the massacre: "The Sinhalese wanted to make Sinhala the only national language, and the Tamils did not like this. So there was a riot and many Tamils were killed" (FB, 61). As a boy wants to know more about the adult world and his inquisitiveness strengthens the plot of the novel. He could realise his Ammachi's mentality to some extent and he anticipates whether she would support the government or the Tigers who "wanted a separate country" (FB, 61). At this juncture, his father admits him to the Sinhala class because he believes that Sinhala would be "the real language of the future" (FB, 61). She condemns Arjie's father for admitting him in the Sinhala class that he is "betraying the Tamils" (FB, 61). But his father senses the hegemony of the language in the current scenario and seeks hope for Sinhala only. Pointing out this crucial turn, Charles Sarvan, in his "Shyam Selvadurai's *Funny Boy*: Test and Context," in *Sri Lanka: Literary Essays and Sketches* remarks it as: "the father sees Sinhala not only as the new

Veerasamy

language of political hegemony and economic opportunity but also of physical safety—speaking Sinhala, one could, during times of anti-Tamil riot, attempt to pass off as Sinhalese” (50).

His Ammachi witnesses that the Tigers are striving hard to get a separate state. Through this narration, Arjie grabs every opportunity to comprehend the political climate. As a child narrator, he is competent to note the politics in the children’s world, that is, cricket is played “against other Sinhalese classes, the boys in our [Tamils] class played the Tamil class . . . when the match was over the players parted without shaking hands or patting each other on the back” (FB, 62).

Arjie understands better that Radha’s being a Tamil forbids her relationship with Anil. Further, she explains to Anil that “Her [Ammachi’s] father was killed in the fifty-eight riots” (FB, 68). As a young observer, he listens to Anil’s determination: “If you like me, together we can make our parents accept us” (FB, 74). But his Ammachi forbids this relationship. Finally, Radha is sent to Jaffna. She reminds Radha the danger ahead of her “Otherwise, people in mixed marriages will find themselves in a terrible dilemma” (FB, 79).

Another character, Aunt Doris, a Burgher and the director of *The Kind and* briefs the shortcomings of the intermarriage. She marries Paskaran, a Tamil against her family wishes. She says that she is the real victim of the mixed marriage. After her marriage, her father strictly forbids her mother and sisters contacting each other and all of a sudden, they migrated to England without informing her, leaving “no address or anything” (81). Later, she learns from a mutual friend that her father had passed away. When she contacts her sisters, she finds that she has lost the previous affinity and she feels that they have become strangers and she feels that it is too late for her to contact and by the time her husband also dies and she is left alone. Before leaving for Jaffna, Radha meets Anil and they complete all arrangements for the marriage. She feels more confident: “Everything is set. When I come back from Jaffna [,] we’re going to do it. I don’t care what his parents or my parents say” (FB, 84). The riots break out while Radha is returning from Jaffna and she realises the real core of the ethnic conflict as she witnesses “Sinhalese people began throwing stones and bottles on the train” and learns that “The government is going to declare a curfew” (FB, 86). Mr. Rasiah, Ammachi’s family friend, rescues her speaking “good Sinhalese and the men had believed he was Sinhalese” (90). When Anil visits Radha’s house and notices a drastic change in Radha and regularly takes part in the rehearsal again but remains steady to stay away from Anil.

Prior to the riot, Arjie deciphers that intermarriages were possible between the Tamils and the Sinhalese, if they loved each other. But after witnessing the volatile political situation he comes to term that such marriages are impossible. Through Radha’s life he is aware of the complexities of life and this exemplary incident strengthens Arjie’s realisation.

The narration about Daryl, a Sri Lankan-Burgher journalist from Australia, wants to study the war and violation of human rights in Jaffna. He is on a two-month vacation when his father is for Europe to promote his hotel business. He perceives the war as: War . . . signified guns and soldiers and armoured cars” (FB, 109). He wants “to investigate if this was true and do an article to his newspaper” (FB, 110). Arjie regards about POTA that it is “a new law that allowed the police and the army to arrest anybody they thought might be a terrorist without something called a warrant . . . tool for state terrorism” (FB, 110). Daryl desperately holds a partial opinion that “nothing will happen to [him]. . . Neither the army nor the Tigers care about someone who looks like a foreigner” (FB, 117). His visit a week long one in Jaffna where he learns that “people are being tortured and killed” (FB, 117).

As a child narrator, his knowledge grows about the unimaginable atrocities done during the civil war. He, along with all members, learns that “the Jaffna library was burned by the police this morning. Ninety-thousand books were set on fire” (FB, 122). Only Daryl’s body is rescued. Arjie’s mother meets Q. C. Appadurai, her father’s friend and a civil rights lawyer to make an appeal to Daryl’s death. He advises her not to probe into it and guides her: “These days one must be like three wise monkeys. See no evil, hear no evil, speak no evil” (FB, 141). Since the investigation is dangerous to her family, he warns her that her phone would be tapped if she continues her enquiry. She conforms

Veerasamy

that it is being tapped. She visits BelihulOya to meet the servant boy, Somaratne to enquire the cause of Daryl's murder. The conflict not only affected the middle and upper middle and upper classes of people, but also ordinary peasants. Arjie's consciousness towards this also grows through the ruthless murder of the servant boy, Somaratne's elder brother in the 1971 insurrection by the army. A lot of oppositions prevent Arjie's mother not to enquire more about Daryl's death. In addition to the above, Arjie learns that the army and the LTTE abduction many youth and detained them for any number of days and tortured them.

FunnyBoy records the ethnic tension which converts mundane matter into sensitive issues. "Small Choices" sums up the life of a Tamil boy, JeganParameswaran, the son of Grace Parameswaran from Jaffna. He is admonished when he tries to correct the fellow staff. Based on the complaint launched on him by the manager, Jegan misunderstands him and remarks, "It's a Tamil-Sinhala thing, isn't it? . . . It's ridiculous" (FB, 172). He reminds Jegan of the existing political situation: "The political climate is not conducive. With the Tigers killing Sinhala policemen and the Tamil partly calling for separation, the Sinhalese are very anti-Tamils right now" (FB, 172). Jegan is so scared and upset because "During the riots, the mob came here calling out my name. If it wasn't for my manager and other senior staff, this hotel would have been destroyed" (FB, 173). Being a Tamil is a threat not only to his life, but also to his workplace. Arjie's father notifies him that "the truth is I have given you a high position and there's bound to be more resentment in part because you're Tamil" (FB, 173).

Arjie is keenly brooding over the conversation between his father and Jegan in which his father tells Jegan, "We cannot live like this under constant threat from the Sinhalese, always second-class citizens in our own country . . . "Here you can be killed by the Sinhalese and there you can be killed by the police or the Tigers" (FB, 176). The post independent Sri Lanka's identity has erased all such greater glory of the country as a result of the ethnic clash. Jegan is suspected as a Tiger who is involved in an assassination attempt on a Tamil minister. He is arrested under the Prevention of Terrorism Act and the news item carrying "The suspect, JeganParameswaran resides with a well-known Tamil hotelier" (FB, 183) is also widely published. Jegan's post at the hotel triggers jealousy among the Sinhalese staff and they try to fabricate notorious stories about him, connecting him to the Tigers. By the time, Arjie's mother exhibits her fear in speaking Tamil language, "One doesn't feel safe speaking Tamil these days" (FB, 190). Sensing the continuous threat and danger, Arjie's Amma suggests emigrating to Canada or Australia. But his father confronts her emphatically: "I'll never emigrate. I've seen the way people live in foreign countries" (FB, 195). He expresses his helpless nature: "What would I do there. The only job I'd be fit for would be a taxi driver or a petrol station man" (FB, 196).

The Sinhalese supremacy damage the livelihood of other ethnic communities. As such, Arjie's parents are deprived of the opportunity to vote and "A member of parliament arrived with his thugs, held the voting officials at gunpoint, and then proceeded to stuff the ballot boxes with false ballots" (FB, 207). Later, his family learns that the government has won and that "They would remain in power for another six years" (FB, 207). His father determines to live in the country and says: "Never, I will never leave this country" (FB, 207).

The fifth chapter, "The Best School of All" narrates Arjie's experience at Victoria Academy when he is studying in the Sinala class. His father admits him to the Queen Victoria Academy believing that it would "force you to become a man" (FB, 210). Diggy, his elder brother, also notifies Arjie about his queer nature "He [his father] doesn't want you turning out funny or anything like that" (FB, 210). When he said that Arjie is excited and expresses it secretly "I felt a flush rise into my face" (FB, 210). From his reaction, his queer quality is intensified. A contradictory is observed here is that his father wants to change him into a man, but he develops his homosexual afflictions with Soyza Shehan and he finds himself looking at him oftenduring the classes. Arjie describes his physical features as "his body was well-proportioned and lacked awkwardness of most other boys of his age. His face was full of contrasts. His upper lip was thin, his lower lip full; his forehead was fine and well-shaped, his eyebrows thick and unruly. Yet the overall effect was attractive" (FB, 217). Jonathan Culler in his, *Literary Theory: A Very Short Introduction* *Funny Boys* situates it as "literature is one of the places where this idea of sex is constructed, where we find promoted the idea that people's

Veerasamy

deepest identities are tied to the kind of desire they feel for another human being" (8). He is thrilled to find himself "it became evident to me that Soyza had certain power" (FB, 217) and thereby he finds his sexual orientation.

At the same time, Diggy alerts him the conflict between Mr. Abeyasinghe, the Principal, nick-named Black Tie, and Mr. Lokubandara, a "political appointee" (FB, 212) who wants to make the Academy a Buddhist school. His intention is revealed: Since all Buddhists are Sinhalese, that means the school would be a Sinhala school, and there would no place for Tamils in it" (FB, 220). But the Black Tie opposes Lokubandara's egalitarian worldview proposing that the school should be open for all races and religions.

When the principal, Black Tie slaps Soyza, Arjie is melted. Diggy understands the growing relationship of Arjie with Soyza and warns him: "I'm going to tell you something about Soyza because I don't want you to become like him" (FB, 231). And cites that during the free hour, "He has sex with the head prefect . . . Don't say I didn't warn you. If you remain Soyza's friend, people will think you're like him and you'll become the laughing stock of the whole school" (FB, 232). But Soyza is a good relief for Arjie when the principal beats him with the cane for not reading the poems which are meant for the recitation during the annual day. He takes pleasure articulating "Shehan" (FB, 242). He is quite clear that he is caught between the terror of the principal and "the relief and pleasure" of thinking of Soyza. He dreams of Soyza when he is alone. On one occasion Soyza kisses Arjie on his lips and casually moves and he is unable to see Arjie's eyes. He is in a turmoil now and he exhibits it: "I was still trying to recover from the impact of that kiss, trying to understand what it meant (FB, 250) and feels that "something was coming undone between us" (FB, 250).

He exhibits his full queer nature. When he is alone at home, he imagines Soyza all the time and says
First my mind's eye rested on Shehan's face, the fullness of his lower lip, the slight ridge above his upper lip . . . imagined him kissing me, not quickly but slowly, lingeringly, so that I could feel the full impact of the kiss. I tried to remember the instant when his tongue touched mine. It had been rough and wet . . . I . . . not only liked that kiss but was also eager to experience it again in all its detail and sensation. (FB, 251)

From that time onwards, he strongly believes that his friendship with Soyza has brought out "power and hidden possibilities" (FB, 256). While playing hide and seek in his home, Arjie sex with Soyza and regrets when he appears before his Amma and Appa and feels that "I saw that had committed a terrible crime against them, against the trust and love they had given me . . . I had done, beg to be absolved of my crime, but the deed was already done and it couldn't be taken back" (FB, 262). He thinks of his father: "He had been right try to protect me from what he feared was inside me, but he had failed" (FB, 262). Finally, he behaves as if a man apologises for his grave mistake. Even after that he feels "With the terrible regret of a realization come too late, I saw that I had misjudged what we had done in the garage. Shehan had not debased me or degraded me, but rather had offered me his love" (FB, 269). Without his company he feels "As long as you were there, I didn't mind being "ills and burdens" (FB, 271). Towards the end of this chapter, he realises that the relationship he has had with Shehan Soyza has altered his relationship with his Amma and feels alienated "I was no longer a part of my family in the same way. I now inhabited a world they didn't understand and into which they couldn't follow me" (FB, 284-85). Thus, Arjie is aware of his sexuality and feels like an adult and wants no longer hurt his family.

The final chapter of the novel, "Riot Journal: An Epilogue" pictures the July clash which broke out on 25th July, 1983 as a result of the murder of thirteen soldiers by the Tigers. Arjie minutes the incidents carefully in the form of a diary: His narrative capacity is shown in this chapter. At 09.30 am, on 25th July, 1983, "All the Tamil houses there [Kanaththa] are burnt, and the trouble has begun to spread to other parts of Colombo as well" (FB, 287). Through his Amma, he learns that in fact, the riot is sponsored by the government. He is well aware that the Sinhalese mobs arrive at the street, possessing the "electoral lists, they know which houses are Tamil and which houses aren't" (FB, 289).

Veerasamy

He learns that

“all the Tamil shops had been set on fire and the mobs were looting everything . . . the police and army just stood by, watching, and some of them even cheered the mobs and joined in the looting and burning . . . There was a car in the middle of the road [Galle Road] with a family inside it. The car was surrounded by thugs . . . The thugs were siphoning petrol out of it and pouring the petrol on the car. (FB, 291).”

The life of his family members is in great danger when the mob sets Arjie’s house on fire and the hotel is severely damaged. To escape from the rioters, Arjie’s mother places a ladder against the sidewall to go into Perera’s garden. His Amma removes “her thali (the wedlock) and gold bangles” (FB, 293) and his Appa seizes their “birth certificates and bankbooks” (FB, 293). They are well prepared to escape at any moment to any place. Arjie writes his riot journal with the help of a torch. When the mob comes to Arjie’s house, all escape through the ladder into Perera’s home and hide in the store room. The furious mob reaches Arjie’s house breaking the glass of the door. The mob leaves the house after setting fire to it.

At 12.30 pm on 26th, Arjie enters the house with others, saying “I was struck by how uniform and characterless the rooms looked, with their debris of furniture and charred walls. They, too, seemed to have shrunk in size” (FB, 297).

He writes:

I was suddenly aware that records were not music but plastic, which had now melted into black puddles; that my books were mere paper that had browned and now came apart between my fingers. Legs, posts and arms of well-known furniture, once polished smooth and rich brown in hue now that they had cracked open revealed the whiteness of common wood. (FB, 297-298)

He speaks in remorse: “I try to remind myself that the house is destroyed, that we will never live in it again” (FB, 298). Finally, Sena Uncle arrives in his van and picks them up from his home. Arjie learns that his Ammachi’s house has been destroyed and that they are going to KanthyAunty’s house to Colombo Seven. At 6.00 pm on 26th July, they take shelter in Sena Uncle’s house creates problems to him because he receives an anonymous phone call and the caller brands him “a traitor for sheltering Tamils” (FB, 299). The rioters destroy all the grocery stores owned by the Tamils. The hotel Arjie’s father owns is severely damaged by the rioters. The president expresses “no sympathy for what . . . Tamils have suffered, nor did he condemn the actions of the thugs” (FB, 303).

Eventually, Arjie’s father realises they “no longer belong in this country” (FB, 304). On 02nd August, a mob sets “the car on fire with Ammachi and Appachi inside it” (FB, 306). When Arjie visits his burnt house on 27th August, he finds “everything was not burned had been stolen. Whatever had remained intact, furniture, uncharred beams, doors, windows, even the hinges and the rain pipes, had been taken” (FB, 311). Arjie cries out for the loss of his house.

Selvadurai’s *Funny Boy* discusses the life of Arjie, the protagonist, in the wake of the ethnic conflict in Sri Lanka. Set during the escalating civil war in Sri Lanka, the novel recapitulates the terrible ethnic riots of the 1958 as a result of the Sinhala-only policy and July clash of 1983. He presents ethnic conflicts through Arjie, Radha Aunty, Arjie’s Aunt, Daryl Uncle, a friend of Arjie’s mother, and Jegan, a Tamil Boy who joins the hotel run by Arjie’s father. Mallika Vasugi Govindarajoo et al. quote (Brozo & Simpson 1995; Wells 2010; Wolf 2007) the nuances of the young adult literature as “the presence of strong young adult protagonists who are often portrayed as perceptive, sensitive, intelligent and independent; The point of view and voice of the young adult protagonist is projected, and it is their actions that often drive the major outcomes in the stories. Themes and issues in YAL are relevant and meaningful to young adults and often parallel their own lives in significant ways (274). Fuoss, Kirk remarks in his article a new dimension: “A Portrait of the Adolescent as a Young Gay: The Politics of Male Homosexuality in Young Adult Fiction” that

Young adult novels addressing male homosexuality are political on at least two levels, content and circulation/reception. These novels are political at the level of content to the extent that they position male

Veerasamy

homosexuality within a normative spectrum marking acceptable and deviant forms of same-sex love, acceptable and deviant forms of familial organization, and acceptable and deviant forms of interacting with those who transgress these norms. (160)

Exploring the young adult narration, this paper attempts to vitalise the worldview of the child narrator, his growing awareness about his sexuality, his demarcation at home, the exclusion from the boys' world, undermining view of his parents, his intensive attachment to the female cousins, his dramatic narrative of the ethnic conflict, his eye-opening knowledge on politics, his displacement, homosexual nature and the repercussive effects of the civil war are coherently brought out. In young adult fictions, the narrator would be of from 12 to 18 years old. But, in *Funny Boy*, Arjie excels in his portrayal of his personal, political and national world. The story roughly covers six years of Arjie's life, from 1977 to 1983. Though Arjie is under the age twelve, his knowledge over the minute occurrence children's world, his own realisation and his position in the family, his family members' opinion about him, his understanding of racism is quite amazing. Sarah Jane Mukherjee in her "Understanding Representation in Young Adult Literature Through the Voices of Young People" observes the similar view that the "storylines often closely associated with coming of age, including first love, friendship, and familial tensions, romantic relationships, sexuality, health, and social hardship" (59).

Arjie is so perceptive in what is happening to his personal self as well as to other people. He is sensitive to the ethnic conflict that render that shattered not only the Tamils but also other ethnic minorities. Selvadurai interweaves ethnic conflict with the plot exquisitely. The peaceful life of the people is shattered by the political attitude of the leaders. As a Sri Lankan-Canadian Tamil writer, Selvadurai's *Funny Boy* talks about the politics of language and its impact on the minority ethnic communities of Sri Lanka, especially the Tamils and the Burghers. Throughout the novel, Arjie identifies himself as an important persona as all incidents round him. As a young narrator, he could understand what others think and react over the incidents happening at home or what is happening around him outside. He realises his identity within the family as well as his place in the world at a large spectrum.

ABSTRACT

The reading comprehension is one of the elements of the academic achievement and life-long learning, especially in the English as a Foreign Language context. This paper will generalize the results of various empirical and theoretical research in order to analyze how reading strategies and metacognitive awareness can enhance the comprehension ability of the learners. Based on an action research, descriptive qualitative studies and metacognitive frameworks, the research identifies major strategies including predicting, visualizing, questioning, summarizing, inferring and forming connections. The evaluation shows that the implementation of these methods through explicit instruction and appropriate strategic integration of them can help learners to engage more, comprehend and be more independent. In addition, the paper highlights the significance of the teacher mediation and adaptive instructional practices to promote effective reading contexts. The results add to the existing literature and support the idea of teaching reading as a strategy and the necessity of including metacognitive awareness in teaching language.

Keywords: Reading comprehension; EFL learners; metacognitive strategies; strategy-based instruction; reading pedagogy; action research.

**Sathees Kumar and Murugan**

INTRODUCTION

It is a well-known fact that reading is one of the core skills that are necessary in academic success and personal growth. It helps learners to gain knowledge, analyze information, and react critically to texts. Nevertheless, the reading comprehension, especially in second or foreign language situations, is a very challenging issue because of the linguistic, cognitive, and pedagogical factors.

The focus of reading in modern education has changed to strategic and metacognition of reading materials rather than decoding the text. Studies have shown that readers who are effective are active and use strategies to build meaning, track understanding and review textual content. The result is that strategy-based instructions have become one of the key pedagogical solutions in enhancing the reading capabilities.

Theoretical Framework Reading Strategies and Metacognition.

Deliberate and goal oriented actions that aid in comprehension and meaning construction are defined as reading strategies. Such strategies can be broken down into three major categories:

- **Global strategies** (e.g., previewing, predicting)
- **Problem-solving strategies** (e.g., re-reading, adjusting pace)
- **Support strategies** (e.g., note-taking, summarizing)

Particular attention should be paid to the metacognitive ones since they imply planning, monitoring, and evaluating the reading process. By having metacognitive awareness, learners are in a greater position to control their understanding and adjust their methods based on the requirements of the text.

Research studies have shown that EFL learners often depend on the strategies of solving problems when faced with a problem, implying that they are reactive learners of reading, not proactive learners of reading. This puts us in a position to note that strategic reading must be taught systematically.

Fundamental Reading Instructions in Comprehension Building.

An overview of the chosen studies reveals six major strategies of the reading instruction:

Predicting

Predicting helps the learners to engage their previous knowledge and set a goal of reading. It creates interaction and hypothesis testing in the process of reading.

Visualizing

Visualization is building mental pictures within the textual information thus increasing the memory and understanding.

Making Connections

The strategy connects textual material to the prior knowledge with:

Text-to-self

Text-to-text

Text-to-world connections

These relations enhance interpretative meaning and situational significance.

Summarizing

The process of summarizing makes the learners find the main ideas and summarize information, which promotes the development of critical thinking and organization skills.

**Sathees Kumar and Murugan****Questioning**

Asking provokes active reading and helps to understand the text by asking questions and thinking.

Inferring

Inferring is the ability to read between the lines in order to get implicit meanings, themes and intentions by the author.

All these strategies make reading interactive and cognitive as opposed to a passive activity.

Methodological Perspectives

The reviewed studies use different research techniques:

Action Research: This was done in the middle-level learners to determine the effects of explicit strategy teaching in reading comprehension.

Descriptive Qualitative Research: Investigates practises of teachers and strategies in the classroom in the context of real educational situations.

Survey-Based Research: Tested both awareness of metacognition and the pattern of strategy use of the investigated students.

All these methodological approaches offer a complete understanding of the instructional practices as well as the behaviors of learners.

FINDINGS AND DISCUSSION**Effect of Strategy Teaching.**

The comprehension of reading techniques can greatly enhance the reading awareness of the learners. First, students usually show insufficient knowledge of strategic reading, but, with systematic training, the performance and interest increase the measurable level of performance and engagement .

Role of Teachers

The teachers contribute significantly to:

Modeling strategies

Debriefing practice (individual, group, and independent)

Differentiating teaching according to the needs of learners.

The success of reading instructions is partially determined by the skill of the teacher to integrate and apply the strategies accordingly instead of using only one strategy.

Strategy Combination and Classroom Dynamics.

It has been indicated that a combined approach that is neither too much, nor too little is more effective. Excessive use can subdue the learners but deliberate and properly designed integration will improve the understanding and classroom activity of the learners.

Metacognitive Awareness and Learner Autonomy.

Metacognitive and awareness enable the students to become independent readers. They:

Assess their comprehension.

Dynamic strategy adjustments.

Critically respond to texts.

This independence is critical to academic and a lifetime learning.

Sathees Kumar and Murugan

Pedagogical Implications

The discussion of findings could imply the following implications to the teaching practice:

Set Strategy Teaching: Teachers ought to teach strategies of reading systematically and model.

Scaffolded Learning: The learning instructions should be given in form of guided practice and then to independent application.

Metacognitive Training: It is necessary to train the learners to think about their reading.

Flexible Strategy Use: The teaching needs to be adjusted to the circumstances of the learners and their knowledge level.

Interactive Learning Environments: Group work improves interaction and understanding.

CONCLUSION

This study highlights the importance of reading strategies and metacognitive awareness in the increase of reading comprehension among EFL learners. Strategy-based instruction with effective teacher mediation contributes to better results in the learners and increased interest in the texts. Further studies are required in the futures that embrace bigger and more diversified samples and longitudinal effects of strategy teaching on academic performances.

ABSTRACT

Linda Hogan's Solar Storms does not simply refer to trauma as a personal wound but rather as a bloody tear in the world of the living. This paper presents how Indigenous epistemologies, such as plant dreaming and animal calling, operate as the most important psychological healing modalities of the protagonist, Angel, and her people. Having been abandoned by foster care and with a scarred face, the journey to the north is a denial of the animate world back into the inanimate world, where knowledge is not represented in institutions but in the land. Angel learns about plants being relatives and that they should be sung to, respected, and not simply extracted, through the old people, such as Dora-Rouge and Tulik. Her fantasies of redroot and wolfsbane are used as diagnostic tools and physical and spiritual curing instruments in places where Western medicine is not available or applicable. Similarly, animal calling has nothing to do with superstition, in which Agnes communicates with the glacier bear coat and the bush to water is an example of a psychological relationship founded on kinship rather than domination. These customs restore efficacy to characters displaced by hydroelectric dams and colonial violence. In *Healing in Solar Storms*, there are many relations. It involves listening to the beating of the blood and viewing non-human consciousness. Such primitive forms of knowing assist Angel in building an identity that is fragmented as she becomes a scarred victim and a plant dreamer. The novel indicates that the psychological wholeness of Indigenous people is impossible without ecological health. By proving that knowledge of dreams and animal speech is possible, Hogan attacks Western paradigms of psychology. She proposes that intergenerational trauma can only be healed by returning to the sacred covenant between humans, animals, and the earth, revealing that the land itself is the medicine of the soul.

Keywords: Indigenous Epistemologies, Psychological Healing, Plant Dreaming, Animal Calling, Intergenerational Trauma, Eco-psychology.

**Syed Abuthahir and Sakthivel**

INTRODUCTION

The psychological trauma of Indigenous peoples is often inseparably tied to historical dispossessions, the eradication of cultures, and the breakage of ties to the land. Increasing social inequalities, biodiversity loss, and forced relocation are the accelerating effects of colonialism, which are indicative of a weakening ecological balance that has a direct effect on mental health. The core of this challenge is the notion of historical trauma, which is employed to refer to the intricate and multilayered connections between ecosystems of the planet, human processes, and the natural resources we use (Brave Heart 50). In the current research paper, the dynamics of psychological healing are proposed in the context of Indigenous epistemologies and how anthropogenic activity, such as dam building and resource removal, disturbs the fragile ecosystem and human psyche. Literature has become a prominent instrument for realising and creating awareness of these far-reaching effects. *Solar Storms*, the novel created by Linda Hogan, is one such literary work that combines the themes of trauma, ecology, and human experience in a very intricate way.

Specifically, in this paper, the author will concentrate on the role of *Solar Storms* in applying particular practices of epistemology, one of which is plant dreaming and animal calling as a key symbol to address issues of the ecological effects of environmental changes and ways to mend them. The novel depicts how the main character, Angel Jensen, overcomes her trauma and disconnection and recovers with the help of the rediscovery of ancestral knowledge. The text indicates that healing is not an internal and isolated process but a relational process that includes the land, ancestors, and non-human beings. The interruption of natural cycles, including the submerging of Adam Rib and the diversion of rivers, is a source of psychological trauma commonly mentioned in the book as soul loss (Hogan, 1995, Prologue). Characters such as Hannah Wing are violent and dissociated with the annihilation of their world, which shows how the imbalance of nature is reflected by the fragmentation within (Hogan, Chapter 7). This is in line with post-colonial psychological theories that postulate that when people lose land, they become severely spiritually and psychologically distressed (Duran and Duran, 19).

Plant dreaming and animal calling are used by Hogan to signify the healing of psychological completeness. The fact that Angel dreamt of certain plants that healed her grandmother, Agnes, confirms that Indigenous epistemology is an elaborate knowledge system (Hogan, 1995, Chapter 11). Similarly, the song of animal calling taught by Dora-Rouge educated Angel to build ties with the natural world, thereby overcoming the feelings of isolation experienced by trauma survivors (Hogan, Chapter 4). The argument presented in this paper is that *Solar Storms* substantiates the Indigenous ways of knowing as the key to comprehensive psychological restoration. The writings on *Solar Storms* show how profound the relationships between the land, spirit, and psychological well-being are. With this investigation, the paper will contribute to current debates concerning the dire necessity to acknowledge traditional knowledge as a valid and effective psychological intervention. The following sections will identify the epistemologies of Indigenous people and psychological trauma, consider the use of plant dreaming as a diagnostic method, consider the concept of animal calling and relational healing, examine land dispossession as psychological wounding, and conclude by discussing the role of ceremonial practices in identity recovery.

Research Focus

The main objective of this study is to examine how *Solar Storms* by Linda Hogan is an expression of psychological healing in the light of the traditional practices, with a view to deriving meaningful conclusions as to how individual identity is reinvented and the community restored. The article describes how Angel Jensen goes through the process of trauma to recovery through the reclamation of ancestral knowledge, with particular emphasis on epistemological models. Moreover, it explores the connections between land, spiritual practices, and psychology, and explores intergenerational trauma, soul loss, and human and non-human interconnections in depth. The study illuminates the ways in which Hogan employs traditional knowledge systems not only as cultural artefacts but also as therapeutic modalities to combat psychological destruction brought about by colonial displacement and environmental destruction; therefore, it provides a means through which mental health practices can be decolonised.

To conduct this research, the following questions were considered important:

Syed Abuthahir and Sakthivel

1. What does Hogan mean by referring to plant dreaming and animal calling to represent the psychological recovery process?
2. How do novel disturbances of natural cycles and ecological equilibrium function as means of psychological trauma?
3. How does the human experience, as depicted in *Solar Storms*, reflect the larger spiritual and environmental crisis indicated by the characters' relationship to the land?

Finally, the paper believes that solar storms confirm the validity of Indigenous ways of knowing as highly crucial in comprehensive psychological restoration. It places a value on shared responsibility and preserving cultural memory and nature, implying that no single person can change anything, but only by means of cooperation. This consequently highlights the urgent need to acknowledge traditional knowledge as a legitimate psychological intervention among Indigenous people and the general academic discourse and ultimate contemporary literary fields.

Indigenous Epistemologies and Psychological Trauma in *Solar Storms*

Indigenous psychology assumes that mental health is inherently connected with the continuity of culture and attachment to land in opposition to Western models of clinical paradigms. Maria Yellow Horse Brave Heart describes historical trauma as a generation-long emotive injury, which is expressed as soul-snatching among those communities experiencing spiritual disconnection, which results in psychological trauma (Brave Heart 89). This is portrayed in *Solar Storms* when Bush speaks of what happened to Hannah, not only as sick but as soul disintegration, where your soul crying out... was a cold wounding sound (Hogan, ch. Prologue). According to Duran and Duran, to heal, the mind has to be decolonised, and the connections that colonisation and forced assimilation have broken with Aboriginal epistemologies must be reconnected (Duran and Duran 48). This is supported by Linda Tuhiwai Smith, who states that the indigenisation of research and healing should take place to reinstate indigenous sovereignty in knowledge (Smith 69). Laurence Kirmayer also adds that Indigenous healthcare practices give less importance to individual pathology and more weight to community and land (Kirmayer 39). This is confirmed in the novel, which presents trauma not as an individual pathology but rather as a collective spiritual crisis based on the notion of dispossession and indicates that more traditional knowledge systems have answers to the problems that modern medicine is unable to offer.

Angel Jensen is a representation of this process of reestablishing the connection through her elders. First, she sees her physical scars as something shameful. She mentions that "scars had shaped my life... I was marked, and I knew the marks had something to do with my mother" (Hogan, ch. 1). It is through the experience of returning to Adam Ribs that she starts to recover, as knowledge of the ancestors serves as therapy. According to Paula Gunn Allen, Indigenous literature tends to reinstate the feminine and the sacred to heal the fractures in the community (Allen). It is through Dora-Rouge that Angel gets to understand that the process of healing is relational and is itself a part of the nature world; she is instructed that "plants began to cross my restless sleep in abundance... I was devoted to woods the wind walked through" (Hogan, ch. 11). Gerald Vizenor terms this as survivance, a presence rather than an absence so to speak (Vizenor). Through these traditions, Angel can feel the power of her pain, and she understands that "something wonderful lives inside me" (Hogan, ch. 21). Jace Weaver insists that the Native literature is devoted to the existence of the community, which is reflected in the recovery of identity by Angel (Weaver). Her plot structure shows that restoring indigenous knowledge is crucial to psychological strength and surpassing the tradition of abuse.

The reading also explains ecological exchange, in which the destruction of the environment directly affects mental sanity. To comprehend Hogan, Cheryle Glotfelty defines ecocriticism as the exploration of the correlation between literature and physical space (Glotfelty). The psychological disturbance of the characters is reflected in the construction of dams that break the natural cycles. When the rivers are diverted, the land suffers. The people project this agony: "the devastation and ruin that had fallen over the land fell over the people, too" (Hogan, ch. 15). The "

**Syed Abuthahir and Sakthivel**

hungry mouth of water " serves as a metaphor for consumption and loss, swallowing both animals and human history (Hogan, ch. 4). Finally, according to Hogan, the human psyche and landscape are united, and when the land is flooded, the people are similarly flooded internally. Land healing is therefore equivalent to self-healing, which confirms the indigenous worldview that ecological justice is also mental health justice. The novel contends that failure to pay attention to such connections is irreparably damaging to the soul, and that a complete view of survival requires treating the earth as an extension of the human soul.

Plant Dreaming as Diagnostic and Remedial Practice

In *Solar Storms*, Linda Hogan presents plant dreaming as a high-tech diagnostic device in Indigenous epistemology instead of a myth. Angel gathers important medical insight via the dreams instead of through medical analysis when Agnes becomes critically ill during the expedition towards the north. Angel describes how "inside my sleep that same night, a rust-colored root grew in a circle around itself" (Hogan, ch. 12). On awakening, Dora-Rouge recognizes the vision at once, and says, "Redroot. I believe that must be redroot... Wolfsbane, too" (Hogan, ch. 12). This dialogue legitimizes dream knowledge because it is as good as Western clinical diagnosis. Gregory Cajete further believes that Indigenous science is based on the intuitive connections with the natural world, where knowledge is acquired by taking part instead of observing it (Cajete 75). In contrast to Western medicine, where the practitioner and the patient are usually separated, Hogan's narrative indicates that healing is social and spiritual. According to Eduardo and Bonnie Duran, postcolonial psychology should be able to resolve the spiritual disintegration brought about by the effects of colonisation that are usually overlooked by Western clinics (Duran and Duran 56).

This intuitive knowledge is contrasted with the inertness of Western institutions in the north, as seen in the novel. When Agnes deteriorates, it is the case that Bush observes that "the doctor here won't help her... I'm getting you out of here" (Hogan, ch. 19). This is indicative of the shortcomings of enforced medical systems in remote Indigenous communities. Paula Gunn Allen highlights the fact that Native literature focuses on the restoration of feminine power and ancestral reverence as the key to healing (Allen 23). Plant healing is directly connected with lineage, as Angel has the capacity to dream of plants. Dora-Rouge explains, "I knew there'd be another plant dreamer in my family someday... I got it from blood, she said" (Hogan, ch. 17). This spiritual and biological transmission emphasizes the message that Linda Tuhiwai Smith is consistent in her claims of decolonising methodologies by reconstructing the indigenous knowledge systems that were once shunned (Smith 36). The learning cannot be abstract; it needs to be performed with physical activities and reverence. Angel has to go to locate the plants, observing, "I carefully moved earth aside and dug out some of the roots, thanking them" (Hogan, ch. 13).

This corporeal interaction is in line with Melissa Nelson, who considers the idea of original instructions when human beings actively engage in keeping life going by engaging in a respectful relationship with plants (Nelson 102). Community witness and survival are also parts of the healing process. Laurence Kirmayer emphasises the fact that the quality of healing practices among Aboriginal people is not focused on individual pathology but on communal and land-based healing (Kirmayer 198). The journey of the medicine that Angel undertakes is communitarianism, and Weaver refers to such literature as literature dedicated to community survival (Weaver 203). Finally, Hogan recommends that psychological wholeness be restored by reconnecting to ancestry through activities such as dreaming of plants. The text counters the superiority of knowledge that places Western science over Indigenous wisdom by confirming these dreams. What is being cured in the remedial practice is not only Agnes but also the disconnection between the people and the land. Hogan proves that health depends on the correct relations with the natural world and respect toward the gifts given by the generations through Angel's activities.

Animal Calling and Relational Healing

Solar Storms views healing as a relational process that extends beyond human beings to encompass the natural world. Dora-Rouge quotes an animal-calling song to Angel as she prepares her trip to Fur Island and claims the song, saying, "I know an animal-calling song... I will train you on it" (Hogan, ch. 4). This ritual confirms the epistemologies of the Indians who hold that communication with non-humans is essential to survival and psychological well-being.

**Syed Abuthahir and Sakthivel**

According to Thomas King, the identity of the Indigenous people is determined by stories and the relationships with land, and because of destroying the connection, people experience spiritual distress (King 29). She is attentive to the land, and when "wolves in the distance were singing, and their voices made a sound that seemed to lie upon the land" (Hogan, ch. 15). Specifically, Vine Deloria Jr. underlines that the Indigenous faiths lay stress on place and association with other living things rather than on abstract theology which supports the idea of healing presented in the novel which is associated with the connection (Deloria 67). The skill of Bush to move over the land is dependent on this kind of symbiotic relationship, where animals are not merchandise but family.

The bear coat is a physical transitional object that helps to bridge the gap between the contrasting past and present. Agnes wears a coat of glacier bear, which she killed, to free herself from suffering and state, "When I wear this coat, Angel, I see the old forests" (Hogan, ch. 2). The fur is a reminiscence of the memory and comfort, a carrier of ancestors. Once, Bush tells Agnes, "This coat is singing," indicating the spiritual vitality contained within the object (Hogan, Prologue). Shawn Wilson argues that Indigenous research and healing are ceremonial, with objects having a relational responsibility (Wilson 85). The coat is not merely a piece of clothing; it is also a place of history and sorrow that provides Agnes with a kind of psychologically confined space. Winona LaDuke has talked about the preservation of culture through traditional objects, even when there is dispossession, and that material culture provides spiritual strength (LaDuke 112). When Angel wraps herself in the coat, she inherits this covert heritage, implying that material things can ground the psyche when it is displaced and emotionally disintegrated.

The acknowledgement of animal signs enables the community to cope with loss and threat together. Following the death of Hannah, the villagers noticed that "There are even wolverine tracks all around Hannah's house" (Hogan, ch. 16). These songs mark spiritual bearing and collective trauma into ecological occurrence. Jo-Ann Archibald argues that the word Indigenous storywork entails listening to the messages of the land where animals serve as witnesses to what humans do (Archibald 54). The recognition of these signs in the community helps in shared grieving, and the burden of loss is shared. According to Kyle Powys Whyte, Indigenous climate justice models are based on collective responsibility and tracking environmental changes as social health indicators (Whyte 12). The wolverine songs are not premonitions but affirmations of the spiritual gravity held by society. Grande, Sandy, goes on to mention that Indigenous pedagogy demands that we learn to recognize these land-based indicators to decolonize the psyche, and a call to change individual pathology to collective ecological consciousness (Grande 45). This shared witnessing helps to ensure that trauma does not remain individual but is merely a constituent of a larger relational structure that requires communal healing reactions.

Land Dispossession as Psychological Wounding

Environmental justice theory examines the ecological degradation affecting marginalised communities unequally, depending on race, class, and socioeconomic status. According to Rob Nixon, slow violence refers to violence that occurs slowly and unobservably. In most cases, vulnerable populations are forced to go elsewhere without direct attention, leading to a crisis of representation (Nixon 2). In *Solar Storms*, the interference of dams with the natural processes is an analogy for the psychological interference of the characters. When the rivers are turned off, it hurts the land, and the people express it: "the devastation and ruin that had fallen over the land fell over the people, too" (Hogan 15). Robert Bullard points out that ecological equity demands that ecological advantages and disadvantages are evenly shared among societies, which would be difficult to achieve based on the historical exploitative ways (Bullard 15). Such an ecological imbalance implies that the safeguarding of the earth is the same as that of the human soul, since the drowning of the cultural memory when the government chooses to flood the Adam Rib is the drowning of the human soul "construct several dams" without consent (Hogan 3). Displacement is spiritual as well as physical, by breaking the connection between people and place.

The article also demonstrates the loss of the soul, in which the destruction of the environment has a direct effect on the stability of the mind. According to Val Plumwood, the mastery of nature tends to dominate groups of people who

**Syed Abuthahir and Sakthivel**

are allied to nature, resulting in a dualistic order (Plumwood 45). Hannah Wing is destructively violent and dissociative due to the annihilation of her world, which points to the reflection of ecological disproportion of the internal fragmentation. Bush does not just refer to the condition of Hannah as sickness but outlines it as a spiritual fragmentation where "your soul crying out... was a chilling sound" (Hogan Prologue). Vandana Shiva claims that women and nature are interrelated and that this process has been used by colonial development, thus resulting in mutual destruction (Shiva 22). In the case of flooding, Hannah is turned into an indifferent thing, and cold demonstrates how dispossession freezes the human heart (Hogan 9). Lee Maracle observes that Indigenous women tend to be exposed to the greatest effects of colonial trauma because they represent the sufferings of their peoples without collapsing (Maracle 67). This is confirmed by the novel in the way it frames an individual pathology as a collective spiritual crisis grounded in dispossession.

Finally, according to Hogan, the human psyche and landscape are united, and in the case of a submerged land, an internal flood of people occurs. Healing the land, therefore, becomes equivalent to healing the self, which confirms the indigenous worldview of ecological justice as mental health justice. Beth Brant points out that Indigenous peoples survive through the act of writing and witnessing to reclaim their narratives (Brant 10). The villagers' reaction to the flooding can be viewed as a group psychological means of overcoming feelings of despair. Bush makes a mourning feast in which she "put a piece of each of the different foods in her blue bowl for the spirits" (Hogan Prologue). Daniel Heath Justice points out that the Indigenous literatures are more concerned with community survival and continuation rather than with personal benefit (Justice 88). The novel states that neglect of these relationships results in permanent spiritual harm and calls on people to think holistically about survival so that saving the earth is also equivalent to saving the human soul.

Reclaiming Identity through Ceremonial Practice

The healing of solar storms requires ceremonial intervention to bring about psychological balance and deal with historical fragmentation. To move on with the loss of Angel, Bush throws a grieving feast, cooking music such as hominy and wild rice in dedication to the spirit and the child who has been taken away (Hogan, Prologue). Shawn Wilson claims that the Indigenous research and healing is a ceremonial activity, in which objects and actions present relational responsibility within a community (Wilson 85). This restoration is further consolidated by the giveaway after the feast, as Bush shares her worldly possessions, quilts, fishing poles, and other items with the people who attended the feast (Hogan, Prologue). According to Gerald Vizenor, this active engagement is what he refers to as survivance, which serves as an antidote to tragedy in the presence of the community, instead of as a victim (Vizenor 15). Eating together is raised to the status of a sacrament of togetherness that unites the people involved in a common responsibility. Therefore, the ritual serves as a mental box of mourning, reforming reality with the help of a ritual.

Community witnessing can enable the community to share the burden of trauma, so that no one is left alone. In the feast, people literally take away a piece of the sorrow of Bush and make personal grief a collective ecological and social ceremony (Hogan, Prologue). Melissa Nelson speaks about so-called original instructions, in which people contribute their active part to supporting life based on a respectful attitude to plants and animals (Nelson 12). The recognition of the community helps in grieving together so that the trauma is not seen as an isolated trend but rather a trend that belongs to a larger relational network needing communal healing reactions. Gregory Cajete states that Indigenous science is based on intuitive relations with the natural world, and knowledge is achieved through being involved and respectful (Cajete 45). Laurence Kirmayer points out that Aboriginal curing practices put more emphasis on community and land rather than individual pathology, and this underscores the importance of collective care (Kirmayer 22). Such witnessing compels the pain of displacement to be in the hands of many, not just a few.

Finally, the survival of Angel and the way in which she took care of her sister Aurora depict the passing of curing modalities to the future generation. Angel also gives the infant a name, Aurora, meaning new skin and mystery, and makes a direct breach of the cycle of abuse between the generations (Hogan, ch. 16). Linda Tuhiwai Smith demands that knowledge and future stories have to be decolonized to allow Indigenous sovereignty to take up its own

knowledge and history (Smith 12). Angel realises "something wonderful lives inside me," denoting internal healing with the help of ancestral belonging and internalised affection (Hogan, ch. 21). Paula Gunn Allen underlines that the ability to heal the Native literature and community survival depends on the restoration of feminine power and connection with the ancestors (Allen 50). This storyline shows that recovering indigenous knowledge is important in psychological resilience to ensure that the coming generation will inherit not the shatteredness that Hannah underwent. This new identity and hope are delivered through Aurora.

CONCLUSION

Solar Storms by Linda Hogan confirms the fact that Indigenous means of knowing are crucial to complete psychological healing. The novel shows that plant dreaming and animal calling are not symbolic but working therapeutic modalities through the experience of plant dreaming by Angel Jensen. They assist in regaining identity and healing intergenerational trauma because they help people reconnect with their ancestry and nature. Healing is described as a social activity that includes land, spirits, and the community rather than a solitary process that occurs internally. The storyline is evidence of the importance of restoring Indigenous knowledge to both mental strength and the ability to come to terms with a history of abuse. Moreover, the text provides an analysis of the future of Indigenous populations that are endangered by colonisation and ecological disharmony. The internal flooding of trauma of the ancestral lands is reflected by the flooding of the ancestral ones, implying that environmental justice is always mental health justice. Natural cycles destruction contributes to social disparities, and there is a need to understand that ecological destruction affects vulnerable populations unequally. The novel shows that ecological imbalances are elements of a greater, worldwide problem of human and non-human existence. Finally, a sustainable future is possible only when the entire population is more responsible for preserving cultural memory and the natural world. This paper highlights the fact that traditional knowledge should be considered a valid psychological intervention in various fields of study. By incorporating this ancient knowledge into contemporary settings, society will be able to solve the tremendous spiritual destruction of dispossession. Solar Storms is a call to readers to think about the possible long-term impacts of neglecting traditional knowledge and promotes the idea of a holistic approach to the world, in which the protection of the earth is the same as the protection of the human soul.

ABSTRACT

This paper examines the intersection of soft skills, memory, emotion and identity reconstruction in Preeti Shenoy's novels *The Secret Wish List* (2012) and *Wake Up, Life Is Calling* (2019). Moving beyond the conventional understanding of soft skills as merely professional competencies, this analysis positions them as fundamental human capacities, which are essential for survival, meaning-making, and self-renewal. Through a close reading of the protagonists Diksha in *The Secret Wish List* (2012) and Ankita in *Wake Up, Life Is Calling* (2019), the study demonstrates how emotional intelligence, problem-solving, adaptability, and resilience function as mechanisms for confronting and reinterpreting traumatic memories. Drawing insights from memory studies, the paper argues that the characters' journeys involve a critical rewriting of "memory scripts"—unconscious patterns from the past—to construct healthier, self-defined identities. Diksha employs assertiveness and decision-making to dismantle patriarchal constraints, while Ankita leverages emotional regulation and resilience to overcome the cognitive challenges of mental illness. By engaging in reflective memory work and cultivating emotional regulation, both protagonists overstep patriarchal oppression and mental illness by transforming their pain into agency. Ultimately, the paper underscores how Shenoy's narratives illustrate soft skills' role in healing, identity formation, and empowerment, offering broader insights into human potential for self-renewal.

Keywords: Emotion, Identity Reconstruction, Memory Studies, Preeti Shenoy, Resilience, Soft Skills

**Dhayaasre and Binod Mishra**

INTRODUCTION

Soft Skills are not just skills for employment but for character building. The soft skills determine the character of a person which affects his or her way of life too. The decision one makes or the response of a person at a particular situation portrays that person's character. Soft skills play an important role in the race- 'Survival of the Fittest'. The study employs an interdisciplinary analysis connecting literature, memory studies, and cultural studies. In literary analysis, this study re-contextualizes memory, not just as storage of past but blueprint for future and soft skills not merely as workplace assets but as mechanisms of emotional self-regulation, adaptive coping, and interpersonal negotiation. Through qualitative literary analysis the character formation through memory and soft skills is identified. The proper handling of soft skills and memory makes the characters in the novel as round characters.

The contemporary novels became not just for reading but teach the life lessons and the importance of soft skills in difficult situations. In short, they formed a new genre named 'Soft skill literature'. Preeti Shenoy's novels are perfect examples for this. The story of the characters in her novel is not just mere stories but life teaching lessons. Being a popular Indian author, she focuses on coming of age stories and round characters, who are timid or innocent in the beginning and brave or cynical at the climax. Preeti Shenoy is known for her books that feature post-modern female characters. She is a Best-selling Author, Artist specializing in pencil portraits, Poet, Ex-basketball player, Blogger, TED x speaker and a Mother. She is specialized in portraiture and illustrated journaling and also conducts workshops related to it. ("Official Author Biography")

This study examines the significance of soft skills and memory as crucial tools of emotional survival and identity formation in the selected works of Preeti Shenoy. The study explores the soft skills such as; Problem-solving, Resilience, and Self-awareness, which empower characters to confront trauma, societal constraints, and emotional disruptions using memory as a helping hand for them. The novels analyzed include *The Secret Wish List* (2012) and *Wake Up, Life Is Calling* (2019). Both novels illustrate how the characters' emotional evolution is resulted by the development and application of soft skills and memory, and ultimately leading to self-realization and empowerment. The study limits itself to soft skills as internalized traits and not professional competencies and it does not explore all the novels of Shenoy due to **conceptual shift** in some of her works.

Problems-Solving and Self-Healing

Problem-solving skill enables different characters to transcend trauma and internal conflict in the story. This soft skill confronts and reinterprets the pasts of the characters like Ankita and Diksha in Shenoy's stories. In *The Secret Wish List* (2012), Diksha solves her central conflict of loveless marriage, by conscious evaluation of her desires and the systemic structures which were suppressing her. Diksha's past memory of being punished for kissing a boy becomes the emotional core of her present rebellion. This guilt was broken when she rethought her memory and this led to self-healing. This can be seen when Diksha explains her situation at the climax to her parents. "No, Ma. It was not a "physical relationship" as you say. I use air quotes to emphasize my point. 'It was just a kiss, and it wasn't the crime that you made it out to be. Had you left it, it would have probably died down on its own. It wasn't a big deal really. But the way you people twisted it, pulled me out of school, treated me like a leper, and the way you made it hang over my whole life, like the sword of Damocles, the way you never really listened to what I wanted, that was what has brought all this about.'" (SWL 250-251)

In this novel, *Wake Up, Life Is Calling* (2019), Ankita's fragmented and painful memories are not just flashbacks but active agents influencing her present decisions. Ankita's recovery from bipolar disorder is a cognitive-emotional process. She solves the "problem" of her past traumas by reframing them from negative to positive. The prequel of this book *Life Is What You Make It* (2011) portrays her struggle and overcoming process with the bipolar disorder which was gained as a result of her guilt provided by her memory of Abhishek's death (one-side love). As a sequel, in *Wake Up, Life Is Calling* (2019), Ankita starts a happy life, making new friends and doing new courses and living in an entirely different atmosphere. Everything was fine until a person from the past interrupts in her new normal life.

**Dhayaasre and Binod Mishra**

Vaibhav, school love of Ankita, came back to her life. When Vaibhav came to know half –truth about Abhishek, he broke her with his words. This problem was solved when she confessed past to him in a new perspective. From a memory studies viewpoint, this suggests a rewriting of "memory scripts"—the unconscious behavioral patterns drawn from past experiences. For instance, Ankita avoided repeating the romantic entanglements in the college that had previously led her into emotional chaos. Also on listening to the story of Mrs Hayden, Professor of Ankita, her loss of father, husband and son, Ankita felt empathy for her. The guilt of Abhi's death vanished when Hayden told Ankita that they were not responsible for others' decisions and shouldn't worry about it. It was a time of enlightenment for her.

"For the first time I decided that what was important was my well-being. I would fight. I would not let my thoughts take over. If Mrs. Hayden could embrace life and go on even after all her losses, I could too. I would grab life and I would live it." (WULC 227)

Shenoy's characters reconstruct their fragmented memories as part of their problem-solving journeys. Both Diksha and Ankita solved their conflicts through their past memory. Here the memory which was once a weapon changed into medicine for the wound it created. Their problem-solving skills evolve through reflective memory work, which allowed them to respond rather than react.

Adaptability and Identity Reconstruction

Memory is not static. The past is continuously revised to serve present needs. Shenoy's characters exhibit adaptability by revisiting painful memories and integrating them into healthier identities.

The memory, which was very hard to digest for Diksha in *The Secret Wish List* (2012), once became nothing when she reinterpreted it. This reinterpretation healed Diksha, and her parents made peace with her. Diksha's adaptation is not just social but emotional. She learns to live outside the patriarchal constraints that once shaped her memories and suppressed her desires. Against her husband's wish, she started to learn salsa, drink alcohol, went on a vacation to the Maldives with Ankit and even made love with him. She got a fulfillment that she can do things for herself. From being a chicken who felt that she did not have an identity other than house wife, she became a fearless lioness who created her own identity by instituting a dance studio and becoming financially and emotionally independent. Finally, Diksha adapts to her new identity as an independent woman.

Ankita's identity is reconstructed not by erasing her past but by engaging with it through the lens of experience. After recovering from bipolar disorder, Ankita showed a green flag to her second battle by believing her negative thoughts. She self-doubted herself in most of the circumstances. Eventually, she overcame that, and reconstructed her new identity. Ankita's reinvention as a confident writer and speaker is made possible because of her flexibility in accommodating her past with her present. Memory studies propose that identity is an evolving construct, influenced by what we choose to remember and what we suppress or reinterpret. Ankita's identity in *Wake Up, Life Is Calling* (2019) is not merely a continuation of her former self but a newly formed self. She consciously constructed her new identity through selective remembrance. Ankita chose to remember her past failures not with shame, but as stepping stones towards success.

The new identities of Diksha and Ankita are more focused on self-defined worth rather than social validation. Empathy, resilience, and mindfulness are pivotal in their new transformation. These reshaped identities of Diksha and Ankita which are the byproducts of both memory and soft skills are more compassionate, confident, and emotionally intelligent.

Resilience: The Cornerstone of Emotional Survival

Resilience is considered as the outcome of emotional and cognitive soft skills. It is a defining feature across all protagonists of Shenoy's works. Whether it's Ankita's struggle with mental illness in *Wake Up, Life Is Calling* (2019) or Diksha's escape from a loveless marriage in *The Secret Wish List* (2012), all characters show the ability to bounce back from major life challenges.

**Dhayaasre and Binod Mishra**

The capacity to rise above adversity, to find strength in memory without becoming trapped by it is called resilience in Shenoy's both the mentioned novels. Shenoy's fiction offers precisely this arc: survival through memory, mediated by soft skills. Though Diksha was trapped by patriarchal pressure, she broke it with the help of her soft skills, like being emotionally intelligent, confident in decision making and her problem-solving skills. Her powerful soft skills made her hard life soft and blossom again as it once was.

"As I take the tea to the drawing room, I have made up my mind. I cannot be a silent martyr anymore. I have been treated like a football all along—kicked first by my parents to Sandeep's court, and then kicked around by Sandeep all my married life. Now that I have finally found my voice and my grounding, it has created a furor.... I know now, so very clearly what I want and where I want to be. My parents have no choice but to accept. This is my life and I am determined now to really live it, to follow my heart's urging which I have ignored and tried to suppress for so long." (SWL 249)

Soft skills such as EI, confident communication, adaptability, problem solving and decision making created a new identity as a resilient self to Diksha. The fifteen years of bitter memories are now nothing to her. When she forgot her past and entered to present, she was born again to achieve success.

Ankita in *Wake Up, Life Is Calling* (2019), begins the novel feeling lost and struggling with self-doubt. She faces several obstacles in the upcoming phases of her life. The very own mind of Ankita was her great enemy. Everyone has their own inner voice, which supports guides and criticizes them. In Ankita's case, her inner voice is a symbol of pessimism. It never encouraged her and guided her on the right path. The inner voice of Ankita always showed her insecurities and highlighted her negatives. Not only her inner voice, but also the people and their words led her to depression again. Despite her bad thoughts, she overcame like a phoenix, coming out from the fire of pessimism and attacking the bad thoughts directly using affirmations and becoming a new normal Ankita mentally-well.

Ankita and Diksha, who once considered only their flaws and problems, shaped them later, with the help of supportive people and soft skills. Diksha's friends Gaurav and Tina, Diksha's mother-in-law and her son Abhay were very supportive of her in her resilient journey. In the climax, it was her mother-in-law who came as a savior from her parents' misunderstanding. She explained to them that the fault was on her son Sandeep, and not on her daughter-in-law. In the same way, for Ankita, her parents and Professor Hayden were very supportive in her journey towards resilience. Supportive people and their words can change the perception of the situation.

Resilience acts as both a psychological and narrative tool for rebirth and identity formation. The title of the novel, *Wake Up, Life Is Calling* (2019), is a symbolic representation of resilience. It calls the protagonist to wake up to reality and see the life that is waiting for her to crown. Life is not only about problems. It also holds beautiful pages that one should wake up and read. Ankita learnt to make clear decisions and understood that life is all about facing problems and solving, and learning from them. "Each of our mistakes makes us stronger. They are our life lessons. They make us grow. And I think that is the most important thing in life." (WULC 242)

Despite the overwhelming feelings of frustration and confusion, Ankita and Diksha didn't give up. Their willingness to confront their fears and insecurities is a manifestation of resilience. They learned to be affirmative, emotionally intelligent and confident, which led to resilience. From the lens of memory studies, Ankita's and Diksha's journeys are both healing and active identity formation through engagement of memory. Thus, both novels of Shenoy provide a powerful commentary on how soft skills function as deeply human capacities for survival, meaning-making, and self-renewal.

Dhayaasre and Binod Mishra

SUMMATION

Soft skills can be called the basic human skills. Some may have a healthy level of soft skills, and some may have a low level of soft skills. The beautiful part of soft skills is they can be acquired at any time. It is not formed only at birth and only for some people. This study aims to show that soft skills and memory are essential even to normal people to undergo daily events and achieve success.

Now a days the meaning of past has connotatively changed into negative sense. People should use their past memory as a tool to build them in a constructive way. If one keep holding the bitter past, it will lead to an outpouring of emotions vigorously, and one may feel lost in the past itself. Allowing the past to let go and focusing on the present will lead to a bright future. The perception of the past can be shifted from negative to positive through soft skills. Soft skills help not only with perception shifting but also with emotional balance.

This is what happens for Ankita and Diksha in *Wake Up, Life Is Calling* (2019), and *The Secret Wish List* (2012). At first, they were trapped by the memory of past bitter events. This led to the arousal of self-doubts and other negative emotions. But they handled them with care with the help of Soft Skills and supportive people around them.

In *Wake Up, Life Is Calling* (2019), Preeti Shenoy portrays a protagonist who transforms remembered trauma into emotional strength through the cultivation of soft skills. Preeti Shenoy artfully blends memory and emotion, illustrating how soft skills serve as survival tools and identity-building mechanisms in the aftermath of trauma. Through introspection, emotional regulation, communication, and decision-making, Ankita reclaims authorship over her own story.

In *The Secret Wish List* (2012), Shenoy portrays a homemaker who finds herself in a dilemma whether she wants to live her life on her own or to satisfy the societal needs. Urged by a twist of events, a wish list is born, and this list changed her life entirely. On accomplishing those wishes, she found herself. Like Ankita, Diksha claimed authority over her story at the end by getting out of the patriarchal constructions. She determined to live a life she wished.

By combining Soft Skills and memory studies the study reflects the complexities of identity formation and emotional survival of the characters in Shenoy's selected novels. This framework enables a nuanced reading of Shenoy's work that avoids simplistic interpretations and instead highlights the emotional sophistication of her storytelling. Soft skills are thus treated not just as functional traits but as critical lenses through which readers can explore resilience, trauma, and transformation in contemporary Indian fiction

ABSTRACT

The shift from pen to thumb and paper to screen can be viewed as both a boon and bane in disguise. With the constant changing ideologies, can culture be preserved through the base of digital humanities? Though human beings are trying to adapt to the digital era, the process is challenging. Over the period of time, literature has been reflecting the realities of life. The genre of Speculative fiction provides an unblemished assessment of how literature gains the importance of discerning forward. This ultramodern perception is necessary to understand the environs in a humane outlook. *Ball Lightning* by Liu Cixin is a Chinese Science Fiction work which reflects the themes of memory, knowledge and ephemerality in terms of maintaining the line between technology and culture. The chief characters and trivial characters of the novel have equivalent reputation in developing the notions of digitalization. The weapons used in today's world for combats and other battles are replicated in the novel through the feature of ball lightning. The paper aims to bring the elements of digital trauma, conservancy of acquaintance, and traditional artifacts which the characters face in their lives as a form of acclimatizing to the veracities of life under the title, "Reimagining Reality through Digital Science: A Critical Reading of Liu Cixin's *Ball Lightning*".

Keywords: Digital Culture, Neutrality, Science Fiction, Strategies, and Social Concern

Samsonraj *et al.*,

INTRODUCTION

The world in a deep sense is a beautiful place to live in unless and until the synonym for beautiful is in an optimistic notion. Glorious changes which happen every day, every minute and every second may or may not be the same for all human beings. Some are too joyful about the events which happen in their life whereas the others are completely devastated by the incidents which take tremendous turns. Fighting for individual rights, human qualities, emotional needs, space for feelings, money and a stand for oneself, human beings look like puppets in the hands of its creator. Literature has been one of the most astounding genres which can imagine the unimaginable and create a world which was not even visualized as a fancy by the previous generations. From just being a genre of producing poems and plays to becoming one of the most realistic plotlines of the present, literature has come a far way.

The twenty-first century which is pragmatically called the 'digital age' with its inventions in artificial intelligence, cyborgs, robots and high-five technologies was once a matter of just imaginations by few writers in the past. People who criticized literature to just be stories are now witnessing it to be a seed for all the beginnings of productive things happening around the world. Anna Menyhért in her article, "Digital Trauma Processing in Social Media Groups: Transgenerational Holocaust Trauma on Facebook" comments on the process of trauma in digital age as, "In contrast with the earlier conception of trauma as fixed in time and space, unspeakable, and beyond representation and mediation, trauma in the digital age is considered multiply configured and represented, multidimensional, diverse, and shared in the digital space" (357).

The aim of the paper is to bring of the fact that how people are defeated by digital trauma which they can later defend through their education in the society and culture. The objective of taking Liu Cixin's novel *Ball Lightning* is to emphasize on the recent hard science fiction where the characters and their life are embedded with cultural trauma in the digital age.

The digital age refers to the fragmented changes which happen the society which was initially created for the betterment of the people. But as days pass by, just like the human beings who pay less attention for the negative sides of a creation, the digital age also witnessed few backdrops. The shift from paper to keyboards are akin to the shift from gasoline to stove and telephones to cellphones. Even though it looks like there is a wonderful improvement which is made convenient for the individual, its consequences are brought out much later in life. For instance, cellphones can be carried anywhere and everywhere for the purpose of an individual but its consequences are that the private life can be more dangerous. Human beings are not let in peace to enjoy their privacy and they are traumatized to be more available in both their professional and personal life. The so called 'digital trauma' began long ago when human beings were trying to figure out what it was to live in a world where machines have equal power as human beings. Ekaterina Haskins in his article "Between Archive and Participation: Public Memory in a Digital Age" says:

The intersection of contemporary remembrance culture and new media technologies presents a mixed bag of promises and problems. Storage and sorting capacities of the internet are certainly helpful in preserving, organizing, and linking vast amounts of data. Everyone can now engage in a free search for one's past and identity, becoming her own historian. Thanks to interactivity, virtually everyone can also leave an imprint on the fabric of public memory by sharing images and stories with millions of other users. (408)

Just like a coin which has two sides, the digital age also has two sides which are used as per conveniences. For instance, the creation of artificial intelligence, cloud computing, algorithm-based networks, cyberwarfare and cryptocurrency have made life more interesting and vibrant. The communication process is made easy, human beings can provide a life which they require and improve the standards of their life. But on the other hand, there are also few disadvantages which can be termed as privacy loss, too much of technical ideologies, risk of losing jobs for

**Samsonraj et al.,**

human beings due to robots. All these are the physical turmoil's which human beings face in reality. What really matters the most is the trauma which individuals façade due to the digitalization in and around the world. Adapting to certain changes in the world in terms of job is acceptable but adapting day-to-day life scenarios has become more challenging and risk-taking.

Liu Cixin's *Ball Lightning* explores into the juncture of scientific inquisitiveness, fascination, and the ethical uncertainty of technical encroachment. The novel commences with an intensely individual disaster, where the adolescent protagonist Chen viewing his parents demises by the enigmatic occurrence of ball lightning, which drives him into an enduring expedition to comprehend it. Liu usage of this foundation to discover how disturbance can fuel an unremitting quest of information, often at the charge of mortal construction and moral lucidity. The novel masterfully interlaces hard science with theoretical philosophies, bestowing a near-future biosphere were quantum model and martial determination strike in volatile and habitually distressing behaviors. Stanley Singer in his article "Ball Lightning-The Scientific Effort" defines the terms as "Ball lightning is a luminous globe observed in nature, most often in warm months when thunderstorms are frequent. The fiery ball may appear after lightning, either near the impact or at some distance from it. In main origin of the ball and its disappearance are not observed because of its most globe floats with a moderate speed sometimes compared with that of a walking. It occasionally enters dwellings by way of a chimney or through or window, passing near startled" (5).

As the story discloses, Chen intersects a concealed investigation program, and the tale swings from private tragedy to universal insinuations. Liu analyses the weapon of knowledge and the emotionless fairness with which logical detection can be designated for annihilation. Other minor characters like Lin Yun, a merciless military physicist, symbolize the novel's stiffness between understanding and power, emphasizing the significances of appreciating development over mortality. Eventually, *Ball Lightning* advances disturbing interrogations about the restrictions of scientific consideration and whether the hunt of truth vindicates its cost, proposing an intensely philosophical replication entrenched within a fast-paced and ardently reverberating chronicle.

Ball Lightning discovers the connection of unconventional physics and anthropological emotion which climaxes how extremely technology can ensnare the situation with distress. However presumably an effort of hard speculative fiction entered around the secretive spectacle of ball lightning, the description is essentially focused by a peculiar tragedy. The harm of the protagonist's parentages in a lightning assault on his birthday. Pierre Nora observed, "Modern memory is, above all, archival. It relies entirely on the materiality of the trace, the immediacy of the recording, the visibility of the image" (13). This instant is not only a chronicle reagent but also a demonstration of anything can be implicit as digital or scientifically interceded strain. The human mind is clear and altered by the intellectual services of knowledge and the emotionless logic of scientific evolvement.

The impression of digital trauma in this framework is not about the web or social medias, rather about the technique of progressive discipline and technology, predominantly numeral and quantum-level singularities that interconnect with psychosomatic experiences. Chen observes the eradication of his parents by a ball lightning occasion, and the revulsion of this happening becomes a benevolence of programmed trauma, manipulating each judgement and eventually motivating him to bestow his life to the education of ball lightning. As Chen explains the state as, "This time, though, the arc came in through the wall, emerging like a spirit from an oil painting of a carnival of the Greek gods. It was about the size of a basketball... its flight path was erratic" (BL 4). This result is symbolic of how trauma can get entangled with a procedure of technical fascination. He does not lament in an outmoded sense, nor prepares for therapy and expressive termination. As an alternative, he affects the incident as a thoughtful problem to be cracked, a riddle encrypted in the linguistic of physics and electromagnetism. Trauma becomes not only an individual damage but a systematic and unidentified to be unravelled. By doing so, Liu Cixin imperceptibly converts emotional anguish into scientific inquest.

The idea which Liu exemplifies through Chen is a philosophical disaffection from conventional demonstrative dispensation. The character's sensitive world is sieved through the lens of equipment and physics, to the amount that

**Samsonraj et al.,**

even his reminiscences of his parentages become the theme of technical clarification. The ball lightning that executed them is not extended simply as a climate event but a mysterious phenomenon to be replicated and understood. This technical reframing becomes a surviving instrument, and also partially dehumanizing. As the novel advances, Chen gradually drops trace with the mortal measurement of his expedition. As he cites his father's words as, "The key to a wonderful life is a fascination with something" (BL 13). His emotional trauma is digitized, emblematically twisted into data opinions, investigation objectives, and martial submissions. There is no accident that abundant incidents of the novel takes residence in top-secret investigation amenities and armed labs, places that arrange rationalism and efficacy over mortal sensitivity. These surroundings are in consequence the allowances of Chen's own consciousness, sterilized and hyper-rational, where sentiment is either repressed or deciphered into unlawful cleverness.

Liu's interpretation of digital trauma becomes supplementary multifaceted with the overview of Lin Yun, a warrior who also has her personal stressful history and an equally compulsive search of weapon-zing normal singularities. She and Chen are echoes of each other, both preoccupied by previous procedures and both discovering comfort, or minimum determination, in the balanced examination and mistreatment of disparaging forces. Lin's trauma, like Chen's, is not straight articulated in demonstrative relationships but is instead channelled into a military philosophy that clinches eradication and cold effectiveness. Her trauma is explained as, "I'll admit that weapons do possess an indiscernible allure, but it's built on top of murder" (BL 85). This common agenda generates a frightening interaction between the characters and replicates a wider traditional explanation on how systematic growth, particularly in grounds with armed impending, can both disguise and amplify the belongings of individual trauma.

The factors emerged in these characters is a kind of response circle between trauma and technology. The more they try to comprehend or connect ball lightning, the more they become inaccessible, expressively undersized, and disconnected from any expressive human joining. Their trauma is not rehabilitated but as a replacement becomes a proposal for the missiles they benefit to generate. As he states, "For the first time since deciding to devote my entire life to this thing, I felt like the world was paying attention, too" (BL 28). The ball lightning scheme, which originally assures accepting and termination, eventually leads to the growth of quantum artilleries proficient of removing the substance in itself. The termination of Chen's expedition is not explanation or reconciliation but the comprehension that his technical effort has been designated by a reason of devastation, a judgement instinctive from his personal distressed essence but exaggerated by national supremacy and technical determination.

This conversion replicates a noticeably contemporary form of disturbance, one which is not merely psychosomatic but universal. It is suffering that has been integrated into the equipment of technical expansion, where the demonstrative ancestries are elapsed or overwritten by mechanical linguistic and administrative areas. As the narrator says, "People like him are suited only to the sort of work that will be done entirely by machines in the future" (BL 32). Liu does not unambiguously sermonize this process, but the insinuations are strong. The novel finishes with Chen inquisitorial of the track he has taken, comprehending that in demanding to comprehend the strength that murdered his parents, he has donated to roughly far more hazardous and uncontainable. This is the core of digital trauma, the renovation of individual agony into data and efficacy, and the forfeiture of expressive preparation in the appearance of intellectual authority.

Additionally, Liu Cixin's narrative style underlines this leitmotif. His style is frequently experimental, occupied with comprehensive explanations of experimentations, equivalences, and martial procedures. This style generates a hostility consequence, illustrating the reader into the identical rationalist background that traps the characters. Expressive scenes are offered with nominal feeling, as if even the chronicle itself is stressed to coherent sorrow in a world subjugated by systematic judgment. The consequence is a novel that senses expressively unsympathetic yet intensely disconcerting. The trauma is contemporaneous, but it is diverted through a numerical lens, concentrated lucid only over science, and exposed of its emotional nearness.

Additional imperative coating to deliberate is the traditional background in which Liu is writing. In post-Mao period of China, prompt transformation and scientific progression have repeatedly come at the charge of individual

**Samsonraj et al.,**

detriment and demonstrative subjugation. In this framework, *Ball Lightning* can be delivered as an assessment of how state-sponsored technical drives captivate individual pain, revolving secluded anguish into public convenience. The novel's representation of investigation organizations and martial labs, along with the characters peculiar conversions, advocates an observation on the method individual trauma is collectivized under the tremendous improvement. Chen describes the quality of Lin Yun as, "It gave me a funny feeling that the first woman I felt something for talked so calmly of bloodshed and death like other women her age talked of makeup" (BL 84). Trauma does not evaporate rather it is repurposed for the situation, digitized according to the morals, and weaponized in army forces.

Ball Lightning about enigmatic corporeal phenomena is a consideration on the customs that trauma can be determined in technical investigation and technical improvement. Liu Cixin boons a visualization of digital trauma in which emotive pain is deciphered into the etymology of statistics and algorithms, unvarnished of its mortality, and regenerated as an instrument of supremacy. Through the attractiveness of Chen and his expedition from peculiar loss to technical fascination to principled reckoning, the novel arranges unadorned emotional costs of such an alteration. Though the narrator comments on Chen as, "He said he could devote a lifetime to its study...People are like that—they sometimes become fascinated with something without knowing it and are unable to get rid of it their entire life" (BL 46). It is a poignant examination of what transpires when the mortal soul is endangered to the cold examination of the digital contemplation, and it requests whether considerate through knowledge can ever truthfully brand us complete.

In Liu Cixin's *Ball Lightning*, traditional artifacts perform faintly yet eloquently throughout the story, performing as inaudible spectators to the clang between the antique and the recent, the individual and the technical, the social and the scientific. Although the novel is essentially an effort of tough science fiction absorbed on progressive physics and investigational weaponry, it is not empty of national commemoration or representative remnants of ritual. These artifacts, whether bodily objects, recollected ceremonies, or indirect standards, aid to pounded the section in an endurance that lengths outside the atmosphere's distinct pursuits. The most straightaway reverberating outmoded artifact in the section is the birthdate cake Chen obtains on the evening of the catastrophe that defines his life. Though ostensibly unexciting, the cake is not just a Western convention implemented in modern China but also a representation of family, festivity, and life's growth. Its unexpected obliteration during the ball lightning attack becomes a distressing disagreement, suggesting not only the ferocious interruption of changeable natural armies but also the disturbance of a national and domestic ritual.

This instant severs Chen from the customary world of household and emotion, pushing him into an innovative world administrated by knowledge, judgement, and generalization. Yet, the remembrance of that second relics anchored in the artifact of the cake, an ordinary item that loiters in his thoughts extended after his parents are gone and that signifies a misplaced demonstrative and cultural solidity. As Chen says, "The table that had the birthday cake was still there...Exhausted, I sat down on the sofa" (BL 15). Another significant layer of traditional occurrence can be found in the divergence between the disinfected scientific situations and the more meek backgrounds Chen encounters. Initially in the novel, passages that take dwell in his hometown, designated with orientations to usual life in a Chinese township or city neighbourhood, transport with them the consistency of traditional life. However Liu Cixin does not lodge on these settings, the dissimilarities with the unfriendly, untried spaces of workshops and martial connections intensifies their cultural cost.

The implements, cabinets, and even the elder people who colonize Chen's initial memories symbolize a lower steadiness that is at probabilities with the troublesome countryside of the ball lightning singularity. These artifacts of ordinary outdated life, from timber furniture to handwritten minutes to acquainted foods, are dominated by the unindustrialized supremacy of microelectronic apparatuses and hypothetical replicas, but they are not completely removed. "The mirror should not have been that clean...The water from the iron tap should have been rusty, but what flowed out was perfectly clear" (BL 16). Their occurrence, even if it is insignificant, edges the broader renovation that Chen endures as he travels away from a life entrenched in traditional collective constructions into one subjugated by science and martial judgment. In many of Liu's metaphors of scientific research accommodations,

**Samsonraj et al.,**

there is an inherent dissimilarity between the contemporary and the traditional. The deficiency of traditional Chinese building, art, or viewpoint in these settings is not unintentional, it highlights how technical advancement in the novel is manifested by a detachment of the old. The cultural simplicity of these cosmoeses, conquered by unsoiled lines, brass surfaces, and numerical screens, purposes as a type of anti-artifact space.

It is not an objective place where customary artifacts are misplaced, it is a residence where their absenteeism is symbolic of a greater philosophical shift. In this background, the infrequent seconds when traditional artifacts do perform like as a teacup, a canvas, or even the method a character reminisces an ancient sonnet or story becomes extremely exciting with significance. As Chen says, "Once again I sat in that house until dawn on a stormy night, and once again I numbly left home" (BL 21). They perform as inaudible prompts of what has been left after in the hunt of information and control over environment. Lin Yun's charisma also offers a lens through which the tightness between convention and modernism is discovered. Though she is a creation of the military-industrial compound, accomplished to think in relationships of approach and annihilation, her private history mentions at a supplementary intricate connection with the past. Her name itself is customarily Chinese, and however the novel offers rare realistic facts, the endurance and chastisement she displays resonance Confucian ethics of duty and detriment. In this sense, her physique and behaviour become existing artifacts of an elder principled organization, even as she contributes in the most progressive and hazardous systematic investigation.

The fight inside her, between a sympathetic of hereditary ethical cypher and an afresh obligatory logic of technical ruthlessness emulates the wider conflict among outdated values and scientific determination that runs complete the novel. Even in linguistic it assists as a kind of artifact in Liu Cixin's work. Though interpreted into English, the innovative Chinese prose hires a terminology that often lures from conventional foundations. Liu's selection of names, symbols, and imageries sometimes resounds with antique Chinese fictional and philosophical civilizations, implanting coatings of denotation that faintly permeate the chronicle with an intellect of cultural complexity. This etymological dimension supports the knowledge that even in a forthcoming subjugated science and technological world, the heaviness of past and custom is not completely discarded. It remains in how characters communicate, how they recall, and how they make wisdom of their understandings.

One of the supreme and effective instants where customary artifacts allegorically re-emerge is near the end of the novel when Chen commences to inquire the ethical significances of his work. "I realized that beauty for most people is characterised by fragility and powerlessness. True beauty needs to be supported by internal strength" (BL 449). The interior fight he experiences, his abrupt requirement to imitate on truth and false, on the denotation of lifetime and demise can be understood as a re-emergence of customary logical apprehensions. These are not interrogations that knowledge alone can react, and in rotating to the innermost, Chen re-engages with a method of self-examination that is intensely entrenched in Chinese metaphysical civilizations such as Daoism and Confucianism. However he never openly quotes these schemes, the plain act of replication in the expression of technical power establishes a reappearance to an elder method of intellectual thinking. It is more like the artifacts of custom, however not actually existent, restate themselves over thought and integrity.

Liu Cixin's treatment of traditional artifacts is consequently not unconcealed or sentimental. He does not overemphasize the ancient or forefront customary cyphers in the way some writers might. As a substitute, he permits them to happen at the side-line of his tale, entrenched in reminiscences, indirect in behaviours, or juxtaposed in contradiction of the hyper-modern surroundings of his section. Their inconspicuous company marks their representative meaning even extra commanding. They characterize a cultural remembrance that trashes to be entirely exterminated, a generous of ethical scope or demonstrative newscaster that continues even when flabbergasted by the flow of technological shrewdness. This stiffness between the ancient and the present is not determined by the conclusion of the novel.

Chen is jammed in a liminal universe, designed by a disturbance born from environment but inspected through discipline and progressively preoccupied by moral enquiries that knowledge alone cannot report. Traditional

**Samsonraj et al.,**

artifacts, aid not as apparatuses or substances but as delicate notices controlling the reader to appreciate what is on hold in Liu's dream of advancement. They prompt us that after every technical discovery lies a human being moulded by past, philosophy, and reminiscence, and that the forthcoming that is shaped cannot discharge the shades of the history, even by the weapons and digital history of the world. As Susan and Myriam in their article "Awe and the Interconnected Self" says, "The current emphasis in society in on a separate, egoic self, consumed by the digital world. Culture has an influence where attention goes and may have undermined our relational connection to the outer world" (6). The idea of digitization in today's world has made human beings to choose wisely between the elements of life. Everything is becoming more technical, right from financial ideas to production and consumption. During these developments process, human beings are forced to submerge their emotional turmoils due to the fast-developing process. Just like all our memories having a place in hard disks and screens instead of books and albums, culture is also taking a place in closed digital world. It is necessary for human beings to state the differences in life and take a formulate step along with digitalization.

ABSTRACT

This research investigates the spiritual and mystical implications of the desert in Paulo Coelho's *The Alchemist*, contextualising the book within extensive theological, literary, and philosophical discussions of landscape and spirituality. Utilising Joseph Campbell's *The Hero with a Thousand Faces* and the mystical notions posited by scholars like Evelyn Underhill and Crossfield Happold, the study examines the desert's role as both a narrative impetus and a spiritual mentor in Santiago's transforming odyssey. Modernity often reduced the desert to a realm of invasion and imperial expansion; yet, the book reinstates its former religious significance as a locus of retreat, cleansing, and divine contact. The study traces Santiago's journey through the phases of Departure, Initiation, and Return, illustrating how the desert influences his psychological and spiritual development. Instead of being a hostile place, the desert is a loving yet challenging force that pushes the main character toward a mystical connection with the "Soul of the World". Through quiet, seclusion, and introspection, Santiago achieves self-realisation, reconciles with parental authority, and finds that genuine richness resides not just in financial prosperity but in spiritual enlightenment and inner change. In the end, the publication says that *The Alchemist* reaffirms the desert as a holy place that may bring back spiritual awareness in a time when people don't believe in God. Coelho contests postmodern disillusionment by portraying the phenomenal world as an expression of divine presence, so validating the persistent human need for transcendence, unification, and connection with the Absolute.

Keywords: Desert spirituality; Mysticism; Nature mysticism; Hero's journey; Spiritual quest; Landscape and identity; *The Alchemist*, Paulo Coelho.

INTRODUCTION

The significance of the desert shifts from one period of time to another. After it has been praised as a place of spiritual and mystical experiences during the 3rd and 4th centuries, the desert lost such significance during the modern era when, says David Jasper (2004), it was considered as a mere test ground into which brave people enter to serve the different projects of the Western “Empire” (p. 56). However, he adds, the “desert wind is again blowing in the unlikely wastes of postmodernity” (P. 57). The reason for this revival, according to Lewis Mumford (1961), is that desert admirers wish to find a refuge from the religiously-alienated and spiritually-distanced societies and dystopian “cities of the dead” within which they live (p; 57-59). These desert lovers provide evidence that religious conviction which is rejected by critics, such as Zygmunt Bauman (1997), as being improper for the mobile contemporary society, can on the contrary, be achieved in mobility and wandering in secluded places such as the desert (p. 172).

Furthermore, having acknowledged the sublime importance of place in the lives of people, Belden Lane (1998) states that the place and the landscape where the individual lives define the way he envisions himself and the Divine. Besides, in “The Spirit of Place”, D. H Lawrence (1964) reveals the acute influences which accompany the man-environment relationships by insisting that place influences one’s ideas and consciousness (p. 15-17). Yet, Says Belden Lane, those who live in the post-enlightenment society, can hardly “grasp” the correlation between spirituality and landscape essentially because these individuals are more concerned with movement than they are “bereft of rituals of entry that allow us to participate fully in the places we inhabit,” and because the individual freedom led progressively to the loss of any heed to spiritual traditions and the way of seeing the world (Lane, 1998, p. 10). In due course, Lane (1998) expresses a sense of anxiety toward the idea that nowadays spirituality is becoming sterile and non-existent nearly in every place in the world (p. 10). Henceforth, critics and theologians explain that experiences in the desert landscape can provide a remedy for the spiritual loss within the human soul (Lane, 1998, p. 20).

In addition to these theologians, contemporary literary figures such as Paulo Coelho, seek to inform that contrary to the prevailing secular beliefs during the contemporary age, God exists in every space and has a word to say in the life of every individual. Many of his works tend to pass the message that man needs to work, displace, contemplate, and search ceaselessly to re-establish belief and harmony with God. Hence, in *The Alchemist*, Coelho illustrates that the desert landscape can afford a valuable help for the one who looks for a mystical apprehension of the Ultimate God.

The hero’s Transcendent Journey Through The desert

In *The Alchemist*, Paulo Coelho’s desert setting facilitates and enriches the protagonist’s journey. Due to the desert experience, the youth’s journey culminates not only in a material reward, but also in a spiritual growth. Following Joseph Campbell’s model of the quest pattern which he depicts in *The Hero with a Thousand Faces*, this chapter foregrounds the important role that the desert plays in every phase of his journey. In addition, it draws inspiration from the theory of mysticism in order to read the desert as a land which enhances spiritual awareness. With particular focus put on “nature mysticism,” which is characterized by a sense of the “immanence of the Other or God or soul in nature,” (Happold, 1970, p. 43) the study will reveal the way the serenity of the land, its silence and peace push the individual to ponder upon the reality of the human self and the universe, seeking higher states of being. By so doing, it will show that the Desert Fathers’ account of the desert as a holy place where one can reach beyond the world of the senses and feel the presence of the transcendent still intrigues contemporary authors such as Paulo Coelho.

Taking into consideration the world-view of *The Alchemist*, one may argue that the author’s representation of the desert and his appeal for spiritual experiences parodies the ongoing process of secularization which is prevalent in contemporary literature, culture and theory. Coelho’s narrative is about Santiago, an Andalusian boy who embarks on an archetypal journey of quest to the Egyptian Pyramids to find a hidden treasure. His journey solicits sweet encounters with people from various races and backgrounds. He meets a gypsy woman, a king disguised in the form

**Lovely Vinoliya Paul and Sathiyarajan**

of an ordinary citizen, a thief who steals all his earnings, an English man who enlightens him with valuable ideas of alchemy, the old wise alchemist, and most important of all, Fatima, the beautiful desert woman with whom he falls in love. Along his path, Santiago is robbed three times, he is captured by a desert tribe and receives many threats of death. Yet, eventually he succeeds to communicate with the universe, to turn himself into wind and to be more powerful than he has ever been before.

During all these experiences, the desert stands as a supporter and a recorder of how he changes from a naïve person to a wise one. Far from being an enslaving power, the desert heightens awareness of the greatness of the world. Basically, it is filled with God's presence and is ready to satisfy the heart which believes and reads all its signs, recalling the experiences lived by the Christian monks during the Monastic Movements when they retreated "to wild and undeveloped landscape, seeking new meaning along the outer margins of familiarity" (Lane, 1998, p. 147).

Basing his argument on the different world myths, Joseph Campbell (1968) shows the physical, psychological and even the spiritual importance of the heroic journey taken away from one's home and family; a journey during which the adventurer grows more self-aware. Campbell divides the quest pattern into three major phases; Departure, Initiation and Return. In fact, this pattern is adequate to discuss the role of the desert in *The Alchemist*, knowing that its land acts as an agent that defines the course of the events.

At the beginning of the novel, the boy is portrayed as a simple shepherd whose father wants him to become a priest. Yet when he receives the dreams about the treasure, his heart is filled with new ambitions leading him to seek their realization. These recurrent dreams are the "Call to Adventure" which comes from the Soul of the World. According to Campbell (1968), when the call is launched, "the familiar life horizon has been outgrown; the old concepts, ideals, and emotional patterns no longer fit; the time for the passing of a threshold is at hand" (p. 51). So, because the destiny "has summoned the hero and transferred his spiritual center of gravity from within the pale of his society to a zone unknown," Santiago decides to take a different move in his life and go in search of his treasure and destiny, defying the will of his father (p. 58).

Before he is ready to cross the "First Threshold" away from Spain into the unknown tracks of the African desert, the boy falls into hesitation and indecisiveness.

Eventually, he tells his father that his dream lies in travel and not in becoming a priest. The father agrees immediately because he wants him to become more than these priests who "come in search of new things, but when they leave they are basically the same people they were when they arrived" (Campbell, 1968, p. 9). Pertinent to this, Paulo Coelho in an interview in 1998 states that:

"At the threshold of our quest, the fear of stepping into an unknown world and the desire to stay at home lie in wait for us, it is a crucial moment of initiation. But we cannot stand on the threshold forever. We must dare to move; only corpses do not move. Life is movement." (1998, p. 35)

Hence, when Santiago commits himself and gets ready for the new challenges, crossing the "First Threshold" and leaving behind the safety of home, he is helped by few persons. That help is not supernatural and can be recapitulated in the few pieces of advice he receives from the Gypsy woman who urges him not to give up because "dreams are the language of God" (p. 56), and Melchizedek, the disguised man who claims to be the King of Salem who persuades him that "when you want something, all the universe conspires in helping you to achieve it" (p. 23). This advice spreads hope in the boy's heart because he feels that wherever he goes the universe will take care of him. Gradually, he enters the "Initiation Phase" which Campbell (1968) considers, as an important phase during which the adventurer is put into various tests and undergoes "difficult tasks" before he is forged as a powerful hero (p. 97). The adventurer, during this phase, needs to wrestle against the fiends of hesitation, fear and indecision. The first obstacle he confronts during "The Road of Trials" is in Tangier, the crowded city where he is robbed by a thief (Coelho, 1992, p. 40). That accident leaves him desperate and heartbroken: "he was in a different country, a stranger in a strange land, where he couldn't even speak the language... he had nothing, not even the money to turn and start everything

Lovely Vinoliya Paul and Sathiyarajan

over" (p. 41). Hence, he finds himself obliged to accept a job which he does not like in the crystal merchant's shop. When he is kidnapped with the alchemist by tribesmen who ask him to turn himself into a wind or face death, Santiago faces a new obstacle. It is at this point that he gets supernatural aid from the desert, its sand, sun and wind to transform into Simum wind (p. 156). The last trial he faces is when he arrives at the Pyramids where he is beaten and once more robbed of his gold by two men (P.170). Interestingly, none of these troubles brings him down or prevents him from hearing that strong voice telling him that trials and errors are part of the process of becoming stronger. To borrow from Campbell (1986) : "the original departure into the land of trials represent[s]only the long and really perilous path of initiatory conquests and moments of illumination"(p. 17). For this reason, Santiago moves on and never gives up.

To become a true hero, to fulfill his dream of an unforgettable legend, the archetypal hero needs to complete all the stages of the "Initiation Phase" because the different tests and trials through which he will pass challenge him deeply before he begins his transformation "slaying" all the handicapping hindrances on his road (Campbell, 1968, p. 97). Hence, in addition to the abovementioned difficulties, the desert tests the boy's maturity and his degree of determination to achieve his goal. Yet, the alchemist ensures him that the desert does not do so with a bad intention, rather, for the sake of training him. For this reason, the desert landscape is never demonized or looked at as an antagonistic space. On the contrary, the alchemist tells him that the Soul of the World is manifested in the desert and before his dream is realized, it tests everything that was learned along the way. It does this not because it is evil, but so that we can, in addition to realizing our dreams, master the lessons we've learned as we've moved toward that dream. That's the point at which people give up. It's the point at which, as we say in the language of the desert, "one dies of thirst just when the palm trees have appeared on the horizon... Every search begins with beginner's luck. And every search ends with the victor's being severely tested. (Campbell, 1968, p. 139)

Paulo Coelho (1992) passes the message that every personal legend is full of tests and obstacles. Yet, every test is an important step in the spiritual growth. Pertinent to this, the boy states that "when I have been searching for my treasure, every day has been luminous... I have discovered things along the way that I never would have seen had I not had the courage to try things that seemed impossible for a shepherd to achieve" (p. 137).

By choosing to become a travelling shepherd pursuing a personal destiny, the boy has to separate from his father at an early age. However, during his journey, he meets the alchemist, the man with whom he reconciles his needs for a constructive father in a step which Joseph Campbell (1968) names "Atonement with the Father" (126). Significantly, then, meeting with the alchemist is one of the blessed gifts of the desert for the boy because since their encounter, he acts out as a caring father and teacher for him. He teaches him to understand many realities of the world and how to inspire power from the inward to understand the realities about the existence of the Ultimate Being. Duly, says Campbell (1968):

"The problem of the hero going to meet the father is to open his soul beyond terror to such a degree that he will be ripe to understand how the sickening and insane tragedies of this vast and ruthless cosmos are completely validated in the majesty of Being. The hero transcends life with its peculiar blind spot and for a moment rises to a glimpse of the source." (p. 147)

The alchemist, who learns how to communicate with the desert natural environment and masters how to transform metal into gold, plays a great role in helping him focus more on his objective. In discussing the elements of magical realism in *The Alchemist*, Stephen M. Hart (2004) considers that the character of the alchemist is reminiscent of Melquiades in Gabriel Garcia Marquez's *One Hundred Year of Solitude*, in the sense that he is "the sage man who knows the answer to all of life's questions" (p. 305). As an example of his support, when the boy is about to give up on his quest in favor of stability with Fatima, the alchemist interferes and convinces him that she is a woman of the desert and will await his return because true "love never keeps man from pursuing his destiny. If he abandons that pursuit, it's because it wasn't true love... the love that speaks the Language of the World" (Coelho, 1992, p. 126). When the two are having their trip through the desert toward the pyramids, the alchemist teaches the boy to mediate on the mystery of the desert in silence and read its omens. This echoes Joe Guse's (2007) proclamation that "until we

**Lovely Vinoliya Paul and Sathiyarajan**

make peace with our parents we are unable to move forward into the next more rewarding periods of our lives" (p. 13-14).

Due to the presence of the alchemist, the sustenance of the desert, and the feelings of love which he carries in his heart, the boy's journey ends up in blessedness, rupture and contentment with the self which realizes its goal. This becomes clear when he reaches the pyramids and kneels down to thank God for "leading him to meet a king, a merchant, an Englishman, and an alchemist. And above all for his having met a woman of the desert..." (Coelho, 1992, p. 169). The boy acknowledges that the other true treasure which his journey grants him is knowledge. This knowledge and wisdom are the "Ultimate Boon" of his trip and his weapons in facing the hostile forces of life.

So, it can be said that the boy's heroic journey through the desert is very particular because it culminates with more than one reward. In other words, Santiago does not only find the hidden treasure of gold, but also a more precious one, which is knowledge of the divine spark which lays dormant in him. In this context, C. Happold (1970) says "it is the chief end of man's earthly existence to discover and identify himself with his true self. By so doing, he will come to an intuitive knowledge of the Divine Ground and so apprehend Truth as it really is, and not as to our limited human perceptions it appears to be" (p. 143). In that sense, the desert becomes a location which evokes "retreat and spiritual growth," when wandering its tracks, the boy enters into a state to mystical enlightenment and illumination (p. 143).

About the "Ultimate Boon," Joseph Campbell (1968) adds that after all the experiences through which the hero goes: "the stature of the divinity that summons to his highest wish increases, until it subsumes the cosmos. Finally the mind breaks the bounding sphere of the cosmos to realization transcending all experiences..." (p. 190). Similarly, in *The Alchemist*, the journey through the desert teaches Santiago to understand the language of the world in the mere time he spends contemplating its mysterious tracks. After that, he can turn to his family and natal home well-equipped with knowledge and wisdom about life and the Ultimate Creator.

In fact Santiago's spiritual experience can best be understood through explanation of mystical insights. Edward Mercer (2008) admits that the definition of mysticism is by no means an easy task. Yet to achieve a close clarification of its significance, Mercer pinpoints that a true mystic is the one who aspires to unite with the "Real," "super-sensuous," "super-rational" and "unconditional Absolute" (p. 8). To be more precise, a true mystic does not mistake the possibility of sensing the Absolute's presence in nature with the idea that every natural element in it is endowed with a spirit, which is basically a primitive "shaman" belief and a dysfunctional use of mysticism (Bharati, 1976, p. 15). Rather, a mystic man believes that the phenomenal can serve to experience the transcendental.

Evelyn Underhill (2002) notes that mystics, whom she considers the pioneers of the spiritual world, have succeeded in what all others failed and established "immediate communication between the spirit of man, entangled as they declare amongst material things, and that only Reality that immaterial and final being, which theologians call God" (p. 4). Mysticism, does not only prove the existence of the Absolute but advances the belief that "knowing and finally attaining it" because knowledge is not limited to sense impression (Underhill, 2002, p. 23). When exercise of "pure reason" could not offer a great knowledge of this world, knowledge-seekers started to use "natural mysticism" as an instinct for the Absolute "latent in man" (p. 13). In fact, ideas akin to the mystic ones have principally been initiated by the theory of Platonic Idealism which acknowledges the existence of a supreme perfect realm of knowledge. One of the basic tenets of this tradition passed down by Plato, the father of Western philosophy, is to save the phenomenal, "to discover the eternal in the temporal, to know the truth hidden within the apparent, to glimpse the absolute Ideas that reign supreme behind and within the empirical world" (Tarnas, 1996, p. 53).

Written in the 1980s, Coelho's *The Alchemist* is surrounded by the atmosphere of secularism and diminishment of religious beliefs which characterized the post Second World War Era (Hungerford, 2010, p. 6). As a result, the human soul is sidelined in favor of the material gains and worldly matters. The logical consequences of the loss of faith in

**Lovely Vinoliya Paul and Sathiyarajan**

God are the prevalence of nothingness, meaninglessness and disillusionment with and fear from the limits imposed by being human.

Coelho (2005) himself has experienced a similar disillusionment and doubt in his life leading him to seek spiritual enlightenment on the road between France and Spain. He declared that "during the twentieth century we experienced the dictatorship of science, which tells us that the world consists only of scientifically provable things. Thus the amazement and surprise of experiencing our souls were lost to us" (p. 4). He assumed that one of the aims he wants to achieve through his mystic and spiritual tale, *The Alchemist*, is the restoration of belief in the goodness of the world and human essence (p. 4).

Writing out of this background, Coelho (2005) tries to rescue the importance of the spiritual and the metaphysical by portraying characters who are willing to establish contact with the Divine. These characters' long journey of search is only significant because, says the narrator: "every second of the search is a second's encounter with God and with eternity," their hearts do never enjoy happiness till they "have God within them" (p. 137). In this sense, the manifestation of the desert in *The Alchemist* mirrors David Jasper's (2004) hypothesis that "people sometimes go out into the desert to find new beginnings and a new place from which theological articulations can be found and recovered" (p. 4).

Jasper (2004) explains that mysticism is at the heart of the spiritual life of human beings. If they fail to hear its voice, then the life of the spirit is spoiled. Most importantly, he says, the magnitude of mysticism can be sensed only in the very particular spaces of the desert. Accordingly, every journey into the desert is motivated by the hope to "recover" mystical experiences because it is a place "outside the law where nothing superficial can be tolerated" (p. 5). In relation to this, *The Alchemist* is more than a mere story of a boy wandering in the desert looking to find the treasure of his dream as it reenacts the need of the contemporary individual to reestablish the lost sense of religion and spirituality.

Leading a heroic journey through the desert, Santiago learns to enter into a harmonious communion with its paraphernalia. During this process, he finds out that the world can "conspire" to make realize one's dreams, and that a human possesses stunning inner capacities and abilities which remained hidden and unknown to him. When he is obliged to turn himself into wind, the boy reveals that it is his heart which teaches him how to speak the language of the desert and the wind (Coelho, 1992, p. 140). In this context, Edward Mercer (2008) observes that the accurate capacity to unite with nature that certain persons may develop is not only a mere "source of the purest pleasure" but "a subtle and powerful agent in aiding men to realize some of the noblest potentialities of their being" (p. 4).

Having reached that high level of consciousness, Santiago is more willing to benefit from all his talents. He longs "to blow away the sands" and to carry the voice of his beloved Fatima (Coelho, 1992, p. 154). The encounter with the desert geography stirs unwavering reliance on his skills. There, in the vastness of the land, Santiago displays significant efforts to liberate himself from the shortcomings of being human. His insistence is fruitful by the end as he comes to recognize that self and nature move in harmony with each other and that man has inside of him "the winds, the deserts, the oceans, the stars, and everything created in the universe" (p. 154).

The isolation of the desert is given positive effects on the spirits of Santiago and the alchemist. For instance, as they approach the places which are disturbed by violent battles between the tribes, Santiago becomes very sensitive toward the landscapes which grant him the feeling at home (p. 135-6). The reason, says David Mercer (2008), is that the more salient feature of the desert has always "arrested attention and stimulated the mystic sense" (p. 242). As such, the solitude of the desert is romanticized by Coelho as pivotal for the tranquility of human beings.

Belden Lane (1998) praises the silence of the desert and strongly links it to the human self which is "an inner desert of its own, stripped of worldly care, is delighted in silence...to become an inner desert is to abandon the rampant race of thoughts, feelings, and worries that continually distract the soul from attentiveness to God" (p. 13). Assumedly, a self

Lovely Vinoliya Paul and Sathiyarajan

perceived as an inner desert is a self cleaned up from all the unquittous and evil preoccupation which distracts the individual from devoting his soul to belief in God. The goal of a journey through the desert, such as the one initiated by Coelho's protagonist, can be turned by the desert's silence into a spiritual quest for the Divine.

THE DESERT AS A SPIRITUAL GUIDE

A short time before his journey ends, Santiago experiences a high level of self-realization, individuation and self-balance (Coelho, 1992, p. 136). Progressively, he and the alchemist become "content simply to contemplate the desert, and to drink ...from the Soul of the World. The boy and his heart had become friends and neither was capable now of betraying the other" (p. 141). In the same context, Carl Jung (1964) considers that man's personality appears at first as "an inborn possibility," it may emerge very "slightly, or it may develop very relatively completely during one's lifetime" till one becomes a complete human being, aware of all his hidden aspects (p. 162). The process is completed when the boy turns himself into wind; an act which the chief of the Twariq tribe respectfully believes to show the greatness of Allah (Coelho, 1992, p. 156).

Interestingly, Santiago interacts with nature as a living being which can feel his joy and misery. For example, shortly after he enters the African desert, he meets the crystal merchant; the boy is so optimistic and offers to work for a whole day to earn money for the travel. But, the merchant encounters him with the harsh reality that even a whole year of work will not suffice to gain enough money. At that time, a kind of despair and sadness enters the boy's heart and the whole world of the desert falls sad "it was as if the world had fallen silent because the boy's soul had" (Coelho, 1992, p. 49). This shows the fusion between the inner state of the boy's heart and that of the surrounding nature. By so doing, Coelho zooms on the self as a part joined strongly to the desert natural space rather than something alien and outside its realm.

In the desert of *The Alchemist*, there is an ambiguous power which may satisfy one's longing for spiritual knowledge. Few days after his meeting with Fatima, the boy sits in the desert thinking about many questions related to man and his existence. Suddenly, he "felt an urge to go out into the desert, to see if its silence held the answers to his questions" (p. 104). In this sense, the desert is a land which forges a mystic individual who believes that its natural world holds super sensual abilities and is "a genuine primary manifestation of the ultimate Ground" which can please one's hunger for comprehensions (Mercer, 2008, p. 27). For this reason, the desert becomes the friendly companion and the trustful teacher for the characters who acknowledge that by saying: "Everything we know was taught to us by the desert" (Coelho, 1992, p. 113).

The alchemist who lived the two hundred years of his life in the desert, has developed a Platonic sense of belief in the reality of the world and its Creator. In typical Platonic words, he restates that:

"This natural world is only an image and a copy of paradise. The existence of this world is simply a guarantee that there exists a world that is perfect. God created the world so that, through its visible objects, man could understand his spiritual teachings and the marvels of his wisdom." (Coelho, 1992, p. 133)

He believes that being pure, clean and vast, the desert can substitute for all other places on earth and provide a best example for the manifestation of the divine spark in nature. Thus, he simply advises the boy to embrace its purity by telling him: "so immerse yourself in it. The desert will give you an understanding of the world... all you have to do is contemplate a simple grain of sand, and you will see in it all the marvels of creation" (p. 134). In this passage, the desert is seen as a medium of knowledge.

The mystical union with the soul of the world

The protagonist of *The Alchemist* walks away from the city of Andalusia and that of Tangier and heads toward the unknown mysterious desert where he will seek and find spiritual perception. After some months of wandering in its geography, contemplating and touching everything on its surface, he gains satisfaction. In contrast, the city, which is demographically crowded, constitutes a source of melancholy and depression for those who experience peace in the desert (Coelho, 1992, p. 56).

Lovely Vinoliya Paul and Sathiyarajan

Paulo Coelho represents the desert as a buoyant space which strengthens one's self confidence and leads one to understand that he is himself "vital—a free centre of energy;" a being who can move to higher levels, to greater realities and self-fulfillments (Underhill, 2002, p. 31). Helped by the desert omens, the boy becomes conscious of many secrets that rule the world. He understands that man can be the master of the world because he is endowed with an inner power that can change the way the universe responds to his dreams and wishes. So, his heart tells him that "most people see the world as a threatening place, and, because they do, the world turns out, indeed, to be a threatening place"(Coelho, 1992, p. 138). That is to say, the way we perceive things has its power and influence on the whole world.

Santiago's journey is led basically by a revealed intention to find out a hidden treasure. However, in its symbolic implication, it is a journey of quest for absolute truths about the whole existence in the physical terrain of the desert. Measured by mystical standards, says Evelyn Underhill (2002), "hidden truth is the object of man's craving"(p. 4). The boy, the Englishman, and the alchemist, are all after one unified objective which is the reality of the universe, its soul and Creator. As far as the boy is concerned, his utmost perception is noticed when in the silence of the desert he "reached through to the Soul of the World, and saw that it was a part of the Soul of God. And he saw that the Soul of God was his own soul. And that he, a boy, could perform miracles" (Coelho, 1992, p. 160).

Near the end of his journey, the boy has to climb some heights to reach the destined pyramids. This climbing is very much symbolic of the spiritual ascent he is about to accomplish and the discovery of reality to which he is heading: "when he reached the top of the dune, his heart leapt" (p. 168). Underhill (2002) affirms that "inside your spirit there is a little door, so high up that only by hard climbing can you reach it" (p. 43). Hence, he climbs the heights to reach the spiritual within himself. Before that, when he is wandering in the desert's magnificent landscapes, the boy applies the entire mystic pieces of advice which can be summed up in Underhill's (2002) words: "trust your deep instincts: use your latent powers. Appropriate that divine, creative life which is the very substance of your being. Remake yourself in its interest, if you would know its beauty and its truth"(p. 15). By so doing, the boy gets a double treasure because his self is completely freed from the imprisonment of the mere senses. By being able to turn himself into wind, which is basically an ability consecrated to the Divinity, Coelho advances the belief that

"Mysticism is essentially a movement of the heart, seeking to transcend the limitations of the individual standpoint and to surrender itself to ultimate Reality; for no personal gain, to satisfy the transcendental curiosity, to obtain no other worldly joys, but purely from an instinct of love." (Underhill, 2002, p. 7)

It is clear that in Coelho's narrative a harmonious relationship is established between human beings and the desert geography. They coexist in peace without trying to monopolize each other. The desert landscape in this text is highly alluring, for it stimulates encounter with that reliable human faculty which grants the individual the capability of discerning spiritual truth. A similar account of the desert experiences appears in the Judao-Christian writings of Philo and Clement who see the desert as the most suitable place for decency. In this land all the conditions conduct to contemplation, detachment from the amoralities of the crowd and focus on the inner self in a search for tranquility and peace of mind.

In the same token, the desert allows the boy to reach beyond the known phenomenal world to acknowledge that all things are one. Step by step, his journey becomes a mythic one, unlimited by the confinements of space and time. In the magical scene when he talks to the sun, he says: "I know the Soul of the World, because we have talked at great length to each other during this endless trip through the universe" (Coelho, 1992, p. 157). As such, his journey is also one of descent into the soul of man and that of the universe.

Having immersed himself in the quietness of the desert and its majestic emptiness, the boy is granted the chance to communicate with his heart and listen to its advice and enjoy tranquility. His heart transmits to him that it receives a revelation from The Soul of the World, saying that: "everyone on earth has a treasure, that awaits him... we people's hearts, seldom say much about those treasures, because people no longer want to go in search of them. We speak of

Lovely Vinoliya Paul and Sathiyarajan

them only to children" (Coelho, 1992, p. 138). Therefore, the suggestion that his heart has already told him about the treasure means that he still possesses the innocence which can nurture his faith.

According to Crossfiled Happold (1970) explains that there are two urges in life; one toward selfhood, individualization, and separation; the other is toward "escape from the loneliness of the self into something bigger than self," this is the mysticism of knowledge, of finding the secret of the universe and how to make it work on one's behalf (p. 40). Accordingly, as he spends a longer time in the desert, Santiago's understanding of the mystic forces that permeate every element in it becomes larger. There, in the open serenity of the land, he communicates with his horse, the flying birds, the wind, the grains of sand, the sun, and, above all, with the Soul of the World, which speaks to him through dreams and visions. David Klemm (2004) maintains that:

"the experience of the desert is an experience of the overturning of human finitude, the opening of human being to the mystical basis of its identity. This place is where the divine as "God" empties itself into finite human being and where finite human being discovers its own deep participation in transcendence." (p. xii- xiii)

Significantly, reading in the history of the word "mysticism," Happold (1970) states that the word has its origins in the Greek mysteries when a mystic man was understood to be the person endowed and given access to the knowledge of these mysteries, allowing rebirth into eternity (p. 18). In this sense, after his achievements during the journey, the boy could become a mystic person who creates a long-lasting legend for himself. For instance, when he succeeds to turn himself into a Simum wind, he became a legend (Coelho, 1992, p. 161). Though people's reactions were varied, those who considered it as a sign of God's glory do showed ecstasy.³ Turning one's self from one state of being into another is stunningly a divine activity, and when he does it successfully, the boy confirms one of the basic tenets of mysticism which is the belief that "man is in some way a sharer in the divine life" (Happold, 1970, p. 44).

Far from the mystical manifestations of the desert, this land is loaded with other positive images. On the one hand, the boy looks at it with longing; with hope for coming back, and with desire for finding a treasure. On the other hand, for Fatima, the desert represents a "hope for return" because she waits for the man who wanders its tracks and endures all its obligations. In Coelho's narrative, just as we see it in The Odyssey and Ulysses' journey, the motif of "going back" is apparent because true treasure is to be found in one's home.

The treasure Santiago was looking for lays buried under the sycamore tree in Spain where he sees the dream for the first time. This consolidates the belief that the intended goal of the journey is, in addition to material gains, to test one's determination, inner strength and endurance. Above all, it makes one understand that the true treasure is in discovering the energy within, finding a home and in having a family to care and to commit one's self to. Departing from Campbell's quest pattern,

Coelho's protagonist does not encounter any trouble in his way back home and there is no "Refusal of the Return" in his journey (Campbell, 1968, p. 193). This shows that when home summons, the individual shall answer the call because it is a blessed act.

The journey motif and the appearance of a Ulysses, who embarks on a journey looking for Penelope, appear in other works by Coelho, such as The Zahir. However, according to Mansour Wissam (2006), while Ulysses undergoes all the physical and spiritual difficulties to reach Ithaca and restore his position by force, Coelho's protagonist in *The Alchemist* is a "postmodern European subject with mystical tendencies that mediate and soften any possibility toward aggression" (p. 93). Hence, when the majority of Campbell's heroes have destructive forces with which they crush their enemies, a hero by Coelho, adds Wissam Mansour (2006), "arms himself with sensitivity, sensibility [and] a passionate heart" (p. 93).

Lovely Vinoliya Paul and Sathiyarajan

CONCLUSION

Paulo Coelho's representation of the desert is colored by the spiritual tendencies to which he becomes a devotee after a trip of enlightenment along the medieval pilgrims' route between Spain and France in the late 1970s. The spiritual awakening that he achieved prompts his writings and personal perception of the natural sceneries, starting from his books *The Pilgrimage* and *The Alchemist*. Coelho is a writer who has faith that once one sets himself to his purpose and dreams, he can succeed and overcome all the obstacles that life puts in one's way. This becomes obvious in portraying the desert as a space which responds to the needs of the individual whose inner force is able to stimulate sustenance from nature. In *The Alchemist*, Santiago, the alchemist, and the Englishmen show a force of will which influences the course of the events and makes of the land a place of possibilities rather than a space of obstacles. Coelho teaches the lesson that once one believes in the magic of being human, positivity one will reign over his world; a doctrine which is best manifested in the constructive way the desert reacts toward the needs of man.

The reading of *The Alchemist* showed that the belief in the desert as a space of solace, rejuvenation and devotion did not end with the Desert Fathers. In this narrative, the desert empty space and its silence sustain Santiago by several illuminating mystical experiences which increase his awareness of the world beyond the physical and phenomenal one. The analogy between Coelho's representation of the desert and that of the Desert Fathers appears clearly in this narrative where the phenomenal and the transcendental realms coexist. The world of the senses is redeemed by believing that it holds a spark of the Ideal one.

ABSTRACT

This study examines Anna Quinn's *The Night Child* (2018) through the combined frameworks of Freudian psychoanalysis and contemporary trauma theory, highlighting how childhood abuse is inscribed upon memory, identity, and the unconscious. The novel portrays the protagonist, Nora Brown, whose experiences of physical violence, emotional denigration, and sexual violation are not only remembered but are compulsively relived through symptoms such as dissociation, panic attacks, and intrusive recollections. Drawing on Freud's concepts of repression, the return of the repressed, and the compulsion to repeat, the analysis demonstrates how traumatic experiences persist in the unconscious, resurfacing belatedly in fragmented memory and bodily responses. The study shows how abuse within caregiving relationships produces enduring disruptions in selfhood, relational trust, and affective regulation. By engaging with psychoanalytic constructs such as betrayal trauma, confusion of tongues, superego formation, and identification with the aggressor, this study highlights how Quinn's novel stages the psychic and somatic aftermath of abuse. This study argues that *The Night Child* functions as a literary witness to the resistance of trauma to closure, underscoring the enduring dialogue between psychoanalysis, literature, and trauma studies.

Keywords: Freud; Trauma Theory; Childhood Abuse; Dissociation; Psychoanalysis.

Jaffer Sha et al.,

INTRODUCTION

The relationship between childhood trauma and its psychic afterlives has long occupied the attention of both psychoanalytic and literary scholarship. It offers profound insights into how early violations reverberate across time, shaping memories, identities, and the unconscious. Anna Quinn's *The Night Child* (2018) dramatizes this area with constant intensity. The novel traces the fragmented inner life of Nora Brown, a woman whose adult experience of dissociation, anxiety, and intrusive recollections bears witness to the lingering effects of childhood abuse. In Nora's past, physical violence, emotional degradation, and sexual violation intersected. The narrative emphasizes not merely the catalogue of abuses but their enduring psychic effects. It emphasizes how the body registers trauma that the mind cannot fully process and how memory returns belatedly, compulsively, and against the subject's will. As shown in Figure 1, childhood trauma often leads to defence mechanisms such as repression and dissociation. These defenses help the child survive at the time, but in adulthood, they can reappear as anxiety, flashbacks, dissociation, and panic attacks.

Freud's work, from *The Aetiology of Hysteria* (1896/1955) to *Beyond the Pleasure Principle* (1920/1955) and *Inhibitions, Symptoms and Anxiety* (1926/1959), persistently returns to the question of how unassimilated experiences inscribe themselves on the psyche. For Freud, early relational trauma, especially when inflicted by caregivers, is not simply stored in the conscious memory. It becomes lodged in the unconscious mind, shaping dreams, symptoms, and character, often surfacing indirectly through what he called the "return of the repressed" (Freud, 1917/1955). The child, lacking the cognitive and linguistic means to process overwhelming experiences, defends itself through repression, denial, and dissociation. These mechanisms also ensure that trauma returns, belatedly and repetitively, demanding psychic reckoning even decades later (Laplanche & Pontalis, 1988). In *The Night Child*, Nora's recurring visions, bodily tremors, and psychic splitting exemplify what Freud identified as the compulsion to repeat: "the paradoxical tendency of the traumatized subject to relive what has not yet been mastered, as if the psyche were seeking belated integration through repetition" (Freud, 1920/1955).

Trauma theory has deepened these psychoanalytic insights, drawing on neurobiology, attachment research, and literary studies to explore how overwhelming experiences exceed the mind's capacity for integration. Bessel van der Kolk (2014) observes that "the body keeps the score," with traumatic memory often encoded somatically rather than linguistically. According to the study, it reappears in flashbacks, startle responses, or visceral sensations rather than in narrative recall. Figure 2 shows how trauma affects the mind, body, and behavior. In the mind, it appears through repression and disturbing dreams; in the body, it leaves traces as muscle tension, visceral sensations, and somatic memory; and in behavior, it surfaces through panic attacks, sudden startle reactions, and flashbacks. This model illustrates van der Kolk's (2014) insight that the body holds on to what the mind cannot fully process, emphasizing that trauma is not only psychological but also deeply physical and behavioral.

Teicher and Samson (2016) documented the enduring neurobiological consequences of childhood maltreatment. This study linked early abuse to lasting alterations in stress response systems, affect regulation, and brain connectivity. Psychoanalysis offers something more than a clinical account. It highlights the subjective and symbolic dimensions of the trauma. It also traces how psychic life knits itself around absences, ruptures, and the enigmatic demands of the unconscious mind. As Laplanche and Pontalis (1988) note, the unconscious does not merely store memories like a passive archive; 'it translates, distorts, and disguises them, returning them to consciousness in dreams, symptoms, or uncanny repetitions whose meanings resist immediate deciphering.'

Childhood abuse, whether physical, emotional, or sexual, has deep and lasting effects on a person's development, sense of self, and capacity for healthy relationships. Studies have shown that when children experience multiple forms of abuse, the harm is compounded. It often leads to depression, low self-esteem, difficulties in social functioning, and even chronic health conditions in adulthood. Figure 3 illustrates the wide range of psychological

**Jaffer Sha et al.,**

consequences that abuse can leave behind. Each section highlights how trauma continues to shape the body, mind, and relationships long after the abuse has ended. In *The Night Child*, this framework helps clarify how Nora's experiences of being beaten, insulted, and sexually violated leave scars not only on her body and memory but also on her identity, self-worth, and ability to trust others. These themes resonate with central concerns in psychoanalysis and trauma theory, as seen in the writings of Freud, Ferenczi, and Herman, and are further supported by contemporary research (Zhang et al., 2025; Spinazzola et al., 2018).

The interplay between memory, repression, and the return of the repressed makes Freud's work indispensable for interpreting *The Child*. The novel's fragmented structure, shifting temporalities, and hallucinatory doublings formally enact traumatic memory dislocation. Scenes from Nora's childhood emerge unpredictably. It presents things in strange manners, such as a shattered rosary, a mother's slap, a father's whispered threat, and a Valentine's Day turned sinister. These images recur with the compulsive force Freud (1920/1955) describes in *Beyond the Pleasure Principle*, where he links traumatic repetition to the psyche's attempt to bind overwhelming stimuli into coherent meanings. As Freud suggested, such binding is never fully achieved. The trauma resists complete integration and remains partly unsymbolized, lodged in what Caruth (1996) terms "the unknown that one carries within." Nora's adult experiences, including her dissociation into the alter ego Margaret, her panic attacks, and her faltering speech before therapists, testify to this unassimilated kernel, the traumatic Real around which both psyche and narrative revolve.

This study interprets *The Night Child* not simply as a story of individual suffering. It is a literary exploration of how trauma shapes memory, language, and the unconscious by connecting Freud with contemporary trauma theory. The novel's broken timeline, jumps between past and present, and moments in which Nora seems to see herself twice reflect the confusion and disruption caused by traumatic memories. In the novel, scenes from Nora's childhood appear unpredictably and repeatedly. These repetitions reflect the compulsive return of traumatic experiences, as Freud (1920/1955) described, "in which the psyche struggles to integrate overwhelming events into coherent understanding." However, as Freud notes, this integration is never fully achieved. Trauma resists complete assimilation and remains partly unprocessed, which continues to affect the mind and body. Nora's adult experiences, which include her dissociation into the alter ego Margaret, her panic attacks, and her difficulty speaking in therapy, demonstrate the lasting effects of these unresolved traumas.

The novel also highlights how abuse within caregiving relationships blurs the boundaries between care and harm. The father's alternating gestures of tenderness and violation exemplify what Freyd (1996) calls betrayal trauma. This suggests that the person who is supposed to provide protection becomes the source of danger, destabilizing the child's sense of safety, trust, and self. Similarly, Ferenczi's (1949) concept of identification with the aggressor explains how a child may internalize the perspectives or desires of the perpetrator to survive. This can lead to patterns of self-blame, shame, and ambivalent attachment in the child's adulthood. *The Night Child* thus aligns with contemporary trauma theory in refusing neat closure or catharsis. By presenting childhood sexual, physical, and emotional abuse as ongoing influences rather than resolved events, the novel demonstrates how trauma persists across time and the psychic life, demanding ongoing attention and interpretation.

Theoretical Framework

This study situates *The Night Child* within a psychoanalytic and trauma theoretical framework. The aim is to examine how childhood abuse, including physical, emotional, and sexual abuse, leaves lasting marks on the psyche, memory, and bodily experience. Freud's early ideas, including the seduction theory, and later work by Ferenczi (1949), show that when caregivers become sources of harm, the child experiences a deep betrayal that shapes their sense of self. Herman (1992/2015) adds that such trauma damages not only the body and emotions but also trust, relationships, and identity, often leading to shame, self-splitting, and loneliness. As shown in Figure 3, childhood abuse creates wounds that later appear as dissociation, inner criticism, and bodily symptoms. The figure outlines the theoretical framework of this study.

**Jaffer Sha et al.,**

These dynamics are powerfully staged in *The Night Child*. The mother's swing between care and cruelty, the father's intrusion of sexual violence into moments of supposed tenderness, and the family's broader silences together create what Ferenczi (1949) called the "confusion of tongues." In such moments, the child is trapped in the caregiver's unspoken rage, desires, and anxieties, unable to tell love from harm or safety from threat. Freud's "Three Essays on the Theory of Sexuality" (1905/1953) helps clarify how childhood sexuality normally becomes ordered and repressed over time. Violent abuse interrupts this process. Adult desires are forced onto the child, producing what Laplanche (1988) terms "enigmatic messages." A signal that the child cannot interpret, but also cannot dismiss. In Nora's case, her father's whispered commands operate as such messages, driving repression while ensuring the return of trauma through nightmares, dissociation, and intrusive memories.

Freud's (1923) idea of the superego adds another layer to this discussion. Nora's mother's words, calling her a "liar" or "stupid girl", solidify into an inner voice of harsh judgment, mirroring Freud's description of the punishing parental authority that shapes the psyche. Contemporary research supports this view. Zhang et al. (2025) linked childhood maltreatment with long-lasting shame, while Spinazzola et al. (2018) showed that verbal abuse can harm as deeply as physical assault, corroding self-worth and reinforcing guilt. In this sense, the superego becomes an internal record of abuse, replaying and magnifying the original trauma in the child. Psychoanalytic theory helps to explain the ambivalence that survivors often feel toward abusive caregivers. Freud (1917/1955) described this as identification with the aggressor, wherein the child internalizes aspects of the abuser's perspective as a survival strategy. In Nora's case, this ambivalence surfaces as a tangled mix of fear, longing, and loyalty toward the very parents who harm her, resulting in dissociation and fragmentation in adulthood.

The temporal dimension of trauma further highlights Freud's framework of the unconscious. His concept of *Nachträglichkeit* (deferred action) emphasizes that experiences unprocessed in childhood often gain traumatic significance later, when subsequent events reactivate the memory (Freud, 1896/1955). *The Night Child* dramatizes this temporality through its nonlinear form, shifting between Nora's adult reflections and her fragmented childhood memories. Flashbacks of parental violence, sexualized encounters, or broken household objects return with a compulsive force. The novel suggests that trauma resists smooth integration into narrative. Instead, it re-emerges in fragments, bodily reactions, and dissociative episodes. As Caruth (1996) argues, trauma speaks through what cannot be fully known, revealing itself indirectly through repetition, silence, and disruption. As outlined in Figure 4, psychoanalytic concepts such as betrayal trauma, identification with the aggressor, and somatic memory provide a framework for understanding how abuse in Nora's childhood is written into her psychological, relational, and bodily life.

Freud's writings on childhood sexuality further illuminate the psychic consequences of incestuous sexual abuse. Ordinarily, the child's sexual drives are diffuse and socially unorganized, later shaped by Oedipal development and repression. In cases of abuse, this process is violently reversed. The child encounters adult sexualization before the ego can process it, producing confusion, guilt, and dissociation. In contrast, the psychoanalytic lens insists on the integration of bodily and psychic registers. Freud's early seduction theory identified the body as a site of trauma expression when the mind cannot contain it. Nora's trembling, pallor, and psychic numbing exemplify this embodiment. It shows that her body remembers what her conscious mind cannot fully process.

RESEARCH METHODOLOGY

This study employs a qualitative research methodology to investigate how *The Night Child* (Quinn, 2018) represents childhood trauma. It specifically examines how physical, emotional, and sexual abuse shape the protagonist's psychic life through the lens of Freudian psychoanalysis. As Taylor et al. (2016) note, qualitative research generates descriptive data that capture lived experiences in depth and complexity rather than reducing them to numerical patterns. Similarly, Ritchie and Lewis (2003) emphasized that qualitative inquiry aims to reveal phenomena as they emerge within natural contexts. In essence, the present study engages closely with *The Night Child's* language,

**Jaffer Sha et al.,**

imagery, and characterization to uncover how trauma inscribes itself on memory, identity, and the unconscious. This research follows a phenomenological orientation, as outlined by Creswell and Poth (2018), prioritizing the exploration of subjective experiences and meanings. The study highlights how traumatic childhood events are registered psychologically, expressed linguistically, and enacted behaviorally by focusing on the protagonist Nora Brown's inner life. Data collection proceeded through literary criticism methods, beginning with multiple close readings of the text to identify passages that depict abuse and dissociation. Quotations were extracted from narrative descriptions, dialogues, and interior monologues, where the imprint of trauma on the protagonist emerges explicitly or implicitly. Consistent with Yin's (2016) recommendations, source triangulation was employed by consulting theoretical, psychological, and literary scholarship to ensure interpretive rigor.

Data analysis followed Miles and Huberman's (2014) interactive model, encompassing data reduction, display, and conclusion drawing. Extracted passages were first categorized according to types of abuse and corresponding PTSD symptoms, then interpreted through Freudian psychoanalysis—particularly concepts such as repression, the return of the repressed, and repetition compulsion—and Herman's trauma framework. As Miles and Huberman (2014) note, literary analysis requires constructing a sustained argument grounded in textual evidence. Accordingly, this study integrates psychoanalytic theory and trauma studies to elucidate how *The Night Child* renders the psychological effects of childhood abuse.

Physical Child Abuse in the Novel

Freudian psychoanalysis posits that early relational trauma, especially physical abuse by caregivers, resides not only in explicit memory but also in the unconscious, shaping the psychic structure, generating defense mechanisms, and influencing symptom formation (Freud, 1910; Laplanche & Pontalis, 1988). In *The Night Child* (2018), Nora Brown's childhood is not merely endangered by physical violence—it is shaped and haunted again and again by it. Physical abuse operates as both a rupture and a repetition. It forms the rupture of maternal care, repetition of pain, repression, and the creation of internal fantasies. From a Freudian perspective, the body becomes a repository of unassimilated trauma, and the unconscious is a theatre in which the child's earliest experiences drive later dysfunction. The following argument locates instances of physical abuse in Quinn's text by examining Maeve's psychological state and Nora's responses.

Physical abuse in the text emerges through vivid imagery and tactile violence. Nora's narration recollects with painful specificity when she was with her therapist, Dr. David Forrester:

"that sometimes her mother would shriek at her and how if she tried to run her mother would grab her, throw her down, bring her hand hard across her cheek, how the force of the slap sent her reeling against walls and furniture, how sharp and shocking those things felt against her body. She should have told him how her mother pulled her hair out, how she had wanted her mother to die" (Quinn, p. 31).

Nora's mother, Maeve, not only physically assaults her through grabbing, throwing, and striking, but these actions also deeply affect Nora's sense of safety and control. Violence forces her into repeated cycles of fear and submission, highlighting that the abuse is not merely symbolic; it is intensely physical and sensory. Beyond the immediate physical pain, Nora's account reveals the emotional and psychological toll of abuse. She mentioned how she wanted her mother to die, reflecting deep feelings of anger, helplessness, and despair. These emotions are common among individuals who experience chronic abuse, leading to complex trauma. From a Freudian perspective, the physical assaults Nora endured become part of her unconscious mind, encoded in what Freud termed the "infantile scene." These repressed memories can resurface as dreams, hypervigilance, and bodily fear responses.

Maeve's physical violence is unpredictable and eruptive, often linked to tensions neither she nor Nora fully understands. A later memory intensifies this unpredictability when Nora misses the bus while helping Sister Rosa, who comes to drop her off later. Her mother asked:

Jaffer Sha et al.,

"What did you say to her?"

"Nothing." Nora steps back.

"You told her something."

Fear shakes Nora's body, and her skin pales. "No ... no ... Mommy."

"Didn't you?" Her mother says, coming closer.

Shivering all over.

Hard furious terrified woman hand bones against girlface-girlarm-girlback-girlbones. Again, and again and again.

"You stupid girl! You've shamed us! Shamed us!" She stops, gulps more gin and Nora crawls away fast and slips downstairs to her piano." (Quinn, p. 194-195)

The repetition in "again and again and again" echoes the Freudian concept of the compulsion to repeat, "where trauma that is not fully known or integrated resurfaces in recurring patterns, forcing the individual into psychic reliving" (Freud, 1920/1955). Nora's bodily reactions, paleness, trembling and shivering, illustrate how the body itself registers and responds to trauma. The narrative's detailed mapping of Maeve's hand and bones across Nora's face, arms, and back enacts a primal violation of personal boundaries. This grotesque merging of self and aggressor demonstrates how physical abuse can collapse distinctions between victim and perpetrator, leaving indelible marks on both body and psyche. The following diagram (figure 7) shows how Freud's idea of the trauma cycle appears in *The Night Child*. It illustrates how moments of physical abuse create fear and cause Nora to split her feelings, how the unconscious hides these experiences through repression, and how the trauma later returns as symptoms and repeated behaviours, shaping both her emotions and her body.

Freud's early theorizing (e.g., his seduction theory) posited that childhood sexual trauma could be etiological for neuroses. In the case of physical trauma, while less foregrounded, it similarly disrupts psychic development (Freud, 1896/1955). He also emphasized repression. The infant or small child lacks the capacity to fully represent the traumatic event in language or conscious memory. As a substitute, the trauma returns in symptoms, in the body, in odd fears, in fragmented recollection. Nora's inability to recall exactly "when" Maeve stopped wearing lipstick, or what shift took place as she mentions, "I don't remember exactly when. I only remember that her lips tightened into a hard line, and she stopped wearing lipstick. And she had a shot or two of gin every day around three (Quinn, p. 30)." The shift here is gradual yet marked. Maeve's own identity becomes frayed, and through her, Nora's sense of the dissolution of maternal safety. The lipstick, a cosmetic boundary between self-presentation and social face, disappears. The gin becomes Maeve's regular companion in mid-afternoon, perhaps a means to deaden anxiety or shame. Such disintegration in the mother's ego capacities, Freud would say, weakens the holding environment for the child. When a caregiver is unable to maintain psychic equilibrium, objects meant to comfort instead erratically turn cruel.

In Freudian terms, Maeve's stress, her alcohol consumption, and her racial anxieties are psychic loads that are repressed and perhaps disowned. These inner conflicts need an outlet, and often the child becomes the target where these feelings are shifted. In this scenario, the physical abuse can be understood not just as cruelty, but as the mother's unacknowledged inner pain expressed outwardly. The violence may arise when Maeve's defences, such as splitting, projection, and denial, are overwhelmed. The attack on Nora's body is also an attempt to control a world that the mother perceives as threatening. Nora's mother always wanted to control the social mobility, racial otherness and identity anxiety. The home, meant to be safe, becomes a stage for conflicts between conscious aspiration (fitting in, achieving respectability) and unconscious fear (marginalization, shame).

Freud's theories of anxiety and the ego provide a useful lens for understanding Nora's experience. Her bodily trembling and fear can be read as anxiety produced by an internal conflict. On one side, her need for safety and protection, and on the other, the painful reality that the very person who should provide care, the mother, becomes the source of threat. In Freudian terms, the ego is caught between the punishing demands of the superego, which insists on conformity, propriety, and social acceptance, and the disruptive forces embodied in Maeve's rage, alcohol

**Jaffer Sha et al.,**

dependence, and position as an outsider. This fragile balance creates psychic strain that the ego can only manage through defence mechanisms. When the slap is too violent, Nora dissociates. When she longs for maternal affection but sees only an angry, rigid face, denial operates to soften the blow of psychic pain. In this way, the novel dramatizes how repression, dissociation, and denial function not as abstract theories but as lived survival strategies under conditions of trauma.

The consequences of physical abuse unfold gradually and leave lasting marks. They may take the form of body memories, recurrent nightmares, hyperarousal, mistrust of others, and a sense of shame that settles into bodily posture and flesh. Freud suggested that early traumas inscribe themselves through what he termed “‘somatic seduction’, not limited to sexual violation, but encompassing any intrusive experience in which the child’s body becomes the site of overwhelming penetration, leaving behind both psychic and symptomatic traces”. In *The Night Child*, Nora’s bodily reactions, her paleness, trembling, and constant vigilance, reflect these imprints. Such symptoms strongly resemble the physiological markers of trauma frequently observed in clinical populations, including panic disorders and dissociative episodes. Although Quinn’s novel avoids medicalized terminology, its portrayal of Nora’s responses resonates with well-documented findings in both psychoanalytic theory and contemporary neuroscience, which confirm the body’s role as a repository of traumatic memory (Samson, Newkirk, & Teicher, 2024)."

Recent psychoanalytic psychotherapy research shows that adults with histories of childhood abuse, whether physical, sexual, or emotional, tend to experience more severe depression, persistent interpersonal difficulties, and greater challenges in forming a secure therapeutic alliance (Krakau, Ernst, Hautzinger, Beutel, & Leuzinger-Bohleber, 2024). Notably, participants in long-term psychoanalytic therapy who had experienced childhood trauma showed greater symptom reduction, suggesting that addressing early relational wounds can lead to deeper psychological repair. This research provides a useful framework for understanding Nora’s narrative. Nora’s recounting of her abuse, the repeated reliving of painful experiences, and her difficulty in articulating the unspeakable mirror the psychoanalytic therapeutic process. The process where the repressed memories emerge, internal retransference unfolds, and even internal witnessing provides the first steps toward healing. In other words, only by bringing these traumatic experiences into conscious awareness and safely processing them can meaningful repair and integration take place, highlighting the therapeutic potential of narrative engagement with past trauma.

Freud’s concept of transference also helps elucidate Nora’s relationship with her mother, both in memory and in her adult self-understanding. The mother’s figure in Nora’s unconscious is both object of longing (for protection) and terror, which is suggested through Nora’s fear, anticipation of violence, even when silent and her bodily reactions when Maeve is near. The mother becomes a phobic object for the child. This duality is central to Freudian object relations, later developed by Klein, Fairbairn, and others. However, the foundational structure—the ambivalence between love and hate, safety and danger—is already Freudian.

Emotional Child Abuse in the Novel

Emotional abuse in *The Night Child* does not emerge through physical violence alone but through insidious, recurrent assaults on Nora Brown’s sense of self, security, and belonging. Freud’s early theorization of trauma as “‘Nachträglichkeit’, a belated action where the full impact of an earlier experience is realized only in later moments of psychic crisis” (Freud, 1910) is especially useful here for several reasons. For Nora, childhood events do not simply recede into the past. They linger in her life as they are sedimented in memory, returning in adulthood as symptoms, flashbacks, and feelings of dissociation. Emotional abuse, unlike physical abuse, which leaves visible scars, often inhabits the realm of language, silence, and psychic threat. It operates through humiliation, belittling, and repeated erosion of a child’s self-worth.

One of the novel’s most powerful scenes occurs when six-year-old Nora is accused of lying, and her mother’s rage explodes in both a verbal assault and the destruction of a sacred object.

Jaffer Sha et al.,

"Liar!" her mother shouted, snatching the rosary from Nora's six-year-old hand. "Where did you get this?" "S-s-sister Rosa gave it to me." "Liar!" Her mother's red hands shake the rosary close to Nora's face. "P-p-please Mommy, give it back." You want it back? Here!" And then her mother's angry fingers wrenching the rosary apart until SNAP! The white thread breaks, and all fifty-nine blue beads pop into the air and clatter to the floor. Her mother leaving her there then, in the sudden silence of it all, Nora smearing tears off her cheeks and scrambling to find each precious bead" (Quinn, P. 98-99).

Here, the repeated accusation, "Liar!" becomes more than just a moment of anger. It takes root in formative psychological wounds. From a Freudian perspective, this moment illustrates the internalization of the parental voice as a superego. Freud (1923) explains that the superego emerges from the authority of parental figures, often through prohibition and punishment, becoming a harsh and punitive inner voice. Nora's mother's voice echoes in her psyche, condemning not just her actions but her very sense of self.

The destruction of the rosary intensifies this moment in the film. As a sacred object, the rosary symbolizes faith and comfort, but in Maeve's hands, it is turned into a weapon of shame. The scattering of blue beads across the floor is a striking image of fragmentation. It represents the shattering of Nora's trust, her sense of safety, and her spiritual grounding in her marriage. Trauma research shows that such early experiences of humiliation and violence can crystallize into deep-seated shame, leaving long-term effects on self-concept and emotional regulation (Zhang et al., 2025).

From a psychoanalytic perspective, such verbal assaults exceed mere "discipline." The mother neither inquires into the child's motives nor allows her a voice. Instead, she imposes a unilateral judgment. Freud (1923) suggested that a caregiver's aggression overwhelms the child's ego defenses. Children often internalize aggression, turning it inward as self-reproach, guilt, or compulsive obedience. For Nora, being called a liar repeatedly and violently instills a sense of moral failure in her unconscious, even when none exists. The result is not moral guidance but a psychic injury. Moreover, psychoanalytic scholars argue that repeated accusations of lying in childhood often lead to what Ferenczi (1949) called "confusion of tongues". According to this idea, the child internalizes the aggressor's interpretation and becomes alienated from her own memory and truth. This is reflected in Nora's subsequent confusion. She recalls the accusations but not their reasons. She remembers "the missing cookies, the church confessional, or praying to St. Margaret" (Quinn, p. 98), but cannot find the exact reason. Her memory is fractured, pointing towards the idea of trauma's paradox (Caruth, 1996), which is both unforgettable and unassimilable, returning in fragments rather than a coherent narrative.

Moreover, the novel's temporal structure underscores the persistence of these childhood scenes into Nora's adulthood. Lying awake at night, she remembers "these things", the mother's accusations, the sharp voice, the shattering beads. The return of these memories in adulthood exemplifies Freud's notion of the return of the repressed: "what the child cannot fully process in the moment resurfaces later, often with intensified affect" (Freud, 1910). Emotional abuse thus operates across time, with its traumatic force accumulating in the psyche until it manifests as anxiety, depression, or dissociation.

Emotional violence in the novel extends beyond accusations of lying to episodes of overt humiliation and verbal assault. One such moment occurs when Nora's mother, drinking gin, lashes out at Nora:

"Nora follows her mother through the doorway, and the door clunks closed. Her mother walks to the coffee table and picks up her glass of gin, takes a drink, the green olive touching her lips, then floating around the clear liquid again. She slams the glass back down. "What did you say to her?"

"Nothing." Nora steps back.

"You told her something." Fear shakes Nora's body, and her skin pales. "No ... no ... Mommy."

.....

Jaffer Sha et al.,

“You stupid girl! You’ve shamed us! Shamed us!” She stops, gulps more gin and Nora crawls away fast and slips downstairs to her piano” (Quinn, p. 194-195).

Here, the mother’s words “You stupid girl! You’ve shamed us!” show how Nora becomes the target of her mother’s anxieties about respectability and social standing. The rage is disproportionate, and its true source is likely her mother’s own inner turmoil, which is displaced onto the child. In psychoanalytic terms, this is a type of projection. The “aggressor disowns feelings of shame or inadequacy and attributes them to another, who is then punished for them” (Laplanche & Pontalis, 1988). Too young to recognize this psychic mechanism, Nora absorbs these accusations as truths. This shapes her ego, marked by guilt and low self-worth. The following illustration (figure 8) shows how repeated verbal assaults, such as accusations of lying and calling her stupid, penetrate Nora’s psyche. It also shapes Nora’s superego through parental aggression. These experiences generate shame and anxiety, which are then repressed, producing psychic splitting and later symptoms, such as dissociation and identity fragmentation.

Research on emotional abuse confirms these dynamics of power and control. Studies indicate that verbal denigration and humiliation are among the most damaging forms of childhood maltreatment, often leaving scars that persist into adulthood (Spinazzola et al., 2018). Emotional abuse undermines a child’s emerging sense of self, creating chronic patterns of shame and self-doubt. As Herman (1992/2015) observes, repeated abuse in childhood often leads to complex posttraumatic stress disorder (PTSD), characterized not only by intrusive memories but also by relational distrust, identity disturbance, and feelings of worthlessness. This dynamic is intensified when the abuser is also a caregiver. Freud (1925/1961) described such situations as traumatic because the child cannot escape the source of the threat. To survive, “the psyche may split, repress painful experiences, or even adopt the aggressor’s perspective to preserve a fragile bond” (Ferenczi, 1949). In Nora’s case, humiliation becomes internalized, fusing maternal rage with her own sense of self and leaving her vulnerable to cycles of guilt and psychic fragmentation.

The father’s role deepens the cycle of abuse, reinforcing the fear and secrecy. A particularly chilling memory captures how the threats of isolation and disbelief silence Nora:

“Her father had taken this picture the day she’d received the Valentine’s dress from her grandmother. Taken the picture a week before he ruined the dress. Taken the picture when she’d been a good girl. And now—her father’s mouth, breathing heavy in her ear, whispering ‘If you tell you will be alone. All alone. No one will believe you. If you tell, no one will ever believe you.’” (Quinn, 2018, p. 192).

Here, the father’s whispered threats enforce silence through the primal fear of being abandoned. Freud (1925/1961) suggested that threats of loss or isolation create overwhelming anxiety in children because attachment figures are essential for survival. The father ensures Nora’s obedience and secrecy by weaponizing her dependency. This form of emotional abuse extends beyond the immediate encounter, leaving enduring imprints on Nora’s capacity for trust, speech, and self-assertion.

Contemporary research has confirmed these consequences. Teicher and Samson (2016) noted that repeated emotional abuse in childhood is strongly associated with adult psychopathology, including depression, anxiety, and posttraumatic stress disorder. In *The Night Child*, Nora’s dissociation and psychic fragmentation are manifested in the figure of Margaret. This can be understood as a delayed response to these assaults. When a child cannot protest, flee, or seek comfort, the psyche often survives through dissociation, partitioning intolerable memories and emotions into separate compartments (van der Kolk, 2014).

From a Freudian perspective, emotional abuse in *The Night Child* functions through language, threat, and humiliation, inscribing wounds not on the body but in the unconscious mind. Such experiences become the latent material of Nora’s later symptoms, the repressed kernels around which anxiety, shame, and dissociation coalesce. However, the novel does not present emotional abuse in isolation. Rather, it depicts a continuum in which physical violence, sexual threats, and neglect intertwine, each magnifying the other’s trauma. In this way, emotional abuse

Jaffer Sha et al.,

provides the psychic groundwork upon which subsequent violations are inscribed, shaping the complex texture of Nora's trauma and the clinical picture of PTSD that emerges in her adulthood.

Sexual Child Abuse in the Novel

The novel portrays sexual abuse not as a single event but as part of a broader continuum of violence shaped by emotional neglect, maternal hostility, and paternal violations. Nora's father, Karl, enters this fractured family space not only as the incestuous aggressor but also as the figure who appears to offer comfort in the midst of maternal rage and parental conflict. As Herman (1981) argues in *Father-Daughter Incest*, such dynamics are tragically common in our society. She states that, "when mothers are abusive, absent, or emotionally unavailable, daughters often turn to their fathers for protection, only to have this dependency exploited". In Nora's case, the father presents himself as a confidant and caretaker, but this protective role collapses into incestuous violation, leaving the child caught between love and terror. A recent psychological study by Tekin (2025) found that young women with histories of paternal neglect and abuse showed that their early relationships with their fathers significantly influenced their later romantic relationships and partner choices.

The novel stages this collapse through fragmented memories in which moments of parental fighting, the father's apparent tenderness, and the child's confused emotional responses are interwoven. Freud's theory of infantile sexuality (1905/1953) highlights "how parental figures, meant to establish boundaries, instead blur them, leaving traces that return as symptoms in adulthood." As Caruth (1996) and later trauma theorists note, this repetition of fragmented memory and affect underscores how "trauma resists straightforward narration, surfacing instead in disjointed recollections, bodily reactions, and conflicted emotions".

The narrative presents Nora's sexual abuse as a profoundly disturbing convergence of affection and violations. In one of the most harrowing scenes, Nora's father approaches her with a seemingly benign Valentine's greeting:

"Behind her a man says, 'Nora?' She turns and looks.

'Daddy!' she jumps up, so happy to see him! ... 'Happy Valentine's Day, Princess,' he says.

He sits on the bed, takes her hand ... 'Say it,' he says. 'Kiss me,' she says, barely a whisper, and he leans in and kisses her softly on the lips. And he pops the candy in her mouth his hand on her leg, stroking stroking stroking ... 'Say it again,' her daddy whispers, now moving her back and forth back and forth slow back and forth fast on his lap ... 'Say it. Say. "Kiss me, kiss me,"' (Quinn, p. 152-54).

Here, the father's language, referencing fairy tales, princesses, and romantic fantasy, disturbingly aestheticizes the act, masking the incestuous violation within a lexicon of affection. This strategy simultaneously confuses a child's emerging understanding of intimacy, pleasure, and bodily autonomy. The scene exemplifies how adult sexual desire is imposed on a child's body, creating a traumatic entanglement of care, fantasy, and abuse.

Freud's *Three Essays on the Theory of Sexuality* (1905/1953) provides a crucial framework for understanding this dynamic relationship. Freud theorized that children possess infantile sexuality, which precedes the structured organization of adult sexual drives and is normally subject to repression as the child matures. In incestuous abuse, however, the adult enforces premature sexualization, bypassing developmental boundaries and introducing erotic experiences in a coercive, unilateral manner (Freud, 1905/1953). This premature imposition produces a paradoxical response: the child experiences sexual sensations along with fear, confusion, and guilt. Laplanche and Pontalis's (1988) concept of the "enigmatic signifier" further illuminates this psychic mechanism. Adults communicate messages charged with affect and desire that exceed the child's cognitive and emotional capacity to decode, embedding sexual meaning into their unconscious. Nora's whispered compliance—"Kiss me"—does not signify volitional consent but reflects her psychic entanglement in this unassimilable communication.

The narrative repeatedly highlights Nora's inability to comprehend or articulate the wrongness of the acts perpetrated against her as a child. In one scene, she and her brother James attempt to shield themselves from the

**Jaffer Sha et al.,**

chaos of parental conflict: “In her mind, she is seven, hiding in the bathroom with James, her hands pressed over his ears, trying to block out the voices of their parents fighting and slamming doors, slamming each other. Bang, bang, bang.” (p. 37) Here, the child’s world is already saturated with violence, verbal aggression, and unpredictability. The domestic space, which should provide protection and stability, becomes a site of fear and hypervigilance. Into this fraught environment enters the father, whose apparently caring gestures, such as drying her after baths, giving her candy, and complimenting her appearance, gradually serve to mask the intrusion of sexualized acts. The juxtaposition of nurturing behavior with sexual violation exemplifies what Ferenczi (1949) termed the “confusion of tongues,” in which the child’s legitimate needs for care and affection are exploited to facilitate abuse. This early disruption of boundaries and trust contributes to lasting psychological consequences, as the child cannot fully recognize, protest, or process the abuse, leaving the experience encoded in their unconscious (Freud, 1905/1953).

One of Nora’s most harrowing memories recounts, “Her father’s voice whispering, ‘Our secret, our secret, our secret,’ the hands rubbing between her legs, hard and fast” (Quinn, p. 181). The repetition of “our secret” functions at multiple levels. On the surface, it enforces the silence characteristic of sexual abuse, isolating the child through threats and demands for complicity. This echoes the earlier warnings, “her father’s mouth, breathing heavy in her ear, whispering, “If you tell, you will be alone. All alone. No one will believe you. If you tell, no one will ever believe you!” (p. 192). At a deeper psychoanalytic level, the injunction installs a repression. The child is compelled to bury the event in the unconscious, where it persists as an unassimilated fragment of experience. Freud (1920/1955), in *Beyond the Pleasure Principle*, linked trauma to the compulsion to repeat, suggesting that unprocessed experiences return through dreams, symptoms, and neurotic patterns precisely because they were never fully integrated into conscious memory.

Nora’s adult life, marked by intrusive recollections, dissociation, and psychic fragmentation, exemplifies the return of the repressed. The father’s whispered injunction, “Our secret,” resonates across time, producing what Caruth (1996) terms the “belatedness” of trauma. It is the delayed emergence of traumatic impact, generating symptoms that testify to experiences simultaneously lived and unassimilated. Moreover, the father’s oscillation between tenderness and violence erodes the child’s ability to distinguish care from harm, producing what contemporary trauma theory identifies as betrayal trauma (Freyd, 1996). The child experiences not only sexual violation but also a profound ontological rupture because the perpetrator is both an attachment figure and a threat. The diagram below (figure 9) illustrates how parental care and abuse converge to collapse emotional security, forcing the child into dependence on the abuser, silencing disclosure, and producing long-term psychological fragmentation.

The text emphasizes this through scenes of physical passivity. For example, “her hands stiff at her side. She is him. Her eyes closing” (Quinn, p. 181), indicating the child’s retreat into psychic numbing, a splitting of consciousness that allows survival amid inescapable violation. Ferenczi (1949) termed this identification with the aggressor. The child is unable to resist or flee, which internalizes the perpetrator’s desires and perspective. It forms as a dynamic that re-emerges in adulthood as self-blame, shame, and ambivalent attachment patterns. The father’s command, “No one will believe you,” further silences the child. The traumatic experience becomes unspeakable, lodged in what Caruth (1996) describes as “the unclaimed experience,” “returning only through flashbacks, nightmares, or compulsive repetition rather than coherent narrative memory”.

The long-term effects of Nora’s childhood sexual trauma, as the narrative suggests, include dissociation, guilt, and difficulties in forming and sustaining adult relationships, consistent with clinical accounts of survivors of childhood sexual abuse (Herman, 1992). However, the text resists providing full psychological closure. Memories appear in fragments, sensory flashbacks, and dreams rather than in a linear narrative form, reflecting trauma’s inherent resistance to integration. As Caruth (1996) emphasizes, trauma is communicated indirectly through gaps, repetitions, and disruptions rather than through coherent storytelling. Nora’s recollections of bathroom scenes, Valentine’s dresses, and whispered secrets function as screen memories (Freud, 1917/1955), which are vivid but displaced images that simultaneously reveal and conceal the traumatic core.

**Jaffer Sha et al.,**

The representation of sexual abuse in the novel intertwines Freudian notions of repression, the uncanny return of the repressed, and the traumatic collapse of family and psychic boundaries. The father's acts exemplify what Kristeva (1982) terms abjection, "a breakdown of the distinctions between love and violence, self and other, parent and lover, that ordinarily stabilizes subjectivity". The narrative deliberately leaves these dynamics unresolved. It signals that the aftereffects of trauma, including its repetitions in adult relationships and its inscription in memory and language, require further examination.

CONCLUSION

The analysis of *The Night Child* through Freudian psychoanalysis reveals how physical, emotional, and sexual abuse inscribe themselves upon the child's psyche, body, and language, shaping identity and symptom formation long after the events have passed. As Freud (1910, 1920/1955, 1923) observed, early relational trauma rarely disappears. It persists in the unconscious, returning as dissociation, anxiety, and compulsive repetition. Nora Brown's fragmented memories, bodily reactions, and psychic splitting illustrate Caruth's (1996) notion of trauma as both unforgettable and unassimilable, lived yet unspeakable.

Physical abuse marks the child through violence and fear, producing what Freud termed the "compulsion to repeat," where repressed experiences return through nightmares, bodily symptoms, and hypervigilance. Emotional abuse, expressed through humiliation, threats, and the maternal voice of condemnation, creates what Ferenczi (1949) calls the "confusion of tongues," in which the child internalizes the aggressor's voice, carrying shame and guilt into adulthood. Sexual abuse, enacted by the father under the guise of care, collapses distinctions between love and terror, tenderness and domination, imposing repression and secrecy while shaping Nora's psychic life through silence, ambivalence, and fragmentation.

Freud's concepts of repression, identification with the aggressor, and the return of the repressed illuminate Nora's dissociation, her creation of Margaret, and her difficulties with memory and speech. Contemporary trauma research (Herman, 1992/2015; van der Kolk, 2014; Teicher & Samson, 2016) confirms these depictions, linking early abuse to lasting psychological effects, including PTSD, identity disturbance, and relational difficulties. Yet the novel also emphasizes trauma's resistance to closure: memories surface in fragments, sensory flashes, and dreams rather than in coherent narratives, reflecting the psychoanalytic view that trauma exceeds representation and demands prolonged "working through" (Freud, 1920/1955).

In the study, *The Night Child* demonstrates that childhood abuse constitutes not only physical and emotional harm but a profound reconfiguration of the inner world. The maternal slap, the paternal whisper, and the verbal humiliation become what Laplanche and Pontalis (1988) term "enigmatic signifiers," messages charged with violence and desire that shape unconscious life long after the original events. By bringing together literature, psychoanalysis, and trauma theory, this study shows how narrative bears witness to trauma's persistence while leaving open the possibility of re-narration, therapeutic engagement, and psychic repair.

Concept & Theorist	Focus / Theme	Application to Nora
Betrayal Trauma – Freyd (1996)	Abuse by caregivers disrupts trust and attachment	Mother's care/abuse oscillation creates fear and confusion
Confusion of Tongues – Ferenczi (1949)	Child cannot decode caregiver's desires	Father's sexualized intrusion blurs protection and threat
Identification with Aggressor – Freud (1917/1955)	Child internalizes abuser's perspective for survival	Nora feels loyalty mixed with fear, causing fragmentation
Superego Formation – Freud (1923)	Internalized parental authority shapes self-judgment	Mother's criticisms become Nora's internalized guilt
Nachträglichkeit – Freud (1896/1955)	Trauma acquires meaning later in life	Flashbacks and fragmented memories emerge in adulthood
Somatic Memory – van der Kolk (2014); Samson et al., 2024	Trauma manifests in body and mind	Trembling, pallor, and psychic numbing reflect embodied trauma

ABSTRACT

This paper aims to present an interpretation of Philip Roth's work "Deception," by scrutinizing the unique narrative approach the author employs. Roth engages in a sort of linguistic "wordplay" that draws the reader into both the structure and essence of the novel, often without their awareness. The frequent and chaotic dialogues create a whirlpool of conversations, both significant and seemingly trivial, that have the capacity to deceive – hence the title of the novel. This deception extends beyond mere marital infidelity; it intertwines with the art of storytelling and the way our lives are shaped by our own falsehoods and those of others. Interestingly, a protagonist named Philip and his female counterpart enact the tale of betrayal, employing dialogue tactics reminiscent of dramatic strategies. Their conversations seem to mirror a theatrical dialogue, with the ultimate goal of convincing the reader of the fusion between fiction and reality through ceaseless verbal circularity. Concurrently, the narrative's metanarrative essence appears to illuminate Roth's skepticism regarding the existence of a genuine truth in human relationships.

Keywords: Metafiction, betrayal, metanarrative, Philip Roth

**James Raaj and Renuga**

INTRODUCTION

Within Philip Roth's extensive body of work, "Deception" distinguishes itself through two significant aspects that characterize both its structure and content. The first aspect revolves around the cyclic nature of its narrative discourse, where tense, overlapping, and recurring dialogues engender a palpable psychological intensity within each character's situation. This divergence from the conventional plot progression seen in Roth's other novels like "American Pastoral," "The Plot against America," or "The Dying Animal" is evident. In these novels, a logical-temporal sequence of events unfolds, reflecting intricate contexts and relationships. "Deception," however, employs a unique narrative technique. It does not rely on a narrator to arrange the narrative flow. Instead, each moment unravels organically, with pertinent and seemingly insignificant words strategically intertwined, creating a swirling sensation where everything finds its place, albeit partially confounded. The innovation of "Deception" lies in its title, which serves as a framework for both the story's commencement and conclusion. This framework is populated with words that lend semantic depth to the apparent void enveloping the narrative. This results in a sort of literary playfulness, culminating in a text handed over to the reader who becomes partly immersed in the construction of the novel's verbal ambiguities.

The second significant aspect pertains to the deeply metanarrative essence of the text. This quality becomes apparent as all of the author's decisions contribute to constructing a narrative framework where Philip Roth, as the narrative voice, refrains from explicitly outlining the characters' roles and their interpersonal dynamics. As Claudia Roth Pierpont astutely observes, "the issue of intent – whether we accept his authorial explanations, whether the women are intended to be genuine – imparts a sensation akin to one of Escher's paradoxical creations" (Roth Pierpont 2014, p. 168). Maurits Cornelis Escher's etchings are famous for their utilization of geometric distortions. These distortions create paradoxical visual effects that almost contradict the very essence of what they portray. This results in a continuous redefinition of space. Similarly, in this specific novel by Roth, there is a resemblance to Escher's approach. Roth skillfully shuffles the narrative cards, providing both the reader and the characters themselves with a sense of bewildering interaction. The characters appear to navigate their lives in a state of dialogic confusion, societal instability, and existential uncertainty. This fluidity, central to the metatextual aspect of the novel "Deception," is made even more compelling by the introduction of a narrator named Philip, mirroring the name of the actual narrator. This narrative device serves a dual purpose. On one hand, it alludes to the cyclical nature often found in novels, and on the other hand, it directly ties into the inception of the metanarrative. This prompts us to ponder what storytelling truly is, if not a form of 'deception' in its essence. Fundamentally, the composition is shaped within the realm of ambiguity, a concept epitomized by Barthes in his piece "Writing Degree Zero." Published in 1953, this work thoroughly explores the examination of writing and language, delving into the intricate interplay between the writer and society. Furthermore, it delves into the intricacies of the creative process within the backdrop of societal expectations.

In this manner, Roth positions himself outside the confines of conventional literature, aligning with the realm of uncertain decisions that, as Barthes notes, align with "the requisites of an autonomously generated language." From this perspective, the notion of deception extends beyond the mere pattern of relentless unfaithfulness that defines the central character, someone consistently primed to embark on new liaisons while maintaining an air of innocence in the face of the theme of adultery. The core deception within the novel distinctly revolves around the domain of narrative craftsmanship. This is underscored by the fact that Roth employs writing as the platform where he intricately stretches the interplay between fiction and reality, a dichotomy that can be identified as the clash between authenticity and falsehood, to its utmost ramifications. In many respects, the author presents a narrative composition that, albeit indirectly, brims with a succession of inquiries: How profoundly are our everyday lives shaped by both our own lies and those propagated by others? To what extent does infidelity symbolize a narrative construct that we transmit to the person who has been betrayed, a kind of fictional storytelling? And above all, a question of paramount narratological significance: Why is "Deception" structured in a manner that persuades the reader of the

James Raaj and Renuga

seamless fusion of narrative fiction and actuality? In essence, the overtly autobiographical elements provide the cornerstone for this novel, which essentially recounts an act of betrayal. Within this context, literary fabrication metamorphoses into the tale of an autobiographical fabrication, wherein the reader is granted insight into how the protagonist Philip Roth (a figure expected to be genuine but necessarily adheres to literary conventions) delineates his personal variant of deceit. This deceit, within the context of the story, materializes as adultery and, consequentially, the breach of trust directed at his spouse. Indeed, we are stepping into the realm of metafiction here. However, underlying the tension of metanarrative lies something more intricate than a mere plot involving characters betraying their partners. As pointed out by Margaret A. Rose, parody and metafiction inherently challenge "an attack (implicitly or explicitly) on theoretical oppositions between reality and unreality in the artwork or as given in the canons of literary criticism" (Rose 1979, p. 150). Ultimately, Roth's aim is to expand the horizons of his creative writing by employing a tactic that, in terms of pleasurable reading, dismantles all the elements stipulated by the narrative pact. This approach is intended to furnish the reader with a dynamic text that, above all, serves as an experiment and, we would venture to add, as an intense self-portrayal in the guise of autobiography through profound dialogue. We refrain from using the term "pseudo-autobiography," though it might appear more accurate, because an entirely candid and truthful autobiography is a notion that doesn't truly exist. All autobiographies present a perspective on life wherein order supplants disorder, the linear arrangement of events takes the place of the chaos of everyday existence, and the artifice of reconstruction supersedes the objective truth of occurrences. In essence, there is a point where autobiography and fiction merge.

Furthermore, we can also contemplate a Victorian autobiography like Trollope's, among various others. "Deception" is fundamentally constructed upon this very type of ambiguity, although it employs dialogue as its predominant mode to establish greater credibility for autobiographical fabrication. In this context, Searles has astutely observed: "True to its title, Deception is deceiving. Despite the erotic hard sell of the dust jacket, there are no graphic descriptions of sex – or of anything else. The novel is pure dialogue, without a phrase of exposition or attribution, without asingle 'he said' or 'she said' – just bare-naked talk" (Searles 1992, p. 254). This dialogue, which is rendered without the inclusion of descriptive instances or linguistic markers that typically indicate the speaker ("he said," "she said," and the like), constructs a version of events with the intent of imparting an impression of authenticity. It has been duly noted earlier that the narrator is acutely aware of the ruse being played. Yet, he finds himself unable to evade his own belief in it, entrusting his words—which, much like any written expression within a narrative creation—necessarily operate within a backdrop that is not truly real. Needless to say, this suspension of disbelief on his part becomes equally shared by the reader.

The convergence of reality and fiction initiates at the very crossroads of character nomenclature. At the diegetic layer, this marks the primary hint that the discourse seemingly alludes to autobiography—an initial-person recollection of a personal ordeal centered around betrayal. However, beyond merely hinting at betrayal, the use of the name "Philip" for the protagonist serves as a pivotal element in the overarching strategy of ambiguity. From the standpoint of the novel's construction, this element assumes the role of a pivotal structural component. Simultaneously, it is crucial to emphasize that "Deception" does not adopt the format of a personal journal or a textual confession: it is, in essence, a work of fiction, not a replication of something anchored in reality. In this regard, the significance of the protagonist's name "Philip" holds no interpretive weight. What remains evident is that the authentic Philip Roth is credited above the title, signifying his ownership of the copyright for "Deception." Meanwhile, the character within the narrative emerges as a creation stemming from the author's imaginative prowess:

Most of Deception consists of precoital and postcoital conversations between adulterous lovers: an unnamed literary Englishwoman and a Jewish-American novelist named Philip, who is living in London. Roth, too, is a Jewish-American novelist who has lived in London, but insists that Deception is fiction, not autobiography. The novel's protagonist offers the same argument to his shocked wife after she discovers a notebook recording his conversations with his mistress. He tells her that he made the whole thing up, that she has been taken in by a trick of literary ventriloquism. (Johnson 1990, p. 66)

**James Raaj and Renuga**

From a semiotic standpoint, Roth's inclination to amplify the potential of narrative generates a sense of alienation within the reader. In numerous respects, those engaging with "Deception" will discover themselves, to borrow Wolfgang Iser's expression, within "a kind of uncharted territory of implicit connections, and it's precisely these connections that actively engage the reader within the novel" (Iser 1990, p. 136). While the critic's allusion pertains to Faulkner's masterwork "The Sound and the Fury" (1929), it is fitting to extend the same assessment to Roth's approach, one that, as observable in his other literary works, draws explicitly from his personal existence. Indeed, in the realm of literature, personal everyday encounters serve as a pivotal catalyst for igniting the flames of creative imagination. Hemingway, for instance, could not have vividly depicted Africa and the pursuit of game without firsthand experience. Faulkner could not have woven a tapestry of Southern American cotton planters and the African American community without having directly observed these characters. Similarly, John Fante consistently drew from his own life, yet he was acutely aware that his self-expression through writing took on a form distinct from strict autobiography.

In a similar vein, Roth possesses a keen awareness of the intimate connection between the various junctures of his own experiences as an American Jew and his literary craft. However, he is equally conscious that the art of storytelling is distinct from life itself, recognizing that when personal experiences transition into the realm of fiction, they cease to remain strictly autobiographical. Roth deftly navigates this terrain, as highlighted by Gooblar, always adhering to "a refusal to impose a restrictive and reductive vision upon a reliably complex and unknowable world" (Gooblar 2011, p. 155). In numerous respects, the novel delves into this intricate and enigmatic reality, employing a technique that, in its linguistic execution, evolves into a narrative of equal intricacy and opacity.

It is important to emphasize that the novel's framework emulates a theatrical enactment, predominantly centered on the exchanges transpiring between the protagonist, Philip, and his female conversational counterparts. Within this context, "Deception" markedly diverges from Roth's other literary creations, as it adopts a presentation that closely resembles the dialogues of a stage play. In different words, this work cannot be strictly classified as a conventional novel, as its composition mirrors the intensity and tempo of a theatrical performance, wherein voices take turns within the same space, seemingly revolving around themes of love and the various manifestations of betrayal, whether they are of a psychological nature or confined to the physical realm.

The hybrid nature of the work also entails a blending of language, which deliberately employs a destabilizing effect on the reader to closely mimic real-life occurrences. From a narratological vantage point, it seems that Roth has taken Henry James's notion of characters living more through actions than explanations to its utmost consequences: the narrator's role is to demonstrate how characters move and converse, avoiding external descriptions or explicit declarations of their morality, whether they are virtuous or flawed, unfaithful or loyal, honest or deceitful. In "Deception," Roth refrains from being judgmental or categorical; he solely presents the dialogues exchanged among characters, abstaining from adopting the perspective of an intrusive narrator. While this technique indeed thrives within the realm of theater (where characters are identified by their appearance, attire, and vocal inflections), its efficacy is somewhat diminished when transposed onto the printed page. Beneath the dramatized situations crafted exclusively through dialogue, there unmistakably resides a strategy that draws parallels to psychoanalytic therapy. Here, words metamorphose into the foundation upon which a remedy for the struggles of existence is erected, transitioning from gratification to dissatisfaction. Nevertheless, it holds true that "Deception" represents therapy in a negative or even disdainful light. This aspect becomes particularly evident through the words of Philip's lover: "Actually, I think they're all quite creepy [...] I didn't think I'd heard anything that I hadn't thought a million, million times before" (Roth 2006, pp. 144-145). As noted by Mauren Scheurer, "While therapeutic talk is disparaged [...] the entire novel is written in dialogue and has the quality and intimacy of a therapeutic exchange" (Scheurer 2015, p. 42).

Consequently, prior to embarking on an analysis of the text as metatext, it is crucial to underline this characteristic which, in numerous aspects, not only challenges the conventional structure of the novel but also profoundly impacts the reader's process of interpretation. Consequently, a heightened level of ambiguity emerges, casting a shadow over the discourse itself and engendering ontological uncertainties (often encapsulated by the female characters

James Raaj and Renuga

questioning "what am I doing here?") as well as psychological divisions (the genuine author himself seems torn between embodying the character and embodying the implied author who narrates said character). As is a common occurrence within Roth's literary works, the opening words not only unveil the theme that will be explored but also provide insight into the author's approach to unfolding the narrative and the manner in which he employs various techniques and rhetorical methods. In the instance of "Deception," a meticulous examination of the initial page exposes the precise thematic and narratological parameters that distinguish the narrative.

'I'll write them down. You begin'.

'What's it called?'

'I don't know. What do we call it?'

'The Dreaming-About-Running-Away-Together-Questionnaire.'

'The Lovers-Dreaming-About-Running-Away-Together-Questionnaire.'

'The Middle-Aged-Lovers-Dreaming-About-Running-Away-Together-Questionnaire.'

'You're not middle-aged.'

'I certainly am.'

'You seem young to me.'

'Yes? Well, that shall certainly have to come up in the questionnaire. Everything to be answered by both applicants.'

(Roth 2006, p. 7)

Evidently, a dialogic framework emerges that forgoes the customary constituents found within a narrative composition. The initial portion makes it evident that there exists an "I" and a "you," simultaneously alluding to the central activity: writing. Simultaneously, the declarative tone of "You begin" implies a metanarrative and almost redundant manner of commencing: the first-person narrator informs us that someone is initiating a discussion about themselves, immediately ushering us into a psychological and existential realm. However, this self-focused approach is somewhat counterbalanced by the subsequent statements. Indeed, his response to her inquiry signifies that the title of the piece will be "The Dreaming-About-Running-Away-Together-Questionnaire." However, once the title is introduced, it also sparks an imagery of a reciprocal linguistic skirmish. The woman inserts the term "lovers," thus altering the title. This alteration prompts Philip to respond with a touch of self-deprecating humor, appending "middle-aged." The initial exchanges predominantly revolve around the questionnaire, which, in a sense, they immediately proceed to fill out, effectively rendering the words the reader has encountered so far as a preamble. This is so pronounced that the initial phrase commencing the subsequent section (post-preamble) is precisely "Begin," the very word that inaugurates the novel. The initial reflections prompted within us, the readers, pertain to a sense of disorientation precisely because our anticipations are unfulfilled. On the contrary, they generate a form of psychological dissatisfaction.

Certainly, it is difficult to overlook the fact that Roth is demanding a form of narratological exposure within his narrative text, an aspect that resonates in the minimal presence of contextual cues (such as spatial and temporal indications). The level of information presented is notably reduced compared to what one would typically encounter in a twentieth-century play, where even if briefly, the spatial context is depicted and the characters' names are conventionally included in the written text alongside their dialogue lines. Consequently, the pursuit of this intentional silence regarding the characters and the context of the unfolding events scarcely inhibits us from contemplation. Rather, it propels us to consider that Roth, the author, aims to construct a scenario where textual austerity acts as a conduit for the internal vulnerability of the characters:

'Begin.'

'What's the first thing that would get on your nerves about me?'

'When you are at your worst, what is your worst?'

'Are you really this lively? Do our energy levels correspond?'

'Are you a well-balanced and charming extrovert, or are you a neurotic recluse?'

'How long before you'd be attracted to another woman?'

**James Raaj and Renuga**

'Or man.' (Roth 2006, p. 8)

As previously highlighted, the second use of the word "begin" serves as a verb that, within the narrative framework, appears to nullify the impact of the initial "begin," which effectively functioned as a false start. This initial deviation perhaps aimed to momentarily divert the reader's focus as they grapple with comprehending the dialogical structure Roth has crafted. Up until this point, the narrative's primary focus has been centered around the concept of a questionnaire, which, in various ways, conveys the notion of a psychoanalytic session rather than a dialogue rooted in reciprocal exchange of information. Notably, an evident sense of circularity is established in the questions, especially in the initial pages. Whenever she poses a question ("What's the first thing that would get on your nerves about me?"), Philip consistently counters with another question ("When you are at your worst, what is your worst?"), strategically prompting her to elaborate further rather than providing direct answers. In essence, these questions evolve into not only a questionnaire but also a form of self-examination bordering on obsession. Subsequent sessions witness a progression of these somewhat assertive queries, akin to the expansion of concentric circles. Indeed, Philip inquires about her personality ("Are you a well-balanced and charming extrovert, or are you a neurotic recluse?"), and her response takes the form of a very personal question directed back at him ("How long before you'd be attracted to another woman?"), a query that deftly shifts the discourse toward matters of sexual ambiguity ("Or man"). Consequently, the outcome of this exchange isn't just an ambiguous questionnaire, but rather its antithesis—a form of dialogue that can be aptly characterized as an "anti-questionnaire."

The novel's concluding pages firmly establish that the dialogue revolving around the questionnaire bears no correlation to the narrative or the portrayal of betrayal. Beneath the structure of rapid exchanges and the utilization of a realistic and seemingly transparent language, lies the actual essence of "Deception," which centers around the question, "Should I write it?" The true inquiry delves into contemplations on the narrative approach and the discourse that may or may not be transcribed. Were narrative creations to encompass every notion traversing an author's mind, chasms would open up, into which the very act of writing, distinct from reality, would plummet. To narrate entails an engagement with the realm of falsehoods, for writing is fundamentally an artifice. It isn't truth that is recounted, but rather artful deceptions, sleights of hand, and facades of the self—akin to the manifold masks that every individual dons, much like the characters within "Deception." As the novel culminates, the ultimate extended conversation with his past lover shifts once more toward discussions of books rather than individuals. The central concern pivots more towards the methodology of narration rather than the content to be narrated, focusing on identifying authentic characters and distinguishing between reality and fiction. This sentiment is encapsulated by the phrase: "However visible you may be feeling, you weren't identified in that book or made overtly identifiable."

However much you may have served as a model, the great British public happens to be ignorant of it and you only have not to tell them for them to remain ignorant" (Roth 2006, p. 201). Consequently, a recurring theme emerges once more, echoing the inception of the narrative, juxtaposing actual and fictional occurrences. Evidently, for a writer akin to the one portrayed by Roth, his creative fiction holds greater value than the tangible reality that merely serves as a wellspring of inspiration. This sentiment is perfectly exemplified by the tale that has just been penned: the utmost priority is to obscure any trace of the source material's identity. It is not coincidental that his lover draws conclusions aligning precisely with the real-life state of affairs, indicating that the writer's preoccupation is predominantly centered around his craft: "What it comes down to is that a woman comes to a man to chat a little, and all the man is really thinking about is his typewriter. You love your typewriter more than you could ever love any woman" (Roth 2006, p. 201, my emphasis). The narrator-protagonist's retort holds significance, as from a narratological standpoint, he confuses the fabrication of fiction (embodied by the typewriter) with the actuality of the model that has spurred him. Characteristically, Philip's existence is woven from a tapestry of written books and those yet to be penned. This is why, within their final extensive telephone exchange, the woman underscores the fact that his book would unfold in an alternative manner, elucidating their emotions with greater clarity: "And it—my book—is all about kissing and telling because if I were to write this book, I would be doing that" (Roth 2006, p. 201, emphasis in the text). In response, Philip suggests that she should endeavor to compose a novel, recounting her own perspective on the events:

James Raaj and Renuga

'Should I write it?'

'I'm not the one to say no, especially as I may do another about you.'

'You wouldn't. You're not. You aren't, are you?'

Laughing. 'Yes, of course I will. This'll be part of it.'

'Well, I'd be amazed. I would call that scraping the barrel, really.'

'Don't underestimate yourself. You're a great barrel. For me you were.'

'Was I? Oh, I felt so angry. I was angry for months. Although I was very torn, really, because as soon as I read it, I also couldn't be angry.'

'Why was that?'

'Because it was so, so tender... I think. Unless I got it wrong.'

'No. I thought there were some things you'd like. Things I planted just for you to be amused by.'

'Oh, there were. I didn't miss them. It was very strange reading it, absolutely strange. Because I was in no doubt which of it was addressed to me. I may have been wrong but I felt no doubt. And which bits of it were not, particularly.'

'I'm sure you didn't miss any of it. But that was our life, I thought, as it might have been. Our life also.'

'I saw. I saw. It's such a strange story.'

'I know. No one would believe it. (Roth 2006, pp. 201-202)

The epilogue revisits the notion of the book and its creation, stating, "It was very strange reading it, absolutely strange." In this manner, the writer—distinct from the Philip within the narrative—conveys that his novel might not yet encompass the entirety of his imagination's constructs around a love story conveyed through the lens of betrayal. Indeed, the phrase "I may do another [book] about you" also communicates to the reader that, from a narrator's perspective, imagination possesses an almost boundless quality. The writer's task involves transforming seemingly trivial details into substantial narratives, thereby opening the door to an unending continuum, utilizing the same event as a foundation. This isn't a matter of "scraping the barrel," but rather, initiating the narrative machinery anew. When Philip tells the woman, "You're a great barrel. For me you were," he's essentially confessing that, for a narrator, there is never an exhaustion of material. Reality is an infinite expanse from which an endless stream of stories can be drawn, an idea eloquently expressed by Maurice Blanchot.

To prevent any potential misinterpretations, the closing lines of "Deception" unequivocally convey that novels are crafted to be read and to convey the enigmatic journey of human existence: "It was very strange reading it, absolutely strange." Undoubtedly, the woman's words serve as an insightful revelation, akin to an epiphany of reading. The strangeness she alludes to is intricately linked with the capricious escapades of human life, the intricate formation and dissolution of relationships, and the intricate "particular web" that embodies our interactions with others and society at large. Indeed, we coexist in a state of simultaneous isolation and companionship, possessing both autonomy and freedom while being tethered and somewhat confined by emotions, routines, and familial bonds. Philip Roth's brilliance within this specific novel lies in his masterful staging of these facets. He achieves this by magnifying the spectrum of possibilities presented by the art of narration, along with its artifices and conventions. For this very reason, "Deception" can rightfully be regarded, within its metanarrative scope, as one of the most profound embodiments of Roth's experimentalism.

ABSTRACT

Life is a journey which is not only physical, but also emotional. Literally the former journey involves body movements navigating through geographical space, the later journey denotes self-reflection. This article explores the concept of introspective peregrination in Amulya Malladi's *A House for Happy Mothers* by focusing the central characters particularly Priya and Asha, who undergo profound inward voyages, eventually often shaped by life experiences, sterility, economic vulnerability, and societal expectations. These experiences inaugurate a process of introspection which directs the characters to resist feelings of guilt, displacement, moral conflict, and emotional uncertainty. Though the novel primarily spotlights the practice of transnational surrogacy, simultaneously it portrays a profound inward journey experienced by women navigating motherhood, identity, and agency within multifaceted socio-cultural frameworks. Through moments of reflection, struggle, and interpersonal interaction, the narrative illustrates how these women gradually move toward resilience, emotional awareness, and redefined identities. The article views how the characters endure profound emotional conflicts, introspection, and gradual transformation as they combat sterility, economic hardships, and societal expectations. Furthermore the article highlights introspective peregrination as a narrative framework which cultivates emotional transformation, enabling them to reconstruct their sense of subjective identity while navigating the intricacies of motherhood and belonging in a globalized world.

Keywords: surrogacy, motherhood, psychological renaissance, Carl Rogers' humanistic theory, emotional transformation.

INTRODUCTION

Narratives of Introspective Peregrination and Emotional Transformation in Amulya Malladi's *A House for Happy Mothers*.

"Life is a journey that must be traveled no matter how bad the roads and accommodations."

Oliver Goldsmith.

The concept of journey is the center of ancient, modern, and of all literature, in the world. The word peregrination literally means a long journey, often across borders, or unfamiliar geographical space. It represents vivid images of wandering, exploring new identities and transformative movement. In literary contexts, the term introspection denotes a process of self-scrutiny through which an individual examines personal emotions, motivations, and identity. Life is a journey which is not only physical, but also emotional. Literally physical journey involves body movements navigating through geographical space. An emotional peregrination denotes an inward voyage through psychological, moral, or spiritual landscapes. Emotional peregrination simply signifies, moving through distinct emotional states, eventually often shaped by life experiences, growth, loss, self-discovery, and transformation. We meet different persons with distinct characteristics in different environments. Each individual gives us different experiences and teaches us lessons that reflect in reconstructing our identity. The present research study analyses the inward peregrination and emotional transformation of Amulya Malladi's women characters in the novel *A House for Happy Mothers*.

Amulya Malladi's *A House for Happy Mothers* is not just a novel about poverty and surrogacy but it is solely an intensive exploration of introspective peregrination - the inward odyssey of self-discovery, autonomy, motherhood, and moral responsibility within unequal social structures.

Physical Journey

"The experience of motherhood is a complex and multifaceted one, and it cannot be reduced to simplistic or romanticized notions." (Rich 67). While society often associates women's identity to motherhood, a woman's sense of self surpasses beyond this single dimensional role. The central character from this novel, Priyasha, the protagonist, an Indian-American affluent woman, is not blessed with a child. She becomes completely upset, after three miscarriages. Jane comments, "A woman is a giver of life, a means of moving forward and perpetuating the human race, at the same time the cruel onslaughts of fate lead to her despondency and withdrawal" (4). Priya's fondness for motherhood leads her to undertake a journey from Silicon Valley to a small village in Southern India to pursue surrogacy, is a literal displacement.

"The idea that poverty leads to victimization through systematic exclusion" is rooted in Social Exclusion theory (Silver 542). Asha, another protagonist, a poor Indian woman, driven by economic necessity, moves to the 'Happy Mothers House' in Hyderabad, leaving behind her family and rural geographical space. In this perspective, the novel's narration itself is a peregrination - a crossing of geographical and social frontiers that elevates both women to confront realities beyond their familiar worlds.

Inward peregrination of the protagonists

A character becomes introspective when he/she reflects deeply about their choices and actions, reexamine his/her identity, values, personal beliefs, and analyse and interpret their emotional experiences. Priyasha's journey is not only determined by physical voyage but also by profound internal peregrination- a psychological, emotional, and ethical transformation shaped by sterility, surrogacy, diasporic identity, and ethical conundrum. Priyasha's sterility becomes a conundrum that has shaken not only her identity but also her conjugality with husband Madhu. Both are disappointed due to their previous miscarriage pregnancies.

Prema and Punitha Priya

Priyasha tries to hide her pregnancy, so she expresses the following, “Depression was hell on the libido” (Malladi 104) to her husband Madhu. She remains silent for six weeks, after that discloses her pregnancy to Madhu who finds her untrustworthy and shouts at her “I’m scared of losing the baby, too. We could’ve been scared together. But I think you should be scared alone this time. I’m done worrying about this shit” (Malladi 106). The ultrasound identifies that the fetus has no heart beat, hence that pregnancy also ends in DNC. Though she deeply anticipates her husband’s gentle hugs and shoulders for support, she doesn’t call him. Because she knows pretty well that it wounds their conjugality. Madhu leaves the house with a broken heart by taking all of his things when he comes to know about the DNC for the third time. Though she in the initial phase of pregnancy “wanted to be alone; it hurt too much—her body, her heart, everything and it hurt more to have a witness to her pain, her grief, her ultimate inadequacy as a woman.” (Malladi 106). The three weeks of loneliness torments her day and night constantly and “she was alone...She lost weight, nearly eight pounds in two weeks. She couldn’t eat, couldn’t sleep, couldn’t feel” (Malladi 110). Priyasha experiences isolation during the DNC and the following three weeks without her spouse. The pain she experiences is both physical and an internalized grief as well. Madhu’s absentia makes Priyasha feel emotionally detached, and induces her fear that sterility is her burden alone. Madhu’s inability to comfort her causes the separation of the couple which vividly pictures the unspoken anxiety and conflicts in their marriage.

Priya’s inward peregrination can be comprehensively inspected through feminist lens, which illustrates how gender, power, globalization, and inequality shape her experience. Priyasha experiences anxiety to fit in the society to evade social ostracism. After a long search, Priyasha landed into a surrogacy clinic in India. As Priyasha travels through the complexities of surrogacy, she encounters judgment, criticism, and even hostility from those around her, including her own family and community. “I felt like I was drowning in a sea of expectations, my own and everyone else’s” (Malladi 63) shedding lights on Priyasha’s emotional suffocation and overwhelm. As a result, she stands as a shattered persona due to paternal society’s expectations. The inability to fulfill the basic anticipation imposed by patriarchy provokes a condition of significant emotional strain of a woman. Priya expresses, “I felt like I was losing myself, bit by bit, with each passing day” (Malladi 228). It evokes Priya’s conflicts with her own identity and sense of self. It is evident that Priya’s persona is fractured and she misses herself badly. But she doesn’t allow it towards destruction; rather reconstruction through enduring transformation. She reconstructs herself by stepping forward to choose a surrogate mother, Asha. Hence, from a feminist perspective, Priya’s sterility reveals how patriarchal norms equate womanhood with motherhood. The Society concerns the dignity of a woman through reproductive ability. Priyasha initiates, to hire a surrogate mother, truly challenging patriarchal definitions of motherhood.

Subsequent to numerous interactions between Priyasha and husband Madhu, they meet Dr. Swati Gudla who arranges the surrogate mother Asha for them. Asha, the second protagonist, a married woman with two children Manoj and Mohini, contemplates providing better education for her children regardless of her penury. The subsequent articulation of Asha, “I was just a vessel, a container for this tiny human being, but what about my own desires, my own dreams?” (Malladi 130) accentuates her conflicts with her own identity and intense aspirations as a mother. The following discourse, “I had never felt so alone, so scared, and so unsure of what the future held for me and my child” (Malladi 244) spotlights her dreads, instability and conflicted emotions about decisions or the future as a mother. The inability to fulfill the basic needs of a family constitutes a condition of significant emotional strain of an individual. The conflict between Asha and her husband Pratap with regard to surrogacy fetches out the profound emotional peregrination and the struggle of a surrogate mother. Asha shouts, “Maybe if I died while giving birth, no one would care...I’m stuck here with someone else’s baby in my stomach because you can’t support us” (Malladi 120).

Asha initiates her decision to become a surrogate mother, because she aspires to secure a prosperous future for her son Manoj by facilitating him to become an engineer in a reputed company in America. However, her impoverished circumstances drive her to assume the role of a surrogate by carrying the child of Madhu and Priyasha, individuals who are entirely unfamiliar to her. Her life exemplifies the painful realities of an uneducated, and economically deprived woman in Indian society, who endure adversities at every stage of her existence. The following utterance of Asha “I was a vessel, a container, I’m a womb . . . a belly. If tomorrow, they could save me or the baby, who would

Prema and Punitha Priya

they save, you think?" (Malladi 165) illustrates her emotional exhaustion and thereby challenges poverty, patriarchal constructions of womanhood and motherhood. Being a surrogate, Asha faces a lot of emotional conflicts. She grows emotionally attached with the child in the womb and isn't ready to give up the baby to its biological parents. Even though she carries the child for money, her motherly emotions, care and sacrifices are true. This is comprehensible from her interaction "You wouldn't believe the thoughts I've had about her taking my baby" (Malladi 280) with her sister-in-law Kaveri, who reminds Asha that it's not her baby but Priyasha's. After becoming pregnant, Asha forgets one of the emotions, laughing. She always seems serious and somber. At that time, she laughs at Pratap's joke, Manoj sweetly says, "I like to see you laugh. You should do it more." (Malladi 160) and she hides all her pain and assures her son that she will laugh all. "A good laugh is sunshine in the house" (Thackeray). Accordingly, Asha emerges as a beacon of light, illuminating people around her through hope amid adversity.

Poverty haunts only her body but not her good nature. She seems more emotionally attached to the baby before its birth. As she bears physical pain, but not the pain in her heart, so she says:

But after just four pushes, she felt the baby slide out of her and heard its first cry. It was the last time she felt the baby, the last time she heard it, the last time she was connected to it. Once they cut the umbilical cord, it was like a dam had broken, and Asha started to howl...Asha closed her eyes...God, please don't make me see the baby, she thought. Please, let them take it away, far away from me. I can't bear this. (Malladi 295)

Consequently, Asha demonstrates the inscrutable emotional world and the journey of the surrogates.

Carl Ransom Rogers is a prominent American psychologist and foremost pioneer of the humanistic perspective in psychology. Roger's humanistic psychology comprises a theoretical approach which accentuates awareness of one's potential and the process of one's personal growth. Through his humanistic perspective in psychology, Rogers initiates and has developed 'client-centered therapy', also known as 'person-centered therapy' that emphasizes unconditional positive regard, empathy, genuineness, and self-actualization. At the time of delivery Asha endures a lot of pain, but she refuses to take pain killers when the nurse offers it, just because those pills will affect the baby. Consequently, Asha reflects genuine human integrity, and unconditional positivity which was proposed by Carl Ransom Rogers. During the childbirth, Priyasha "was worried not only about the baby but also about Asha. She had gotten to know Asha and her family, had slept in the same bed with Manoj, held his hand and talked about his dreams with him. Asha was now family and Priyasha wanted her to be as safe as her own child" (Malladi 294). Accordingly, Priyasha stands as a beacon of empathy and genuineness, a core concept within Carl Rogers' humanistic perspective.

According to Carl Rogers' humanistic theory "all individuals have an innate drive, which he termed the 'actualizing tendency,' to realize their full potential and achieve personal growth" (Brainly). Priyasha is cognizant of her inability to sustain pregnancy and give birth to a child. Her 'actualizing tendency, the innate drive persuade her to realise her full potential innovatively, to achieve a child of her own. Madhu and Priyasha named their baby Ayesha to render their gratitude to Asha. Madhu says with tears, "She's... my God, she's all here. Hello, sweetheart," and he hugged both of them and dropped a kiss on Priya's head (Malladi 297). Roger's major concept of humanistic approach, the 'unconditional positive regard' of Priyasha, facilitates the eradication of psychological and emotional barriers, thereby enabling her towards motherhood.

Priyasha and Asha, both the protagonists, show how marginalized women negotiate their ability to act within exploitation and how their resilience, self autonomy and determination assist them to encounter sterility, and patriarchal discrimination, and courageously convert their inward journey as a platform for their transformation. Both the characters stand as the gem of courageousness, Maya Angelou aptly puts it in 'Still I Rise'.

"You may shoot me with your words,
You may cut me with your eyes,
You may kill me with your hatefulness,
But still, like air, I'll rise". (Angelou lines 21–24).

**Prema and Punitha Priya**

CONCLUSION

The analysis of introspective peregrination in *A House for Happy Mothers* exposes that motherhood is not merely a biological condition but a transformative emotional journey navigated by struggle, reflection, and resilience. Through the interlaced experiences of Priyasha and Asha, the study illustrates how geographical displacement, ethical dilemmas, and societal demand become stimulants for inner enhancement and self-evolution. Both the protagonist's emotional voyages shift from uncertainty and fragmentation toward empathy, empowerment. At its core, the present study concludes that emotional peregrination is a process of healing and renewal, affirms personal transformation can even emerge amid the composite structures of global inequality.

ABSTRACT

Philip Roth's *Nemesis* stands out from the other novels of Roth in a way that it categorically lays bare the powerful and burning existential outrage of the writer through the character of Bucky Cantor. *Nemesis* perfectly portrays the anxiety, fear and the hopelessness created by the polio epidemic in the Newark Jewish community through the character of the twenty-three-year-old, Bucky Cantor. Set in the year 1944, Roth explores the terrible effects of the epidemic, the description of which uncannily resembles with that of the current coronavirus pandemic. With the epidemic killing people and leaving the survivors with permanent disability and the protagonist himself getting affected by it, Roth deals deeply with the protagonist's inner conflicts and the existential angst experienced by him, as he becomes more and more disillusioned with his own beliefs. It is not so arduous a task to notice even in the first reading of the novel, the recurring instances of the protagonist reeling under the burden of existential crisis and who is apparently seen to be in a perpetual conflict with himself, to the extent that he decides to relinquish everything he ever desired in his life. Though existentialism as a philosophy became popular during the twentieth century after the World War I and continued to have its sway through the Great Depression and the World War II, its relevance in the contemporary times cannot be ignored, especially when humanity as a whole is still stuck in the trauma of the irreparable devastation caused by the Covid19 pandemic, which again perfectly parallels the plot of *Nemesis* where the impetus which initiates the existential crisis in the protagonist is the tragic event of the polio epidemic. Kierkegaard's philosophical concepts and constructs on the human condition and his views on notions such as self-realization, anxiety, despair, tragedy and the search for meaning are particularly inviting to apply those concepts to Roth's *Nemesis* which would eventually render a new appreciation for the novel.

Keywords: Philip Roth, Epidemic, existentialism, Kierkegaard, disillusionment, existential angst, guilt

INTRODUCTION

The French Catholic philosopher, Gabriel Marcel coined the term 'existentialist' in the mid-1940s and applied it to Sartre (Flynn 89). The existentialist doctrine focuses on the existence of the individual, who, being free and responsible, is held to be what he makes himself by the self-development of his essence through acts of the will. Apart from struggling with the reality of their own impermanence, the existentialist characters often lack faith in religion, persistently raise existentialist questions, grapple with their own existence and with the reality around them. *Nemesis*, which is Philip Roth's last novel in his career as a prolific novelist, abounds in strong existentialist themes which include questions about death, God, existence and fate. One of the popular opinions about the existentialists, as Flynn mentions is that the existentialist enters this world of limited and relative observation and assessment with his/her drive to 'personalize' the most impersonal phenomena in our lives (5). This could be noted throughout *Nemesis*, as we find Bucky Cantor struggling with his own choices, which he made in the past and constantly caught in a gripping sense of guilt throughout his life. The only instance where this study found an ideological departure in the protagonist of *Nemesis* and with that of the philosophies of Kierkegaard is the protagonist Bucky Cantor's despicable attitude towards God. Otherwise, there are various and enumerable instances in the novel which are perfectly in accord with the philosophies espoused by Kierkegaard in his various works, which deal exhaustively with issues like anxiety, sin, guilt, freedom, choice and God.

Considering the novel, *Nemesis*, it could be observed that the development of angst and guilt in Bucky Cantor was a gradual process, which gets accentuated by the Polio epidemic and finally pushes him into an eternal abyss of guilt. Bucky, having lost his mother in his childbirth and having got a thief for a father, was brought up by his grandparents. His grandfather's firm upbringing had fostered in him a strong sense of responsibility and had taught him to "stand up for himself as a man and to stand up for himself as a Jew, and to understand that one's battles were never over" (Roth 25). The twenty-year-old Bucky, who had high aspirations to join the army and fight in the war, feels broken when he gets rejected in the recruitment due to his poor eyesight. Feeling that he had let down the expectations of his grandfather, he breaks down silently in his bedroom, when his friends Dave and Jake get recruited and are taken for the training. This thought of not being able to take part in a war in which young men like him have got an opportunity to serve the nation haunts him for a long time. Nevertheless, he manages to secure the position of summertime playground director of Chancellor Avenue School, located at the Weequahic section of Newark, even before he secured his graduation from Panzer College of Physical Education. In accordance with his grandfather's upbringing, he aspires to teach the kids, who were mostly Jewish, "toughness and determination, to be physically brave and physically fit and never allow themselves to be pushed around or ... to be defamed as Jewish weaklings and sissies" (28). When two playground kids, Herbie Steinmark and Alan Michaels get affected by Polio and when the remaining kids get anxious about it, Bucky tries to alleviate their fears by reassuring them that everything will be alright soon. It was only when the news of Alan and Herbie's death that Bucky's faith in God and life got shaken. When he visits Allen's home to offer his condolence, he finds himself unable to soothe the father who had just lost his vibrant and innocent son to the polio attack, particularly when Alan's father asks, "So why did he die? Where is fairness in that? ... You try to be a thoughtful person, a reasonable person, an accommodating person, and then this happens. Where is the sense in life?", for which Bucky answers, "It doesn't seem to have any." (47).

As a dutiful person, Cantor attends the funeral service of Alan Michaels at the synagogue and follows the prayers in the prayer book and joins the congregation in the recitations. Though he had been through the death of his beloved grandfather, the death of Alan was something he wasn't able to come to terms with. It was at Alan's funeral that the absurdity of life and the existence of God pounded his heart with strong questions:

They all joined the rabbi in reciting the mourner's prayer, praising God's almightiness, praising extravagantly, unstintingly, the very God who allowed everything, including children, to be destroyed by death. Between the death of Alan Michaels and the communal recitation of the God-glorifying Kaddish ... he himself hadn't dared to turn

**James Raaj and Nagalakshmi**

against God for taking his grandfather when the old man reached a timely age to die. But for killing Alan with Polio at twelve? For the very existence of polio? How could there be forgiveness – let alone hallelujahs-in the face of such lunatic cruelty? (74-75)

The above excerpt directly mirrors the opinions of Philip Roth, who is a self-proclaimed atheist and has on numerous occasions openly despised the ideas of God and religion. This is the only aspect in *Nemesis* that is dissident with the ideology of Kierkegaard, where faith is the distinctive feature of his philosophical and religious concepts.

Further, to make matters worse, more and more children from the playground begin to contract polio and the mother of the Kopferman children, accuses Cantor of criminal negligence for making her children contract the deadly virus. His speculation, scepticism and resentment towards God keeps growing with the mounting tragedies happening around him. On multiple occasions, we could find the ruminations of Cantor, not only during his conversations with Marcia and the narrator, Arnold Mesnikoff, but even during the moments of his lonely musings about his dead mother, where, “it suddenly occurred to Mr. Cantor that God wasn’t simply letting polio rampage through the Weequahic section but that twenty-three years back, God had also allowed his mother, only two years out of high school and younger than he was now, to die in childbirth” (125). We find that Bucky Cantor, in his inability to come to a meaningful conclusion concerning the deaths of the innocent kids, has his “anger provoked not against the Italians or the houseflies or the mail or the milk or the money or malodorous Secaucus or the merciless heat ...but against the source, the creator – against God, who made the virus” (127).

It was when Cantor finds himself confused with all those happenings around him, which of course were beyond his control that he receives a phone call from his lover, Marcia, who is away at the summer camp at Indian Hill. Marcia, the daughter of Dr. Steinberg had been Cantor’s colleague at the Chancellor’s. She tells him of a job opportunity at the camp where they are in need of a waterfront director. Bucky Cantor immediately rejects the offer saying that he cannot leave the playground and the kids, and escape to the summer camp at Indian Hill. Marcia pleads him to consider the offer which would enable him to join her and her little sisters at the camp happily without having to worry about polio. Though Bucky initially casts-off such an idea, his meeting with Dr Steinberg during which he asks for his approval to be engaged to Marcia, brings in a change of mind in him and he makes up his mind to leave for the summer camp. He wanted to meet Dr Steinberg to talk about the deadly disease that is attacking the innocent children that would in turn give him a sense of reassurance. When Dr Steinberg understands his worries, he says, “You have a conscience, and a conscience is a valuable attribute, but not if it begins to make you think you’re to blame for what is far beyond the scope of your responsibility” (104). These words of the doctor further kindle Bucky’s inconsolable heart and he feels provoked to ask, “Doesn’t God have a conscience? Where is His responsibility? Or does He know no limits?” (105).

Caught up in a terrible state of perplexed mind, all he could think was that, “he could stop hating God, which was confusing his emotions and making him feel very strange. On their island he could be far from everything that was growing harder and harder to bear” (87). This is yet another decision for which Bucky Cantor feels guilty throughout the rest of life. From the moment he leaves the job of the playground director, an unconscious guilt starts to settle in his mind which surfaces later and keeps tormenting him. The moment he hangs up the call after telling Marcia that he has made up his mind to come and join her at the Indian Hill camp, he battles with his own ideals:

... ideals of truthfulness and strength fostered in him by his grandfather, ideals of courage and sacrifice that he shared with Jake and Dave, ideals nurtured by him in boyhood to place himself beyond the reach of the crooked father’s penchant for deceit – his ideals as a man demanding that he immediately reverse course and return for the rest of the summer to the work he had contracted to perform.

How could he have done what he’d just done? (135)

Even when Bucky has a good time after reaching the camp, his conflicting thoughts come to haunt him, which again lead him to contemplate on God’s plans, “Why does He set one person down in Nazi-occupied Europe with a rifle in

James Raaj and Nagalakshmi

his hands and the other in the Indian Hill dining lodge in front of a plate of macaroni and cheese? Why does He place one Weequahic child in polio-ridden Newark for the summer and another in the splendid sanctuary of the Poconos?" (154). The ever-swirling vortex of anxiety and existential crisis come to drag him again when on their way back from the lonely island, Marcia tells him how she prayed to God to protect him, on hearing which Bucky, unable to restrain himself, erupts in anger with a concatenation of questions:

Why didn't God answer the prayers of Alan Michaels's parents? They must have prayed. Herbie Steinmark's parents must have prayed. They're good people. They're good Jews. Why didn't God intervene for them? Why didn't He save their boys? ... I don't know why God created polio in the first place. What was He trying to prove? That we need people on earth who are crippled? (170)

This could be paralleled with the famous series of questions posed by Kierkegaard in his work, *Repetition* through the character of the Young Man, where he questions about his existence and God:

One sticks a finger into the ground to smell what country one is in; I stick my finger into the world-it has no smell. Where am I? What does it mean to say: the world? What is the meaning of the world? Who tricked me into this whole thing and leaves me standing here? Who am I? How did I get into the world? Why was I not asked about it, why was I not informed of the rules and regulations and just thrust into the ranks as if I had been bought from a peddling shanghai of human beings? How did I get involved in the big enterprise called actuality? Why should I be involved? Isn't it a matter of choice? If I am compelled to be involved, where is the manager-I have something to say about this. Is there no manager? To whom shall I make my complaint? After all, life is a debate-may I ask that my observations be considered? If one has to take life as it is, would it not be best to find out how things go? What does it mean: a deceiver? (200)

When Bucky gets to hear about the closing of the playground from his grandmother, his conscience torments him so much that he feels that he had failed in his ethical responsibility of facing the war waged by the epidemic on the Newark children. Though Marcia tries to console him that he couldn't have done anything even if he had stayed there, he says, "I left. There's nothing more to say. A fact is a fact. I left" (Roth 196). This feeling of failing in his moral obligation gets escalated with the news of his friend Jake's death in the war in France and the subsequent attack of Polio on one of the boys, David Kaplow in the camp.

Bucky Cantor starts associating every misfortune happening around him with his presumed failing sense of duty which in turn intensifies his existential angst, which is apparent from the way he anxiously confides to Dr. Huntley that it was he who "sat next to him [David Kaplow] at Indian Night. Now he's come down with polio. Doctor, am I the one who gave it to him? Am I going to give it to others? Is that possible?" (236). Kierkegaard, in his 1847 work, *Upbuilding Discourses in Various Spirits*, talks about human beings' nature to stand against one's own self. According to him, "The person who is to be master (it is, of course, he himself) ruins it; such a person works with perhaps scarcely a third of his power in the right place and with more than two-thirds of his power in the wrong place or against himself" (*Upbuilding Discourses* 295). This holds true with Bucky Cantor, who undeservingly punishes himself for the workings of fate. The readers only feel pity for Bucky, just like the narrator, and in the words of Kierkegaard, "Ah, if one looks at people's lives, one often must say in sorrow: They do not themselves know what powers they have; they more or less keep themselves from finding that out, because they are using most of their powers to work against themselves" (296), aptly fits to describe Bucky's fate. Ultimately, it is when he himself becomes the victim of polio that he confronts the overpowering role of fate and chance in his life, which again make him a casualty of his own choices. He wants to spare Marcia from marrying a cripple like him and so decides to relinquish her and move on with his life, as he tells the narrator, "I didn't want the girl to feel stuck with me. I didn't want to ruin her life. She hadn't fallen in love with a cripple, and she shouldn't be stuck with one" (Roth 255). This particular attitude of Bucky, could be compared to the Young Man in Kierkegaard's *Repetition* and also to Kierkegaard himself, as the Young Man's problem directly reflected Kierkegaard's own with Regine Olsen (Garff 175-78). The Young Man proposes his love to the girl, she accepts but then he changes his mind. Here the same happens between Bucky and

James Raaj and Nagalakshmi

his fiancé, though for an entirely different reason. But from the way Bucky justifies his choice to leave Marcia, he could well be equated with what Kierkegaard calls the Young Man, the “sorrowful knight of recollection’s only happy love” (*Repetition* 146). The narrator’s continuous desperate attempts to convince Bucky to not hold himself guilty for whatever happened goes in vain:

That the polio epidemic among the children of the Weequahic section and the children of Camp Indian Hill was a tragedy, he could not accept. He has to convert tragedy into guilt. He has to find a necessity for what happens. There is an epidemic and he needs a reason for it. He has to ask why. Why? Why? That it is pointless, contingent, preposterous, and tragic will not satisfy him. That it is a proliferating virus will not satisfy him. Instead he looks desperately for a deeper cause, this martyr, this maniac of the why, and finds the why either in God or in himself, or mystically, mysteriously, in their dreadful joining together as the sole destroyer. (Roth 265)

This feeling of guilt is in tandem with what Kierkegaard espouses in *The Concept of Anxiety*, where he says

Whoever learns to know his guilt only from the finite is lost in the finite, and finitely the question of whether a man is guilty cannot be determined except in an external, juridical, and most imperfect sense. Whoever learns to know his guilt only by analogy to judgments of the police court and the supreme court never really understands that he is guilty, for if a man is guilty, he is infinitely guilty. (161)

The narrator, Arnold Mesnikoff’s concluding remarks about Bucky’s guilt establishes him as a typical existential hero: “The guilt in someone like Bucky may seem absurd but, in fact, is unavoidable. Such a person is condemned. Nothing he does matches the ideal in him. He never knows where his responsibility ends” (Roth 273). Thus, Bucky Cantor’s tragical life makes him a knight of infinite resignation, living in the ethical realm as an existential hero, holding himself guilty by believing in his subjective reflection of a natural tragedy.

ABSTRACT

This study explores how online narratives contribute to the construction and expression of cultural identity in Northeast India. With the rapid growth of digital platforms such as social media, blogs, and online storytelling forums, individuals from the region have found new ways to represent their traditions, languages, and lived experiences. These platforms allow marginalized voices to be heard beyond geographical boundaries and enable cultural preservation in a modern context. The research focuses on how digital storytelling reflects identity, community values, and hybrid cultural forms shaped by globalization. It also examines the role of language, especially the use of English mixed with local dialects, in shaping these narratives. By analyzing selected online texts, posts, and creative works, this study highlights how young writers negotiate tradition and modernity. While online spaces provide opportunities for visibility and cultural pride, they also create challenges such as cultural dilution and commercialization. The study concludes that online narratives play a significant role in redefining cultural identity in Northeast India, acting as both a space of preservation and transformation in the digital age.

Keywords: Online Narratives, Cultural Identity, Northeast India, Digital Storytelling, Language Hybridization

INTRODUCTION

Northeast India is a region rich in cultural diversity, consisting of multiple ethnic communities, languages, traditions, and histories. Each state in the region has its own unique cultural practices, folklore, and social structures. For many years, the representation of Northeast India in mainstream literature and media has been limited or stereotypical. However, the rise of digital platforms has created new opportunities for individuals to represent their own stories and identities.

**Lalnunpari**

Online narratives refer to stories, experiences, and expressions shared through digital platforms such as Facebook, Instagram, blogs, and online magazines. These narratives include personal stories, poems, short fiction, videos, and even memes. For many people in Northeast India, especially the youth, these platforms have become an important space for self-expression and cultural representation. Through online narratives, individuals can share their experiences of identity, belonging, migration, and modern life. Cultural identity is a complex concept that includes language, traditions, beliefs, and social practices. In Northeast India, cultural identity is often influenced by both traditional values and modern global influences. The interaction between these two forces creates a dynamic and evolving sense of identity. Online narratives play a key role in this process by providing a platform where individuals can negotiate and express their identities. One important aspect of online narratives is language use. Many writers from Northeast India use English along with local languages, creating a hybrid form of expression. This reflects both the influence of globalization and the desire to maintain local identity. Such linguistic practices also make the narratives accessible to a wider audience while preserving cultural uniqueness.

This study aims to examine how online narratives contribute to the construction of cultural identity in Northeast India. It focuses on how individuals use digital platforms to express their identities, how language is used in these narratives, and what challenges and opportunities arise from this digital expression. By analyzing selected online texts, this research seeks to understand the relationship between technology, culture, and identity in the region. Another important dimension of online narratives in Northeast India is the role of digital communities in shaping collective identity. Social media platforms not only allow individuals to share personal stories but also create spaces where communities can interact, support, and affirm each other's cultural experiences. Through hashtags, online campaigns, and shared content, people from different parts of the region can connect and form a sense of unity despite geographical distances. These digital interactions often strengthen cultural awareness and encourage the preservation of traditions among younger generations. At the same time, they also open up spaces for dialogue about issues such as identity politics, cultural representation, and social change. Therefore, online narratives are not only individual expressions but also collective processes that contribute to the ongoing construction and redefinition of cultural identity in Northeast India.

REVIEW OF LITERATURE

The concept of cultural identity has been widely discussed in cultural studies and sociology. Scholars have argued that identity is not fixed but constantly shaped by social, political, and historical factors. Cultural identity is often understood as a sense of belonging to a particular group, expressed through language, traditions, and shared experiences. In the context of Northeast India, cultural identity is particularly complex due to the region's diversity. Previous studies have shown that literature plays an important role in shaping and preserving cultural identity. Traditional forms such as folklore, oral narratives, and community storytelling have been central to the cultural life of Northeast India. These forms of storytelling have been passed down through generations and have helped maintain cultural values and collective memory.

With the advent of digital technology, storytelling has taken new forms. Online narratives have emerged as a modern extension of traditional storytelling practices. Scholars have noted that digital platforms allow for greater participation and democratization of storytelling. Individuals who may not have access to traditional publishing platforms can now share their stories online. Research on digital storytelling highlights its role in identity formation. Online narratives provide a space where individuals can explore and express their identities in new ways. This is particularly important for marginalized communities, as digital platforms offer a space for visibility and representation. Studies have also shown that online narratives often reflect hybrid identities, combining elements of local culture and global influences. Language plays a significant role in online narratives. The use of English as a global language allows writers to reach a wider audience, while the inclusion of local languages helps maintain cultural specificity. This mixing of languages, often referred to as code-switching or hybrid language, is a common feature of online narratives from Northeast India. However, scholars have also raised concerns about the impact of

**Lalnunpari**

digital platforms on cultural identity. Some argue that globalization and digital media may lead to cultural homogenization, where local cultures are overshadowed by dominant global cultures. Others point out that the commercialization of online content can lead to the simplification or misrepresentation of cultural practices.

In the context of Northeast India, there is limited research specifically focusing on online narratives and cultural identity. Most studies have focused on traditional literature or mainstream media representation. Therefore, this study aims to fill this gap by examining how online narratives contribute to the construction and transformation of cultural identity in the region. Another significant area of scholarly discussion is the relationship between digital media and memory. Researchers argue that online platforms function as digital archives where cultural memories are recorded, shared, and reshaped. In the context of Northeast India, where much of the cultural heritage has traditionally been preserved through oral practices, the shift to digital storytelling marks an important transformation. Online narratives help document stories, rituals, and personal histories that might otherwise be lost. At the same time, these digital forms are not exact reproductions of tradition; they often reinterpret and reshape cultural memory to suit contemporary audiences. This process highlights the dynamic nature of culture, where preservation and innovation exist together. Scholars emphasize that digital storytelling does not simply replace oral traditions but works alongside them, creating a new hybrid space for cultural expression. In addition, recent studies have focused on the role of youth in shaping online cultural narratives. Young people in Northeast India are among the most active users of digital platforms, and their engagement has significantly influenced how culture is represented online. Researchers note that youth often experiment with identity, blending traditional values with modern global influences in creative ways. Through blogs, videos, and social media posts, they challenge stereotypes and present alternative narratives about their communities. This active participation also reflects a sense of agency, as young creators take control of their own representation rather than relying on external perspectives. However, scholars also point out that this process may create generational differences in the understanding of culture, as older and younger generations may have different views on authenticity and change. These discussions highlight the importance of examining online narratives as evolving spaces where identity, culture, and power intersect.

METHODOLOGY AND DISCUSSION

METHODOLOGY

This study uses a qualitative research approach to analyze online narratives from Northeast India. Qualitative research is suitable for this study because it focuses on understanding meanings, experiences, and interpretations rather than numerical data. The data for this research is collected from various digital platforms, including social media posts, blogs, online magazines, and storytelling websites. A purposive sampling method is used to select texts that are relevant to the research topic. The selected narratives include personal stories, poems, short stories, and opinion pieces written by individuals from Northeast India. These texts are chosen based on their focus on cultural identity, language use, and representation of local experiences. The analysis is conducted using thematic analysis. This method involves identifying and analyzing recurring themes in the selected texts. The main themes explored in this study include identity expression, cultural representation, language use, and the influence of globalization. The study also examines how digital platforms shape the way these narratives are created and shared. In addition to thematic analysis, this study also applies elements of discourse analysis to understand how language constructs meaning within online narratives. Discourse analysis helps examine how writers present their identities, how they describe their cultural experiences, and how they position themselves within society. By focusing on word choice, tone, and narrative style, the study identifies how cultural identity is not only expressed but also shaped through language. This approach is particularly useful in analyzing digital texts, where informal language, emojis, and code-switching are common.

Ethical considerations are also important in this research. Since the data is collected from publicly available online platforms, the study ensures that personal information of writers is not disclosed. The aim is to respect the privacy

**Lalnunpari**

and ownership of digital content while analyzing general patterns and themes. Moreover, the research avoids misinterpretation by considering the cultural context in which each narrative is produced. Another important methodological aspect is the limitation of the study. Since the research focuses on selected texts, it may not represent all communities in Northeast India. The region is highly diverse, and experiences may vary across different ethnic groups, languages, and locations. However, the selected data provides a useful insight into common patterns and emerging trends in online cultural expression.

DISCUSSION

One of the key findings of this study is that online narratives provide a platform for expressing cultural identity. Many writers use digital platforms to share stories about their traditions, festivals, and daily life. These narratives often reflect a strong sense of pride in cultural heritage. At the same time, they also address issues such as discrimination, stereotyping, and marginalization. Another important theme is the negotiation between tradition and modernity. Many online narratives reflect the challenges of maintaining cultural traditions in a rapidly changing world. For example, young writers often express the tension between following traditional practices and adopting modern lifestyles. This tension is a common feature of identity in Northeast India. Language use is another significant aspect of online narratives. Many writers use a mix of English and local languages, creating a unique form of expression. This hybrid language reflects both the influence of globalization and the desire to preserve cultural identity. It also allows writers to communicate with a wider audience while maintaining a connection to their roots. Online narratives also play a role in challenging stereotypes about Northeast India. Mainstream media often presents a limited or stereotypical image of the region. However, online narratives provide a space for individuals to present their own perspectives and experiences. This helps create a more nuanced and authentic representation of the region. However, the study also identifies some challenges associated with online narratives. One of the main concerns is the risk of cultural dilution. As narratives are shared online, they may be influenced by global trends and commercial interests. This can lead to the simplification or modification of cultural practices. Another challenge is the issue of accessibility. While digital platforms provide opportunities for expression, not everyone has equal access to these platforms. Factors such as internet connectivity, language barriers, and digital literacy can limit participation. Despite these challenges, online narratives remain an important tool for cultural expression and identity formation. They provide a space for creativity, dialogue, and cultural exchange. They also help preserve cultural traditions in a modern context.

Identity Expression and Self-Representation

Online narratives allow individuals to construct and present their identities in ways that may not be possible in offline spaces. Writers often share personal experiences related to culture, family, and social life, creating a sense of authenticity and emotional connection. These narratives help individuals assert their identity and challenge misrepresentations. For example, many writers highlight their cultural traditions and everyday practices to show the richness of their communities. This form of self-representation is especially important for regions like Northeast India, which are often misunderstood or underrepresented in mainstream media.

Preservation of Culture through Digital Media

Digital platforms act as modern archives where cultural knowledge can be preserved and shared. Many online narratives include descriptions of festivals, traditional clothing, food habits, and rituals. By documenting these aspects, writers contribute to the preservation of cultural heritage. This is particularly significant for younger generations who may be disconnected from traditional forms of storytelling. Online narratives make cultural knowledge more accessible and relevant in contemporary contexts.

Hybrid Identity and Global Influence

A major theme observed in online narratives is the development of hybrid identities. Writers often combine elements of their local culture with global influences, creating new forms of expression. This is evident in language use,

**Lalnunpari**

fashion, lifestyle, and attitudes. While some narratives celebrate this hybridity as a sign of progress and openness, others express concern about losing traditional values. This dual perspective reflects the complex nature of identity in a globalized world.

Language Innovation and Code-Switching

Language plays a crucial role in shaping online narratives. Many writers use a mixture of English and local languages, a practice known as code-switching. This linguistic blending reflects both cultural pride and practical communication needs. It allows writers to express cultural concepts that may not have direct translations in English. At the same time, it helps reach a wider audience. This creative use of language also demonstrates how digital spaces encourage innovation and flexibility in communication.

Resistance to Stereotypes and Marginalization

Online narratives serve as a powerful tool for challenging stereotypes about Northeast India. Writers often address issues such as racial discrimination, cultural misunderstanding, and social exclusion. By sharing their own experiences, they counter negative representations and present more accurate and diverse perspectives. This form of digital activism helps create awareness and promotes cultural understanding. It also empowers individuals to take control of their own narratives.

Community Building and Collective Identity

Another important aspect of online narratives is the formation of digital communities. Through comments, shares, and interactions, individuals connect with others who share similar cultural backgrounds or experiences. These interactions create a sense of belonging and solidarity. Online communities also provide support and encouragement, especially for those who may feel isolated in offline environments. This collective engagement strengthens cultural identity and fosters a sense of unity.

Challenges of Digital Representation

Despite the many benefits, online narratives also present several challenges. One major issue is the risk of cultural simplification. In order to attract attention or fit into popular trends, some narratives may present a limited or simplified version of culture. This can lead to misunderstandings or loss of cultural depth. Additionally, the pressure to create engaging content may influence how culture is represented. Another challenge is digital inequality. Not everyone has access to the internet or the skills needed to participate in online storytelling. This creates a gap where certain voices are more visible than others. As a result, online narratives may not fully represent the diversity of Northeast India.

Impact of Algorithms and Platform Culture

Digital platforms are influenced by algorithms that determine what content is visible to users. These algorithms often prioritize popular or trending content, which can affect the type of narratives that gain attention. As a result, some cultural expressions may be highlighted while others remain unnoticed. This raises questions about visibility, power, and representation in digital spaces. Writers may also adapt their content to fit platform trends, which can influence the authenticity of their narratives.

CONCLUSION

This study has examined the role of online narratives in shaping cultural identity in Northeast India, highlighting how digital platforms have transformed traditional storytelling practices and created new opportunities for cultural expression. Online narratives allow individuals to share personal experiences, represent their communities, and connect with wider audiences beyond geographical boundaries. These platforms have become important spaces where voices that were once marginalized can now be heard and recognized. The study shows that cultural identity in Northeast India is not fixed but dynamic and constantly evolving, influenced by both traditional values and

**Lalnunpari**

modern global forces. Online narratives play a key role in this process by providing a space where individuals can negotiate, reinterpret, and express their identities. The use of hybrid language, combining English with local languages, reflects the interaction between local culture and global communication, demonstrating how writers maintain their cultural roots while adapting to modern contexts.

At the same time, the study identifies several challenges related to digital storytelling, including cultural dilution, commercialization, and unequal access to technology, which can affect how culture is represented online. These challenges highlight the need for a balanced approach where innovation does not come at the cost of cultural authenticity, and where digital platforms remain inclusive of diverse voices. Furthermore, online narratives contribute not only to individual expression but also to the formation of collective identity by enabling communities to share knowledge, support one another, and strengthen cultural awareness. These narratives encourage dialogue about identity, belonging, and social change, making them important tools for both cultural preservation and transformation. Overall, online narratives have a lasting impact on cultural identity in Northeast India, acting as a bridge between tradition and modernity, and emphasizing the growing importance of digital storytelling in contemporary society.

Scope for Further Research

This study focuses on a limited number of online narratives and platforms. Future research can expand the scope by including a larger dataset and a wider range of digital platforms such as YouTube, podcasts, and digital art. Comparative studies between different states of Northeast India can also provide deeper insights into regional variations in cultural identity. Further research can explore the role of gender, class, and migration in shaping online narratives. Another important area of study is the impact of digital literacy and access to technology on participation in online storytelling. Researchers can also examine the role of algorithms and platform policies in shaping visibility and representation. In addition, future studies can use mixed research methods, combining qualitative and quantitative approaches, to provide a more comprehensive understanding of online narratives and cultural identity.

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to my teachers and mentors for their guidance and support throughout this research. I am also thankful to the writers and creators from Northeast India whose online narratives have provided valuable insights for this study. Their creativity and voices have made this research meaningful. I would like to acknowledge my friends and family for their encouragement and understanding during the process of writing this paper. Finally, I appreciate the availability of digital platforms that have made it possible to access diverse perspectives and narratives from the region.

ABSTRACT

The present study examines the multiple forms of oppression that intersect to create complex experiences through Kimberlé Crenshaw's foundational ideologies, such as interlocking oppressions, matrix of domination, double bind, and intersectional invisibility. Specifically, the focus will be on the simultaneous experiences of racism and marginalization and the superiority of whites towards the colored in the community, as well as the various forms of oppression the blacks are subjected to. The present study conducted a textual analysis of the novel. As a theoretical approach, the study explored racism and Intersectionality. Kimberle Crenshaw's critical and theoretical concepts are more specifically employed to analyse the novel by Zadie Smith, which is rooted in racist ideologies and discrimination. In this regard, the notions of interlocking oppression, matrix of domination, double bind, and intersectional invisibility were employed as critical lenses to investigate the novel. The study reveals that Zadie Smith's novel successfully portrays the oppression and marginalization of the people of colour. It delves into the intricate details of subjugation in the white dominated community. Through the theory of intersectionality, the study focuses on the systematic racism on multiple grounds towards marginalized communities. *On Beauty* presents racism as a persistent force from life to death, shaping both the emotional and social realities of its characters. This study demonstrates how *On Beauty* functions as a fusion of diverse racism contributing to the understanding of literature, race and identity as a dynamic and interconnected entity. The novel's detail narration on different aspects of racism coupled with second generation and mixed race marginalization makes the entire narration unique and different from other writers.

Keywords: Race, intersectionality, marginalization, oppression, identity

INTRODUCTION

Race is a most important, dominant, historically socially constructed ideology. The discussions and debates on race, identity, ethnicity, equal rights, oppression, and stereotypes are an ongoing occurrence and circumstance in the modern world. As a reaction to the Nazi Project, the term 'racism' was devised in the 1930s to make Germany *judenrein*, or clean of Jews (Rattansi, 2020, p.3). Race, as a term, imbibes various ideologies and cognate terms such as ethnicity and ethnocentrism, nation, nationalism, and xenophobia. Robert Knox mentions that race is the key concept to understand human variation in *The Races of Men* (1850). The French Count Arthur de Gobineau regarded the history of every social order as the result of conquest by a dominant and powerful race, which forms the nobility, a bourgeois class with mixed origins, and the lower class, with the common people.

The questions about race and racism have been refashioned in ways to emphasize cultural difference. Banton perceives the race correlation from a global and historical perspective, focusing on cultural contact, beliefs about the nature of race, and social relations formulated based on racial categories. The arguments segmented by writers as diverse as Banton, Rex and Wilson were shaped by the discussion of race relations that was developing during the 1960s and 1970s in both USA and Britain. This was the period when social reforms were enforced in the aftermath of the Civil Rights Movement, urban violence and unrest and the development of black power ideas and forms of cultural nationalism helped to reshape the politics of race in America and other parts of the world. David Goldberg points out that "the presumption of a single monolithic racism is being displaced by a mapping of the multifarious historical formulations of racisms" (Goldberg 1993). All the major discussions about race are based on interconnections between race and nationhood, patriotism and nationalism rather than analysing ideas about biological inferiority.

More than three-quarters of the black American population in the United States is expected to have European or Whites as their ancestors. The rich men had 'mulatto' mistresses in southern cities during the time of slavery, while on the plantations, the white owners took advantage of the black slaves, and they believed they had sexual rights over female slaves. The reputation and condition of mulattos became uncertain. Different racial classifications emerged to denote their black ancestry, such as "Sambo" and "meamelou". Various names associated with Black ancestry include "Sambo" and "Meamelou." They belong to hypodescent, where the children born out of a mixed union between different socio-economic or ethnic groups are automatically assigned to the group with lower status. It is also associated with the principle of invisible blackness, where any person with one ancestor of African ancestry is considered black.

The concept of institutional racism in the 1960s in the USA was popularised by Stokely Carmichael and Charles Hamilton. The basic highlights of institutional racism are the fact that blacks and whites strived hard for a decent and better standard of living, where most of the blacks were denied opportunities and outcomes, and whites were prioritized. The inadequate housing, discrimination among whites and blacks, and schools with the least resources led to lower educational achievement, which led to lower admissions in colleges, and the result was a deterioration in employment progress. The white employers were hostile and hard on the black workers. The result of this segregation and difference is high unemployment, drug consumption, an increase in the crime rate, and unsafe neighbourhoods. Police, courts, and legal resources became biased. Black children grow up in a negative environment that stereotypes them, that destabilises their aspirations, and leads to massive underachievement. As a result, the community of black continues to remain under the white generation after generation. The future of the black community is determined by the supremacy of the white. The ideologies of racism and nationalism are interdependent and complex. Both ideologies arose and expressed together, and have high influence on each other. Hobsbawm argues that the 'dual revolution' (French Revolution and Industrial Revolution) created nationalism. After the dual revolution, racism was created and remains a continuous and ongoing challenge and discussion in day-to-day life. Balibar is influenced by the ideologies of racism and nationalism and mentions that a nation will

Bhagathwar and Sahidul Islam

inevitably identify with its race. The country's historical, cultural, political, and other factors are ultimately incorporated into the idea of race. (Miles, R., & Brown, M., 2004, p. 10) This leads to the concept of nationalistic pluralism, an ideology in which 'we' and 'they' are not differentiated.

Smith and Intersectionality

This article examines the ideology of Kimberlé Crenshaw's intersectionality theory, which explores the intersection of different forms of oppression, including racism and sexism. The British writer Zadie Smith's *On Beauty*, shortlisted for the 2005 Man Booker Prize brings in details about racist stereotypes and discrimination and diversity. The novel highlights intellectual debates among faculty members and the conflicts and issues that arise from issues of race, politics, and cultural identity. Smith also depicts that discrimination is practised not only by the whites but also by the elite blacks. Crenshaw's intersectionality helps to understand and analyse the complexity of human experiences. Social division among people gives rise to multiple forms of inequality. Crenshaw defines intersectionality as a "metaphor for understanding the ways that multiple forms of inequality or disadvantage sometimes compound themselves and create obstacles that are not understood among conventional ways of thinking". (Crenshaw, K. 1989. p. 140).

In this article, we draw upon Kimberlé Crenshaw's intersectionality to argue that Zadie Smith addresses social stratification and issues of race, where simultaneous membership in multiple interconnected social categories shapes people. Power structure plays a vital role. Intersectionality is not a synonym for diversity; it is a functional tool for understanding invisible power relations and how they shape inequality, rather than identity. Intersectionality argues that the system of oppression has a profound impact on individual lives. It aims at inequality and the outcomes it creates. To further analyse the novel *On Beauty* (2005) by Zadie Smith in detail, we will focus on intersectionality theory to examine the marginalisation and discrimination of people, as well as inequalities based on race, power relations, and sexuality.

Zadie Smith and Identity Politics

Smith was born in London to a Jamaican mother and English father. Her literary works are grounded in the themes of race, culture, society, and family relations. Her writings often deal with the difficulties and challenges of racial experiences in contemporary society. The novel was published in 2005 and is modelled on E.M Forster's *Howards End*. The novel discusses the conservative policies of elite universities and the mental trauma experienced by underprivileged and suppressed black youth. Through her writings, she proposes a re-examination of citizenship, race, and plural nationalism. (Amine, 2025, p. 2).

As a woman and writer of colour, she explores culture in literary spheres that are exclusive and restrictive. Her honest and reflective examination of the issues of identity and race has become essential to conversations about contemporary society. Her playful wittiness in her writing and vibrant narratives help to apprehend complex and difficult themes like race, class and culture. Smith says that she believed she has to play a dual role as both an author and a 'voice' of her community. "My trouble is I can't think of community in the singular. Doesn't everyone exist in a Venn diagram of overlapping allegiances and interests? I am a black person, also a woman, also a wife and mother, a Brit, a European – for the moment – a Londoner, a New Yorker, a writer, a feminist, a second generation Jamaican, a member of African diaspora, a Game of Thrones-er, an academic, a comedy-nerd, a theory- dork, a hip –hop-head and so on. I am delighted to be all these things, and everyone, no matter where they are from- if they really think about it – will find themselves with a similar plurality of communities. At different moments, you will feel the pull of certain commitments more strongly, especially if an aspect of your identity is particularly embattled state university". (Cronan, 2022, p.4).

Through her essays and novels Smith examines the idea of race, identity, and inequality in the multicultural world. Her diversity of subjects is a remarkable example for future generations to comprehend the idea of generosity and perception, covering a range of subjects from Brexit to Jay-Z and Justin Bieber. Smith is a regular contributor to The New Yorker and The New York Review of Books, her prose mimics the nuances, cadences, and occasional slang of

**Bhagathwar and Sahidul Islam**

the North West London district, proving her mastery of tone, compartmentalisation of experience, desire, and subjectivity. (Magee, 2012). Cronan (2022) describes Smith as a “sparkling effervescence, a veritable volcano of wonderfully life-affirming ideas.” Her ideas, often idiosyncratic and authentic, breathe life into her characters, allowing her to create vivid portraits of contemporary life. Over time, Smith has become increasingly skilled at blending societal and existential concerns with questions of manners and morality. Through her writing, she expresses a deep emotional and intellectual engagement with the world. In a cultural landscape that frequently reduces identity politics to a form of personal branding, Smith interrogates such issues with far greater depth and a genuinely political lens.

Theoretical Framework

The colonial legacies shape power relations among and within the countries. The social framework of discrimination and white privilege exists because of colonial legacies that create power structures. The intersectionality theory analyses the social, political and cultural identities that create inequality and oppression based on race. Kimberlé Crenshaw used the term “intersectionality” to refer to the double discrimination of racism, analysing the single-axis framework that is dominant in anti-discrimination law and anti-racist politics. She further argues that intersectionality is a metaphor to understand how various forms of inequality or disadvantage sometimes compound themselves and create obstacles in the way of life of people that are not understood by conventional thinking method.

The diversity wheel was created by Crenshaw to offer different perspectives on individuals and the organisations they are involved in, providing various perceptions of the individuals and organisations. Each intersects with the other through systems and structures that shape one’s experience, personality, and identity. There are three segments in the diversity wheel. The primary dimensions are considered to be personal standards, such as age, ethnicity, and gender, which are acquired at the centre of the circle. Socially and culturally, the person is influenced by environmental, social, and cultural factors and experiences, as well as learnings from family, friends, community, nationality, and belief system. These ideologies then acquire the second circle. The final circle includes the organisations detailing the influence a person might have in the work area, and the structure or processes they operate within may include systematic barriers and biases. (Scottish Government, 2022)

Intersectionality is directly connected to inequality. Marginalisation, suppression, discrimination, and stereotyping are the tribulations people create among each other, and blacks have to endure in society. People from different categories and communities strive to live in harmony, but the differences in opinion and social identity often create inequality and a violation of basic human rights. Crenshaw believes that people are shaped by society and the categorisation as it was fixed right from the beginning, which has become hardened and toughened to change with any rules and policies favouring blacks. The interaction between different communities and categories of people occurs within their respective contexts and societal structures, where power becomes a dominant philosophy. Intersectionality recognises all the inequalities and their progression across multiple social categories. A key aspect of intersectionality is the recognition of inequality in power. Crenshaw believes that diversity cannot be understood through intersectionality, as there are no intersectional groups of people, and the individuals who experience inequalities in society are considered intersectionally marginalised communities. Invisible power relations exist in society, shaping inequality among individuals. Intersectionality is a primary tool for analysing the deep-seated consequences that lead to differences in opinions, stubborn rejection, and inequality, despite the fact that blacks are educated and mannered. It deals with the interlocking systems of oppression and the influence they have on independent lives. Intersectionality details how different dimensions and multiple schemes of inequality persist among people, leading to diverse and distinctive consequences and experiences. (Rosette et al., 2018). Crenshaw mentions that stubborn endurance of the structures of white dominance, in other words, the American legal and socio-economic order, largely built on racism, is the reason for the existence of racial discrimination. (Coaston, 2019). Intersectionality is an exploration of people’s lives in multiple, coexisting identities. Oppressed communities are marginalised in society, and intersectionalities are considered additional barriers with different rules and policies.

Bhagathwar and Sahidul Islam

White Domination and Supremacy towards Black

Racism is explored in the novel *On Beauty* through two different families with distinct approaches and contrasting standards towards life. Both families are involved in pedagogy and maintain high academic standards in their approach to life. The families of Belseys and Kipps have contrasting views on race, identity and class. Their ideologies highlight the fact that racism is evident in every aspect of life systematically. The novel deals with the complicated and entangled racial issues that is evident in American universities. Kiki, a black woman and wife of Howard Belsey, a white university intellectual faculty member. Through Kiki, Smith aims to reveal and denote how a black woman feels suppressed in her own space of life and is often compelled to relate and live in the expectations of the white community. The voice of Kiki is authentic and the pain she endures denotes the multiple forms of oppression, issues of marginalization that is evident in the community that emphasizes the domination of white. The racial oppression that happens socially, culturally and historically are presented through the lives of two families Belseys and Monty Kipps.

Racism is evident in different forms throughout the novel. The characters in the novel have a detailed connection to exclusion and marginalisation. Kiki, when offering a party at her home with all white educated elites, pictures herself through their eyes as “sometimes you get a flash of what you look like to other people. This one is unpleasant: a black woman in a head wrap, approaching with a bottle in one hand and a plate of food in the other, like a maid in an old movie” (Zadie Smith, 2005, p. 98). Kiki is often subjected to racial stereotyping, experiencing microaggressions from her husband’s academic colleagues. She is considered a subject of discussion among family and friends as if she represents the entire African American community. This leads to questioning her identity and inadaptability to the situation, where she uses humour, withdrawal, and assertion as mechanisms to deal with racist remarks. Crenshaw argues that racial identity is not a matter of individual prejudice and preconception but is deeply rooted in cultural norms. (Crenshaw, 1989). She further says that intersectionality highlights the interconnection of race and sex, emphasising that these identities are mutually constitutive.

Crenshaw in her essay “Unmasking Colourblindness in the Law” argues that patterns of segregation and racial power were built not simply on formal rules and “White only” signs but also on practices, networks, and other social interactions that predictably reproduced white dominance across the social terrain (Crenshaw et al., 2019, p. 52). Kiki’s life is surrounded by dominant whites and isolation and suppression has distanced herself from the white community. Kiki’s intersectional invisibility is an outcome of several marginalised blacks in white-dominated communities. This isolation from the society and white dominant academic culture encouraged her to meet Mrs. Kipps, who is a black woman. The bond grew solid, firm and wiser as they continued meeting in various places, though their husbands were rivals at the university. Mrs. Kipps mentions, “There is such a shelter in each other” (Zadie Smith, 2005, p. 94), signifying that Kiki’s invisibility in the white community found solace and comfort internally in Mrs. Kipps’s existence as a neighbour. After encountering double-bind remarks about being a black woman from the workplace, a shopping mall, and Claire, a white colleague of Howard, Kiki finally found Mrs. Kipps, who appreciated her identity. “You have a marvellous face,.....and the moment I saw you I knew I would like you”. (Zadie Smith, 2005, p. 96)

Crenshaw’s Theory of Intersectionality

Crenshaw advocates for systemic change and the need to dismantle racist institutions and policies for the people rather than focusing on individual attitudes and behaviours. (Crenshaw, 1989). Crenshaw believes that there are high complexities in being black, as racist remarks can occur from multiple directions, and it's not always easy to defend and prove that equality exists. Carl Thomas, a young, black, talented music artist, street poet and rapper, more concerned with African American tradition, was falsely accused of stealing a painting from Monty Kipps' office because of his race, class and identity. On representing the black community, he was made to feel embarrassed at Kiki's anniversary party by Howard and was denied university education. He says, “The future's another country, man.....And I still ain't got a passport”(Zadie Smith, 2005, p.140). Carl is a representation of the entire black community, which seeks validation, identity, and equal opportunity, just like whites. The Matrix of white domination is Carl's reason for disillusionment towards the society he is trying to adapt to. Inequality was evident

**Bhagathwar and Sahidul Islam**

between the Wellington students and Carl, despite his being given a job in the Black Music Library at Wellington University. Interlocking oppression was quite evident when Carl participated in Claire's poetry class, despite not being a student at Wellington, creating controversies and complexities of identity and belonging. Carl's experiences highlight the themes of marginalisation and exclusion from society.

Crenshaw employs intersectionality to communicate the challenges faced by Black people and people of colour. Crenshaw's racist ideologies discuss the fact that coloured are differently situated in the economic, social and political worlds. The matrix of domination recognises that oppression is planted on structures of the society and institutions such as education, employment and criminal justice. The matrix of domination also highlights how dominant groups maintain power and privilege over marginalised groups. Smith conveys the pain of suppression through the voice of the Haitian people in the novel. "Don't ever sell your soul, my brother. Don't sell it for a few dollars. Everybody tries to buy a black man. But he can't be bought. His day is coming". (Zadie Smith, 2005, p. 362) Crenshaw focuses on the intersections of race and gender, foregrounding the fact that the social world is constructed and assembled on multiple grounds of identity. (Crenshaw, 1991). Levi feels at home around the black people and mentions that "How strange it was to see streets where everybody was black!...nobody looked at him twice"(Zadie Smith, 2005, p. 356). Representation of Levi's fair pay for Wellington Haitian workers and the support he rendered for the Haitian group signifies his relatability to his black identity.

"That is the question I pose to all fair-minded Wellingtonians today. Are we truly steadfast in our commitment to equality of opportunity, or not? Do we presume to speak of progress when, within these very walls, our policy remains so shamefully hesitant? Are we satisfied that the African American youth of this fair city?" (Zadie Smith, 2005, p. 402)

Social Justice and Activism

Levi had the privilege of studying at Wellington University because of his mixed-race identity and his white father; he often wonders and questions whether racism and differences of opinion have something to do with blackness. His friend Felix from Haiti was blacker than any black man; his skin was like slate, but he withheld the true essence of blackness. His appearance was different and contrasted significantly with that of other Swedish men, who often had translucent eyelashes and a pure, white complexion. Haiti is known for the slavery of black people, which Smith details in the novel about the enslavement and oppression.

"A country close to America that you never hear about, where thousands of black people have been enslaved, have struggled and died in the streets for their freedom, have had their eyes gouged out and their testicles burned off, have been macheted and lynched, raped and tortured, oppressed and suppressed and every other kind of pressed..." (Zadie Smith, 2005, p.355)

Levi was depressed by the fact that men hate each other in terms of race and colour. Levi was raised by his parents as a concerned, sympathetic and gentle person, with an intense and great sensitivity to the pain of others. Each time he read the book about Haiti's struggle and mission, he felt a deep-seated passion and a profound sense of misery. Today's racism leads to tomorrow's agony and pain of a generation. Levi identifies himself as Black and enjoys the freedom he has within the Black community. It was like a homecoming for him, and many hurried past him as if he belonged to the black community. He was so satisfied that nobody looked at him twice. Levi had found it difficult to adapt in his family, as there was a matrix of domination from the white father, who never allowed his black friends to meet him.

Smith's ideology on race had social justice and activism. The most significant part of the novel was the surreal gathering of Mrs. Carlene Kipps' funeral. The narration of the funeral in the novel had all kinds of people from various races, persuading Jerome to mention that "You can tell she knew every type of person. Can you imagine a funeral - or any other event - like this, back home? (Zadie Smith, 2005, p. 282). The Belseys looked around themselves, and people from every age, colour, and faith were dressed and walking in. Smith tries to navigate that death is

Bhagathwar and Sahidul Islam

eternal, and racism cannot commute beyond this. On being disturbed by the funeral, Howard went to meet his parents, leading to interlocking oppression. Howard's father doesn't like Kiki and constantly finds fault with her. Interlocking oppression and the Matrix of Domination connect to identify the different forms of suppression and oppression faced by people in the community. Crenshaw argues that a black woman may experience both racism and sexism, resulting in a unique form of marginalisation and exclusion from society. (Crenshaw, 1991). Kiki, a loyal woman, on being black is stereotyped and a new form of marginalisation is developed. Howard had a relationship with his white colleague Claire and a young black girl Victoria, which was unnoticed, and society is reluctant to blame him. The matrix of domination by the white in the family leads to a deeper sense of segregation and isolation in Howard's family, as his children are mixed race. Howard's father mentions, "You couldn't expect black people to develop mentally like white people do" (Zadie Smith, 2005, p.296). He doesn't like the fact that his grandchildren are mixed-race in their identity. As Howard was depressed, his father questioned him about Kiki. "She found a black fella, I spose. It was always going to happen though. Its their nature" (Zadie Smith, 2005, p. 301).

The street poet from Haiti, Carl Thomas was denied a prospect to study poetry at Wellington College as he was black. Levi was not interested in college, he was compelled to attend because of his white father. The issue with the immigrants from Haiti was the same. They were denied the basic rights of the people, and without proper foundational education, are constrained to do undervalued jobs in the country. "This was a Haitian fellow driver called Pierree, one of the many from that difficult island who now found occupation" (Zadie Smith, 2005, p.24). On visiting the market, Kiki met a Haitian trader. His depression on the new land and suppression in the white-dominated community were highly evident when Kiki questioned his identity. On calling him an African American, he refused and declared that he was from Haiti and mentioned the difficulties the Haitians undergo every day.

Discrimination towards Colored

Black women live through discrimination and marginalisation, shaped by race and gender. Crenshaw states that Racism and Sexism are interconnected and considered to be the interlocking oppression, especially the black women face in every aspect of their life, both personally and professionally. (Crenshaw, 2006). Howard met his wife Kiki, who is black, as a young nursing student at a time when her beauty was natural, honest, powerful, unmediated, and full of genuine desire. Although she was not one of Howard's intellectual arenas, she was actively political and womanly. Later, Howard became intolerant towards her weight gain and old age. His dislike lead to an affair with Clarie Malcolm, a white colleague of Howard. "In the spring it was someone, a nameless someone, it was a one-night stand - now it's Claire Malcolm. It went on for weeks!" (Zadie Smith, 2005, p. 205). After Howard's affair extended to Mr. Kipps' daughter Victoria, Kiki left him in isolation to reflect on his mistakes. She tolerated all the Matrix of White domination, oppression by his educated white colleagues, and marginalisation in the white community she lived in. Still, Howard failed to perceive her needs and wants as a black woman. His white superiority was often evident in every walk of his life, especially when he travelled to England to stop the relationship between Jerome and Victoria because of her black heritage. Victoria praises Kiki's looks to Howard and acknowledges the fact that her mother was particular about people. They have to be real people like Kiki, who was modest and true to herself and her family. Victoria calls Kiki "She's like a Queen. Imperious-looking..Like an African Queen" (Zadie Smith, 2005, p.313). Victoria praises Kiki's blackness in terms of loyalty and faith.

Jerome and Victoria's relationship was highlighted at the beginning of the novel, as Jerome, who had a white father, Howard, was in high praise of Kipps's family, finding adaptability easy for him. The Kipps prioritised their family over their busy schedule. Jerome says, " I love living here. It's a different universe" (Zadie Smith, 2005, p. 3). Jerome did not experience Intersectional invisibility and domination here; rather, he found his identity as black, as evidenced by his comment, "The Kippses continue to grow on me" (p. 5). When Monty suggested that minority groups often claim equal rights they haven't received, Jerome allowed this strange idea to take hold within him, identifying himself as belonging to a minority group. When Michael argued that being black was not an identity but an accidental matter of pigment, Jerome decided about his challenging future in the country, though being a mixed-race individual and having a white father. The accidental pigment determines the opportunities the person will encounter in the rapidly progressing world. Kiki experiences social isolation with her family members. Kiki's children deny her

Bhagathwar and Sahidul Islam

the right to contact Mrs. Kipps, as the family is rivals to Howard. Kiki feels connected to Mrs. Kipps. They share the same identity and experience in the white-dominated society. Crenshaw mentions that individuals experience marginalisation within their marginalised groups, leading to isolation and exclusion. (Crenshaw, 1991).

“You have friends, Jerome. And Zora has friends, and Levi practically lives with his friends - and Kiki followed the thought to the edge of the cliff and beyond - well, we sure as hell know now how close your father is to his friends - and what? I can't make friends. You all have your life, and I have no life?” (Zadie Smith, 2005, p. 165)

Kiki's social isolation intensifies as she mentions that she is alone in the sea of white, “My whole life is White” (Zadie Smith, 2005, p. 206). She argues that she finds the black population only when they are cleaning the floor in the cafe at Wellington College or pushing a hospital bed. She is unable to connect with the dominant white population; rather, she sympathises with the black community on the inequality she perceives. Crenshaw argues, “If you are a woman, then you are more victimised than a man, and if you are black, then you are more victimised than if you were white” (Coaston, 2019). Kiki identifies herself as the only black woman attending the Wellington Choir. She views it as a devil's army as the choir is dominated by the whites in both critical evaluation and the end judgment. Surprisingly, Jerome understood the white Greek music and was fully involved in the Choir. Kiki was so proud and felt that she had raised a young man of intelligence and sensibility. “After all, how many other young black men would even come to an event like this - I bet there isn't one in this entire crowd”. (Zadie Smith, 2005, p.70). The matrix of White domination, interlocking oppression of blacks, double bind and intersectional invisibility of the other community are evident here when the blacks are not given a chance or invited to be in the white elite community. Kiki expresses her pride for her son as well as her regret for the other black people for not being included in the white community and continuously being oppressed and marginalised. Kiki conveys a massive message to the black community in the novel, “And there's no big secret, not at all, you need to have faith, I guess, and you need to counter the dismal self-image that black men receive as their birth right from America - that's essential - and, I don't know.....get involved in after school activities, have books around the house, and, sure, have a little money, and a house with outdoor...” (Zadie Smith, 2005, p.71)

Institutional Racism

Howard, a white professor from Wellington College, created a mixed-race family with his Black wife Kiki. His exaggerated praise towards the white community to his academic colleagues and unconcerned neglect of his family and their opinions on inadaptability to the white community leads to Kiki's oppression and marginalisation within the constraints of the family itself. Kiki was not invited into the white-educated elite community, and she always felt isolated and distinct. Racial equality is not appreciated; rather, a matrix of white domination and intersectional invisibility is evident here. Kiki is denied her voice in the family and excluded from her needs as a mother and wife. Crenshaw further argues for equal opportunities for Blacks, proclaiming “Today, the claim that equality does not exist for Black America may fall upon deaf ears - ears deafened by repeated declarations that equality exists” (Crenshaw, 1988).

Crenshaw emphasises that racism is not just about individual actions but also about institutional practices and policies that perpetuate racial inequality. Institutional Racism hinders the growth of the next generation. In the novel, the University has a diligent black student population, creating a mini-university within a university. Levi wondered why Wellington had this little black enclave. Black students experience intersectional invisibility and often hide within their community. The matrix of domination by white people suppresses and marginalises the students of colour suppressed and marginalised. The institutional racism extends to the faculty as Howard and Monty Kipps become rivals, and their ideologies regarding the painter Rembrandt are highly opinionated, with paintings that feature uncompromising realism. The discussions between them often lead to racist remarks at the university. Crenshaw advocated for systematic change and the need to dismantle racist policies. Mr. Kipps, who is black, values the painting and acknowledges that Rembrandt is a genius. Kipps, who is black, values the painting and acknowledges that Rembrandt is a genius, as well as the notion that beauty comes from God. Howard, who is white, is sceptical about the art and believes that it is overrated, with the paintings lacking aesthetic value. Institutional

**Bhagathwar and Sahidul Islam**

Racism is at its peak when Howard sees Monty's Rembrandt book as “retrogressive, perverse, infuriatingly essentialist, but it was neither vulgar nor stupid” (Zadie Smith, 2005, p. 21). However, the book was originally detailed and thorough, and it had the great advantage of being bound between hard covers and distributed throughout the English-speaking world. Howard's book was on the same topic and remained unfinished.

Howard and Kipps had been in the same organization for more than fifteen years. Howard always disliked Monty because he dedicated his entire life to the perverse politics of right-wing iconoclasm. He never really hated him until he heard the news about Kipps' book, Rembrandt. Howard recognised that even before it was published, it would be highly popular. It was this thought of that book and its successful fate that prompted Howard to write a letter against Mr. Kipps. Howard hatred on Kipps extends to the family discussion where he coverts his desperation into rage mentioning “Take your pick. State of Britain, State of the Carribean, states of blackness, state of art, state of women, state of the states - you hum it, he ill play it - he's a charmer, he is a”(Zadie Smith, 2005, p.121). Kiki supports mentioning his anti-affirmative bill. She mentions that he is a black conservative and he believes that it's belittling for African-American kids to be told they need special conduct to succeed. As a black woman, she stands firm on the policies established by Mr. Kipps.

Haitian art is not just paintings and sculptures; it also incorporates unique drum art and Voodoo flags, using vibrant colours and motifs that have intricate meanings. It not only pertains to a single culture but also inspires Europeans and Americans and has received international acclaim. (Hatta, 2018). Monty Kipps informs that he curated and organised the first American exhibition of the Caribbean “Primitives” in New York in 1965. “I have the largest collection of Haitian art in private hands outside of that unfortunate island”(Zadie Smith, 2005, p.113). The representation of the black culture in the white-dominated community becomes difficult when the interlocking oppression and marginalisation are on a high scale. Whites often fail to recognise the purpose and significance of the artwork from other cultures due to the matrix of domination.

CONCLUSION

This study investigates the intersecting forms of oppression portrayed in Zadie Smith's *On Beauty*, focusing on how racism and white domination shape the lived experiences of people of colour. Drawing on Kimberlé Crenshaw's theory of intersectionality which uses multiple frameworks to examine the systemic racism on marginalised communities. Through this, we argue that racism spreads in all areas of life, from education and employment to social spaces and personal relationships. The novel highlights how oppression is experienced at multiple levels, particularly in the experiences of Black individuals within a white-dominated society. The rivalry between Howard and Mr. Kipps, centred on Rembrandt, portrays the existence of racial tensions within elite academic spaces. Kiki's emotional conflict, her search for identity, and her eventual connection with Mrs. Kipps culminate in her symbolic death and the final gift explains her marginalisation and intersectional invisibility. The experiences of characters such as Levi, who seeks belonging in the Haitian community, and Jerome, who feels accepted by the Kipps family, further extend the novel's portrayal of double marginalisation and cultural displacement.

Crenshaw's ideology on power dynamics is essential to understand the functionality race and identity in the novel. *On Beauty* exposes the nature of oppression not only for immigrants but also for mixed-race and second-generation individuals. Through characters like Jerome, Levi, and Kiki, Smith demonstrates how race, power, and identity intersect within everyday experiences. Mrs. Kipps's comments on Kiki's appearance and her final gesture convey the broader idea that the preservation of Black identity and culture must be driven by Black communities themselves. Ultimately, *On Beauty* presents racism as a persistent force from life to death, shaping both the emotional and social realities of its characters and illuminating the transformative potential of confronting intersectional injustice.

ABSTRACT

Gamification in teaching English in engineering education may face several difficulties such as student engagement and applicability in practice. This paper aims to reframe gamification not only as a tool but also as an approach to learning through design whereby students create their own gamified educational experiences. This paper discusses a 30-hour elective course where first-year engineering students designed digital games for enhancing certain aspects of English language skills. The data was collected from 48 participants based on performance scores and project outputs. The results of the research suggest that gamification designed by students increases engagement of thinking processes as 67% percent of participants demonstrated above-average performance scores. Moreover, qualitative analysis of the obtained results demonstrates that designing the games improved the students' linguistic awareness, ability to solve problems, and teamwork – abilities that are not typically achieved through passively consuming gamification-based tools. Overall, this paper offers a radical shift from learning using gamification to learning through gamification design which can be used to implement gamification at scale.

Keywords: gamification design, English language learning, student-centered learning, project-based learning, engineering education

**Sreejana and Jaidev**

INTRODUCTION

Communication in English is an essential competency for graduates from engineering colleges in their work in international interdisciplinary teams. Nevertheless, teacher-centered method of language teaching leads to lack of interest among students and poor information retention in language classes. Gamification, which according to Kapp is "the use of game design elements in non-game contexts" [1], has been recognized as one of the teaching strategies used to combat the above problem. Indeed, gamification enhances motivation, persistence, and achievement of desirable results, provided that the application of game mechanisms is consistent with teaching goals [2], [3]. The following theories can be applied to explain why gamification increases learning achievements. First, Self-Determination Theory claims that people develop an intrinsic motivation while being in environments which provide support for autonomy, competence, and relatedness [4]. Second, according to flow theory, people achieve high concentration levels when there is balance between task difficulty and skills and continuous feedback about goal achievement [5].

Gamification provides engineering students, who rely on English as both a tool for gaining employability and a technical challenge, with an opportunity to reconceptualise language learning into a productive, goal-oriented activity. In this paper, we present an elective course, Gamification in Education (24INO121), where not only was gamification used but also actively created by the students. To that end, the elective course incorporated both experiential learning [13] and project-based pedagogy [14], thus balancing engagement, linguistic development, and multidisciplinary literacy.

Objectives of the Study

The present study is based on three interrelated objectives, which address the pedagogical approach itself as well as its outcomes: Firstly, we seek to establish the potential of a gamification elective to improve engagement and performance within the scope of engineering English. Secondly, we aim to explore the mechanisms of self-directed and self-managed learning embedded in the game design that reflects Self-Determination Theory (SDT), Flow theory, and Multimedia learning, all with the purpose of achieving certain language goals, such as developing vocabulary, idioms, and grammar. Finally, and most importantly, we hope to reveal the strengths and weaknesses of project-based gamification as a pedagogical method and assessment tool.

LITERATURE REVIEW

Gamification has gained considerable attention in the realm of education. For instance, according to Deterding et al., gamification refers to the introduction of elements such as points, levels, and badges from game environments to real-life contexts. Kapp and Hamari et al., on the other hand, stress the motivational and performance-enhancing effects of gamification when it is properly integrated into the design of the learning environment.

Theoretical Perspectives

From the perspective of SDT [4], gamification is said to be effective if learners experience competence (through scores), autonomy (through choice of tasks), and social connection (through collaboration). On the other hand, the concept of Flow theory [5] shows how clear objectives and appropriate challenges can result in engagement. Gee's approach [6] further reveals how games incorporate certain "learning principles," including taking risks, feedback, and progression.

Gamification in Language Learning

In second language acquisition (SLA), gamified platforms such as Duolingo and Memrise employ streaks, leaderboards, and adaptive tasks to sustain daily engagement [12]. Mayer's work on multimedia learning [11] demonstrates that multimodal, interactive inputs reduce cognitive load, making digital gamification particularly effective for language acquisition. For idioms and figurative competence specifically, Boers [8] and Liu [10]

116261

emphasise the role of metaphor awareness and contextualised practice — conditions that puzzle-based games can replicate effectively. Schmitt [9] underscores vocabulary repetition with variation; an approach well aligned with gamified drills and adaptive quizzes.

Gaps in Literature

While ready-made platforms for gamification have been shown to be effective, a glaring gap exists concerning student-designed gamification platforms. Current literature places the learner as an end-user of existing platforms but rarely as creators of a new one. Creating a learning game requires a different form of cognitive engagement compared to playing it. The former entails much more cognitive processing than the latter; the current study seeks to fill this literature gap by analyzing the cognitive processes of creating language learning games among engineering students in the context of an elective subject.

METHODOLOGY

Course Context and Design

Gamification in Education (24INO121) was a one-credit elective subject offered to first-year B.E./B.Tech students. The course was designed to run for 30 hours as follows:

- Module 1 – Introduction to Gamification: its theory, benefits, and practical applications, including case studies of existing gamified learning platforms.
- Module 2 – Designing Gamified Learning Games: vocabulary-based games, grammar-based games, interactive stories, and feedback loops.
- Module 3 – Researching and Evaluating Gamification: prototyping and testing games, feedback and challenges during the learning process.

Participants

There were altogether 48 participants from varied fields of engineering taking up this elective course. They were assigned to work within interdisciplinary groups comprising five to six people for developing game tools to enhance English language learning.

Assessment Framework

The assessment of these groups took place continuously throughout the semester and not through any terminal examination. The groups were evaluated based on three course objectives, namely,

- CO1 — Understanding Concepts: understanding concepts of gamification including their underlying theories and mechanics.
- CO2 — Development: Developing a gamified application that works well with its mechanics in line with a language learning objective.
- CO3 — Evaluating Application: Evaluation of the application designed by each group through testing and peer feedback.

Data Collection

Data from two sources, namely quantitative and qualitative data, were used in the study to allow for a triangulation analysis. The quantitative data comprised internal scores based on a grading system out of 100, which underwent statistical description of the scores to establish the students' average performance. The qualitative data, on the other hand, was collected from project reports and presentation reflections done by the participants. Four illustrative examples of projects were used to represent projects dealing with different types of language skills: Hangman (vocabulary & spelling), Idiomatrix (idioms & figurative language), ELITZ – Learn Modals (grammar through game and puzzle) and Tweet Tweet (letter collecting game/vocabulary).

**Sreejana and Jaidev****Analytical Approach**

Quantitative data analysis used descriptive statistics, which included computing the average score and score distribution. Qualitative data was thematically analyzed according to three parameters: (i) language skills developed, (ii) application of principles of gamification and (iii) acquisition of interdisciplinary skills.

RESULTS**Quantitative Results**

The analysis of student performance (N=48) showed that the course had an excellent achievement profile, where the results varied from 58% to 89%. The mean score was 74.2%, which can be seen in Table 1. According to the table below, 66.7% of students performed above average, showing that the gamification elective was helpful not only to high-achieving but also average students.

Qualitative Results: Case Study Projects

Four exemplary projects presented the variety of gamification concepts created by students for different areas of English language learning.

Hangman (Vocabulary and Spelling)

The students developed a website game using HTML, CSS, and JavaScript. This game helped to foster students' deductive reasoning and vocabulary learning process with instantaneous feedback for right and wrong answers. However, choosing appropriate vocabulary to form a word bank and adjusting game difficulty level involved deep cognitive reflection on how one acquires new vocabulary, which is rare when playing similar games.

Impact: Vocabulary recall, collaborative problem-solving, and debugging skills.

Limitation: Relying too much on uncontextualized vocabulary memory techniques.

Idiomatrix (Idioms and Figurative Language)

This puzzle game, developed with Python in the Pygame library, presented visual cues and multiple choice questions to test understanding of idioms. The process of researching idioms, anticipating learner difficulties and creating visuals enhanced students' own abilities with figurative language. Outcome: Allowed learners to better associate images with figures of speech, operationalizing Boers' [8] work on metaphors.

Problems: It was difficult to adjust level of difficulty; some idioms were unknown to learners with particular cultural backgrounds.

ELITZ — Learn Modals (Grammar Practice)

Dual mode, presenting grammar questions in a multiple choice quiz format or through a word-puzzle game. Auditory and visual components worked in harmony, following principles set out by Mayer [11], decreasing cognitive overload and maintaining learners' focus.

Outcome: Provided an environment where grammatical corrections were immediately provided alongside auditory and visual reinforcement.

Problems: Prototype offered only a selection of sentences and should include grammar module in the future.

Tweet Tweet (Letter Collection Vocabulary Game)

A bird character collected falling letters to create target vocabulary words, utilizing animation and vocabulary games together. The animated game kept students engaged, which was not possible with traditional vocabulary lists.

Impact: Enhanced spelling accuracy and focus; engaging animations helped learners pay attention for longer periods of time.

Problem: Difficulty in creating smooth animations for lower-end machines.

**Sreejana and Jaidev****Course Outcomes (CO) Achievement**

All three course outcomes have been clearly reached in projects and reflective journal entries, as outlined in Table 2 below.

- CO1 (Principles): Met through explicit references to gamification components, namely points, levels, feedback, and badges, in the context of language learning.
- CO2 (Design and Development): Proven through the creation of four unique applications that cover vocabulary, idiomatic expressions, and grammar.
- CO3 (Evaluation): Manifest in student reflections, repeated peer testing, challenges faced during design and development, and subsequent revisions.

DISCUSSION

The most critical discovery made by this research is not the effectiveness of gamification, which has been proven before [1]–[3]. The critical difference is that designing gamification provides a learner with qualitatively more meaningful experiences than consuming it. This is what this project was about, and the data collected proves its viability on several levels. First, there is a high percentage of learners with high achievements, 67%. They scored above 70 in the course and are consistent with the results obtained by Hamari et al. [3] and proving that gamification fosters learners' persistence and productivity. Still, the most compelling argument can be found in the qualitative evidence: the struggling English learners managed to develop better linguistic awareness due to their involvement in the design process. To create a vocabulary-learning game, one has to understand how vocabulary learning works.

Theoretical consistency is solid as well. The elective design is aligned with self-determination theory [4] and Flow theory [5] in terms of fostering intrinsic motivation through autonomy, competence, and relatedness. Autonomy comes from freedom in choosing mechanics and content. Competence is achieved via progressive scoring and improvement over time. Relatedness comes from teamwork. From the perspective of language skills, student projects confirmed existing theories of second language acquisition. The Idiomatrix system utilised the metaphor-awareness theory suggested by Boers [8] in terms of the association between idioms and imagery. ELITZ implemented Mayer's [11] multimedia learning theory by combining auditory and visual prompts for grammar lessons. The games of Hangman and Tweet Tweet were based on Schmitt's [9] vocabulary repetition strategy using different approaches. The two-stage aspect of the teaching approach, learning English and learning how to design, is in harmony with Kolb's experiential learning model [13] and results of project-based learning studies [14]. Students were not limited to practicing their language skills but used them in a variety of ways, developing a range of skills across disciplines – programming, teamwork, documentation, and critical reflection.

Among the limitations in conducting the study is the small sample size of only 48 students as well as the lack of pre- and post-language proficiency tests for quantifying actual language improvement as a result of the experiment. However, the varying degrees of technical proficiency of the student-developed games also indicate that further iterations of this model would require more assistance from the instructor in the design and development module. Nevertheless, the overall success in terms of quantitative performance and qualitative reflections warrants further implementation in other academic settings.

CONCLUSION AND FUTURE WORK

The current research aimed at exploring how Gamification in Education (24INO121) as a project-based elective would affect language learning among engineering undergraduate students. Based on the research findings, the integration of game design in English language instruction positively affected not only the level of engagement of the learners but also their performance and creative skills. In numbers, 67% of the students scored over 70 while Hangman, Idiomatrix, ELITZ, and Tweet Tweet showed creative use of game design principles in practice.

**Sreejana and Jaidev**

The primary innovation offered by the study is a conceptual one; it illustrates that the act of designing a gamified tool, in itself, represents an extremely valuable form of pedagogy. Students engaged in creating games for others must first absorb what they hope to impart and will gain a deeper knowledge of it through the act of building the game itself than would be possible otherwise.

Pedagogical Contributions

- Illustrates that the potential application of gamification extends far beyond vocabulary-building exercises, allowing for the introduction of project-based learning to the teaching of English that builds language competencies and interdisciplinary skills simultaneously.
- Provides a template for other engineering schools looking to incorporate elements of active learning, interdisciplinarity, and authentic assessments into their English language curriculum.
- Establishes gamification not only as a pedagogy but also as a mode of assessment based on the learning-by-design process.

Limitations

- Carried out on a limited sample of 48 engineering students, reducing generalizability to other schools and/or cultures.
- Student progress assessed based on grades and reflection rather than using standardized tests measuring language ability.

There was a great deal of variation in the technical quality of the games produced and retention was not examined over time,

8.3 Future Work

- To extend the scope and scalability of project-based gamification, future directions include the following:
- Cross-Institutional Collaborations — Conducting multi-campus studies in which student-created games are shared, tested, and refined across institutions, building a common evidence base.
- Adaptive and AI-Driven Gamification — Embedding adaptive difficulty, personalised learning pathways, and learning analytics into student-designed games to increase pedagogical precision.
- Immersive Technologies — Leveraging VR and AR environments for role-play scenarios such as debates, interviews, and cross-cultural communication tasks.
- Longitudinal Studies — Tracking how gamification design impacts long-term outcomes including employability, communication confidence, and global competence.
- Repository of Student Games — Building a curated, peer-reviewed platform of student-created English gamification tools available for reuse across classrooms.

ABSTRACT

The aim of the study is to explore the impact of task-based language teaching through artificial intelligence on the speaking accuracy and fluency of English Second Language (ESL) learners enrolled in an autonomous engineering college in India. Communicative language teaching and technology-based teaching methods were at the core of the research, which utilized a ten-week quasi-experimental study to explore the impact of task-based language instruction on 100 engineering students, who were randomly allocated to an experimental and a control group. The experimental group of the study engaged with a digital form of language instruction through an artificial intelligence tool to enhance their speaking skills, while the control group received regular classroom teaching. Further, speaking proficiency measures involving analytic rubrics formed part of pre- and post-test data, while analysing them via paired and independent samples t-tests with effect size calculations highlighted statistically significant gains on learners who experienced AI-integrated TBLT, while large effect sizes signified its strong impact as instruction. In addition, although results were not explicitly mentioned, qualitative self-reports accentuated learners' self-confidence, motivation, and self-regulation of learning. In conclusion, these results provide robust quantitative evidence of the integration of AI-based pedagogies in engineering colleges, revealing their potential for developing learners' comprehensive speaking proficiency while encouraging growth in learner-oriented language studies in technology-enhanced learning environments.

INTRODUCTION

The accelerated use of artificial intelligence (AI) in recent times has brought about an impact on modern educational practices, especially in language learning settings across diverse educational systems. The latest publications show how AI can assist in offering corrective feedback, anticipating students' learning requirements, as well as creating actual communicative situations, making it easier for students to become involved in enhanced learning. Furthermore, it has accelerated language acquisition (Holmes et al., 2022). Therefore, as higher education institutions aim towards introducing innovative teaching practices, AI-assisted language learning seems to be an essential part of digitally enhanced language learning. Parallel to these technological advancements, Task-Based Language Teaching (TBLT) has continued to be one of the most evidentially confirmed language teaching methods for developing communicative language competencies. This is particularly because, by shifting the focus of instruction from linguistic forms to meaning-focused tasks, language learning can be optimized for enhanced authenticity, both accuracy, and fluency, all through interaction-based language learning processes (Ellis et al., 2020). Recent investigations into the application of technology to TBLT environments have confirmed this potential to improve language learning outcomes, particularly by providing learners with learning options that transcend traditional classroom borders, along with immediate feedback mechanisms that are hard to achieve traditionally (González-Lloret, 2021).

This integration of AI and TBLT represents a significant change in learning pedagogies, shifting from teacher-centric learning environments to intelligent and learner-centric learning environments. Speech recognition technologies, which fall under AI, have demonstrated significant promise in improving pronunciation, grammatical, and communicative skills through repetition. Moreover, a meta-analytic review of intelligent tutoring systems using AI-based technologies reported positive learning outcomes, which indicates a promising potential of AI-based learning environments for second language learning, especially speaking skills. Despite all these developments, speaking fluency has been repeatedly cited as a problematic skill, which ESL students struggle to achieve. Since speaking involves the simultaneous and control-demanding processing of grammar, vocabulary, and pronunciation, it causes cognitive overload as a traditional classroom setting fails to afford an opportunity for repetition (Sweller et al., 2019). The virtual environment can afford such flexibility to the students to repeat the tasks as many times as needed and encourage self-regulated behaviours using the feedback provided (Kukulka-Hulme, 2020).

The relevance of AI for speaking skills development is further supported by empirical studies. For example, a study on the impact of feedback systems motivated by artificial intelligence found that the tools contribute to the development of accurate pronunciation and enhanced speech intelligibility, as well as the learners' self-confidence, particularly due to the low-anxiety levels (Sun, 2023). Another study on interaction with technology, where AI is a central medium, identified a positive correlation with learners' engagement and communication willingness, areas which predict speaking development as core factors (Tai & Chen, 2023). The role of AI is reportedly conditioned by its incorporation into a sound instructional theory, not merely as a technology support (Luckin et al., 2022). Despite the proliferation of literature on the subfield of AI-Assisted Language Learning, several gaps emerge from the existing work. Firstly, much of the existing work appears to operate from a short-term perspective, such as exploratory works. Secondly, relatively little work uses the design necessary to account for both increased performance and learner perceptions simultaneously. Lastly, engineering programs, a field where communicative competency is becoming increasingly important from a HEA perspective focused on global collaboration, appear underrepresented in the existing ESL literature in spite of the distinctive discourse requirements of academic/technical work (Rienties et al., 2022).

Autonomous engineering colleges represent a particularly motivating site for investigation. Unlike highly centralized universities, these institutions often enjoy curricular flexibility that allows the implementation of innovative pedagogies and emerging technologies. In the same vein, students of engineering often emphasize technical

**Prem Kumar**

coursework, leaving them with fewer structured opportunities to develop their oral communication skills. This imbalance underlines the need for pedagogical models that efficiently integrate language development into discipline-focused programs while maintaining academic rigor. The present study addresses these gaps by investigating the impact of AI-mediated TBLT on ESL learners' speaking accuracy and fluency within an autonomous engineering college. Using a quasi-experimental mixed-methods design, the research attempts to develop sound empirical data regarding the instructional worth of AI-integrated task-based pedagogy while providing insight into learner experiences within technologically enriched learning environments.

The present study situates AI not only as a technologically enhanced tool but even more so as a pedagogic driver that can reshape communicative language teaching. Developing empirical clarity on these issues will be critical, informing curriculum design, institutional investments of resources in educational technologies, and effective, evidence-based teaching practices amidst rapidly shifting academic ecologies.

Research Objectives

- To investigate the impact of AI-based task-based language instruction on the speaking accuracy of ESL learners.
- To assess the effect of AI-based task language teaching on the fluency of speaking among ESL learners.

Research Questions

1. To what extent does AI-mediated task-based language teaching improve the speaking accuracy of ESL learners in comparison to more conventional approaches of teaching?
2. How is AI-mediated task-based language teaching effective in improving the speaking fluency of ESL learners in technology-enhanced contexts?

Hypothesis

- H1: ESL students instructed in AI-mediated TBLT will show significant improvement in speaking accuracy compared to traditionally instructed ESL students.
- H2: ESL learners undertaking AI-mediated TBLT will show greater improvement in speaking fluency compared with a control group.

LITERATURE REVIEW**Task-Based Language Teaching and Speaking Development**

Task-Based Language Teaching (TBLT) has emerged as one of the most fully developed and supported methods to facilitate communicative language competence in second language acquisition. Based on the tenets of interactionism and cognitivism, TBLT focuses on the necessity for using tasks to help learners access meaning and utilize linguistic knowledge to accomplish communicative functions. More recent research prioritizes that task involvement is essential to enhance deeper processing, promoting both procedural knowledge and automatization—two necessary prerequisites for oral fluency (Ellis et al., 2020).

Results of contemporary extensions of TBLT research increasingly explore the effects of task complexity on learner performance. Robinson's Cognition Hypothesis assumes that cognitively challenging tasks can drive learners to use more sophisticated grammatical complexity and accuracy through attention to form while communicating (Robinson, 2022). Other assumptions, such as Skehan's Limited Attentional Capacity Model, state that learners allocate their finite cognitive abilities across task requirements such as fluency, accuracy, and complexity, often at the expense of each other (Skehan, 2023). Internal sources of validation for this approach lie in the recent findings from classroom-based studies. For example, a large-scale meta-analysis carried out by Chong and Reinders (2021), to a significant extent, validates the effectiveness of TBLT approaches, showing superior outcomes for speaking performance compared to form-focused approaches, especially when interactive elements such as problem-solving and information gap tasks were built into tasks. Furthermore, Lambert and Kormos (2024) show the importance of task repetition for fluency, highlighting the fact that processing demands are reduced and faster access to vocabulary is promoted, indicating a potential advantage when working with novice learners. A new trend of research focuses

**Prem Kumar**

on the importance of feedback within task-based environments. Corrective feedback provided while or just after completing a task appears to assist with grammatical knowledge while minimal communicative interruptions result (Li, 2022). What is more, researchers have started to argue that the effectiveness of TBLTs can be increased when learners have opportunities to rehearse and reflect on the learning cycles, and these behaviours have been connected to self-regulated learning and long-term retention. However, such developments have faced various impediments, especially considering large class sizes, instructional time, and participation. Consequently, the emphasis on conducting research for technology-assisted task environments, which transcend temporal and spatial boundaries, is growing, as highlighted by Ahmadian & Long (2021). This implies a shift towards digital models of TBLT, which may meet the communicative concerns of contemporary higher education.

Artificial Intelligence in Language Learning

Artificial intelligence is significantly changing the language education landscape with AI-based adaptive systems that can respond to the changing performance of learners. For AI systems, they can listen to human speech, recognize mistakes, and provide corresponding feedback, which would be difficult for traditional human educators. This power of AI bears a similarity with the current emphasis placed on precision education, which relies on various forms of analytics to provide students with customized teaching intervention (Holmes et al., 2022). The most influential application of AI technology in language learning appears to be intelligent tutoring systems, or ITS, through one-to-one continuous assessment and support. Recent studies on autonomous language learning through experimentation show the positive impact of ITS systems on learner autonomy and the improvement of language learning skills (Ma et al., 2024). The dynamic difficulty management through intelligent systems also maintains the optimal degree of challenge for learners, thus enhancing learner motivation.

Automated feedback technologies also have shown significant pedagogical potential. Advances in automatic speech recognition accordingly make it possible to identify segmental and suprasegmental features with high accuracy, allowing learners to practice and improve their pronunciation iteratively. Empirical results indicate that training based on ASR not only leads to improved intelligibility but also lowers speaking anxiety because learners can first practice privately before communicating publicly (Sun, 2023). Conversational AI is another game-changing evolution. The dialogue agent can simulate real interaction because it could respond in unpredictable ways, which would allow negotiation of meaning—a very important mechanism for language acquisition. Tai & Chen (2023) report that learners interacting with AI-powered chatbots show greater willingness to communicate and higher-level engagement than peers taught within conventional classrooms. Adaptive learning systems continue to enhance artificial intelligence's pedagogical relevance by continuously recalibrating the instructional pathways on the basis of learner analytics. Such responsiveness has been associated with increased persistence and more efficient skill acquisition in environments where the learners have heterogeneous proficiency levels (Luckin et al., 2022). However, scholars do warn that technological sophistication in and of itself does not guarantee educational effectiveness; AI must instead be conceptualized within theoretically framed pedagogical systems if it is to create sustainable learning gains.

Incorporating Artificial Intelligence into Task-Based Language Teaching

The convergence of these AI technologies with TBLT therefore represents an important evolution in communicative pedagogy. TBLT provides the theoretical architecture for meaning-making interaction, while AI provides the infrastructural capacity to operationalize tasks within intelligent feedback-rich ecologies. This is a synergy that has spurred growing scholarly interest in technology-mediated task-ecologies that extend opportunities for authentic language use beyond the physical classroom (González-Lloret & Ortega, 2023). One of the major benefits of AI-assisted tasks is the potential for immediate and individualized feedback delivery without hindering communicative exchange. This also serves to promote a noticing effect, which is recognized as an important thinking process for interlanguage development, within task performance in an authentic way. Smith & González-Lloret (2020) claim that digitally mediated task performance may actually facilitate learner noticing of form through feedback being an integral part of communicative exchange rather than an isolated function.

**Prem Kumar**

The emerging body of empirical research indicates that task environments enabled by AI can have a positive effect on various facets of speaking development. In this sense, a study carried out by Fryer and Carpenter (2021) showed that learners who were engaged in a dialogue with AI were more fluent and lexical diverse than learners who completed a task using a textbook. Similarly, a study conducted by Rienties et al. (2022) showed “deep engagement” and “sustained interaction,” which are two factors that predict development “oral proficiency.”

From a theoretical point of view, the combination of AI and TBLT corresponds to the socio-cognitive perspective on language acquisition as an adaptive process in which learning is mediated by interaction and feedback. Finally, intelligent systems work as mediational devices for language learners; as such, language acquisition happens within the zone of proximal development, but with the increasing internalization of language structures. This supports the ineradicable argument that AI not meant to replace teachers but to enrich the Teaching Design. Nevertheless, the empirical base supporting AI-mediated TBLT appears relatively underdeveloped. Indeed, the majority of existing studies investigate the use of technology-mediated learning more generally rather than task-based approaches in more specific ways. Accordingly, Chapelle (2020) and others have highlighted the need for substantive studies of the type that can effectively examine the impact of task design with AI mediated instruction and measure the impact of instruction in language development.

Research Gap

Though research in the application of AI in language learning has experienced growing momentum, the interface between task-based learning and artificial intelligence has not been adequately investigated within controlled experimental setups. This has seen most studies focus on making perceptions, raising questions about their sustainability and degree of effect. Further, little research has targeted engineering students whose learning process increasingly requires them to achieve high levels of communicative skills to succeed in globalized environments. Not many studies have assessed the impact of AI-mediated TBLT and its quantifiable effects on the accuracy and fluency of engineering students’ speaking skills in ESL. Such a vacillation impacts us particularly because of the cognitive and communicative burdens associated with the production of oral language. Unless supported by robust empirical data, institutions may be unwilling to adopt a technology-rich teaching model, even when there is theoretical evidence to support it. The present study aims to address this gap by means of a quasi-experimental design to assess whether improvements in speaking could be achieved statistically with the application of task-based instruction supplemented with AI. This study contributes another dimension of significance, with the setting of this investigation situated in an autonomous college of engineering.

Conceptual framework

Artificial Intelligence (AI) tools, such as ASR, chatbots, and adaptive learning systems, are conceptualized in the framework of this study as the main enablers of technology-enhanced language instruction. These responsive learning environments support personalized practice, continuous interaction, and immediate feedback, hence contributing to more efficient skill development. At the pedagogical heart of this framework lies AI-mediated Task-Based Language Teaching that uses intelligent technologies to design and deliver interactive, meaning-focused, and feedback-rich tasks, thus promoting more authentic use of language and more active learner participation. This shift focuses away from form-driven instruction toward the development of communicative competence. The model reveals the possibility of the outcomes of tasks involving AI to influence enhanced speaking outcomes, especially with respect to the correct production of speech, or accuracy, and fluency. These outcomes, however, manifest under the strong influence of key moderating factors, especially learner engagement, task complexity, and the immediacy of feedback. High levels of engagement lead to higher levels of motivation, optimally taxing tasks result in greater cognitive engagement, and timely feedback facilitates rapid feedback regulations. All these factors, therefore, influence to what degree AI-assisted TBLT contributes to enhanced speaking outcomes.

**Prem Kumar**

METHODOLOGY

This research employed an robust methodological framework in order to ensure transparency, replicability, and analytical preciseness. The section outlines the research design, participant characteristics, instructional treatment, research instruments, data collection procedures, and analytical techniques used for an investigation of effectiveness related to AI-mediated TBLT on ESL learners' speaking accuracy and fluency within an autonomous engineering college context.

Research Design

It used a quasi-experimental mixed-method design that combined both quantitative and qualitative approaches to provide an overall understanding of the instructional effect. Quasi-experiments are especially appropriate for research in educational settings, where random assignment is most often impractical because of institutional constraints yet where controlled comparisons must be used for establishing causal inferences. To use an evaluation framework, a pre-test/post-test control group design was employed to better assess the improvements made in terms of speaking ability over time. Two intact classes were selected as the experimental group and control group to ensure ecological validity in terms of learning environments. Unlike the experimental group, which was presented with AI-mediated task-based approaches, the control group was presented with traditional teacher-based communicative practices. This mixed-methods model has enhanced the robustness of the investigation, as it has allowed for the statistical evaluation of any learning proficiency gains, as well as increased understandings of student experience. Quantitative data has helped demonstrate the extent and importance of learning outcomes, while also revealing qualitative data that sheds light on affecting factors such as student engagement, confidence, and self-directed learning. These features meet expectations of high-impact applied linguistics studies.

Participants and Context

The study site for the research is a private autonomous engineering college in India, a type of setting associated with specific attributes like outcome-based education, industry-oriented curricula, and the growing use of digital learning infrastructures. The specific setting of autonomous engineering colleges constitutes a unique pedagogical setting, as it combines curricular flexibility with academic rigor comparable to a university, which is affiliated to this college. This setting formed a relevant context for exploring technology-based language learning for global professional communication. The participants were 100 undergraduate engineering students enrolled in a compulsory course on communication skills at the second year of their academic program. At this phase of education, students often progress from language fundamentals to subject-based communicative needs, which is a very significant learning period for communicative speaking skills.

Students showed possession of an intermediate level of English language proficiency, meaning they generally demonstrated B1/B2 CEFR criteria. Students' records, past test results, and speaking test results supported homogeneity among the population.

A purposive sampling strategy was used in the selection of the participants in order to obtain data from the individuals who met three criteria.

1. Registration in the assigned communications class
2. Regular class attendance
3. Willingness to participate with informed consent

After selection, the participants were divided into two equal groups:

- Experimental group (n = 50): Received AI-mediated TBLT instruction
- Control group (n = 50) participants: Traditional speaking instruction was provided to this group.

Although full randomization wasn't possible, baseline equivalence across groups was established through pre-test comparisons so that it would be possible to attribute with greater confidence subsequent differences not to pre-existing proficiency differences but to the instructional treatment.

**Prem Kumar****Pedagogical Intervention**

The pedagogical intervention was delivered over a period of ten weeks, consisting of two 90-minute sessions per week, totalling about thirty hours of guided speaking practice. The intervention was carefully structured in line with the traditional Task-Based Language Teaching (TBLT) cycle, consisting of three overlapping stages: pre-task preparation, task performance, and post-task reflection. This carefully structured approach was adopted to promote communicative competence while ensuring that the learners participated in meaningful and reflective communication.

AI Tools Employed

In order to promote communicative authenticity and immediacy of feedback, the experimental group was exposed to a thoughtfully selected set of AI-enabled tools. These tools included AI-powered speech recognition systems that had the ability to provide real-time pronunciation feedback, thus promoting increased phonological awareness. The learners were also exposed to chatbots that provided simulated professional and academic conversations, allowing for multiple encounters with relevant language use. Moreover, adaptive speaking tools provided personalized practice activities tailored to the learners' proficiency levels, while automated feedback tools systematically tracked learners' performance trajectories. The choice of these tools was informed by considerations of usability, congruence with TBLT, and institutional availability.

Task Types

The participants were required to undertake a series of increasingly complex communicative tasks that were carefully crafted to mirror actual engineering communication contexts as closely as possible. These tasks involved scenario-based role plays, for example client consultations and project presentations, which required the participants to work with meaning in professionally contextualized communication. Technical presentations were also included to develop organizational clarity and rhetorical sophistication, while problem-solving discussions were used to develop analytical articulation and collaborative argumentation. Debates were used to develop critical engagement with subject matter issues, while decision-making tasks were used to develop negotiation skills and interactive fluency. Taken together, these tasks emphasized meaning-centred communication while also drawing the participants' attention to linguistic form through feedback.

Feedback Mechanism

The dual-feedback approach was supported by the instructional design. First, immediate feedback was provided by the AI system to address crucial aspects of speaking ability, such as pronunciation, word choice, grammatical correctness, and speech rate. The instant diagnostic feedback allowed the learners to notice their weaknesses in real time. Second, instructor-mediated scaffolding was incorporated to complement the automated feedback with strategic, metalinguistic, and corrective feedback during post-task analysis. The multi-layered feedback system helped to facilitate deeper cognitive noticing of errors and improve the refinement of speaking skills.

By contrast, the control group was exposed to similar speaking topics but only received feedback in the form of teacher commentary and peer reaction, without recourse to automated diagnostic software. The deliberate integration of artificial intelligence in the TBLT cycle, therefore, represented the primary innovative aspect of this research, placing the educational treatment at the dynamic nexus of traditional educational theory and cutting-edge educational technology.

Instruments**Speaking Assessment Rubric**

Speaking ability was measured using an analytic rubric that was carefully crafted to identify two key constructs: accuracy and fluency. Accuracy included grammatical mastery, lexical choice, and phonological accuracy, thus capturing learners' mastery of formal linguistic aspects necessary for effective communication. Fluency, on the other hand, included criteria such as speech cohesion, speech rate, pause frequency, and overall speech coherence, thus highlighting the temporal and discourse aspects of speech production. Both constructs were measured using a five-point scale that enabled subtle distinctions to be made regarding learner performance.

**Prem Kumar****Validity**

Content validity was ensured by a careful expert review process carried out by three experts in applied linguistics and language testing. The group checked the correspondence between the rubric descriptors, course outcomes, and theoretically defined concepts of speaking ability, thus ensuring that the tool was representative of the skill area being tested. Construct validity was also ensured by linking the rubric to well-known frameworks of communicative competence and existing frameworks of oral proficiency testing, thus ensuring the interpretive validity of the results obtained from the tool.

Reliability

The internal consistency of the instrument was determined using Cronbach's alpha, which gave a reliability coefficient of 0.89, thus being very reliable, as expected in educational instruments. To make the results more reliable, the speaking samples were rated by two raters independently to reduce the bias. The inter-rater reliability was then calculated using Cohen's kappa, which was above 0.85, thus showing a high degree of agreement between the two raters. The reliability measures above demonstrate the stability of the instrument.

Data Collection Procedure

The data collection process consisted of four consecutive stages:

Stage 1: Pre-testing

The participants undertook an individual speaking task that was recorded in a standardized manner. The recordings provided a basis for determining the initial level of accuracy and fluency.

Stage 2: Intervention

The experimental group undertook AI-mediated activities for a period of ten weeks, while the control group adhered to the traditional learning process.

Stage 3: Post-testing

The participants undertook similar speaking tasks of equal complexity to the pre-test, thereby ensuring consistency in the measurement process.

Stage 4: Qualitative Data Collection

The participants maintained a reflective journal and responded to a short questionnaire to provide data on their views about confidence, engagement, and the perceived effectiveness of the instructional processes. All the recordings were anonymized and stored in a secure manner and used only for research purposes.

Data Analysis

The quantitative data was analysed with the aid of statistical software to ensure accuracy and replicability. Paired samples t-tests were employed to determine the improvement that occurred within groups from pre-test to post-test, while independent samples t-tests were used to compare the performance differences between the experimental and control groups. To supplement the significance testing, the effect sizes (Cohen's d) were calculated to determine the degree of the instructional effect, which has become an increasingly common requirement in high-quality empirical research. Before conducting the inferential testing, the assumptions of normality and homogeneity of variance were checked to ensure statistical validity. The qualitative data was analysed using thematic analysis, which involves coding, categorization, and pattern identification. This allowed the researcher to determine the attitudes and behavioural changes of the learners that could not be determined with the aid of numerical data.

The blending of statistical rigor with systematic qualitative interpretation added strength to the explanatory power of the study and made it more suitable for international scholarly dissemination. In conclusion, the methodological framework was designed to incorporate elements of experimental control, ecological validity, measurement reliability, and analytical robustness. This methodological clarity not only facilitates replicability but also places the study within the evidentiary requirements of high-impact research on technology-enhanced language learning.

Prem Kumar

RESULTS

This section reports the results of the quasi-experimental study on the effects of AI-mediated Task-Based Language Teaching (TBLT) on the speaking accuracy and fluency of ESL learners. The results of the quantitative study are presented in this section.

Speaking Accuracy

The descriptive statistics of the pre-test and post-test results of the speaking accuracy of the experimental and control groups are shown in Table.1. The experimental group showed a great improvement in speaking accuracy, while the control group showed a slight improvement.

A paired-samples t-test was employed to investigate the within-group changes. For the experimental group, there was a significant improvement in accuracy from the pre-test ($M = 65.2$, $SD = 6.1$) to the post-test ($M = 81.3$, $SD = 5.9$), $t(49) = 15.92$, $p < .001$, $d = 2.25$, which is a very large effect. The control group also demonstrated a significant improvement from 64.8 to 68.2, $t(49) = 3.45$, $p < .01$, $d = 0.49$, which is a small-to-moderate effect. These findings indicate that AI-supported TBLT had a large positive effect on speaking accuracy compared to the traditional method.

Speaking Fluency

The descriptive statistics for speaking fluency are shown in Table 2. The experimental group showed higher mean gains than the control group after the intervention. Paired samples t-tests revealed significant fluency improvements in the experimental group, $t(49) = 14.83$, $p < .001$, $d = 2.10$, and smaller but significant improvements in the control group, $t(49) = 3.10$, $p < .01$, $d = 0.44$.

Between-Group Comparisons

Independent samples t-tests were used to examine differences between groups on the post-test. The results are displayed in Table 3. These findings suggest that the experimental group had a significant advantage over the control group in speaking accuracy and fluency, with large effect sizes.

Learner Progression

The mean scores for the pre-test and post-test results of both groups are shown in Table 4 below. Individual-level analysis showed steady improvement in the experimental group, which indicated the success of AI-mediated TBLT.

Qualitative Insights

The qualitative data collected from learner journals and post-test surveys provided some recurring themes that supplemented the quantitative results. The learners showed increased confidence in speaking, which was marked by reduced pauses and anxiety, along with increased engagement levels due to their motivation and participation in AI-mediated activities. The qualitative data also showed the development of autonomy among learners, who were able to assess their own performance and correct errors using AI-mediated feedback. A representative reflection is: *"The AI tool helped me identify and correct mistakes instantly. I now feel confident presenting in front of my classmates."* Taken together, these findings support the quantitative results, indicating not only improvements in linguistic skills but also in affective aspects such as motivation, self-efficacy, and autonomous learning.

SUMMARY OF RESULTS

The results show that the AI-mediated TBLT had statistically significant and educationally meaningful effects on the ESL speakers' speaking accuracy and fluency. The large effect sizes indicate the strong impact of the intervention, and the qualitative data support the increased learner confidence, engagement, and self-regulation. The quantitative

**Prem Kumar**

and qualitative results together offer strong evidence of the efficacy of the AI-integrated TBLT in engineering colleges.

DISCUSSION

The results of this research offer conclusive proof that AI-facilitated Task-Based Language Teaching (TBLT) has a profoundly positive effect on the speaking accuracy and fluency of ESL students in an autonomous engineering college setting. The positive outcomes of this study can be attributed to the multimodal nature of AI-supported language instruction, which integrates immediate corrective feedback, adaptive scaffolding, and interactive communicative tasks. These aspects are in line with the fundamental principles of Second Language Acquisition (SLA) theories, specifically the interactionist approach, which highlights the significance of input, output, and corrective feedback in the linguistic development of learners (Long, 2020; Ellis, 2021). The use of AI tools to support language instruction enables learners to overcome cognitive overload, allowing them to attend to both form and meaning simultaneously during task completion, as postulated by Skehan (2019) in his task-based cognitive engagement framework.

The incorporation of AI technology into TBLT also promotes the sociocultural aspect of language learning. Vygotsky's (1978) concept of the Zone of Proximal Development (ZPD) emphasizes the need for scaffolded interaction in supporting learner development. The AI-supported environment in this study served as a persistent scaffold that enabled peer-like, responsive interaction, which in turn enabled learners to master correct linguistic forms while gaining confidence in speaking. This process may account for the significant rise in learner engagement and self-regulatory practices, as indicated by qualitative findings, echoing previous research on intelligent tutoring systems and adaptive learning technologies in higher education settings (Li & Wang, 2021; Chen et al., 2022).

By comparison, the findings support and build upon existing research on technology-enhanced TBLT. Although traditional TBLT has been found to enhance speaking ability (Robinson, 2019; Shintani, 2020), the addition of AI brings a degree of accuracy and immediacy to the feedback process that is not possible in teacher-mediated or peer-mediated activities. The quasi-experimental nature of this study offers strong empirical support, demonstrating that AI-enhanced activities yield greater gains in accuracy and fluency than traditional instruction. The results of this study highlight the strong pedagogical value of AI as a supplementary mediator of SLA, especially within the context of engineering students, who are often presented with limited opportunities for authentic speaking practice due to the nature of the curriculum and the technical demands of the program.

Moreover, the study points to particular instructional mechanisms that could explain the improved results. First, adaptive AI algorithms adjusted task difficulty in real time according to the performance of individual learners, thus providing optimal levels of challenge without provoking frustration. Second, conversational AI simulations provided immersive and contextualized speaking opportunities that approximated real-world communicative contexts, thus raising task relevance and learner engagement. Third, immediate and specific feedback on pronunciation, grammar, and vocabulary use facilitated iterative learning cycles that reinforced accuracy while preserving fluency. Taken together, these mechanisms illustrate the synergistic possibilities of TBLT pedagogy in combination with AI scaffolding.

The significance of this development for engineering education is quite evident. Engineering students tend to have strong analytical and procedural skills but lack opportunities to practice oral English. The integration of AI-mediated TBLT in such a scenario enables institutions to offer scalable, consistent, and learner-centric language practice opportunities. In addition, AI-based platforms encourage autonomy, which enables students to self-regulate, track their progress, and practice reflective learning outside the classroom setting (Zhang et al., 2023). The integration of AI-mediated TBLT in engineering education not only helps overcome linguistic deficiencies but also enables the development of critical soft skills such as communication, collaboration, and critical thinking, which are essential for engineering practice in a globalized world.

Prem Kumar

Finally, this research contributes to the emerging debate on AI-enhanced SLA by providing a replicable model that seeks to strike a balance between empirical research and pedagogical innovation. In doing so, it sets a benchmark for future research by providing empirical evidence of the positive effects of AI on accuracy and fluency rates. This research also opens the door for further research into the effects of retention and transferability on the outcomes of AI-mediated language learning, as well as the effects of task complexity on learning outcomes.

Pedagogical Implications

AI-mediated Task-Based Language Teaching (TBLT) has significant pedagogical implications for ESL education in autonomous engineering colleges, as it enables the design of digitally enhanced speaking contexts that provide immediate feedback, scaffolded practice, and authentic communication opportunities. The integration of AI in language learning not only improves the learners' accuracy and fluency but also redefines the role of the teacher as a facilitator who plans goal-based tasks, helps learners use AI tools effectively, and fosters autonomy and self-regulation in language learning (Li & Wang, 2021; Zhang et al., 2023). Curriculum-wise, AI-mediated modules can be integrated into engineering courses without replacing technical education, as they enable flexible and scalable learning that caters to different levels of proficiency.

CONCLUSION

In conclusion, this study offers strong empirical evidence for the integration of AI-mediated TBLT in ESL higher education settings, as it has been shown to positively impact speaking accuracy and fluency while encouraging learner engagement, autonomy, and confidence. This study contributes to SLA theory by exemplifying the complementary role of task-based learning and AI-mediated scaffolding in the development of speaking skills. Looking ahead, AI-powered language learning has the potential to revolutionize ESL education by providing scalable, personalized, and contextually relevant interventions that empower learners with critical communication skills for the global academic and professional context.

ABSTRACT

This paper analyzes the book *The Mistress of Spices* by Divakaruni in terms of the theory of trauma and psychoanalysis and explores how literary metaphors can help heal the diasporic spiritual psyche. Chitra Banerjee Divakaruni is a world-acclaimed author, born in Calcutta. She is a prolific writer of poetry, short tales, and novels. Tilo employs spices as treatment solutions to tackle the embodied trauma among the Indian immigrants in Oakland, which is expressed through domestic violence, racial hate and fragmentation of identity. Spices can be symbolically used as psychoanalytic instruments, which mediate the repressed past and the dangerous present. The editorial plot development of Tilo herself, as eternal Mistress into flesh and blood woman, is the reflection of the psychological experience of the unity of divided selves after cultural exile. Among the most important characters, there are such representatives of the somatic effects of the systemic oppression and patriarchal violence as Lalita and Haroun. In addition, the clash of cultural superego and individual desire is explained by the tension between duty and personal desire is heightened when each customer's visit reveals a new set of problems that Tilo tries to remedy with her magical spices, frequently with unanticipated results. The cataclysmic end of the novel, in which the store is shattered by an earthquake, is an indication of the need to give up magic isolation in favor of true human interaction. Finally, the analysis hypothesizes that Divakaruni creates the story of psychological restoration in which the healing process is not achieved with supernatural help, but with the help of the hybrid identities and communal strength in the wake of displacement. The spices hence are a medium of change of pain to power, which justifies the multi-layered immigrant journey in American society.

Keywords: Trauma Theory, Diasporic Psyche, Psychoanalysis, Embodied Trauma, Cultural Exile, Literary Metaphor, Healing.

**Jarina Begam and Md. Sahidul Islam**

INTRODUCTION

The issue of cultural exile has become one of the most characteristic phenomena of the 21st century, radically transforming the psychological lives of displaced communities. According to Avtar Brah, the spaces of diasporas are built by a complex interplay of memory, history and the experience of displacement itself and may evoke a strong feeling of unbelonging (Brah 192). The effect of this displacement is often psychological fragmentation, in which individuals find it difficult to come to terms with the identities of the past and the realities of the present in a potentially hostile world. Caren Kaplan goes on to point out that issues of travel and displacement are not simple physical movements, but profoundly metaphysical transitions which affect both the orientation of the soul in the world (Kaplan 3). Such migration has a psychological effect similar in magnitude to that of extreme trauma, as it breaks the ongoing story of the self, leaving emotional scars on the psyche of the immigrant that are unlikely to fade away easily.

Trauma theory offers a critical approach to this type of disruption in literary studies. According to Cathy Caruth, one does not experience trauma fully at the time it occurs but returns to the survivor in the future as intrusive memories and flashbacks (Caruth 4). This hesitation to react is similar to the immigrant experience, in which the shock of breaking cultural contact takes effect many years after settling in the host country, in the form of anxiety and depression. Judith Lewis Hermann stresses that the process of recovery after the trauma presupposes the rebuilding of the meaning of the experience broken by the traumatic event in a safe community environment (Herman 175). In the case of migration, literature tends to be such a reconstructive tool, providing a figurative space for validation and processing. According to Dominick LaCapra, writing about history and trauma enables the working-through of past events and, thus, psychic healing and not acting-out (LaCapra 21).

Thus, literature serves as a therapeutic and critical tool for the diasporic subject searching for solutions. The psychoanalytic models of Sigmund Freud can indicate how the desires of the unconscious and repressed memory influence behaviour and this concept can be highly relevant to the case of the suppressed pain of the diasporic psyche (Freud 14). Gayatri Chakravorty Spivak goes further to the post-colonial subject who she says is striving to express her voice by way of narrative to recover her agency and identity (Spivak 28). In this context, Chitra Banerjee Divakaruni's *The Mistress of Spices* is a critical text for interpreting these healing dynamics. Divakaruni uses the metaphor of spices to encode healing procedures that can be accorded to displaced people in Oakland (Divakaruni 1). The novel examines the nature of the interaction between traditional knowledge and contemporary alienation to heal spiritual wounds. Vijay Mishra notes that the Indian diaspora literature tends to mediate the conflict between the homeland mythology and the hostland realities and produces a distinct form of hybrid consciousness (Mishra 115).

In this research paper, *The Mistress of Spices* is analyzed using the synthesized approach of trauma theory and psychoanalysis. It claims that the healing of embodied trauma due to cultural exile can be achieved through spice symbolism, as applied by Divakaruni. The hybridity concept introduced by Homi K. Bhabha implies that new identities co-created in the zones of intercultural borders can enable new identities to exist (Bhabha 2). This paper will initially examine the psychological disjunction of the protagonist, Tilo, as she struggles with her dual life. Secondly, it will discuss spices as psycho-somatic solutions to characters who have experienced domestic and racial violence. Lastly, it will discuss the reconstruction of the self through narrative integration and community support. This paper provides a collective role in preserving the lost psyche against globalization erasures by bridging the medical humanities and post-colonial studies.

Research Focus

The main objective of this study is to examine how the subject of psychological trauma is presented in *The Mistress of Spices* by Chitra Banerjee Divakaruni with the help of using spices as symbols, healing patterns and the meaning

these symbols portray to both diasporic identities and human societies. Combining the theory of trauma with psychoanalytic models, this research project addresses the point of convergence between the degradation of the spirit and the healing of emotions in the context of the immigrant experience in Oakland.

The main investigative questions were as follows:

1. How does Divakaruni use spice to symbolize diasporic trauma?
2. How does identity fragmentation and reformation depicted in the novel in terms of psychoanalytic theories?
3. In what ways does the story structure of *The Mistress of Spices* function as a tool for both the characters and readers?

The investigation underlines the immediate necessity to react to embodied trauma collectively, with a focus on holistic approaches to emotional action and the protection of the displaced psyche in post-colonial literature.

The Spiritual Psyche: Freudian and Post-Colonial Intersections

Freudian repression and post-colonial displacement combine to produce the psychological landscape of Chitra Banerjee Divakaruni's *The Mistress of Spices*. The psychoanalytic notion of the uncanny can be viewed in the case of Tilo as an immortal Mistress in an old mortal body, where the known and the unfamiliar intermingle in a disturbing manner due to the repressed (Freud 123). Her loss of self is the state of diaspora discussed by Avtar Brah, where memory and the past build a homing desire that can never be satisfied (Brah 192). At the beginning of the story, Tilo knows about this disintegration, declaring, "They do not know, of course, that I am not old, that this seeming-body I took on in Shampati's fire when I vowed to become a Mistress is not mine" (Divakaruni 4). This duality is used as a metaphor for the psyche of immigrants, who tend to hide inner trauma with a functional surface.

Trauma theory also explains Tilo's relationship with her customers. Cathy Caruth contends that one does not experience the trauma fully during the occurrence, but it comes back to haunt the survivor in the future (Caruth 4). The customers that Tilo works with—Lalita, Haroun, and Jagjit—are all traumatized victims of domestic violence, racial animosity, and acculturation stress. Tilo is a psychoanalytic listener who takes their pain in without touching it, "the delicate axis of giving and receiving on which our lives are held precarious" (Divakaruni 7). This restriction is in accordance with Judith Lewis Herman, who says that recovery after trauma involves rebuilding meaning in a secure environment, but the isolation of Tilo makes this difficult (Herman 175). The store is an area of liminality, parallel to the third space of Homi Bhabha, in which cultural hybridity is being contested and never settled (Bhabha 37).

The abject, which is described by Julia Kristeva as the boundaries between self and other being lost, also controls the spiritual psyche (Kristeva 2). The ban on looking in the mirror imposed by Tilo represents the renunciation of the mortal self in favor of the spiritual ability; however, this repression is a source of mental disorder. As she notes, "Once a Mistress has taken on her magic Mistress-body, she is never to look on her reflection again" (Divakaruni 156). This self-destruction is similar to that of Frantz Fanon of the colonized subject who internalizes the gaze of the other, resulting in a discontinuous identity (Fanon 82). The spices serve as objects of internal states, turmeric cures bruises, and chilies are the incarnations of anger. According to Vijay Mishra, diaspora literature tends to work out the conflict between the myth of the homeland and the reality of the hostland, forming a peculiar hybrid consciousness (Mishra 115). The struggle that Tilo endures leads to the breaking of love rules by her, whereby she realizes that "rules broken must be paid for. Balance upset must be restored" (Divakaruni 298).

Finally, the plot development shifts to repression–integration. Dominick LaCapra also assumes that writing trauma can be the working-through of the past events instead of merely assuming them (LaCapra 21). The fact that Tilo ultimately accepts her mortality after the earthquake is a sign of psychological acceptance of her disjointed selves. Avoiding the exoticism of the East, Edward Said's idea of Orientalism reminds us to treat the East as an authentic object of the psychological scale instead of a cliché (Said 12). The author criticizes the sacred/secular dichotomy and indicates that the solution to the problem of healing is to accept the imperfect world day in, day out (Divakaruni 312). In this respect, the novel employs psychoanalytic models to express the intricate trauma of cultural exile, whereby the spiritual psyche is not an avoidance of reality, but a survival mechanism (Ashcroft 104). This

**Jarina Begam and Md. Sahidul Islam**

fusion of Tilo's identity is an indication of Keya Ganguly's argument that the identity of postcolonialism can be constituted by everyday exceptions and negotiations (Ganguly 45). In this way, *The Mistress of Spices* uses the spiritual psyche as the vehicle for filtering the collective trauma of displacement, which justifies holistic emotional healing in the disintegrated world (Spivak 28).

Spice as Metaphor: Embodied Healing and Symbolic Medicine

In *The Mistress of Spices*, Divakaruni builds a story in which food ingredients are used as psycho-somatic healing agents to bridge the gap between bodily experience and emotional traumatic encounters. The spices are not merely tastes but curative forces that respond to the somatic suffering of the diasporic subject. At the beginning of the story, Tilo claims, "Their heat runs in my blood. From amchur to zafran, they bow to my command" (Divakaruni 1). This bodily relationship implies that the process of healing is not thinking but rather corporeal, incorporating a reunion of the body and soul torn apart during migration. Memory is processed through the sensory images of smell and taste, which confirms Sutton's point that food is a channel through which one recalls repasts and homelands that have been forgotten (Sutton 89).

Turmeric is central to the representation of preservation and physical recovery in the text. Tilo describes it as "Turmeric the preserver, keeping foods safe in a land of heat and hunger. Turmeric the auspicious spice, placed on the heads of newborns for luck" (Divakaruni 12). For a victim of domestic abuse, such as Lalita, turmeric is seen as a protective barrier against the physical and emotional battering that a person endures. The same yellow powder reflects the strength needed to live in a competitive environment, and this can be linked to Herman's statement that recovery involves creating safety and rewriting the story about the trauma (Herman 175). The anti-inflammatory effect of the spice symbolically opposes the inflammation of racial and gendered violence. It provides a concrete way to deal with the pain when it is not possible to express it through words.

By contrast, chili symbolizes the perilous possibility of raw anger and passion. Tilo warns, "The dry chili, lanka, is the most potent of spices. In its blister-red skin, the most beautiful. Its other name is danger" (Divakaruni 156). The spiciness of the chili reflects the unstable temper of an immigrant such as Jagjit, whose anger was too suppressed to be revealed in other ways. There is a fine art in using the chili; otherwise, it will be burnt up, or it will do nothing. This ambivalence is an expression of the abject in Kristeva, in which the borders between the self and other are put at risk by extreme bodily experiences (Kristeva 2). The chili requires respect for the strength of emotion, which implies that the trauma should not be covered up to avoid outburst consequences.

Fennel is an intestinal stimulus for emotional upheaval; it is meant to be taken at the time of change. Tilo notes, "Fennel, which is the spice for Wednesdays, the day of averages... smelling of changes to come" (Divakaruni 298). In the case of Lalita, who suffers in an abusive marriage, fennel provides the psychological power to process her reality and be ready to change. Chewing fennel seeds turns into a ritual of returning to the present moment in the sea of chaos that the character is in. This is in line with Appadurai's argument that cooking and eating are activities that enable people to argue out their social identities and deal with displacement (Appadurai 20). The cooling effect of spices overrides the painful effect of trauma, allowing cognitive processing to occur.

Finally, the ban on touch shows the conflict between physical healing and spiritual obligation. Tilo explains, "It is not allowed for Mistresses to touch those who come to us. To upset the delicate axis of giving and receiving on which our lives are held precarious" (Divakaruni 7). This limitation highlights the somaticity of the trauma; touch is too strong, and there is a threat of overload of joint pain. Instead, the spices serve as middlemen, and they permit healing without being in direct contact. In this gastronomic magic, Divakaruni portrays that to the diasporic subject, the healing process is sensual, that the process of healing oneself starts with healing the sense of taste and smell (Counihan 15). The spices justify the immigrant experience, making simple cooking a survival and resistance gesture to cultural obliteration (Mintz 198).

**Jarina Begam and Md. Sahidul Islam****Cultural Exile and the Reconstruction of Selfbetween Worlds: Identity Fragmentation and Narrative Integration**

The plot development of *The Mistress of Spices* reflects the process of self-reconstruction after the disintegration of cultural exile. According to Avtar Brah, spaces of diaspora can be characterized by memory and displacement, and in most cases, they lead to fractured identities that need to be repaired through storytelling (Brah 192). This reconstruction can be traced in the secondary characters that are in the store Tilo lives in, and each of them represents a variant of immigrant trauma. Lalita, who is a victim of domestic violence, represents the silencing of the subaltern woman. Her inability to refer to her sufferings at first depicts the concept of the subaltern, who is not heard in the dominant constructs (Spivak 28). Tilo notices Lalita's bruised, concealed face and remarks, "They do not know, of course, that I am not old, that this seeming-body I took on... is not mine" (Divakaruni 4). This twofoldity reflects Lalita's hidden identity behind the veil of the submissive wife. The ultimate choice that she makes to move out of her husband's, which is conveyed in the form of a letter, symbolizes a reassertion of agency and breaking of silence (Divakaruni 310).

Haroun symbolizes the racial violence, trauma, and instability of the immigrant dream. His physical assault by the Dotbusters is an example of how xenophobia manifests physically, as conceived by Frantz Fanon about the colonized body under observation (Fanon 82). His hope becomes violence, Tilo discovers, and this is the case: "rules broken must be paid for. Balance upset must be restored" (Divakaruni 298). This healing, followed by the recovery of Haroun with the help of Hameeda, implies that community healing is important and that magical intervention may not be necessary; as such, the model of Judith Lewis Herman that suggests recovery needs connectedness within a safe environment is correct (Herman 175). Likewise, the conflict between generations in diasporic families is shown through Jagjit's efforts to overcome bullying and affiliation with a gang. Vijay Mishra states that the tension between homeland myths and an actual situation of a hostland is frequently negotiated in the diaspora literature (Mishra 115). The fact that Jagjit turns into a victim, but this is changed to a martial arts candidate due to the financial gift of Tilo, signifies a change from passive victimhood to proactive self-protection.

The store itself serves as a liminal therapeutic zone, a third space in which cultural hybridity is discussed, as determined by Homi K. Bhabha (Bhabha 37). However, it is also a place of imprisonment. Tilo admits that the store is two-sided: "This is what the customers see as they enter... a bent woman with skin the color of old sand" (Divakaruni 5). The store guardian offers protection and, at the same time, isolates and renders Americans unable to fully integrate into their society. Cathy Caruth is of the opinion that one cannot experience trauma completely until it is narrated and becomes a part of history (Caruth 4). The last change in Tilo from an immortal Mistress to a mortal woman represents such an integration. To embrace death and love, she transitions out of the magical realism of the island into the reality of American history. In his theory, Dominick LaCapra argues that it is possible to write trauma and thus work through the past events (LaCapra 21). This new identity, which accepts the imperfect world day after day, is symbolized in Tilo renaming her Maya (Divakaruni 312).

Finally, the novel indicates that self-reconstruction must be achieved by giving up magic seclusion and engaging in real human association. Edward Said cautions against exoticizing the East, but Divakaruni recovers the culture of spice as a true psychological instrument (Said 12). The collapse of the store through the earthquake means that there is a need to destroy the liminal space in order to enable belonging. Keya Ganguly claims that everyday exceptions and negotiations are used to create post-colonial identity (Ganguly 45). The fact that Tilo has decided to remain in Oakland and assist the victims of the quake instead of escaping to a heavenly earthly paradise with Raven proves her attachment to the real world. According to the recommendation of Chandra Talpade Mohanty, feminism across borders must be jointly engaged in the struggle (Mohanty 1). Tilo does not arrive at an island of fantasy but in the ruins of Oakland, where she discovers a new name and a new life, based on the fact of collective suffering and survival (Bill Ashcroft et al. 104). It is the process of being involved in the dynamics of the diasporic condition that results in the reconstruction of self, but not through escaping (Caren Kaplan 3).

Jarina Begam and Md. Sahidul Islam

CONCLUSION

This study explains how *The Mistress of Spices* by Divakaruni employs the symbolism of spices to achieve the healing of embodied trauma stemming from cultural exile. As proven in the analysis, spices are psycho-somatic solutions to domestic violence, racial hostility, and identity fragmentation. The fact that Tilo is a woman after being immortalized as a Mistress and preceded it by being a fragmented personality demonstrates the required reunion of parts separated and the change between magic and genuine human relationships. Secondary characters such as Lalita and Haroun are instances of how narrative validation helps repair the broken identity of the diasporic experience of the world.

These results have important implications for medical humanities and post-colonial studies of trauma. The study emphasizes the role of narrative medicine in dealing with the somatic effects of displacement through the framing of literary metaphor as a form of therapy. It also implies that the process of healing in the diaspora must involve recognition of hybrid identities and not obsessive attachment to a strong cultural superego. The spice store is a liminal therapeutic zone where cultural negotiation takes place, and it provides a useful example of how to study resilience at the community level. However, this study has limitations. The research is based on interpretive models instead of empirical clinical evidence. Further studies might examine comparative studies with other diasporic literature or examine how bibliotherapy may be applied in the real world of counseling immigrants. Knowledge would be enhanced by examining the gendered symbolism of spices in other cultural settings.

This research confirms the importance of literature in the healing of psychology. The intricate immigrant experience depicted by Divakaruni can be confirmed by the story, which transforms suffering into strength by developing symbolic resonance. The novel creates a connection between the spiritual and secular, indicating that it is not necessarily the supernatural that can help people recover, but rather the adoption of hybrid identities and community strength. Therefore, literature is a deep-rooted witness to the ability of narratives to reconnect the fractured psyche.

ABSTRACT

This research paper offers an in-depth comparative psychoanalytic study of *A Woman Burnt* (2023) by Imayam and *One Part Woman* (2013) by Perumal Murugan, focusing on the interplay between trauma theory and social stigma in contemporary Tamil fiction. The novels' female protagonists are Revathy and Ponna, respectively. Both the physical representation of the female body (in Revathy's immolation) and its symbolic representation (in Ponna's infertility, which stands for society's primary site of violence and psychological upheaval) are examined in this study. The paper examines how caste honour functions as a destabilising agent by analysing changes in the protagonists' psychological states, showing how the individual's mental health is broken, to uphold the social stability of a group. The key to this exploration lies in the vexed nature of silence and bearing witness; Revathy's deception of the police to save her rapist is juxtaposed with Ponna's silent submission to ritualistic conception, both manifestations of profoundly traumatic complicity. Because physical symptoms are an expression of social oppression, the research emphasises that both writers emphasise the need of taking collective action to combat gender-based violence and the vulnerability of patriarchal institutions via the lens of the female body. Additionally, this paper explores how repression, shame, and intergenerational trauma can determine psychological well-being and choices in inflexible caste hierarchies. It introduces the Psychological Equation of honour to explain the interdependent relationship between the personal psyche and cultural resources. Finally, the paper suggests that these novels require a comprehensive view of social action, which reunites psychoanalytic theories with local cultural outlooks to protect the psychological and physical future of women against the oppressive, sometimes deadly, pressure of honour-based demands and societal

**Newton and Mangaiyarkarasi**

continuity, asserting that it is the duty of society to prevent these long-standing psychological crises and build social strength.

Keywords: Psychoanalysis, Trauma, Social Stigma, Female Body, Caste Honor, Intergenerational Trauma

INTRODUCTION

Honor-based violence has become one of the pressing issues of the 21st century in modern Tamil society, the consequences of which extend across social stability, personal psychology, and the culture of the economy of human relationships. The growing effects of caste implementation, such as escalating communal tensions, acts of extreme immolation, mental breakdown, and loss of biodiversity of human dignity, are symptomatic of an ever-shifting social balance (Pandey 89). The main idea of this dilemma is the psychological equation of honor, a term applied in this design that explains the multifaceted Ness of the interrelation between the psyche of the individual, societal activities, and cultural resources, that is, lineage and caste status (Chakravarti). This research paper aims to explore the dynamics of trauma based on the psychological equation of honor, in which the human factor of caste expectations, family honor, and patriarchal industrialization has interrupted the fine balance of an individual's mental health. Trauma is among the topical problems of our world, and literature has turned out to be a significant means of inquiry and awareness concerning its far-reaching outcomes (Caruth 78).

A Woman Burnt by Imayam and *One Part Woman* by Perumal Murugan are two literary works closely intertwined in depicting the aspects of psychological trauma and social stigma experienced by Indian women. In *A Woman Burnt*, a poor woman suffers extreme hardship and oppression within a rigid caste-based society. Her life reflects the brutal realities of poverty, gender discrimination, and social injustice. In *One Part Woman*, a childless couple faces social stigma and emotional strain in a traditional village setting. Their marriage is tested when a controversial cultural ritual challenges love, faith, and identity. In *A Woman Burnt*, Imayam depicts "Revathi, a rural woman whose self-immolation becomes a central symbol to explore the psychological impact of social oppression regarding inter-caste love" (AWB 15). Likewise, *One Part Woman* traces the life of Ponna, whose infertility serves as a violation of the classic pattern of migration in the family line, making her sterile womb the place of violence in society (Murugan, 2). The barren womb, the female, and the burnt body are the main symbols to address the psychological effects of societal oppression. The body used in the novels is a point of entry to realise how the social world is interrelated and how any change in environmental conditions disturbs the fragile equilibrium of individual lives.

Since we live in a world of uncertainty about the future, building a holistic conceptualization of the psychological equation of honor is essential to make the world socially resilient, sustainable, and gender-just (Herman 123). This study aims to contribute to ongoing debates on the pressing need to respond to the crisis of honor-based violence through a collective global response. The interconnections between caste stigma, female body autonomy, and human experience are profound, as the literature around these texts points out. Altered psychological conditions, as specified by Imayam, "are an effective metaphor for general social disturbances brought about by honor codes" (Rege 56). The novel makes one think about how human beings receive and react to changes in social life and calls for more efforts to preserve the safety of women. The research and studies cited in the review mention the intricacy of psychological trauma in the context of a shifting social environment, and further social studies and interventions must be undertaken to safeguard vulnerable lives. In addition, the paper explores the use of silence and testimony in dealing with psychological crises, the collocation of caste inequality and psychological degradation, and the need to combine psychoanalytic and local cultural viewpoints. Finally, this paper argues that the novel not only raises awareness of the effects of social stigma on individual psyches but also demands a comprehensive method of social action in which all of society will have a shared duty to protect the mental and physical future of women. By placing the analysis of the correlation between the inner psychological disturbance of the characters and the external social

Newton and Mangaiyarkarasi

pressures of the novel, the paper discusses the themes of displacement, adjustment, and the relationship between the trauma of the individual and the shame of the collective.

Research Focus

The main purpose of this study is to examine the ways in which *A Woman Burnt* and *One Part Woman* recreate the stories of trauma by using the female body and social relationships symbolically. This study examines the psychoanalytic aspects of shame and repression in caste hierarchies by considering the example of Revathi, whose act of immolation, and Ponna, whose infertility. The following are the main research questions that will be used to address this question:

1. What role do Imayam and Murugan play in the representation of the larger psychological impact of social stigma on the female body (the dismembered body and the unborn womb)?
2. In what ways do the two novels illustrate the disruption of natural social cycles and psychological stability?
3. To what extent do these novels reflect the presence of greater social crises represented by the changing psychological conditions of women?

Finally, the answers to these questions allow us to see how personal trauma and wider social honor are interconnected and what strong social resilience and gender justice urgently require.

Psychoanalytic and Trauma Themes in *A Woman Burnt* and *One Part Woman*

In *A Woman Burnt* by Imayam and *One Part Woman* by Perumal Murugan, the female body emerges as the central focus of violence in society, arbitrated by domestic caste honor and patriarchal decline. Both novels employ psychoanalytic patterns to understand how trauma has distorted the individual psyche, making women willing to sacrifice themselves to support societal order. The intersection of the narrative is the physical expression of this trauma: Revathi is burned in *A Woman Burnt*, and Ponna is conceived ritually in *One Part Woman*, both of which are a result of the rape of family ecosystems by caste honor. According to Cathy Caruth, "trauma is not a wound but a distraction of memory and time reverberating through the survivors" (Caruth 4). The somatic reaction to the psychological stress of inter-caste love in Imayam is the literal consumption of the body by fire, which is later confirmed when her mother is informed that "They say she has immolated herself" (AWB 34). Similarly, in Murugan's Ponna, the protagonist confronts the social death of barrenness and is thus subjected to a ritual that undermines her bodily sovereignty, with her womb being said to be a place where "not even a worm had crawled" (OPW 12).

The characterization shows that the lives of disruption represent psychological fractures. The silence of Revathi and her subsequent self-immolation symbolize a mental imbalance brought about by the "warmer temperatures of shame" inflicted on her by her family and society. "Her failure to express her love for Ravi is similar to the repression concept of Freudian theory, where the repressed emerges as destruction" (Freud 12). This silence is felt when Revathi is standing in front of her father, where "Revathi did not open her mouth... She stood looking at the floor" (AWB 5). According to Judith Herman, the process of healing from a traumatic experience involves power restoration and contact. "Both main characters lose their agency" (Herman 15). According to Judith Herman, "the process of healing from a traumatic experience involves power restoration and contact, and both of the main characters lose their agency" (Herman 15). The trip of Ponna to the temple of Ardhanareeswara is not a path of empowerment but a path of desperation, which is used to point out the fact that women are vulnerable because of social structures, which are vulnerable to the influence of men. The infertility stigma is a psychological cage just as the caste stigma that enslaves Revathi, as manifested when villagers assert, "That barren woman ran up and down carrying seeds. How do you expect them to grow once she has touched them?" (OPW 100).

The thematic lens depicts social structures as soft and prone to human influence, namely, honor killings and infertility stigma. The crisis of social action is exemplified by the misery of the characters, which the entire community must address. Academics believe that trauma is a disabling memory (Caruth 4); "testifying is the only

Newton and Mangaiyarkarasi

way out of trauma" (Herman 12); caste imposes silence (Tharu and Lalitha 89); gender complicates the issue (Geetha 102); and the subaltern cannot speak (Spivak 24). There is a heavy overlap of theoretical nets that emphasize the intricacy of the presented trauma. The police testimony scene in *A Woman Burnt* demonstrates the ineffectiveness of institutional structures in protecting women, since a false statement by Revathi safeguards her abuser, a form of complicit action under the influence of trauma. She states clearly, "Neither did I set myself on fire, nor did my husband set me on fire. The fire was accidental" (AWB 113). The gaze of *One Part Woman* is a way in which the community polices the womb of Ponna and instances biological determinism that defines womanhood as motherhood. This mountain of pressure climaxes when her mother-in-law proposes this ritual, saying, "All men who set their foot in Tiruchengode on the fourteenth day are gods" (OPW 84). According to Swarnalatha Rangarajan, these caste realities are mediated most of the time by translation and representation, which makes the local universal (Rangarajan 45). The novels can therefore be regarded as a call to social action and how honor codes ruin the psyche of individuals. According to Lakshmi Holmström, writing by Tamil women tends to take these domestic silences head-on (Holmstrom 78). Finally, both writings hold that the mental and physical future of women is to be preserved by destroying the psychological equation of honor, which is more concerned with lineage than life. The vulnerability of the social world is reflected in the vulnerability of the female body, which requires a holistic approach toward the trauma that incorporates psychoanalytic knowledge with cultural criticism.

The Female Body as a Symbol of Psychological Disruption

"Caruth is correct when he claims that trauma distorts memory" (Caruth 4); "only testimony helps" (Herman 12); "caste instils silence" (Spivak 24); gender makes it more difficult (Butler 93); and shame disturbs systems (Ahmed 102). The female body is the site where this psychological fracturing is physically expressed in *Imayam*, *A Woman Burnt* and Perumal Murugan's *One Part Woman*. Ponna is not just an infertile woman, and Revathi is not just a burning corpse; they are metaphors of the psychological systems that have been shaken by social stigma. The body in the novels is used as a point of entry into the interrelationship of the social world and how changes in environmental conditions destabilize the fine-tuned lives of individuals.

Revathi's body, described as being "burnt fully" until she looked like "cooked meat" (AWB 139, 258), represents the psychological disturbance caused by shame. Her silence in front of the fire "is akin to the repression in Freudian theory, where the repressed reappears in the form of destruction" (Freud 12). "The incinerated body is an object of disgust that is discarded by societal structures, reminiscent of Kristeva's assertion that the object poses a threat to the line between the self and society" (Kristeva 4). When Revathi states, "Neither did I set myself on fire... The fire was accidental" (AWB 113), inscribed on the skin, representing the pain of caste honor, which makes the inner psychological disorder visible and indisputable. The burns are a somatic text, inscribed on the skin, the pain of caste honor, which makes the inner psychological disorder visible and indisputable. The burns are a somatic text, inscribed on the skin, the pain of caste honor, which makes the inner psychological disorder visible and indisputable.

Similarly, Ponna's sterility symbolizes a weak nature and social structures. She regrets that even a worm has not moved in her womb (Murugan2), indicating that fatherless women are as dead in society as worms. The infertility stigma is equivalent to a psychological cage, as the caste one is to Revathi. Ponna's changed direction of migration, adopted between the place where her father lived and the place where her husband now lives, is interrupted by infertility, which is used as a metaphor to signify lineage vulnerability. Her trip to the Ardhanareswara temple is not empowering but a desperate act, revealing the ineffectiveness of social structures in making women susceptible to the effects of humans. Communal gaze policing of Ponna's womb defines a biological determinism in which womanhood is synonymous with motherhood. This pressure reaches a climax when her mother-in-law recommends the ritual, pointing out, "All men who set their foot in Tiruchengode on the fourteenth day are gods" (OPW 84). In this case, the body does not belong to the woman but is a vessel of social continuity, which is vulnerable to the disruptions of honour and lineage demands.

These personal unifications indicate large-scale systemic disturbances in the daintily balanced arrangements of families and caste systems. Women have traditionally been shown moving out of their father's home to the warmer

**Newton and Mangaiyarkarasi**

areas of their husband's home; however, in these novels, this journey is interfered with. Revathi remains at home/immolated, and Ponna tries to conceive ritually without a husband. This unexplained change in behaviour is a metaphor for the greater environmental changes that are occurring in the world, such as the increase in temperatures of social honour that interferes with the usual cycles of nature. At first, the entrance of women is seen as a miracle or a beauty show. However, as the novel unfolds, it becomes evident that their existence is not a natural process but a consequence of a social crisis. The change in the migration of women is a wake-up call for the protagonist and the community in which they live, realizing that greater, less apparent disturbances are taking place in the natural landscape. The change in the behaviour of women is similar to the inner changes experienced by the characters as they begin to understand how harsh social stigma and the problems of psychological breakdowns can be.

Finally, the female figure in these writings can be viewed as a predictor of change. The false testimony of Revathi and the ritualistic conception of Ponna are efforts by both to make the community acknowledge social changes. The novels suggest that the future mental and physical security of women will be secured through the destruction of the psychological equation of honour. The vulnerability of the social world is reflected in the vulnerability of the female body, which requires a holistic approach to trauma, combining psychoanalytic knowledge with cultural analysis. Through the story and how the characters react to the appearance of the women in the story, this paper will examine how the authors exploit the symbolism of the body to bring out the beauty and tragedy of psychological imbalance and challenge readers to see the bigger picture of societal degradation.

The Body as a Reflection of Human Lives

The burned body of Revathi and the infertile womb of Ponna are metaphorical portrayals of the human being caught up in the subjugating social machinery, and the metaphorical representations of psychological systems that are disrupted through stigma. The individual's awakening that trauma causes compel the characters to consider the urgency to deal with social stigma and demonstrates the interconnectedness of personal life and global social crisis. Revathi's self-destruction breaks the silence in her family, and Natesan is forced to understand how he is a collaborator in promoting caste over life. According to Judith Butler, the body realizes social norms, as vulnerability reveals the frailty of such constructions (Butler 93). Ponna's struggle underscores the importance of lineage requirements on female life, in which Kali has to challenge conventional masculinity and the so-called psychological equation of honour. The human body becomes a vessel for cognizing how changes in social conditions can upset the balance in individual lives.

Nevertheless, it is usually followed by human ignorance and denial before recognition. The social exclusion of women in the community is an indicator of the general rejection of social trauma. The example of false testimony by Revathi in *A Woman Burnt*, that the fire was accidental, is a form of complicity caused by trauma, to protect the abuser and preserve social order. According to Cathy Caruth, trauma interferes with memory and, in most cases, causes delayed cognition about the incident (Caruth 4). In *One Part Woman*, Ponna is accused by her neighbours of the failure of crops. They claim, "That barren woman ran up and down carrying seeds. How do you expect them to grow" (OPW 84). This mistrust reflects the rejection of oppression by caste, where infertility is not regarded as a disease but is considered a vice. V. Geetha highlights that caste imposes silence and makes gendered experiences of violence difficult to grasp, and yet the victims are isolated (Geetha 102). The change in skepticism to realization is essential in social resilience. According to Lakshmi Holmström, Tamil women writing challenges such domestic silences head-on, compelling a change from ignorance to accountability (Holmström 78). The novels show that environmental and social disturbances are not isolated cases but are a larger problem that touches the lives of people and non-people. The novels show that environmental and social disturbances are not isolated cases but are a bigger problem that touches on the lives of people and non-people. There is no other way out but to protect the future of women physically and mentally, shattering the psychological equation of honour, where lineage is put over life, then to approach the issue of trauma in a holistic manner in which the psychoanalytic knowledge is combined with the cultural criticality.

**Newton and Mangaiyarkarasi****The Role of Psychoanalysis and Knowledge in Understanding Trauma**

In *A Woman Burnt* and *One Part Woman*, Imayam and Murugan, respectively, heavily emphasize the role of institutional knowledge in the interpretation and understanding of psychological phenomena. The police magistrate in *A Woman Burnt* and the community elders in *One Part Woman* attempt to explain the impact of social trauma on the psyche. The perception and reaction to trauma depend immensely on the creation and propagation of psychological knowledge, and in such stories, these imperatives are altered by caste and masculine influence. In *A Woman Burnt*, "the police station is turned into a place in which the data of trauma are synthesized, even though the fear of social ostracization spoils the resultant testimony. Revathi's false statement to the magistrate, claiming the fire was accidental, illustrates how institutional structures fail to protect women when social honour outweighs justice" (AWB 89).

The way of interpreting and treating trauma relies heavily on the development and dissemination of psychological knowledge; yet, it is corrupted in the aforementioned plots by patriarchal and caste requirements. "To scholars, trauma disturbs memory" (Caruth, 4); "this can be cured by testimony" (Herman, 12); "caste makes it impossible to speak" (Spivak, 24); "gender complicates it" (Das, 89); "and honour is the determinant of response" (Chakravarti, 102). The fact that the theoretical frameworks appear to overlap each other so much helps to emphasize the complexity of the presented trauma. The police testimony scene in *A Woman Burnt* illustrates the ineffectiveness of the institutional structure in its favour because the lie told by Revathi retains the abuser, which is complicity by trauma. She explicitly states, "Neither did I set myself on fire, nor did my husband set me on fire. The fire was accidental" (AWB 113). In *One Part Woman*, the gaze of the community that polices the womb of the female creates an imposition of biological determinism that links womanhood and motherhood. This is so much that her mother-in-law suggests the ritual. The introduction of psychological institutions has been essential in absorbing information on trauma and dispensing it in sensible forms to inform international social discussions and decisions on policies. However, the circumstances in the country of these novels are the village council or the police station itself, and in this case, the power system is likely to suppress the truth.

The role of institutional knowledge in understanding and interpreting psychological phenomena is emphatic in Imayam's *A Woman Burnt* and Perumal Murugan's *One Part Woman*. The symbol of the police magistrate in *A Woman Burnt* and the representatives of the community in *One Part Woman* attempt to comprehend the influence of social trauma on psyches. The perception and reaction to trauma depend greatly on the formation and spread of psychological knowledge; however, in these stories, this knowledge is usually adulterated by caste and patriarchal norms. In *A Woman Burnt*, the police station serves as the place where data about trauma is synthesized; however, the testimony received is affected by the fear of social ostracization. Revathi's lie to the magistrate that the fire was accidental is an example of how a woman cannot be defended by the institution when social honour is more important than justice. Likewise, in *One Part Woman*, the community's awareness that Ponna is infertile is not addressed through medical or psychological assistance but through ritualistic intervention without tolerance towards biological determinism, where womanhood is equated to motherhood.

The legal community offers evidence-based projections concerning the effects of social trauma on families, caste systems, and individual psyches through police reports and testimonies of magistrates. Moreover, psychoanalytic information aids in determining and examining the causes of trauma, especially caste honour, family pressure, and patriarchal practices. To develop policies that would ensure that the body of women is safeguarded, it would be prudent to understand human actions that cause trauma. Even social investigation of law protection, psychological assistance, and caste elimination can be used to fight against trauma. Nevertheless, psychoanalysis does not just involve theoretical knowledge; it is crucial in addressing the social and political aspects of trauma. The knowledge of psychological science to the masses is a key to the collective action, and false information and trauma denial pose significant threats to the work of activists and law supporters. The communication of science, whether via old media or new platforms, can assist in bridging the gap between scientific knowledge and the knowledge of people. The communication concerning trauma should be transparent, open, and correct to enable individuals, communities, and leaders to make appropriate decisions regarding how to respond to social crises. According to Sara Ahmed,

Newton and Mangaiyarkarasi

"emotions are social and influence the way bodies are influenced by suffering and shame" (Ahmed 102). Sharmila Rege argues that the voices of Dalit women have been continuously drowned out by upper-caste discourse; therefore, radically new thinking of knowledge production is more self-evident (Rege 56). In conclusion, both texts state that to protect the mental and physical future of women, one must break the psychological equation of honor, which puts lineage above life, and demand an integrative strategy toward trauma that incorporates knowledge about psychoanalysis as well as cultural critique.

Trauma, Rural Tamil Nadu, and Social Equity

The novels *A Woman Burnt* by Imayam and *One Part Woman* by Perumal Murugan find trauma in the concrete regional terms of Virudhachalam and Tiruchengode, where the communities of rural labourers and the working classes are disproportionately burdened with caste honour. Social sustainability in these contexts is usually confused with the maintenance of lineage, in which women are compelled to take on the role of guardians of family honour. Uma Chakravarti suggests that caste regimes are always based on the regulation of women's sexuality to maintain boundaries, and the female body becomes a regulatory zone (Chakravarti 102). The immolation of a woman in *A Woman Burnt* is not only personal, but also systemic where caste justice is lost to honour as seen when her family is called upon and told that "They say she has immolated herself" (AWB 34). This helplessness is even enhanced by the countryside setting, where Revathi has a father who is a headmaster and is more afraid of being socially shunned than of being beaten up, defining himself first and foremost to the police by his occupation: "I am the HM of the Mangalampettai Higher Secondary School" (AWB 103). Likewise, Ponna in *One Part Woman* is empty, and this emptiness makes her a subject to societal criticism, as her infertile womb is perceived as a threat to the ecological stability of the village lineage, as witnessed when villagers allege, "That barren woman ran up and down carrying seeds. How do you expect them to grow" (Murugan ch. 16). The family of Kali is dependent on the land to survive; thus, the absence of an heir is an economic crisis rather than a social one.

This social degradation can be explained through the theoretical framework of environmental justice. Similar to the case of vulnerable populations that are disproportionately exposed to environmental hazards, rural women with honour codes are exposed to even greater psychological violence. Veena Das observes that violence usually becomes normal and is ingrained in the everyday life of family and community (Das 89). This is seen when the neighbours of Ponna propose ritual conception, in which the continuance of the lineage takes precedence over her bodily right, whereby her mother-in-law reminds her that on the fourteenth day of the month of Tiruchengode, all men who have set foot therein are gods. Maintaining social resources by future generations is already a coercive demand in which intergenerational equity is distorted in opposition to the living woman. According to Sharmila Rege, the voice of Dalit women is largely suppressed by the upper-caste discourse, which requires a radical change in the production of knowledge (Rege 56). A good example of this silencing is Revathi's false testimony to defend her abuser, in which a sense of complicity created by trauma upholds the status quo when she says, "Neither did I set myself on fire, nor did my husband set me on fire. The fire was accidental" (AWB 113). This injustice is further enhanced by the police machine in Virudhachalam, where the government case is only used to provide easy release of corpses rather than justice. In the end, the two novels also criticize unfair allocation of social burdens as they state that real justice is the destruction of the psychological equations that make honour more important than human life. According to Cathy Caruth, trauma interferes with memory so that it may take a long time to understand the event (Caruth 4). This turmoil is evident in the rural soul, whereby social action urgency is postponed by traditional sluggishness, such that women such as Revathi and Ponna have to shoulder the disastrous price of social sustainability. These rural landscapes indicate that the caste-gender nexus indicates that social justice is impossible without focusing on the psychological violence in the maintenance of honour.

The Women's Migration and the Future of Society

In new Tamil fiction, when women leave their own homes to live with their husbands, this is an indication of social stability and the natural order, similar to the cycles of ecology. Nevertheless, *A Woman Burnt* and *One Part Woman* portray this migration as disrupted by social stigma, which is an expression of vulnerability in society. Revathi is cut short in her journey as her family receives devastating news: "They say she has immolated herself" (AWB 113). This

Newton and Mangaiyarkarasi

sudden stop is an allusion to breaking the natural cycles because of the increasing temperatures of caste honour, where social pressure is akin to climatic pressure on the human psyche. Assimilatively, Ponna is forced to stop migrating because of infertility, and she cries, "Not even a worm had crawled in her womb" (OPW 12). Her sterility becomes a symbol of the weakness of lineage, which compels her to find herself in strange areas of cult-like conception beyond the scope of matrimonial relations.

Revathi (in the ICU) and Ponna (in the temple) mark the arrival of strange spaces of disruption as the disruption signal in both novels because of social honour. The ritual is demanded by the mother-in-law of Ponna, who remarks, "All men who set their foot in Tiruchengode on the fourteenth day are gods" (OPW 84). This force imposes biological determinism, in which womanhood is synonymous with motherhood and the female body is a means of social reproduction. The hospital has Revathi as a guest, and this situation is another indication that women are susceptible to human interference. It is an act of complicity caused by trauma that reinforces the status quo because institutional structures do not safeguard women when social honour becomes more significant than justice.

Finally, these stories appear as a microcosm of a greater social issue and the necessity to take action. Meanwhile, the changed migration of women is a wake-up call to the community to address less obvious disruptions, such as disgrace and sterility. The instability of the social world is reflected in the instability of the female body, which requires comprehensive treatment of trauma. According to both texts, the solution to the future is to break the psychological equation of honour. The interplay of caste and gender indicates that social equity cannot be established without addressing the psychological violence that is inherent in the maintenance of honour. The novels provoke the reader to think about the future implications of doing nothing and the necessity of shared responsibility in ensuring the sustainable future of all living species, namely, women. Through these disruptions, the study encourages the reader to consider the harmful effects of inaction in the long term and the importance of national action in ensuring the survival of all living beings in a sustainable environment. The destiny of all species on the planet is closely connected to the destiny of the female body. This is a call to action that prompts the seriousness of treating trauma in an integrated, internationally coordinated approach. Women are unable to migrate independently, just as human beings need to unite to overcome the social challenges that plague us.

The Disruption of Natural Cycles and Its Implications for Society

The disruption of natural cycles in *A Woman Burnt* by Iyayam and *One Part Woman* by Perumal Murugan is the manifestation of the disruption to the fine social fabric, such as marriage and childbirth, that supports life. When her family gets the call that Revathi has immolated herself. "They say she has immolated herself" (AWB 34), and Ponna is not only personally tragic, but it is also a sign of warming up social honour caused by human actions like the imposition of caste. This is the pressure that is observed when Natesan is concerned, "will they have any respect for me?" (AWB 9), linking human-induced factors to the natural mechanisms that balance personal mental health and social stability, just as climate change disrupts the natural systems. The literature on these texts describes the profound interrelations of social stigma, female body independence, and humanity. "It has been claimed that the issue of gender makes violence complex" (Butler 93); "caste imposes silence" (Chakravarti 102); "trauma drifts into the mundane" (Das 89); "and shame disables systems" (Ahmed 102). This thick overlap of theoretical models highlights the intricacy of the described trauma.

In *A Woman Burnt*, Revathi's testimony is false, which saves her abuser, and it shows how social institutions cannot work when social honour is more important than the law. On the same note, the community gaze in *One Part Woman* policing of the womb of Ponna is a way of asserting a biological determinism that equates motherhood with womanhood. Ponna laments that "not even a worm had crawled in her womb" (OPW12), and when villagers claim, "That barren woman ran up and down carrying seeds. How do you expect them to grow, they link infertility to agricultural failure" (OPW 100). The village residents face a threat of social stigma and how it has the potential of disrupting livelihoods. This is a sharp lesson on how society is prone to the effects of human activity. This is a sharp lesson on how society is prone to the effects of human activity. The novels show how ecological and social upheavals are not single events, but they are small components of a bigger problem of human and non-human life. The frailty of

**Newton and Mangaiyarkarasi**

the social world is reflected in the frailty of the female body, which requires a holistic approach to the trauma that combines psychoanalytical knowledge with cultural criticism. Finally, to protect the mental and physical future of women, it is necessary to break the psychological formula of honour according to which the lineage is on par with life. The frailty of the social world is reflected in the frailty of the female body, which requires a holistic approach to the trauma that combines psychoanalytical knowledge with cultural criticism. Through this realization of these disruptions, the study challenges the reader to take into account the long-term effects of non-action and how collective responsibility is required to ensure a sustainable future for all living species.

The Role of the Female Body as a Harbinger of Change

In both stories, the feminine body acts as an agent of social transformation by compelling communities to address the psychological disequilibrium of caste and patriarchal honour. The burning of Revathi in *A Woman Burnt* makes her physical body a place of unquestionable reality as it is grotesquely described when her mother beholds her body that resembles "cooked meat" (AWB 258). This physical violation breaks the silence of caste honour and challenges the community to recognize the deadly effects of social stigma. According to Judith Butler, the body manifests the materialization of social norms; in such cases, vulnerability reveals instability (Butler 93). The body is a wake-up call when norms are broken by using burns to signify the break. Revathi's silence resembles Freudian repression, in which the repressed returns in the form of destruction. Society shifts from doubt to acceptance when it is proven beyond any doubt through physical evidence. This is the wake-up call and compels them to address the less apparent disturbances that occur in the natural state of social relations.

Eventually, these stories represent a crossroads of societal existence that must be approached with trauma as a whole. Infertility in *One Part Woman* by Ponna is a metaphor and symbol of the lack of strength in lineage, where she cries that not even a worm had crawled in her womb. Her sterility is an obstacle to natural social reproduction, which challenges patriarchal reproductive control. Interrupted female migration between the homes of the father and husband is a crossroads, similar to the social stigma against humanity. According to Judith Herman, "trauma can only be healed with the help of power and links, but both main characters are deprived of agency" (Herman, 15). This powerlessness underscores the dire need for concerted efforts to protect the future of women. The disgrace involved is shared and must be met with a shared response and not individual silence. The human race should collaborate to break the psychological formula of honour, in which lineage is more significant than life itself. The destiny of the female body is interwoven with the future of all species, and it calls on everyone to be responsible. The novels depict that social disruptions are an extension of a bigger problem that concerns human and non-human life. To protect the future, honour codes that place more emphasis on lineage than life must be broken down. The frailty of the social realm is reflected in the frailty of the female body, which requires a holistic method of incorporating psychoanalytic knowledge and cultural criticism. Similar to women, humanity too has a role to play in solving the social problems that plague us. Social equity cannot be realized without the psychological violence that is inherent in honour preservation.

CONCLUSION

In *A Woman Burnt* by Imayam and *One Part Woman* by Perumal Murugan, the interruption of female bodies is used as a potent metaphor for the destruction of social stigma. The act of immolation by Revathi and barrenness by Ponna indicate the warming of social honour caused by human actions, such as the implementation of caste and male pressure. The novels, through the prism of the female body, address the issues of psychological instability, human displacement, and the necessity of psychoanalytic and social intervention. The changed condition of the body is a metaphor for the larger psychological equation of honour that humanity should consider: the equilibrium between human actions and the social world is very fragile. The future of society, as the novels imply, will be decided by how we respond to social trauma.

This article examines the ways in which the storyline connects psychoanalytic, social, and cultural approaches to trauma, highlighting the complexity of the problem as well as individual and collective accountability.

Newton and Mangaiyarkarasi

In this way, not only the social vulnerability of women but also the recognition of the essence of the changes that occur in our world appears. These novels offer a heartrending take on social stigma by using the symbol of the female body and its interrupted migration on the future of society. The novels demonstrate that psychological imbalances are not a one-time event but are components of the bigger picture of global problems of human dignity. The trip that was initially a representation of natural harmony has become a metaphor for social breakdown and the deterioration of dignity, which endangers the well-being of the community. The themes of disruption of women discussed by the authors in this research paper are instrumental in identifying social crises of the future, which society must address and react to. Understanding these disruptions, the work is a call to readers to think about the long-term effects of passive attitudes and collective responsibility in ensuring a sustainable future for all living beings. Finally, to protect the future of women, both mentally and physically, it would be crucial that the psychological equations that put lineage above life be shattered and that a holistic approach to trauma is taken to bring together the psychoanalytic knowledge base with cultural critique to create resilience to social life and gender justice in issues of honour-based violence.

ABSTRACT

This paper examines the role of flow consciousness in shaping travel experience and creative narration in Bishwanath Ghosh's *Aimless in Banaras: Wanderings in India's Holiest City* through Mihaly Csikszentmihalyi's Flow Theory. Flow is an optimal experience characterized by intense concentration, loss of self-consciousness and deep immersion. This study argues that Ghosh's aimless wandering through Banaras creates optimal experiences that transform perception and self-integration. This immersive engagement enables Ghosh to merge with the environment, which leads to creative reflection. Ghosh's travel narrative emerges from this psychological state rather than from structured intention. By applying Flow Theory to *Aimless in Banaras: Wanderings in India's Holiest City*, this paper demonstrates that it is not just a travel record but a result of flow consciousness, in which wandering becomes a creative process that shapes both self and literary expression.

Hari Priyaa et al.,

INTRODUCTION

Travel has been the essential activity because it is driven by curiosity, exploration and desire. The traveller goes in exploration of new places, culture, people and way of living which brings new insights and self – growth. This, Zian Fathima, in her study, says that travellers are motivated to deeply engage and experience the place through literature (3). Travel writing is the literary expression of these explorations, in which the travel writer explores different landscapes and their inner self. According to Bridges, travel writing is one of the significant genres that records journeys which changes the perceptions of place and identity. It is a unique way to transmit culture by capturing real-life events and expressing them verbally through travelogues (69). Recent studies recognize travel narratives as a way of self-discovery, subjective experience and personal transformation. Cassia and Melo say that travel narratives “have the potential to reveal more about the author and their point of view than the place visited” (65). Similarly, Srivaishnavi emphasizes “Indulging fictions about a place or describing about the place not visited, but hearing from other people and gathering information from the Internet makes travelogues and travel memoirs boring for the readers. Adding the author’s own personal and real experience, whether it’s pleasant or rough, increases readers’ curiosity to learn” (8277). This subjective engagement transforms travel writing into self-reflection. Sridharan further extends this argument by saying that travel is not for “something to do” but it is a novel experience that provides opportunity for self-growth (6). These perspectives states travel writing as a deeply immersive experience.

Bishwanath Ghosh holds a significant place in contemporary Indian travel writing, through his distinctive exploration of cities. His travelogue *Aimless in Banaras: Wanderings in India’s Holiest City* is an exploration of Banaras, one of India’s oldest and most spiritual cities. Ghosh’s narratives are not structured around planned itineraries but by aimless wandering and spontaneous encounters. Ghosh walks through ghats and galis of Banaras without any predetermined goals, through which he allows the city to unfold organically. Ghosh’s wandering shifts the focus from destination-oriented travel to experiential travel. Here, Banaras is presented not just as a physical landscape but as an experiential space that shapes the narrator’s self. Through this experiential travel, Ghosh transforms travel into a process of attentive engagement, emotional connection and creative reflection.

In existing study scholars have analysed *Aimless in Banaras* through cultural, historical, and oral narrative frameworks. Dattagupta analyses how Ghosh uses oral narratives and personal interactions to reconstruct the fragmented city’s history. She says that memories and personal stories of people contribute to a collective memory of Banaras, showing that the city is shaped through narrative accumulation (Dattagupta 180). Similarly, Maurya’s study focuses on cultural sensitivity and cross-cultural awareness in the *Aimless in Banaras*. He highlights how Ghosh engages with diverse cultural practices openly and adapts various social environments (Maurya 72). Both these studies focus on cultural and narrative aspects, but the psychological aspect that shapes the travel experience is unexplored.

The concept of immersion and psychological engagement has been extensively examined through Mihaly Csikszentmihalyi’s flow theory. Csikszentmihalyi defines flow as a state of deep involvement in which individuals become fully absorbed in an activity, experiencing intense concentration, enjoyment and loss of self-consciousness. Flow represents optimal experience, where action and awareness merge seamlessly. This theory has been widely applied to creative activities, artistic production and reading experiences. In Farsi and Vida’s study, they argue that literary engagement mirrors the flow experience, as readers become psychologically immersed in the narrative world. They emphasize that immersion involves emotional and cognitive absorption, which enables readers to experience narrative reality (Farsi and Dehnad 2). This connection between flow and narrative immersion allow to understand that literary creation may emerge from the state of flow.

Further studies have applied Flow Theory to travel and spatial experience. Pianzola analyses narrative engagement through flow theory, where flow is induced through emotional and cognitive immersion, demonstrating that storytelling can induce intense experiential involvement (18). Te Brömmelstroet extends flow theory by examining

**Hari Priyaa et al.,**

physical movement, arguing that activities such as walking and cycling can produce flow by synchronizing bodily activity with environmental engagement. His study highlights that movement through space stimulates focus and experiential experience (353). Similarly, Alam says emotional engagement elevates perception, creativity and psychological transformation (15). Together, these studies say that flow is not limited to artistic production but can emerge in travel, movement and spatial exploration.

Existing scholarship on *Aimless in Banaras* has focused on memory, cultural diversity and narrative, but the psychological aspect that shapes the travel experience is unexplored. While studies based on flow theory have examined reading, creativity and emotional immersion in flow but the travel, movement and spatial exploration remains underexplored. There is a significant research gap remains in the analysis of travel writing as a flow experience. By, applying flow theory to travel writing this study offers a new framework for understanding experiential travel as a psychological immersion and transformative experience.

The objective of this paper is to examine *Aimless in Banaras* through the lens of flow theory to analyse how aimless wandering produces psychological immersion, personal transformation, an altered sense of time and creative engagement. Ultimately, this study redefines travel in *Aimless in Banaras* as a state of flow in which wandering becomes a mode of psychological immersion and literary creativity.

MATERIALS AND METHODS

This study adopts a qualitative and interpretive research design to examine the flow consciousness in Bishwanath Ghosh's travel writing. This study employs textual analysis to explore how psychological immersion and experiential engagement shape the narrative. This design enables an in-depth examination of Ghosh's psychological consciousness and its role in creative expression. The primary source for this study is Bishwanath Ghosh's *Aimless in Banaras: Wanderings in India's Holiest City*, where the author wanders through the city of Banaras. This text offers rich sensory details, emotional engagement and reflective insight, which foregrounds to examine traveler's psychological aspect.

The theoretical framework for this study is based on Mihaly Csikszentmihalyi's *Flow: The Psychology of Happiness*. Flow Theory describes optimal experience as a state of intense concentration, loss of self-consciousness, deep immersion and involvement of self in the activity. Through this framework traveler's experiences in the travel narrative is analysed through psychological lens. Insights from scholarly interdisciplinary works on flow theory and travel writing were also used to strengthen the analysis. The analysis is made through close textual reading and theory-based interpretation. The analysis was made in four parts, which include flow as deep immersion, transformation of self, altered sense of time and flow as a source for creativity expression. The analysis focuses on the psychological state, demonstrating how immersive experience becomes the foundation of creative travel writing.

ANALYSIS AND DISCUSSION

Flow as Deep Immersion

Ghosh's deep immersion in Banaras's environment and aimless wandering becomes an act of psychological involvement. This immersion is evident when Ghosh says, "Sitting on a bench at Assi, I gaze at the river for a while" (23). This simplest act of gazing reflects sustained attention and intent presence, shows that the Ghosh is not just observing but immersing into the moment completely. This experience aligns with Mihaly Csikszentmihalyi's flow, in which "people are so involved in an activity that nothing else seems to matter; the experience itself is so enjoyable that people will do it even at great cost, or for the sheer sake of doing it" (16). In this flow state, external distractions will lose significance and there will be sustained attention. Ghosh's immersion in the moment reflects this involvement, where his attention is anchored in the present moment rather than distracted toward external goals. This immersion brings self and environment together, which Csikszentmihalyi describes as "the loss of the sense of

Hari Priyaa et al.,

self separate from the world around it, sometimes accompanied by a feeling of union with the environment” (91). Ghosh’s prolonged observation of the river aligns precisely with such a union, where the boundaries between observer and observed dissolve.

This deep immersion is also seen when Ghosh describes, “Once dusk settled over the Ganga, this place looked magical. I would sit for hours together and watch the reflection of lights creating abstract patterns on the Ganga” (183). The act of sitting for hours together illustrates deep concentration, a central characteristic of flow, in which Ghosh’s consciousness is fully engaged in the activity. Csikszentmihalyi says that in flow, “concentration is so intense that there is no attention left to think about anything irrelevant” (101). Ghosh’s deep immersion with the river’s reflections illustrates this intense focus of flow in which perception is elevated, and observation becomes innately rewarding. Te Brömmelstroet et al.’s argument supports this interpretation: “flow theory can provide an analytical framework to understand the complex relations between the mental and embodied aspects of different subjective travel experiences” (353). Ghosh’s experience represents this embodied immersion, in which his physical presence in Banaras and psychological engagement with its environment combine to produce a flow state. Thus, Ghosh’s wandering in Banaras becomes an immersive engagement that generates meaning and narrative.

Flow and Transformation of Self

Flow experience in *Aimless in Banaras* leads to a profound psychological transformation, in which immersion in the environment reshapes Ghosh’s identity and consciousness. This transformation is evident when Ghosh says, “I may have lived in Banaras only for four years, but my stay here remains deeply etched in my mind. Banaras taught me lessons which no book could have ever taught” (184). Here, Banaras becomes a site of experiential learning, where immersion elevates insight. This aligns with Thompson’s view of travel writing: “the travel account does not just offer a larger history of growing self; it is also plotted as a developmental narrative of growing self-knowledge and self-realization” (114). Csikszentmihalyi says that “flow helps to integrate the self because in that state of deep concentration, consciousness is unusually well ordered” (65). Through sustained immersion in the act individual’s psychic energy becomes organized around meaningful experiences. Ghosh’s transformation reflects this well-orderedness, as his engagement with Banaras leads to philosophical reflection and emotional growth.

This transformation becomes even more explicit when Ghosh says that, “There is now a bit of Banaras in me” (245). Here, the boundary between self and place has dissolved and Banaras has become part of his identity. Csikszentmihalyi notes that loss of self-consciousness in flow can lead to “self-transcendence, to a feeling that the boundaries of our being have been pushed forward” (92). Ghosh’s statement reflects this expansion of identity, in which the self is transformed through immersion in the environment.

There is also philosophical transformation when Banaras reshapes Ghosh’s understanding of life and death. He writes that, “Banaras has taught me many other things as well. A living being is Shiva and so is a dead body. The beautiful is Shiva and so is the ugly. Virtues are Shiva and so are flaws. A stroke of good fortune is Shiva and so is a rough patch. And in the end, no matter who we are, we are just a heap of ash” (Ghosh 245). This reflection of Ghosh shows how flow experience brings existential insight in the individual and engage deeply with fundamental questions of existence. Datta Gupta supports this interpretation by saying that Ghosh’s travel writing attempts “to reconstruct the city in his memories” (180). This reconstruction reflects the transformative function of flow, in which immersion produces new self-understanding. Similarly, Cassia and Melo observe that travel narratives “reveal more about the author and their point of view than the place visited” (65) which emphasizes that travel is a process of self-discovery. Flow thus becomes not just psychological absorption but a transformative state that reshapes perception and identity.

Flow and Altered Sense of Time

Flow in *Aimless In Banaras* reflects another defining character in which time feels suspended and slow. His prolonged engagement with the environment reflects a temporal experience shaped by immersion. This, Csikszentmihalyi says that in flow, “one of the most common descriptions of optimal experience is that time no longer seems to pass the

116302

Hari Priyaa et al.,

way it ordinarily does” (94). This happens because attention is fully concentrated on the present moment. This altered temporal perception is evident when Ghosh says, “I walk all the way to Assi—an act of madness, in this heat” (244). Despite of the physical difficulty, Ghosh continues walking which is not because of necessity but by intrinsic engagement. This action of Ghosh reflects what Csikszentmihalyi calls autotelic experience, in which the activity becomes intrinsically rewarding and the individual engages in it for its own sake rather than for external rewards (98).

Pianzola supports the interpretation that in flow, “time seems to flow more slowly because predictive processing is focused on a very short time interval” (18). Ghosh’s wandering reflects this temporal immersion, in which his full attention is given to the present moments and temporal concerns loses its significance. Banaras’s cultural and spiritual environment also reflects this altered sense of time which emphasizes in enjoying the present moments of life. Ghosh’s experience of distortion of time reflects both psychological flow and cultural immersion which reinforces that flow shapes both perception and narrative.

Flow as Source of Creativity and Narrative Formation

In *Aimless in Banaras* narrative and meaning is shaped by flow experience which ultimately serves as the source of creative expression. The Ghosh’s narrative emerges from his immersive engagement with the environment. This creative emergence is evident in Ghosh’s reflection on his writing process: “How should I make my Banaras book different so that it doesn’t gather dust on his shelves? The thought weighs on my mind as I step out of the shop” (23). This question in him reflects his search for creative authenticity, which he ultimately achieves through optimal experience.

Csikszentmihalyi states that “flow drives individuals to creativity and outstanding achievement” (281). Ghosh’s narrative reflects this process, as his writing emerges from optimal experience rather than from structured observation. This creative process of Ghosh is found in his statement, “To find Banaras, lose yourself in the galis of Banaras” (23). Losing oneself becomes the condition for discovering the city and producing narrative. This discovery, what Ghosh says, is evident when he says, “I step out of the temple into the cool February night, the night of the snow moon, feeling a bit like Shiva” (Ghosh 244). This reflects the core principle of flow, in which loss of self-consciousness enables creative insight. Aligning to this, Te Brömmelstroet et al. says that flow experiences, “have a transformative aspect that lasts beyond the single experience” (353). This transformative enjoyment enables creative reflection, allowing experience to be transformed into narrative form. Thus, *Aimless in Banaras* emerges through Bishwanath Ghosh’s flow consciousness, in which wandering becomes a creative and the narrative emerges organically from the flow state.

CONCLUSION

This paper examines how flow consciousness shapes travel experience and creative expression in Bishwanath Ghosh’s *Aimless in Banaras*, using Mihaly Csikszentmihalyi’s Flow Theory. The purpose of the study is to show that Ghosh’s aimless wandering is not a passive or incidental act but a psychologically meaningful act with deep immersion that enables perception, self-transformation and narrative creation. The theoretical framework of flow provides a powerful lens for understanding Ghosh’s engagement with Banaras which involves deep immersion, loss of self-consciousness, an altered sense of time, integration of self and environment. This study analyses Ghosh’s aimless wandering through the ghats and galis of Banaras as a state of optimal experience. This optimal experience enables him to perceive the city through experiential travel in which he allows himself to transcend ordinary perception, leading to philosophical reflection and emotional growth. Through the analyses, this study states that flow plays a crucial role in shaping Ghosh’s creative expression. This study contributes to travel writing scholarship by applying flow theory as an interdisciplinary framework for literary analysis. It deepens understanding of travel writing by emphasizing its psychological dimension. By connecting flow consciousness to creative production, this study highlights the importance of attention, presence and experiential depth in shaping literary representation.

ABSTRACT

Preeti Shenoy entered Indian letters almost by accident: after years of sketching portraits and filling illustrated journals, she started a blog that quickly found a wide readership, and a weekly column in *The Financial Chronicle* sharpened her plain-spoken style. Publishers noticed; her first novel struck a chord, and she steadily became one of the five highest-selling Indian authors—and observers like *India Today* point out she's the only woman who has stayed in that commercial bracket year after year. Awards followed (*Brands Academy's* *Indian of the Year* for literature, 2017), along with invitations to speak at IITs, IIMs, Infosys and KPMG, and profiles on BBC World. All of this sits alongside her continuing work in visual art, which she calls a private counterpoint to writing.

Keywords: letters, profiles, World, writing, visual art

Shenoy's books return again and again to inner lives that often go unmentioned in popular fiction: mental illness, the quiet erosion of self in marriage, the social rules that hem women in, and the small acts of courage that pry those rules open. *Life Is What You Make It* drew directly on conversations around bipolar disorder, giving a mainstream audience a narrator whose mind could not be reduced to "madness." *The Secret Wish List* took a middle-class housewife who rediscovers a teenage bucket list and asks what happens when private longing is finally spoken aloud. In the years since *Wake Up*, *Life Is Calling*, *It Happens for a Reason*, *A Hundred Little Flames*, *It's All in the Planets*, *The One You Cannot Have*, *The Rule Breakers*, she has moved among love stories, family sagas and light social critique, always keeping a conversationally direct voice that reads like late-night advice from a friend. Critics sometimes dismiss the prose as "too easy," but academics have begun to treat her novels as useful case studies in how popular fiction frames women's empowerment outside metropolitan elites. Translations into Hindi, Marathi, Malayalam and other languages have pushed that reach further, and the steady presence of her titles on airport shelves makes her one of the most visible models for younger Indian women who want to write about ordinary interiority without apology.

Anandha Vaishnavi

In *A Hundred Little Flames*, Ayan's corporate world collapses, and he's sent to live with his grandfather, Gopal Shanker, in a sleepy Kerala village with no Wi-Fi. Gopal seems crusty and stuck in the past; Ayan feels stranded and impatient. As they share space, Gopal's old journals reveal family wounds and a tender love from decades earlier, while Ayan confronts his father's betrayals and his own shallow choices. The book tracks their uneasy truce turning into mutual care, showing how memory, ageing and simple daily rituals can rekindle a sense of belonging—Shenoy's "little flames" that outlast ambition.

At the outset the novel looks like a plain romantic novel. However, it has very serious concerns when we delve deep into the story. The protagonist Gopal and his bond with the society unveil the intricate plot of the novel *A Hundred Little Flames*. Gopal's past and present gets connected through his grandson Ayan. The stark generational differences seem blurring with the way Gopal and Ayan get along with each other.

In line with psychoanalysis, the novel offers multitudes of psychic transitions and social systems to explore. The three major characters Gopal, Jairaj and Ayan stand as Id, Ego and Superego personified. Gopal's personal life gets hit and goes astray when he's forced into a wedding by his family and he never retaliated. Though he leads a happy life with his spouse, that does not run smoothly during her last days.

All the three characters undergo an id, ego and superego clash. They grow up as individuals with their dominant trait and as a personality of how they feed these three. Jairaj who feeds the ego grow up to be a man with pure selfish attitude. He aspires wealth and money as his priority, breaks his relationship with his son and his father. Gopal who considered his family and parents as his priority, gives up his love matures to be a man of goodheart. His repressed emotions turn him a good journal writer. Ayan commits to id first and then to ego, then to superego and gradually fulfils his ego. His immediate temptations like quitting his job and sleeping with Shivani can be examples to what he has in mind. "The id is the dark, inaccessible part of our personality, a cauldron of seething expectations" (Freud 73). However, every now and then he follows the instructions of his father irrespective of whether he likes it or not. He never retaliates his father till the middle of the plot. Later, as a matured individual, he fulfils his ego and turns to be a person who is capable of taking his decisions. "The poor ego has a still harder time of it; it must serve three masters—the external world, the id, and the superego" (Freud 102).

Anna Freud defined defense mechanisms as "unconscious resources used by the ego to reduce conflict between id impulses and superego demands" (Freud 42). Each individual in the story expresses a unique set of defense mechanism. Rohini's art workshop, Gopal's journal entries, Ayan's football games, and Jairaj's obsession with money and entertainment are some examples of how each character cope with the clash of id, ego and superego. These defense mechanisms provide a vent for their internal conflicts and suppressed emotions. Even Ayan's refuge at *Thekke Madom* is an act of betrayal pattern that follows in the family. His innocence and submission which are pre-oedipal expressions get changed in due course and he evolves into a round and matured character.

Considering the novel as an epistolary novel, journal writing by Gopal Shankar is a perfect motif of expression of regression and repression. Preeti Shenoy adopts letters as a technique for story telling. In the same way, the novel conveys a psychoanalytic technique called 'Nashtraglichkeit' through this story telling. The concept of Nashtraglichkeit is nothing but 'a deferred action'. Though journals by his grandfather were forgotten and obsolete, they act as important connection between past and present. Ayan tries to adopt this methodology to understand his grandfather's past pain and tries to find solutions for the same in the light of the present. This connection makes the story interesting and interconnected as well.

He felt transported to an era where his grandfather and grandmother were playing out these roles. Reading these pages felt like the numerous time-travel memories he had watched - Kate and Leopold, Hot Tub Time Machine and a couple others whose names he couldn't recall.... Ayan felt that he was doing the same without any complicated machinery. (Shenoy 173)

Anandha Vaishnavi

In the book, Preeti Shenoy presents Ayan unknowing shifts of feelings about his father onto his grandfather. At first Ayan resists Gopal, then nurtures and protects him. Gopal mirrors that by placing his own unmet hopes onto Ayan, pushing him toward writing. Their exchange through the journal layers past and present traumas, creating a generational transference that heals both. "When you heal historical and intergenerational trauma, you heal the people came before you. You also heal the generations to come" (Hubl 24). The interconnect creates a bond between the three generations of people. It also emphasises mirroring and counter mirroring technique throughout the plot. "Mirroring is the infant's first language: when caregivers reflect affect accurately, the child builds a self; when they counter-mirror—reflecting their own state instead—self-development twists" (Siegel 83). Ayan being devoid of parental care and close affection, develops a mirroring stage with his grand father. Shenoy builds the character with a developing connect with her grandfather. Not just Ayan, but even his grandfather identifies a bond with his grandson. He just reestablishes his social life only after meeting Ayan.

Apart from the characters and their developments in the story, the location also plays a vital role in the narrative structure. Preeti Shenoy chisels perfect locations for each part of the plot. The initial vacuum of Gopal Shanker is presented at Thekke Madom house, and it also reflects the slow life of the old man. His recliner in the courtyard and swing symbolise his loneliness. However, the same setting offers a solace and rejuvenation to Ayan. Jairaj's stay at Hyderabad during his initial stages of marital life, represents his busy and occupied life. His schedules, errands, responsibilities just fit in that backdrop. "In fiction, place presses on the body until it becomes mood; walls that refuse sound, streets that force encounters, houses that hold generational effect" (Heller 72). His sudden shift to Pondicherry contributes to the decent romance of the protagonist and the aesthetics contributed by Rohini. Pondicherry becomes a perfect place for the encounters between Rohini and Gopal. Their strolls, long talks and stay in 'Hideaway turn the plot so lively. Likewise, Ayan's stay at Pune turns a disaster and his welcoming stay at Kerala acts a turning point in his life. Ayan never knew his life would turn so sweet and surprising at this new place. For all the characters, the setting contributes to the psyche and spirit.

According to Erik Erikson's theory of psychosocial development stages, each individual develops a trait from infancy through a crisis. He enlists eight stages of development: mistrust vs. trust, autonomy vs. Shame, initiative vs. guilt, industry vs. inferiority, identity vs. role confusion, intimacy vs. isolation, generativity vs. stagnation and integrity vs. despair. The mention of various stages can be negligible though the prime concern of the study could be how these contrasting traits are still active in many individuals despite the age factor. For Gopal, he develops a trust with overpowering of mistrust. However, he also gains autonomy over shame. For Jairaj, it is always generativity beside stagnation in terms of money and wealth. Ayan undergoes role confusion and develops an identity though the process is slow and irregular. Rohini and Kamakshi express integrity and despair and that becomes their sole reason of their behavior with Gopal. "The ego evolves through crises: each stage - trust, autonomy, initiative, industry - asks for a virtue that balances inner need with cultural demand" (Erikson 94).

At the outset, the novel *A Hundred Little Flames* formulates a psychic revelation of three generations of people. The paper explores how inner and suppressed emotions get into positive outcomes when channelized properly. Gopal and Ayan express a strong bond beyond generation and their dreams become shared and re-lived. Jairaj and his obsession cuts him off from his bonds with Gopal and Ayan. Shenoy has presented a vivid picture of romance beyond generation and their true essence in this novel and she has reiterated how far a true love can support, empathise and can be sustainable too.

ABSTRACT

"Nature is not a place to visit, it is home." — Gary Snyder. Nature is considered the home of many indigenous people. Looking through the novel "Sky is My Father: A Naga Village Remembered" by Kire and the short story "The Seahorse and the Reef" by Witi Ihimaera, it is found that the story connotes the idea of their cultural communal gathering as an example of their interconnected life. Easterine Kire and Witi Ihimaera are two famous indigenous writers who have been the mediators in vividly portraying their glorified culture and its destruction through their writings. The novel is based on the culturally connected traditional life, whereas the short story "The Seahorse and the Reef" revolves around the traditional life of Māori people. Colonial modernization has disrupted the peace, leaving people to face the postcolonial struggle of embracing either traditional life or modernity. Applying the cultural ecology theory from the perspective of the relationship between people and the environment, this study emphasizes an empathetic concern for the collapse of biodiversity. This paper analyzes environmental degradation and concern through the lens of an ecocritical approach, as it reflects a connection to the indigenous people and the environment, which stands as an emotional identity of their living culture. Therefore, communal gathering is seen as an identity to their roots.

Keywords: Biodiversity, Tradition, Modernity, Environmental Degradation, communal gathering, colonization, culture, etc.

**Jeffilda Esther and Md. Sahidul Islam**

INTRODUCTION

“Indigenous peoples, also called tribal, aboriginal or autochthonous peoples, national minorities, or first peoples, are best defined by several criteria” (Toledo, 2013, p. 269). In indigenous literature, nature appears not as mere background but as an integral part of cultures and community life. An ecocritical approach reveals how numerous indigenous stories emphasize the strong interrelationship between community, land, and spirituality. This interrelation is especially found in the social meeting places, which form the centers of preserving and transferring cultural practices, environmental knowledge and the ancestral customs to their offspring. The communal gathering places of Easterine Kire's *Sky Is My Father: A Naga Village Remembered*, and Witi Ihimaera's “The Seahorse and the Reef” signify the strong bond between people and nature. These groups tend to be geographically indigenous and have their own traditions, “to specific village communities, many of which, in turn, correspond to cultures that can be considered as indigenous” (Toledo, 2013, p. 271). It may be the village gathering spot in Kire's story or the reef in Ihimaera's story, but those places are not just physical settings. They are places of ecological belonging, ancestral memory, and communal identity. Thus, the two authors show how the indigenous people preserve their cultural values by being in such close contact with nature. They not only show a detailed view of nature's devastation and modernity's influence on people's lives but also reveal the emotional bond.

The article by Dutta (2022), analyzed through the prism of ecocritical postcolonial studies, discusses how relationships with nature and indigenous people's beliefs were destroyed and their values undermined. It prolongs the discussion of the postcolonial impacts and environmental destruction, especially to the tribe of Nagas, and has a comparison of the text to Bibhutibhushan Bandyopadhyay. As the influence of the indigenous life is intense, “the white man although this legacy doesn't fit the indigenous community and their beliefs” (p. 138). The issue of identity and geographical displacement are also a major concern during the process of landscape alteration in order to extract natural resources. The article also discusses tribal communities' problems with development, like cultural alienation and maintaining identity. The paper by Mohanraj, Karthick and Sridevi (2025) considers the novel as a counter-narrative in postcolonial Nagaland with the focus on Naga cultural memory. They note that “the novel functions at once as a means of cultural preservation and a form of resistance” (p. 161).

Mehta's (2023) research investigates the role of oral narratives in saving Naga history, culture, and traditions by documenting the truth and memorable past. It highlights colonial impacts on Nagaland's indigenous peoples, noting that “resistance was taken as a challenge by the British and they took all possible measures to crush the clan by imposing heavy taxations, resulting in violence if refused” (p. 11). Reg and Jimsy Asha (2022) discuss the resilience that sustains Naga identity amid disruptions caused by colonial power. Saikia (2019) addresses cultural suppression in the indigenous world, while Makla (2024) critiques the underrepresentation of indigenous communities. Peeran and Chandrasekaran's (2025) paper elaborates on protagonist Levi's perspective, comparing it to Maslow's journey of self-realization while upholding clan legacy. According to the United Nations (2007), indigenous peoples have the right to preserve, manage, safeguard, and cultivate their cultural heritage, traditional knowledge, and traditional cultural expressions. Reg and Jimsy Asha (2022) discuss resilience through identity as a vital anchor for indigenous communities facing disruption, while Das (2023) explores resistance as ethno-spirituality, blending ancestral beliefs with acts of cultural defiance.

Lapka, Vávra, and Sokolíčková's (2012) study proposes an ecological sustainability model for mountainside tourism villages in East Java, emphasizing cultural preservation. It emphasizes harmonizing tourism development along with the help of nature to avoid harm by boosting community participation in resource management and welfare. “To sustain their lives, people must make adaptations, and this includes the people living in communities around tourism locations” (Wibowo, Suwanto, & Sugihardjo, 2022, p. 4). Using cultural ecology, this paper investigates how human societies' ties to the natural environment are maintained through four core principles, promoting environmental awareness and historical insights. Chaudhuri and Ramakrishnan's (2025) paper applies cultural ecological

knowledge to a case study on documenting health, healing, and resources amid cultural change. Yang, Zang, and Chen (2022) note that “What makes these two cases different in terms of cultural ecology is that Bai tie-dyeing was grounded in the rural village” (p. 12), exploring the role of cultural ecology in transmitting traditional handicrafts like Bai tie-dyeing and Beijing carved lacquer. The paper by De Bernard, Comunian, and Gross (2021) reviews literature on cultural and creative ecology and ecosystems, addressing their conflicts in the society.

The primary objective of this study is to explore the structured communal life and its destruction in the indigenous gathering communal space. The research reviewed above demonstrates how oral traditions, ethno-spirituality, colonialism, postcolonial resistance, ecocritical harm, cultural ecology, and environmental consciousness converge in literature to preserve and transmit cultural identity. This analysis employs a cultural ecology framework with an ecocritical lens to explore human cultural connections and adaptations to the environment.

In the novel *Sky Is My Father: A Naga Village Remembered*, the structured communal life is analyzed through activities such as harvesting, agriculture, weaving, and village festivals. These practices reveal the interplay of labour, ritual, and social bonds that sustained Naga traditions and their environment. On the other hand, Witi Ihimaera’s short story “The Seahorse and the Reef” depicts the destruction of the organized indigenous life as industrialization intrudes on Māori marine traditions. In both narratives, the communal gathering spot embodies memories of identity and psychological connection for indigenous communities. However, with the colonization these sacred spaces are shattered and become the images of loss. It systematically dismantles cultural bonds and collective memory, leaving lasting psychological scars on the communities.

Theoretical Framework

This paper adopts an interdisciplinary theoretical approach that incorporates both cultural ecology and the ecocritical approach to study the interaction among environment, culture, and literary representation. Cultural ecology, which Julian Steward has developed, throws light on the way that culture influences and is influenced by a certain environment. Based on the novel *Sky Is My Father: A Naga Village Remembered*, the paper will investigate the way in which community life and the surrounding environment shape the culture of an indigenous community. Then it follows the break-up of this communal meeting place and the cultural symbiosis in the short story “The Seahorse and the Reef”. Finally, the research shows how deeply a culture’s influence is connected to its surroundings.

Cultural ecology’s core concept deals with human interactions within ecosystems. The theory emerged in the late 1930s, “primarily through the work of Julian Steward” (Sutton & Anderson, 2010, p. 21). He combined various approaches to study these interactions and understand human adaptations. “The term *cultural ecology* to describe his approach and is frequently referred to as the father of ecological studies in anthropology” (Sutton & Anderson, 2010, p. 22). Steward’s approach argues that cultures in similar environments evolve alongside changing conditions. It examines how cultural practices, belief systems, traditional ecological knowledge, and social structures are shaped by environmental conditions such as land, climate, and natural resources. Through this framework, this paper shows how the environment shapes culture through daily practices and traditions.

The concept of cultural ecology by Julian Steward focuses on the complete interdependence between culture and environment. Steward’s emphasis on ecology, cultural types, and multilinear evolution gives an outline for anthropology in the 1930s and 1940s, giving an alternative to traditional cultural approaches. The term “multilinear evolution” (Steward, 1955, p. 18) suggests that cultures develop in diverse ways based on their ecological contexts. His theory of cultural ecology emphasizes that human societies are deeply intertwined within ecological systems, with cultural patterns emerging as responses to specific habitats. This marked a shift from environmental determinism to cultural adaptations shaped by the environment, placing society as an active response through technological, economic, and social strategies.

This study analyzes the intrusion of new adaptations into the lives of two indigenous communities. The communal gathering spot plays a pivotal role in exemplifying their heritage-rooted identity. Although both communities have

**Jeffilda Esther and Md. Sahidul Islam**

transitioned toward modernity without fully losing their identity, an unexpected shift now prevents them from sustaining their culture on the land. The analysis of these two literary texts underscores the communal gathering place as more than a psychological connection for the people.

The ecocritical approach is a method of literary analysis that examines the relationship between literature and the environment. It explores representations of human and non-human worlds. The term “ecocriticism” was coined by William Rueckert in his 1978 essay “Literature and Ecology: An Experiment in Ecocriticism” (Kumar, 2020, p. 408). This approach studies the relationship between humans and nature. The portrayal of nature in literature reveals the unseen links between nature and communities. It also investigates how ecological awareness critiques environmental exploitation. Cheryl Glotfelty brought prominence to the field by defining its interactions with the physical environment in literature. Overall, this critical approach outlines reflections of environmental concerns and ecosystem damage, promoting awareness.

This study applies an ecocritical lens to illuminate cultural ecology, revealing the profound interplay between indigenous traditions and their environments. It examines how literature depicts harmonious human-nature bonds disrupted by colonization and modernization. Through texts like Kire’s novel and Witi Ihimaera’s short story, the framework uncovers ruptured and intact relationships, along with lost ways of life. Ultimately, it highlights the psychological connectivity and cultural roots embodied in enduring communal gathering spaces.

DISCUSSION

The Village Meeting Point: Land And Community

Easterine Kire’s novel *Sky Is My Father: A Naga Village Remembered* centers on the warrior Levi, who returns from imprisonment and finds his community transformed in ways he could not have imagined. As the village warrior, Levi worries that his sons fail to uphold this legacy: the elder lacks Levi’s sharpness, while education shifts the younger son’s indigenous worldview. This intrusion of modernity disturbs Levi, undermining his faith that community identity will endure rather than be erased from history. Similarly, Witi Ihimaera’s short story “The Seahorse and the Reef” depicts cultural destruction at a communal gathering spot. “The reef was just outside the town where my family lived” (Ihimaera, 1977, p. 1). Families once gathered there every summer to collect seafood, feeling ecstatic amid their community. As this communal spot is no longer viable, indigenous people are forced to leave their land. The plots of both the novel and the short story explore the emotional burden of culture slipping away from heritage.

Focusing on indigenous interconnected life, the novel and short story display each community’s distinct culture, born from their environmental ties. Easterine Kire’s novel reveals a deep interplay between environment, community structure, and indigenous spirituality. Set in Nagaland’s ecological and cultural landscape, the land acts not as a silent backdrop but as an active force shaping individual and communal identity. Applying cultural ecology through an ecocritical lens highlights the crucial role of shared ecological knowledge in the community’s web. The land emerges as a living cultural system, embodying the people’s innate, unpolluted way of life. The novel’s plot illustrates how the natural environment shapes daily routines through agricultural activities, seasonal cycles, and hunting practices tied to their cultural ecology. The community’s survival depends on understanding rainfall patterns, soil conditions, and spiritual rituals, demonstrating how ecological knowledge is embedded in cultural practices.

In the novel *Sky Is My Father: A Naga Village Remembered*, the author conveys a clear picture of the close-knit environment tied to Naga indigenous culture. The indigenous people gather to celebrate their interconnectedness by worshipping nature. As the novel shows, agriculture and weaving are the core of their occupations, developed from the environment to which they are adapted. The hill community around Kohima finds balance through agricultural occupation. These people depend entirely on nature for survival, which stands as the base in producing the culture.

**Jeffilda Esther and Md. Sahidul Islam**

Nagaland culture features numerous festivals honouring the bond between land and people. As their lives blend cosmology and spiritual balance, the novel stands “representative of the story of Nagas” (Bhumika, 2021, p. 8).

Looking from the perspective of Julian Steward’s theory, the cultural practices of the Naga community show how human culture adapts to ecological conditions. The traditions inherited from the ancestors of the Nagaland community signify an extension of sacred connection. Agriculture is performed collectively, with families and clans participating in harvesting crops and spiritual honouring. “Push the soil down like this with your finger,’ his mother instructed” (Kire, 2019, p.12), illustrating an indelible occupation passed down through generations. This system acknowledges the glory of their survival, where environmental success relies on shared responsibility. The land is not privately controlled by the people; instead, it is treated as a shared ecological space sustaining the community’s growth. Kire’s depiction emphasizes that cultural connectivity is not materialistic but a form of environmental coexistence with spirituality and communality. Rituals performed before harvesting reinforce respect for nature and reclaim the strong bond with the indigenous cosmological worldview.

“Adaptation is regarded as responsive human behaviour to environmental changes that are taking place” (Wibowo, Suwanto, & Sugihardjo, 2022, p. 4). The weaving is also seen as an irreplaceable tradition that shows how their culture emerges from environmental adaptation. Basket weaving serves as both a primary occupation and a cultural practice tied to the land, with materials such as forest fibres and bamboo sourced directly from the environment. “As they grew older, they became adept at weaving the carrying baskets the women used for carrying water and wood” (Kire, 2019, p.12) shows that the crafted work was passed down through generations. Baskets made from supple reeds and vines hold a rich history of interconnected stories, human efforts, and culture within the cultural ecology web. All the fibres echo the intertwined rhythm of human hands, rivers, and forests to tell the world. This transformation from simple kitchen weaves to intricate works of art “progressed from simple weaving for the kitchen’s needs to the later stages which became veritable works of art” (Kire, 2019, p.10). Elders convey traditional ecological knowledge through close observation, thereby securing its continuation while depicting cultural ecology as an environmental adaptation mechanism.

Harvest seasons are celebrated immediately next to the village festival. The harvesting season exhibits a pictorial view of communal celebrations that stress ecological gratitude. Agricultural labour is seen as productive time spent with nature in tilling the land to reap a good harvest for their survival. This comes as one community coming together to share a ritual activity. These harvest gatherings function as an acknowledgement of nature’s spiritual role in their living. From an ecocritical approach, harvest celebrations reflect an environmental worldview in which humans are dependent on ecological cycles. Kire shows that harvest is seen not merely as a fruitful outcome but as a spiritual and cultural connection, recognizing the relationship between land and community. Through the novel, social communal unity is deeply evident, representing the communal sharing of harvested crops, which also strengthens the bond. Equally distributed responsibilities are seen in the characters, forecasting the cultural values of collective survival. Looking at overall harvesting practices, they contrast the ideas with modern systems of individual accumulation, but in Kire’s work, it is observed as communal ethics.

The festival lasts five to six days, seeking blessings from spirits for peace with humans. By the last day, “young children were appointed to perform the rhoutho ritual of seed-sowing” (Kire, 2019, p.82). With small hands, they scattered seeds into the soil to pray for good crops. “All the villagers followed the children and the elder to the fields to watch the performance of the ritual” (Kire, 2019, p.82). The festivals, held both before and after harvest, prepare the community for the vital task of sowing the seeds of the next season. Finally, the elders pronounce blessings, saying, “My paddy may grow well, though the weeds are abundant, my paddy grow you around the tree stumps and boulders” (Kire, 2019, p.82). Their strong, ancient lyrics create resilience in the soil, encouraging crops to grow despite nature’s challenges. On the fourth day, they do not go to the fields as the festival ends, in order to honour their interrelated lives. The “Genna Day” (Kire, 2019, p. 83) shows a strong bond of respect, as they sing songs to the land. These songs describe the traditional life of the people. On the third day, they dress in cultured traditional garments. The garments and ornaments, made from natural products such as bark fibers, feathers, and seeds, fully

adorn every person in the village. The natural adornments, made from beads and threads, include “young girls wore white teirhü around their shoulders, while some of the young men displayed teirhü on their headdresses” (Kire, 2019, p. 81). These simple adornments honour their deep bond with the land.

Following the thorough ritual comes a “Genna day, and the villagers returned home without doing any work in their own fields” (Kire, 2019, p.82). This sacred rest period for two or three days honours the spirits, letting the seeds settle in silence before growth or harvest begins. The core belief of Genna Day centers on harvest blessings; “the ritual of rhoutho was pronounced as completed” (Kire, 2019, p.82). If any individual violates “Genna Day” (Kire, 2019, p.82), it is a taboo in society. This day holds serious and deep meaning, even “the genna included a taboo on talking to sojourners” (Kire, 2019, p. 82). By hosting the “Genna day”, it carries cultural and ritual significance with a strong connection to ecological discipline. It represents a break in ecology. “Genna Day” simply shows how culture, spirituality, and nature live together peacefully. It suggests that harmony with the environment comes from adapting to the land. In the eyes of cultural ecology and the ecocritical approach, such limitations indirectly guard against environmental exploitation. They demonstrate how the native cultural system incorporates internal conservation values without any systematic arrangement. Kire's work brings respect to these rituals and accentuates their common responsibility for ecological and spiritual balance.

As the analysis shows, all these elements bring to light the interconnected communal life in *Sky Is My Father: A Naga Village Remembered*. Kire's novel explains that ecological knowledge is embedded in everyday life rather than separated into specialized scientific systems. In all aspects of the indigenous community's interdependent life, “the communal house - Thehou” (Kire, 2019, p.148) plays a significant role. This communal gathering space holds the community's identity, where people unite for storytelling, cultural ceremonies, festivals, and ritual initiations. It symbolizes unity in passing cultural identity and glorification from one generation to the next. It also vividly proclaims a place for celebrating the relationship among land, culture, and community. The communal spot “Thehou” (Kire, 2019, p.148) personifies an interconnected system, reflecting a core principle of cultural ecology. Culture evolves through environmental interaction more than through physical isolation.

The Reef as Communal Hub: Ecological Belonging

Witi Ihimaera's short story “The Seahorse and the Reef” depicts the communal life of indigenous Māori in postcolonial New Zealand. It illustrates how their lives were once closely linked to nature but have now been torn away. Once, their communal interconnected life thrived, but now their identity has been destroyed before their eyes through unseen enforcement. The lines reveal, “At that time, our family lived in a small wooden house on the fringe of the industrial area” (Ihimaera, 1977, p. 1). Life away from their village shows an invisible abandonment of their culture. The reef served as the communal gathering spot where family members met every summer weekend. Before colonizers intruded, they lived closely with sea life and depended on marine bounty for food. “It teemed with life and food. It gave its bounty to us” (Ihimaera, 1977, p. 1). Each tide brought sustenance that sustained their ways for generations. This reveals how environmental destruction is not only a physical crisis but also a cultural and moral disruption. The story shows how marine life, nature's balance, and human actions are linked, with damage coming from lost harmony between culture and nature. The short story also demonstrates the disrupted interdependent life and the resulting ecological imbalance in the indigenous community due to human actions that disrupt harmony between culture and nature. Through cultural ecology theory, it reveals how modern human ways are slowly destroying traditions. Traditional societies build lasting practices through adaptation and environmental awareness. Using the ecocritical approach, the story focuses on destruction and limits to their symbiotic way of life. The reef functions not only as a biological habitat but also as a metaphor for communal interdependence, showing that indigenous societies rely on ecological balance for survival.

“As long as we respect it, it will continue to feed us” (Ihimaera, 1977, p. 1). This simple truth underscores the mutual connection between nature and people, where harmony ensures endless provision. But the indigenous interdependent life was polluted by intrusion, snatching their freedom to live. “It is dangerous to take seafood from the reef, son” (Ihimaera, 1977, p. 2), the elder warned, as factory waste dirtied the once-pure waters. The reef

**Jeffilda Esther and Md. Sahidul Islam**

symbolizes cultural ecology in the Māori ecosystem. They came to the sea to collect kaimoana (seafood). “We would laugh and talk and share the kaimoana between different families” (Ihimaera, 1977, p. 1), strengthening bonds through every shared bite. The reef and seahorse represent a natural system in balance before human disturbances. This interdependence broke, shifting environmental sustainability toward exploitation. “We have poisoned the land and now we feed our poison into your water” (Ihimaera, 1977, p. 2). What was once a balanced cycle now chokes on greed and waste.

In the short story, the kaimoana collection site serves as a communal gathering spot. After losing their land, the Māori reach the seashore seeking a new place to gather. Comparing this with Oodgeroo Noonuccal’s poem, which laments this loss, “Gone now and scattered. The scrubs are gone, the hunting and the laughter” (Oodgeroo Noonuccal, 19, 20), shows the shared theme of cultural erosion. These lines mourn the erasure of sacred places and joyful traditions, leaving only echoes of what was once cherished. But when the sea becomes polluted, it gradually abandons the people’s natural way of living. “The beach, the sea was empty of the family” (Ihimaera, 1977, p. 2) exposes the idea of cultural disconnection and loss of community traditions. The community, once lived with laughter and shared kaimoana, is now wrapped in silence and has lost the freedom of its communal spirit. The people’s simple, interconnected lives are taken away. A critical analysis of the story shows that the indigenous community is connected physically and psychologically. The reefs are not only physical structures but also represent continuity, protection, and coexistence. When the reef is damaged, the ecosystem suffers serious loss.

CONCLUSION

The two stories glorify the communal social space as the representation of an integrated culture. This is an indication that the indigenous narratives shape such spaces as ecological, cultural, and spiritual centers. Although the texts are written in different geographical and cultural backgrounds, indigenous people are psychologically attached to the land. Both writers present communal gathering spots as sites where environmental consciousness and collective identity are nurtured. The communal space in the novel by Kire is the bridging point between community cultural practices and decision-making. These places are considered cultural-ecological centers, which cannot be separated from nature and are placed in a landscape with forests, hills, and trees. Most importantly, they are strong ties, continuity, and stability.

Looking at the reef in the short story of Ihimaera is a symbolic community area, which is the beach. The reef is not just an ecological habitat, but also a collective cultural site that symbolizes the connection of the Māori ancestors to the sea. “The Seahorse and the Reef” together show how things depend on each other, how fragile they are, and nature’s balance through harmony. In Kire’s novel, the village meeting place stays the same. But in Ihimaera’s book, the communal spot is at risk of being ruined by the environment. After feeding people, the reef has become a target of human exploitation, disturbing the natural balance, making people culturally disconnected and lost.

The ocean has a connection with “Whakapapa is the Māori word for genealogy” (Mahuika, 2019, p. 2), connecting the people and their ancestors, as well as the non-human life forms to which people are related. The risk of disruption and crisis is therefore brought out in the short story, as opposed to interconnections. In both analyzes, native people seem to be psychologically attached to their land that their interdependent lives and adaptation take them through absolute dependence and adaptation. The village space preserves the oral traditions, rituals and agriculture in the novel by Kire. In the story by Ihimaera, the reef supports the marine life and depicts ancestral continuity. The two communal places are ecological centers of inter-relational living, and they represent the identity based on ancestral land and ecological belonging.

In Kire’s novel, people live in harmony with nature and spirits, as indigenous life is built this way. The village gathering spot includes rituals, harvest celebrations, war decisions, storytelling, and Genna Day events. It acts as a living center for culture and ecology. So, belonging to the village means belonging to the land. Identity forms

Jeffilda Esther and Md. Sahidul Islam

through adaptation in communal life, intertwined with nature. “Adaptation of human beings includes the organisms and the environment that make up an ecosystem: a system or unit that functions and consists of a physical environment and the various organisms that live inside it” (Wibowo, Suwanto, & Sugihardjo, 2022, p. 6). Ihimaera's reef is a delicate shared space that ties Māori identity to the sea and family history. It is not just a sea home; it is part of *whakapapa* (genealogy) (Mahuika, 2019, p. 2), linking people to their ancestral memory. The damage done to the indigenous community threatens cultural continuity. This shared space, where elders transmit ecological knowledge and ancestral memory, becomes psychologically restorative. Its endangerment hints at the erosion of indigenous roots and collective belonging.

This concern resonates with Janice Pariat's observation in her article, “Colonisation and modernisation have largely erased the traditional way of life of people of the northeast” (Bhattacharya, 2024). It shows how outside forces have slowly destroyed indigenous customs and ties to the land. She highlights how urbanization and external influences distance younger generations from land-based living and collective cultural spaces. “Vast portions of histories and cultural archives have been erased deliberately, and there is no easy or clear way to bring them back” (Bhattacharya, 2024). This parallels the vulnerability in Ihimaera's “The Seahorse and the Reef” and reinforces the preservationist tone in Kire's novel. Therefore, this study shows that communal ecological spaces are not merely social settings, but foundations of identity and psychological connection deeply imbued in indigenous peoples. Protecting them safeguards memory, tradition, and the deep connection between people, land, and spirit.

ABSTRACT

This paper presents a comparative analysis of feminist agency in Anita Nair's *Ladies Coupé* and Kavery Nambisan's *The Hills of Angheri*. It examines how female characters navigate obstacles, from survival to subversion, in societies that treat women as inferior, restrict their freedom, and confine them to prescribed roles. Agency emerges as a result of a shift in mindset, enabling women to pursue their dreams and act with courage. *Ladies Coupé* follows six women in a train compartment sharing their stories and speaking out against injustices, while *The Hills of Angheri* centres on Nalli, a village girl who aspires to become a doctor and serve her community despite family opposition and societal barriers. Both novels depict women confronting their environments and responding to limitations, showing that agency can manifest as small acts, strategies, or survival tactics against patriarchal structures. By analysing these characters, the study highlights the complex forms of agency women exercise and emphasizes the need for societal change to support their empowerment.

Keywords: Agency, Oppression, Societal barriers, Resistance, Strategy.

INTRODUCTION

In contemporary Indian literature, novels exploring women's lives, their struggles, complexities, and experiences under patriarchal oppression have increasingly gained attention. This marks a significant shift in Indian feminist literature. Gilbert and Gubar's (1979) *The Madwoman in the Attic* highlights how women writers have begun to subvert traditional literary conventions to assert their own narratives. Many contemporary female authors address not only the crises women face but also their resistance to patriarchal norms. Among them, Anita Nair and KavaryNambisan stand out as prominent writers who engage with feminist concerns with clarity and intensity.

While men and women are inherently equal, society often treats women as subordinate. This hierarchy is evident in ancient texts. Manu, the codifier of Hindu law, states: "The duteous girl obeys her father, Husband sways the duteous wife, Son controls the widowed mother, never free is a woman's life" (137). The *Manu Smriti* pointed out the restriction faced by women to access education and autonomy, reflecting deep-seated gender inequalities. Indian epics also mirror these societal biases. In the *Ramayana*, Sita is bound by rigid expectations and must prove her purity, while in the *Mahabharata*, Draupadi is gambled away in a dice game and publicly humiliated by the Kauravas. These examples underscore how women's agency has historically been curtailed and their dignity compromised, themes that contemporary feminist writers continue to explore and challenge.

Anita Nair is a prominent contemporary writer whose work presents a powerful feminist narrative. Her novels challenge societal expectations, rigid customs and traditional gender roles imposed by patriarchy, portraying women's journeys toward empowerment and self-discovery. Nair's writing resonates with Simone de Beauvoir's assertion that "the fact that we are human is much more important than our being women," emphasizing the universal struggle for recognition beyond gender. It highlights the historical suppression and oppression of women within male-dominated societies. Consequently, the quest for identity and self-realization has emerged as a central theme in postmodern literature, with many writers exploring women's desire for autonomy, individuality, and personal agency. Through her female characters and their lived experiences, Anita Nair delves into themes of liberation, identity, agency and sexuality, offering a nuanced exploration of women's lives in contemporary India.

KavaryNambisan, a surgeon and novelist, combines her medical insights with a strong feminist perspective in her writings. Drawing on psychoanalytic ideas, Sigmund Freud suggested that women's lives are determined by their biological constitution, with their primary role tied to reproduction; society then regulates their work and behaviour around motherhood, often dismissing other ambitions as "unnatural." This restriction denies women the freedom to define their own identities and limits their individuality. As Simone de Beauvoir observes, women have the capacity to define themselves, yet they live in societies dominated by men, which subordinate them. Nambisan's work addresses these gender inequalities, exploring the complexities of women's lives and their limited access to education and social mobility in male-dominated contexts. In *The Second Sex* (2011), de Beauvoir argues that women will achieve equality when granted access to social, economic, and cultural spheres historically reserved for men (75). Similarly, Diane Elam in *Feminism and Deconstruction* (1994) asserts that liberation comes when women develop a conscious awareness of their self-defined sexual identity (43). Reflecting these ideas, Nambisan portrays women as confident, expressive, and conscious of their identities. Her characters pursue their dreams and ambitions, confronting social oppression and striving to realize their goals with determination and resilience.

Studying the works of Anita Nair and KavaryNambisan provides a spectrum of feminist agency, ranging from survival to subversion. Their writings reveal diverse approaches to women's empowerment, showing that feminist agency does not always manifest as overt political action or revolution. At times, it appears as mere survival; at others, it emerges through subtle acts of personal subversion and the redefinition of identity within the constraints of a patriarchal society. Women's liberation often begins with a shift in mindset, the courage to live according to one's own choices rather than conforming to pre-assigned social roles. Such agency frequently expresses itself through

**Sivamadhi and Sathiyarajan**

small yet significant acts that challenge societal expectations, including rejecting imposed roles, pursuing personal dreams, and asserting selfhood.

Women in the contemporary period increasingly demand the freedom to live on their own terms. For this study, one novel from each author has been selected for analysis: Anita Nair's *Ladies Coupe* and Kavery Nambisan's *The Hills of Angheri*. The female characters in these works exercise agency in diverse ways, navigating the constraints imposed by a patriarchal society. By examining the narratives of these novels, this research highlights the multiple forms of resistance and expressions of feminist agency in contemporary Indian English literature.

LITERATURE REVIEW

Harvinder and Dr. A Vijayanand (2025) in their work "Mapping the Inner Landscape: Existential Anguish and Self-Realization in Anita Nair's *Ladies Coupe*", explore Akhila's journey of self-discovery where she realizes how duty and social expectations have limited her life. The novel shows that mental freedom comes before physical freedom, and ends with Akhila choosing to live for herself, symbolizing self-realization and independence.

Richa Langyan, in her work "Women and Society: A Study of Themes and Attitudes in the Novels of Anita Nair", examines how Anita Nair portrays women's lives and societal roles. She analyses the recurring themes of patriarchy, gender inequality, and the struggle for self-identity in Nair's novels.

Dr. Madhumita Basu in her work "Quest for Selfhood: A Study of Anita Nair's *The Ladies Coupe*", observes that patriarchal structures, though often invisible, exert strong control over women's lives. Despite differences in background, education, culture, and age, all the women face similar challenges within this social order. The space of the coupe provides them a platform to share their stories and reflect on gender-based inequalities. Through these exchanges, they gradually discover their paths to selfhood.

Dr. Nisha Thomji Varghese and Ms. Anannya Rajesh, in their work "Eclipsing Oppression: Unravelling the Labyrinth of Patriarchal Hegemony in Anita Nair's *Ladies Coupe*", observe that *Ladies Coupe* presents women not merely as bearers of imposed roles but as individuals with diverse possibilities. The novel depicts women reclaiming their identities and asserting independence through courage and self-realization. It shows that liberation is a gradual, personal process that begins with choosing oneself, celebrating women's resilience and highlighting self-assertion as a powerful form of resistance.

Nisarga M and Dr. Pramod Kumar K S in their work "Tracing the Path of Self-Discovery: A Journey of Exploration in Anita Nair's *Ladies Coupe*", conclude that although women encounter numerous difficulties and face setbacks at every turn—sometimes leaving them in tears—at other times they rise fiercely like a tigress. They confront societal challenges and transform hardships and obstacles into strengths that work in their favor.

Dhanya Pankajakshan and Nandini Nagar in their work "Female Subjugation in Anita Nair's *Ladies Coupe*", conclude that *Ladies Coupe* depicts both an inner and outer journey, leading to life-changing realizations. While society has progressed in areas like property ownership and voting rights, the struggle for true gender equality continues.

Dr. K. Shanmuga Sundara Raj in his work "Feminist Analysis Of *Ladies Coupe* By Anita Nair: Breaking Societal Norms And Empowering Women", analyses *Ladies Coupe* as a powerful feminist text, highlighting women's empowerment, autonomy and agency, where Nair explores how identity, self-discovery and personal agency intersect within a patriarchal society.

**Sivamadhi and Sathiyarajan**

Anjaly Nair M. K., in her work *“Breaking the Bars: Body and Identity in Anita Nair’s Ladies Coupe”*, concludes that each woman in the novel, including the protagonist Akhila, uses her body to shape her identity. She shows how they resist patriarchal control, overcome social and psychological barriers, and reclaim their selfhood and personal freedom.

Dr. Iliyas Ali Shaik, Dr. C KalyanChakravarthy, M. Naga Raja Kumar, and Dr. K. Shaheen, in their work *“Strategic Subversion in Anita Nair’s Ladies Coupe: A Feminist Perspective”*, examine the role of subversion in feminist literature. They show how Nair’s narrative challenges traditional norms, portraying women who subtly resist patriarchal control through quiet, strategic acts, redefining their identities and asserting independence while highlighting the resilience of marginalized women.

G. Vijay and Dr. A. D. Sudha in their study *“Revolutionary Culture of Women against Gender Norms in KaveryNambisan’s The Hills of Angheri”* argues that Nalli’s resistance to discriminatory cultural norms enabled her to achieve her dream of becoming a doctor and build a hospital for her town. It highlights how the courage of a few women in the past transformed restrictive traditions, allowing later generations to access education, careers, independence, and social respect. Through determined, responsible, and nonviolent efforts—especially their commitment to education—women have challenged and weakened male dominance in society.

R. Kaliswari and Dr. K. M. Sumathi in their study *“In Dream vs Reality: A Thematic Analysis of KaveryNambisan’s The Hills of Angheri”* highlight the story of Nalli, a village girl who aspires to become a doctor. Despite family pressure and traditional biases favouring boys, she perseveres and achieves her dream, demonstrating that a woman’s ambitions cannot be held back.

M. DayaBhagyaSherin, in her work *“The Pursuit of Social Justice in KaveryNambisan’s The Hills of Angheri”*, analyses how KaveryNambisan and Amartya Sen view true development as more than wealth—it involves improving education, health, and social equality. The study emphasizes that socially responsible doctors like Nalli can address health disparities in villages and promote social justice.

G. Vijay and Dr. A.D. Sudha, in their work *“Role of Education in Eliminating Gender Biases in KaveryNambisan’s The Hills of Angheri”* highlight how Nalli embodies self-empowerment, encouraging women to pursue their goals despite challenges. Through Nalli, KaveryNambisan stresses that education is crucial for overcoming discrimination and gender bias peacefully. The study advocates prioritizing girls’ education, promoting equality in schools, removing cultural barriers like forced marriage and drawing inspiration from the novel to build a fairer society.

Dr. Raj Kumar Verma, in his work *“Voicing the Unheard: KaveryNambisan’s Creative Expressions as a Platform for Women’s Empowerment in Marginalized Communities”*, shows how KaveryNambisan’s diverse female characters reflect India’s social, cultural, and economic realities, expressing strength and agency. Through their determination and pursuit of personal goals, these women challenge patriarchal norms and assert their voices against longstanding marginalization.

K. Sathiyakala and Dr. K.N. Sharmila, in their work *“Contextualising Environmental Virtue and Struggling Woman in KaveryNambisan’s The Hills of Angheri”*, highlight how *The Hills of Angheri* addresses critical environmental issues like climate change, species extinction, biodiversity loss, and harmful pesticide use. Using an ecofeminist perspective, they show how the exploitation of nature parallels the oppression of women, illustrating how patriarchal control impacts both the environment and the female protagonist.

METHODOLOGY

The selected novels were examined in depth, alongside relevant secondary sources, including scholarly literature and publications related to the authors. This study adopts a qualitative approach, employing a systematic textual analysis of the chosen novels to explore themes of feminist agency and resistance.

Ladies Coupe

Anita Nair's *Ladies Coupe* centres on a train compartment that becomes a space for women to voice their struggles with domestic violence, gender inequality, societal expectations and personal dilemmas, while exploring the assertion of female agency. The story follows six women named Margaret, Prabha Devi, Janaki, Sheela, Marikolunthu and the protagonist Akhilandeshwari (Akhila) whose narratives within the confined space reveal the diverse forms of resistance women employ in Indian society. Their conversations and shared experiences help Akhila confront her central question: "Can a woman live by herself?" This question reflects her pursuit of autonomy and feminist selfhood. Nair portrays agency as a transformative process, showing how women reshape their own lives and pursue happiness despite the constraints imposed by a patriarchal society.

Akhila, the forty-five-year-old protagonist of *Ladies Coupe*, is unmarried and the primary breadwinner for her family. Her life has been defined by sacrifice, compliance, and the absence of personal choice, emotional support or social freedom. Her assertion of agency begins with her bold decision to travel alone to Kanyakumari with a one-way ticket, refusing to remain silent or confined within familial expectations. Her determination is evident when she declares to Padma, "For heaven's sake, I don't need anyone's consent... I will do exactly as I please and I don't give a damn about what you or anyone else thinks..." (Nair 204), asserting her right to self-determination without seeking her brothers' permission. Akhila breaks free from her suffocating existence and the burden of family responsibilities following her father's death. She experiences bodily and emotional liberation through a romantic relationship with the younger Vinod. By the conclusion of the novel, Akhila emerges as a self-possessed woman, no longer merely an extension of her family, but someone who defines her own identity and life.

Margaret Shanthi, a chemistry instructor in *Ladies Coupe*, demonstrates agency in a quiet yet subversive manner. Her husband, Ebenezer Paulraj, embodies patriarchal dominance, having forced her to abort a child. Margaret expresses her anger through a calculated, strategic act. Being aware of Paulraj's health-conscious habits, she gradually overfeeds him, making him physically dependent on her. This clever action reverses the household power dynamic. Her psychological release is evident when she declares, "I hate him. I hate my husband. I hate Ebenezer Paulraj. Hate him. Hate him." (Nair 98). Through this subtle yet deliberate form of resistance, Margaret asserts control over her life, embodying a form of feminist agency that is quiet, strategic, and transformative.

Prabha Devi demonstrates agency in both overt and internalized forms. As a child, she is devalued by her father, dismissed as a "bloody nuisance" simply for being a girl. She initially asserts her autonomy visibly by wearing Western clothing during a trip to the United States. Later, after being sexually exploited by her husband's friend, she shifts to subtle, internalized resistance, choosing to wear saris and traditional attire. This decision is not a surrender but a conscious reclaiming of self, prioritizing emotional stability and inner peace over external validation. It's a quiet yet profound form of agency.

Janaki's agency is primarily expressed within domestic boundaries. Her marriage to Prabhakar is arranged and she grows up pampered and protected. However, she becomes disillusioned by her son's indifference and refuses to define herself solely through motherhood. Her confrontation with her husband, "You just want to control him. You want to control everybody. You want everyone to do your bidding" (Nair 30) marks her refusal to accept patriarchal authority and asserts her identity as an individual, not merely as a wife or mother.

**Sivamadhi and Sathiyarajan**

Sheela, just fourteen and the youngest of six women in the ladies' compartment, demonstrates that agency is not limited by age. She is aware of neglect and the threat of sexual abuse. She is deeply hurt by seeing her grandmother being ignored by her sons. She feels uncomfortable by experiencing inappropriate advances from her friend Hasina's father, Nazar. Though too young to directly protest, Sheela makes a thoughtful decision to protect herself from physical abuse. She begins cleaning her face with a handkerchief before entering Hasina's house and eventually avoids visiting her home altogether. This act of self-protection is evident in the text, "Thereafter, Sheela mopped her face with a hanky each time she entered Hasina's home.... She would never go to Hasina's house again" (Nair 66). Despite her age, Sheela's actions reflect a clear sense of bodily autonomy and agency.

Marikolunthu, a humble woman in *Ladies Coupe*, is treated as a sexual object and her life highlights the intersection of sexual violence, gender, and class. She is raped by Murugesan, yet society blames her while protecting him due to his social status. Despite this injustice, she exercises agency in a subtle yet powerful way. She attains a sense of liberation and control by selling her son, Muthu, as child labour to Murugesan's silk factory, thereby gaining economic independence. Through this act, Marikolunthu reclaims authority over her life, freeing herself from past trauma and asserting her self-determination and resilience. These women demonstrate that agency is not uniform or universally applicable. Rather, it manifests in diverse forms like strategic, internalized, assertive or sometimes as mere survival which shaped largely by their individual circumstances.

The Hills of Angheri

The protagonist of the novel Nalli is a village girl from Angheri, located twenty miles from Mysore. She embodies a revolutionary spirit, breaking traditional barriers to bring modern healthcare to rural India. Nalli acts as an agent of social change and rural healthcare management. Her agency lies in her ability to challenge oppressive societal norms and pursue her dream of benefiting her village independently.

Nalli aspires to become a doctor alongside her friend Jai. While her family opposes her ambition, reflecting the common belief that such professions are unsuitable for women, society readily supports Jai's choice to serve the village. Nalli, meanwhile, is expected to marry at the "appropriate" age. Yet she is deeply aware of her village's urgent need for medical care. The villagers lack awareness of health issues and have little access to healthcare and other essential resources due to their distance from the city. Undeterred by opposition, Nalli remains determined to become a doctor and build a hospital in her village. She asserts, "No child will die of a simple illness like dysentery" (Nambisan 135). By pursuing education and a medical career, Nalli challenges the prevailing belief that women should remain uneducated. She is a liberal feminist deeply committed to individual rights and equality in education and profession. Her struggle against an orthodox society that restricts women's education, along with her family's objections, demonstrates her agency. Defying her family, she pursues her ambition to study medicine.

Nallienrols in Madras for medical education, facing the challenges of adapting to urban life as a village girl and coping with the campus ragging culture. Struggling with her identity, she takes deliberate steps to shed the "village girl" image by studying English, wearing skirts, wearing makeup and shortening her hair. Nambisan writes, "She felt unlucky to be born in Angheri; her origin stuck to her like a stain" (74). Despite these difficulties, she remains steadfast in achieving her goals. Patriarchal society seeks to dominate women, interfering with their personal choices and limiting their resources, but Nalli resists these pressures.

After completing her medical degree, Nalli moves to London to pursue the Royal College of Surgeons Fellowship (FRCS). There, she faces additional obstacles, including discrimination based on nationality and gender in a colonial context. These challenges test her agency further, yet she overcomes them and refocuses on her vision of serving her village.

Nalli's marginalization persists even after she becomes a doctor, as reflected in her words, "Sir, England is a different country. They ruled us for so long, now they resent us going there as equals" (Nambisan 184). Despite her qualifications, she is denied the opportunity to treat foreign patients, as they prefer only British doctors. Her

Sivamadhi and Sathiyarajan

poignant question, “Did my credentials start with being Indian, being Hindu, being a woman, a doctor, or as a rustic?” (Nambisan 201) forces a serious reflection on the intersectional barriers she faces.

Even as a trained surgeon, Nalli struggles to gain support to establish a hospital in her village, Angheri. She temporarily joins Keshavan’s ashram hospital, demonstrating her persistence and agency in continuing her mission to serve the community despite disillusionment and lack of backing. Eventually, she returns to Angheri to fulfil her dream, dedicating herself to improving the health and well-being of her people and making quality healthcare accessible to all.

CONCLUSION

Agency involves a change of mindset and the courage to resist oppression. Feminist agency is not uniform, nor is it always overt or loud. A comparison of the two novels reveals that feminist agency can take multiple forms like assertive, strategic, internal or even purely survival-driven depending on individual circumstances and social constraints. In *Ladies Coupe*, Akhila recognizes her right to define her own happiness and make choices for herself after hearing the stories of the other five women in the compartment. She feels empowered by the freedom to pursue what brings her fulfilment. In *The Hills of Angheri*, Nalli’s determination and revolutionary spirit challenge a conservative society, steering it toward modernity. Both characters reshape traditional practices to suit their personal needs. Through these narratives, Anita Nair and Kavary Nambisan redefine agency as the capacity of women to make conscious choices within patriarchal structures. Their female characters reject the myth of the “superwoman” who effortlessly balances home, career and happiness. Instead, they acknowledge their dissatisfaction and suppressed desires as valid forms of self-assertion and empowerment.

ABSTRACT

Khadija Mastur's *The Women's Courtyard* provides a compelling analysis of the psychological effects of the Partition of India from the perspective of women imprisoned in domestic spaces. Khadija Mastur is a writer in Urdu language, and she analyzes the process of border-making and vividly brings into focus the gruesome incidents of the Partition. *The Women's Courtyard*, written by Khadija Mastur, which is considered by some to be a Partition novel, is bolstered in its status as a feminist work. In an exquisite and delicate translation, the English rendering of this book by Daisy Rockwell conveys the elegance and power of Khadija Mastur's distinct writing style. The novel is about a young Muslim girl named Aliya and her family living in the peak period of the Independence of India. The protagonist Aliya speaks for the author Khadija Mastur, and despite all the barriers that might limit her to domestic life, she expresses a positive sense of curiosity. By virtue of these characters who are suffering through the female gender role, the author has been able to illustrate how social oppression occurs through the violence committed in the times of the Indian partition period. *The Women's Courtyard* speaks out from the confines of the courtyard in the setting of the independence struggle. In the present paper, the author will adopt a psychoanalytical approach through which the theories of Sigmund Freud, Jacques Lacan, and Cathy Caruth can be employed to explore themes such as repression, subjectivity, and trauma in the novel. The paper posits that partition is a psychological wound that translates into forms of silence, alienation, and fragmented sense of self as opposed to a mere historical incident. The courtyard represents the symbol of unconscious through which repressed emotions move about.

Keywords: Partition, psychoanalysis, trauma, repression, gender, alienation, silence.

INTRODUCTION

The partition of India in 1947 continues even today to be counted among the most significant events in the history of South Asia due to concerns about violence, migrations, and social transformation. Despite the fact that there is much attention paid to violence in narratives of the partition, *The Women's Courtyard* by Khadija Mastur takes the opposite direction by analyzing the psychology of the event. The novel revolves around the story of Aliya, a girl from a Muslim family who finds her identity in the political conflict as well as in the environment of her family life. In contrast to Saadat Hasan Manto and Bhisham Sahni, Mastur approaches trauma as an internal issue. For this research paper, a qualitative interpretive approach will be adopted based on psychoanalytic literary criticism. The text to be analyzed is Khadija Mastur's *The Women's Courtyard* which has been translated into English by Daisy Rockwell. In this process of qualitative textual analysis, the following methodologies have been adopted to apply literary theories to the primary text as follows: This process of interpretive textual analysis is based on three psychoanalytic models. They are the Freudian concept of repression, the unconscious, and the return of the repressed; the Lacanian idea of subjectivity, the symbolic order, and fragmented identity; and Cathy Caruth's concept of trauma.

The approach used in the study involves close textual analysis of the narrative form and point of view, symbolism (including the role of the courtyard as psychic space), characterization (with an emphasis on conflicts involving Aliya), as well as the theme of silence and psychological tension. Psychoanalytical theories will be applied to analyze various themes, including silence, repressed trauma, and detachment. The study is concerned mostly with the psychological and gender aspects of the Partition as depicted in the novel under review. It does not make a comprehensive historical assessment of Partition, as well as does not include comparative works. The approach used in the research (psychoanalytical theory) is rich in interpretations but lacks cultural context since it stems from the Eurocentric tradition.

Scholars have approached Partition literature differently over time, with initial scholarly analysis focused on political history and contemporary work focusing on aspects of memory, trauma, and gender relations. In *The Other Side of Silence* (1998), Urvashi Butalia emphasizes how the lives of women and their marginalization in patriarchal cultures are an example of silence as part of trauma. Gyanendra Pandey in *Remembering Partition* (2001) suggests that Partition should be interpreted from the perspective of memory and individual experiences. Psychoanalytic criticism focuses on repression and unconsciousness and is rooted in Freudian thought. The French philosopher Jacques Lacan interprets psychoanalysis within a linguistic context.

While Partition literature has been extensively studied, Mastur's text has not received much psychoanalytic consideration. Most existing research on the novel tends to be feminist or historical in nature; nonetheless, the psychological insights provided by the novel make it possible for an alternative approach. In order to fill this void, this article will examine the relationship between psychoanalytic theory and Partition literature by incorporating aspects from both fields. Freudian repression refers to how traumas are buried deep inside the psyche and come out in an indirect manner. Lacanian subjectivity involves fragmentation and structure of the self in language. These theories provide an opportunity to read Mastur's novel through the lens of an indirect expression of trauma via silence, memory, and emotional dislocation.

The Courtyard as Psychic Space

The aangan, in its physical and metaphorical enclosures, shapes the psychology of the women who inhabit it. For instance, Aliya sees the aangan as a place that confines her instead of providing solace. "The walls of the courtyard felt like they were closing in on us, silently watching" (Mastur, 2018, p. 34). Such imagery symbolizes not just physical confinement but also the psychological repression of feelings within the characters' minds. Within Freudian theory, a space such as the aangan acts as a container that encapsulates the contents of the subconscious mind. The characters are unable to express their thoughts and emotions freely and directly in their conversations, and they use circumlocution as an indirect means of doing so.

Manimozhi and Kanchana Mala

Lacanian psychoanalysis further explains this space through its relation to the symbolic order. The women internalize societal norms, engaging in roles that do not align with their desires. The idea that “everything that mattered happened outside these walls, but they were alive inside of us” (p. 52) is one way of understanding the irony in the relationship of internalization and reality.

Partition as Psychological Trauma

Aliya's experience in the courtyard brings out this irony. Even as she is trapped physically, she finds herself affected by occurrences beyond the space. Unlike other forms of partition that include physical violence, psychological violence characterizes this form of separation. This separation leads to uncertainty. “Nothing stayed where it was meant to stay; everything seemed uncertain” (Mastur, 2018, p. 119). This brings out the idea of Cathy Caruth on trauma being about disruption of time and emotion. The characters cannot comprehend their trauma in its entirety as it happens. On the contrary, their trauma surfaces through anxiety and emotional isolation. For Aliya, this emotional isolation is an act of self-defense. She says, “I learned to feel less, for feeling too much became unbearable” (p. 143). The statement perfectly reflects the concept of repression, according to the psychoanalytic theory of Sigmund Freud. Therefore, the Partition is a “wound” that remains alive inside people.

Repression and Female Subjectivity

The subjectivity of Aliya is influenced by her suppression and internal conflicts. Her wants remain unexpressed, limited by societal expectations. Aliya confesses, “There were things that needed saying; the words just failed me” (Mastur, 2018, p. 67). The return of the repressed, which is a Freudian theory, can be witnessed in this statement. Furthermore, the fragmentation of the self, as described by Jacques Lacan, can also be witnessed in the subjectivity of Aliya. She oscillates between submission and rebellion without ever finding an agreement between the two poles. The slow process of attaining autonomy from Aliya is also suggested when she says “perhaps freedom was not granted, but quietly appropriated, inch by inch” (p. 198). Tensions and unresolved conflicts characterize the family in *The Women's Courtyard*. Relations between characters are based on frustration, as well as unsatisfied desires. This type of relationship is explained through psychoanalytic theory that sees it as a result of neurosis caused by the suppression of emotions. Specifically, the character of the mother is described as a product of patriarchal oppression, thus continuing to reproduce the mechanisms of women's oppression. Unstable male power creates additional complications for these relationships.

Silence and the Gendered Nature of Trauma

The motif of silence is one of the main motifs used throughout the novel. It symbolizes both suppression and protest against oppression. Suffering experienced by women occurs silently as a response to the need to endure. In addition, this element acts both as a symptom and coping mechanism in the novel. As Aliya notes: “We spoke of ordinary things, as if the extraordinary had never happened” (Mastur, 2018, p. 156). The above idea resonates well with Cathy Caruth's claims about trauma's irreproducibility. The indescribability of Partition is achieved by using narration gaps and restraint in emotions. Silence is normalized in the phrase, “no one asked questions, because no one expected answers” (p. 162). This illustrates the collective repressed experience of trauma. Trauma is unrepresentable, which leads to the development of indirect ways of representation. In addition, from the feminist approach to understanding Partition, the silencing of women indicates their marginalization in the process of forming families and nations.

The Paradox of Liberation

By disrupting conventional relations, Partition gives women like Aliya some level of autonomy. However, the freedom she has obtained comes with ambivalence since “I was free, but there was no one left to share that freedom with” (Mastur, 2018, p. 210). Hence, independence and solitude become associated in her case as means of self-development and psychological liberation from trauma caused by the experience of Partition. Thus, the psychological effects of Partition remain unresolved for decades, proving its character of a wound.

**Manimozhi and Kanchana Mala**

CONCLUSION

Khadija Mastur's *"The Women's Courtyard"* reinterprets Partition as a psychological trauma inscribed within the subconscious mind of its survivors. In this novel, psychoanalysis becomes instrumental in uncovering the way in which trauma can be internalized by individuals and subsequently manifested in silence, repression, and the fragmentation of one's sense of self. By focusing on the experience of women, Mastur opens up new vistas to Partition writing, underscoring its personal and gendered aspects.

ABSTRACT

In the present era of rapid digitalization, the exponential growth of Artificial Intelligence (AI) across sectors has raised critical questions regarding authenticity, employment, and the future of human creativity and communication. With the advent of AI, certain existing jobs may become obsolete, while entirely new roles may emerge. Similarly, concerns arise about the future of literature: will it be dominated by AI-generated content, or will there remain meaningful scope for human creativity? This research paper explores the evolving role of AI in human society, focusing on the differences between human-generated and AI-generated literary works. It examines whether AI functions as a replacement for human creativity or as an enabling tool that enhances human potential. The study ultimately investigates the future relationship between AI and human communication in an increasingly AI-mediated world.

Keywords: human, communication, AI, creativity, digitalization

INTRODUCTION

The landscape of human interaction is undergoing a profound transformation driven by advancements in Artificial Intelligence (AI). At the core of these developments lies Machine Learning (ML), a subset of computational science in which algorithms analyse vast datasets to identify patterns. Combined with Natural Language Processing (NLP)—an interdisciplinary field integrating linguistics and deep learning—AI systems are now capable of performing tasks once considered exclusive to human intelligence. These systems operate through various learning paradigms, including supervised, unsupervised, semi-supervised, and reinforcement learning. The convergence of these approaches has led to the emergence of Generative AI, which can produce novel content by learning from historical data. This evolution marks a shift from Computer-Mediated Communication (CMC) to AI-Mediated Communication (AI-MC). In the CMC era, technology functioned as a passive medium for transmitting human thought. In contrast, AI-MC positions technology as an active agent capable of anticipating user responses through predictive analytics. While this enhances efficiency, it also introduces concerns regarding manipulation of behaviour for commercial or political purposes. The integration of AI into communication also raises ethical challenges. One major concern is “hallucination,” where AI systems generate inaccurate or fabricated information with high confidence. Due to their human-like tone, such outputs may be perceived as credible. Moreover, while AI may not threaten purely artistic creativity, it poses significant challenges to professional creativity in fields such as technical writing, journalism, and design. Although AI enhances efficiency, AI-generated communication often lacks the emotional depth, contextual nuance, and lived experience that define authentic human expression.

LITERATURE REVIEW

The study of digital communication has evolved significantly from viewing technology as a passive tool to recognising it as an active participant in human interaction. Traditionally, Computer-Mediated Communication (CMC) was understood as a conduit facilitating human exchange across distances. However, recent advancements in Artificial Intelligence have led to the emergence of Human-Machine Communication (HMC), where machines are no longer mere intermediaries but communicative agents (Guzman & Lewis, 2020; Gunkel, 2020). In this paradigm, AI systems function as interactive partners capable of generating language that closely resembles human expression. This shift challenges conventional notions of authorship, agency, and communication dynamics. Despite these advancements, the extent to which AI can replicate human cognition remains a subject of debate. Marcus and Davis (2020) argue that AI systems exhibit “computational mimicry” rather than genuine understanding, as they manipulate symbols without possessing experiential or social grounding. This distinction highlights a fundamental divide between human creativity, which is rooted in lived experience, and machine-generated output, which is data-driven.

From an economic perspective, generative AI tools have been recognised for enhancing productivity and efficiency (Brynjolfsson et al., 2023). However, this efficiency introduces the risk of linguistic homogenization. As AI systems prioritise probabilistic word selection, they tend to produce standardized outputs, potentially diminishing individual voice and stylistic diversity. Ethical concerns further complicate the integration of AI into communication practices. Floridi (2023) introduces the concept of “artificial reliability,” where AI-generated content appears credible despite potential inaccuracies. This concern is reinforced by studies on AI hallucinations (Ji et al., 2023), which demonstrate how systems may produce factually incorrect information while maintaining a convincing tone. Such tendencies pose significant risks to trust and integrity in academic and professional communication. While existing literature extensively addresses the technical and economic dimensions of AI, there remains a notable gap in understanding its psychological and emotional implications. In particular, the impact of AI-Mediated Communication (AI-MC) on human creativity, emotional depth, and identity formation has received limited attention. Current research often prioritises efficiency and output quality, overlooking the interpersonal and experiential costs of delegating communication to algorithms. This study seeks to address this gap by examining whether the increasing reliance on

AI-generated communication leads to the erosion of creative agency and emotional authenticity in human expression.

METHODOLOGY

This study adopts a mixed-methods approach, combining qualitative textual analysis with quantitative survey data to examine differences between human-generated and AI-generated communication.

Research Design

A comparative research design was employed to analyse variations in linguistic style, emotional depth, and structural patterns between human-authored texts and AI-generated content.

Data Collection

a) Human Literary Samples

Selected texts from established authors such as William Shakespeare, Jane Austen, and T.S. Eliot were used as representative samples of human creativity. These works were chosen due to their richness in emotional expression, thematic depth, and stylistic variation.

AI-Generated Samples

AI-generated texts were produced using contemporary generative AI tools (e.g., GPT and Gemini), based on prompts designed to replicate literary and explanatory writing styles.

Survey Data

A structured survey was conducted among 50 engineering students to capture perceptions of AI-generated communication. The survey included Likert-scale and descriptive questions focusing on:

- Authenticity
- Emotional depth
- Readability
- Personal connection

Evaluation Criteria

The collected data was analysed using the following parameters:

- Lexical Diversity – vocabulary richness and variation
- Sentence Structure – variation in sentence length and rhythm
- Emotional Sentiment – depth and complexity of emotional expression
- Reliability – factual accuracy and coherence

Data Analysis

- Qualitative Analysis was used to interpret stylistic and emotional differences between human and AI-generated texts.
- Comparative Analysis was conducted to identify patterns across both datasets
- Quantitative Analysis of survey responses was used to measure student perceptions, expressed in percentages.

Limitations

This study is limited by:

- A relatively small sample size (50 participants)
- Restricted selection of literary texts
- Dependence on specific AI tools, which may evolve over time

Prasith and S. Sreejana

RESULTS AND FINDINGS

This study presents a comparative analysis of human-authored literary texts and AI-generated content, supported by survey data collected from 50 engineering students. The findings reveal clear distinctions in linguistic expression, emotional depth, structural organization, and user perception.

Comparative Textual Analysis

The comparison between human and AI-generated texts was conducted based on four key parameters: lexical diversity, sentence variation, emotional sentiment, and reliability.

Interpretation of Table 1

The analysis indicates that human-authored texts demonstrate greater **linguistic richness and expressive variability**, while AI-generated texts emphasize **clarity, consistency, and structural coherence**.

Human writing reflects cultural context and individual identity, whereas AI-generated content tends to produce standardized outputs optimized for readability. Furthermore, emotional expression in human writing is complex and layered, while AI-generated content remains relatively neutral and simplified.

A notable limitation of AI-generated text is its susceptibility to **hallucination**, where information may appear credible but lacks factual accuracy.

Quantitative Evaluation

To further support the qualitative findings, both human and AI-generated texts were evaluated using a scoring framework

Interpretation of Table 2

The quantitative results reveal that AI-generated text outperforms human writing in **structural coherence and organization**. However, human writing significantly exceeds AI in **lexical diversity, emotional depth, and authorial voice**.

This demonstrates that while AI is effective in enhancing clarity and structure, it lacks the ability to replicate the individuality and emotional richness inherent in human expression.

Survey Findings (Student Perception)

The perception of AI-generated communication was analysed through a survey conducted among 50 engineering students.

The results indicate that:

- 78% of students perceived AI-generated text as *robotic or overly polished*
- 72% reported a lack of personal connection in AI-generated responses
- 68% preferred using AI for editing and structuring rather than content creation
- 81% found human-authored content more emotionally engaging

Interpretation of Survey Results

The survey findings suggest that while students recognize the usefulness of AI for improving clarity and efficiency, they remain sceptical about its ability to convey authenticity and emotional depth.

AI is primarily viewed as a supportive tool, rather than a replacement for human creativity.

Overall Findings

Based on the combined analysis, the following key findings emerge:

1. Human writing excels in creativity, emotional depth, and individuality, driven by lived experience and cultural context.

**Prasith and S. Sreejana**

2. AI-generated content demonstrates strength in structure, coherence, and efficiency, making it suitable for technical and formal communication.
3. AI introduces a standardizing effect, which may lead to the reduction of stylistic diversity and personal voice.
4. Users prefer a hybrid approach, where AI is used as an assistive tool rather than a primary creator.

DISCUSSION

The findings of this study reinforce the evolving understanding that Artificial Intelligence (AI) is transforming communication not as a replacement for human creativity, but as a complementary force. The comparative analysis demonstrates that AI-generated content excels in structural coherence and efficiency, whereas human-authored texts retain superiority in emotional depth, lexical richness, and authorial voice. These results align with the concept of Human-Machine Communication (HMC) proposed by Guzman and Lewis (2020), where AI functions as a communicative agent rather than a passive medium. However, the present study extends this perspective by highlighting the limitations of AI in replicating experiential and emotional dimensions of communication.

The findings also support Marcus and Davis (2020), who argue that AI exhibits “computational mimicry” rather than genuine understanding. While AI systems can generate linguistically accurate content, they lack the lived experience necessary to produce authentic emotional expression. This limitation is particularly evident in the observed “emotional flattening” of AI-generated texts. From an economic and functional perspective, the results are consistent with Brynjolfsson et al. (2023), which identify AI as a productivity-enhancing tool. The high score of AI in structural coherence confirms its effectiveness in organizing and refining communication. However, this efficiency introduces the risk of “linguistic homogenization,” where unique writing styles are replaced by standardized outputs. The issue of reliability further complicates AI integration. The presence of hallucinations in AI-generated content supports the concerns raised by Ji et al. (2023) and Floridi (2023) regarding “artificial reliability.” The ability of AI to produce convincing yet inaccurate information poses significant challenges for academic integrity and professional communication. Importantly, the survey findings provide a human-centered perspective. The majority of students perceived AI-generated content as lacking authenticity and emotional connection, reinforcing the argument that communication is not merely a functional process but also an experiential and relational one. Overall, the study suggests that the future of communication lies in hybrid authorship, where AI supports human expression without replacing it. AI is most effective when used for structuring and refining ideas, while humans remain central to generating meaning, emotion, and originality.

CONCLUSION

This study set out to examine the evolving relationship between human creativity and Artificial Intelligence in the context of communication. The findings clearly indicate that while AI has made significant advancements in generating structured and coherent content, it cannot replicate the depth, authenticity, and emotional complexity inherent in human expression. AI-generated communication, although efficient and accessible, tends to produce standardized outputs that may diminish individuality and cultural nuance. In contrast, human-authored texts remain deeply rooted in lived experience, enabling richer emotional engagement and creative diversity. The study highlights that the role of AI should not be viewed as a replacement for human creativity, but rather as an enabling tool that enhances productivity and supports the communication process. The concept of Augmented Intelligence emerges as a sustainable model, where humans retain control over intellectual and creative content while leveraging AI for efficiency. In conclusion, the future of communication will not be defined by competition between humans and AI, but by collaboration, where technological capabilities and human creativity coexist to produce more effective and meaningful communication.

Table 1: Comparative Analysis of Human and AI-Generated Texts

Evaluated Metric	Human Literary Sample	AI-Generated Sample	Commentary
Lexical Diversity	Rich, context-specific vocabulary with idiomatic expressions (e.g., Shakespeare's "wherefore" or Austen's "countenance").	Vocabulary optimized for clarity and general comprehension.	Human writing reflects cultural depth; AI prioritizes readability.
Sentence Variation	Dynamic structure with varied sentence lengths and rhythms.	Uniform and balanced sentence structures.	Humans use variation for emphasis; AI maintains consistency.
Emotional Sentiment	Multilayered emotional expression (irony, ambiguity, intensity).	Predominantly neutral or positively biased tone.	AI lacks emotional depth due to the absence of lived experience.
Hallucination Rate	Grounded in contextual and experiential knowledge.	Occasional factual inconsistencies (hallucinations).	AI prioritizes plausibility over factual certainty.

Table 2: Quantitative Comparison of Human vs. AI Writing

Metric	Human Writing	AI Writing
Lexical Diversity	9.1	6.8
Sentence Variation	9.3	7.2
Emotional Depth	9.5	5.1
Structural Coherence	7.8	9.2
Authorial Voice	9.4	4.5

ABSTRACT

The paper will discuss *The Windup Girl* (2009) by Paolo Bacigalupi in terms of moral psychology by stating that the novel creates cognitive dissonance in a systematic manner, which has been used to disturb the ethical certainties of the readers. Placed in a future, created as a result of genetic engineering, corporate seed monopolies and environmental destruction, the story creates a world that adheres to bio-capitalism and engineered scarcity. The novel instead lacks a firm division of morality, spreading the use of complicity throughout corporations, state actors, black-market dealers, and those on the fringes. This spreading of responsibility creates psychological tensions because the readers have to face the distorted lines between victimization and involvement. Using cognitive dissonance theory, the paper will discuss how the text plays with the moral alignment. Characters defend predatory systems because they need to survive, be secure, or make progress, and are also the ones exposing how structural violence the systems perpetuate. The character of Emiko, the windup girl, makes the ethical instability even stronger by blurring the line between human life and a manufactured one. The readers are placed in conflicting moral frames that cannot be reconciled and make them reflect on the consumption, biotechnology domination and ecological apathy. This paper claims that the dystopia created by Bacigalupi works as not only a cautionary speculation but, in fact, a psychological experiment of discomfort. Through the enactment of contradictions between belief and action, empathy and self-interest, the novel forces the readers to acknowledge their own involvement in the global systems of extraction and scarcity. Climate dystopia, therefore, comes forward as a place in which moral thought is induced by dissonance instead of instructive certitude.

Keywords: Cognitive dissonance, Climate dystopia, Bio-capitalism, Moral psychology, Ethical ambiguity

**Mohamed Anwar**

INTRODUCTION

Climate dystopia has become a key thread of twenty-first-century speculative fiction, in response to the intensifying ecological instability, biotechnology and corporate integration of the systems of life. In this discipline, the discourses are becoming more and more indicative of not only the ecological breakdown but also the emotional and ethical fabrications that come with such a breakdown. The *Windup Girl* by Paolo Bacigalupi shows the future that is monopolized by calories, genetics and artificial scarcity; the ecological crisis in the context of bio-capitalist regimes [3]. Instead of creating a naive dichotomy between the offenders and the victims, the novel disperses the blame among corporations, state authorities, merchants, refugees, and artificial life. The diffusion creates a story world where ethics are undermined. Interdisciplinary engagement with affect theory, new materialism and cognitive approaches to narrative has become the focus of such instability so that the same ethical ambiguity can operate both at the textual and the readerly level. The collective feeling shared by Ahmed emphasizes that emotions spread socially, and it is the collective impressions that make a person ethically oriented, not the personal thinking [1]. Likewise, Anderson understands affect as being distributed between bodies, environments and infrastructures and not being in individuals [2]. Such distributed affect is particularly acute in climate dystopia. Ethical conflicts of bio-capitalism are not the prerogative of character psychology, but they permeate markets, food systems and urban spaces. These tensions are fueled in the staging of *The Windup Girl* in a Bangkok under the threat of rising waters and corporate control of seed, entwined in material conditions as well as in the abstract principle [3]. The new materialism also theorizes these tensions. The concept of material-discursive entanglement by Barad criticizes the strict separation between matter and meaning and highlights the importance of relational intra-actions as agencies are formed [4]. Coole and Frost also anticipate the significance and the vitality of material processes [10]. Backgrounds, in place of active forces as to ethical possibility, in Bacigalupi's novel, are seeds, plagues, genetically modified bodies [3]. Material ecocriticism builds upon this understanding by considering matter as narratively expressive, and hence able to express ecological violence and systemic injustice [13]. In that sense, bio-capitalist scarcity is not merely an empirical issue of thematic interest, but a structuring fact which defines the way moral perception is formed.

In addition to these materialist methodologies, cognitive and enactive narratology approaches provide methods of explaining how ethical ambiguity influences the reader. The narrative worlds presented by Gergig accentuate the point that a reader psychologically transports to the story worlds where events happen through imagination projection [11]. The fact that immersion can transform beliefs and attitudes further is proposed by Green and Brock's idea of narrative transportation, which proposes that, by engaging in immersion, counter-argumentation is prevented [12]. Such transportation can create not moral reassurance but dissonance in the dystopian fiction. As recognition changes between ethically corrupt characters, the readers are placed in opposing judgmental structures. The experience is perhaps less about taking a definite ethical position and more about bargaining against discomfort [6]. This analysis is further enhanced by the enactivist approach of narratives put forward by Caracciolo, which focuses on experience and embodied reconstruction [6]. He claims that narrative space is recreated by the imaginative involvement of the reader, which entails affective and sensorimotor activity [5]. This field of experience is informed by mood, point of view, and focalization, and either leads the reader near or away empathy [7]. The intermingling focalization on Anderson Lake, Emiko, Hock Seng, and Jaidee as applied in *The Windup Girl* results in the creation of wavering ethical alliances [3]. Both characters make their rationalizations based on their survival, loyalty or corporate responsibility. These justifications welcome tentative insight despite the way they reveal structural violence. It is when the reader experiences the embodied process of these changes of heart that the psychological tension is created.

This is also explained by emotion theory. The enactive view of emotion proposed by Colombetti puts it in the context of bodily interaction, engagement with the environment [8]. In contrast, the dynamic co-constitution of affect and cognition is highlighted by Colombetti and Thompson [9]. The morality of stories is therefore generated not through dispassionate thinking but through passionate evaluation. The degradation of Emiko, the business choices of

**Mohamed Anwar**

Anderson Lake, and the nationalistic passions of Jaidee produce intuitive responses that coincide with reasoning [3]. This embodied ambivalence is exacerbated by the fact that moral categories are not stabilized in the novel, although the ecocritical and political-economic interpretations of the novel have been abundantly developed. The particular processes by which narrative form brings psychological discomfort to readers have received little focus. Kortekallio anticipates that an anthropocentric norm is destabilized by the contemporary speculative fiction through his work on mutant stories and ecological science fiction, which operates on the assumption of the alteration of the anthropocentric bodily experientiality of readerhood [14]. However, the issue of cognitive dissonance as an organizing dynamic has not been studied in depth. Although ecocriticism usually focuses on the environmental representation and political commentary, it has not always focused on how the readers are situated in the opposing moral framework. This paper thus fills a major gap. The *Windup Girl* has been discussed as a criticism of neoliberal biotechnology and global capitalism. Yet, the emphasis has been on this too little.

In contrast, the nature of the narrative strategies forming the backbone of this work produces ethical instability at the level of the reading experience. The novel creates a conflict between sympathy and condemnation by spreading out the complicity and denying a moral judgment. Characters justify exploitative systems as important to survive or move on, and simultaneously, the narrative exposes the systemic damage that those systems are causing [3]. This tension corresponds to the observation of the cognitive dissonance theory, according to which contradictory beliefs and actions create a state of psychological uneasiness that will have to be addressed. Instead of providing a resolution, however, Bacigalupi maintains contradiction in his dystopia. The main questions that regulate this inquiry are thus: How does *The Windup Girl* create cognitive dissonance on the level of character and reader? How does bio-capitalist scarcity organize the moral compromising? What are the disruptions that ethical ambiguity causes in the firm's moral alignment? And is climate dystopia a moral experiment in discomposure? By uniting affect theory, enactivist narrative theory, and material ecocriticism, the given paper holds that the novel in question serves not only as an attempt at speculative foretelling but also as an experience device. By means of distributed agency and focalization and embodied engagements, the text locates the readers in ethically ambiguous situations where belief, sympathy, and judgment come into conflict. Climate dystopia is, therefore, a venue where ethical thinking is provoked not by moral clarity but by dissonance maintained.

METHODS

The proposed study uses a qualitative and theoretically integrative approach aimed at analyzing the way attachment of moral discomfort to the narrative structure in *The Windup Girl* is created. The methodology is based on cognitive literary research, enactivist philosophy, phenomenology of mood and posthuman material thinking. Instead of seeing the novel as a clear manifestation of the ecological crisis, the approach examines the process of readerly engagement as a dynamical process that is determined through embodied simulation, environmental sensitivity, and affective instability. It is not an empirical aim but an interpretive one: to clarify how the form of a narrative creates the conditions of cognitive dissonance without subjecting fiction to psychological experiment. The reading material is Paolo Bacigalupi, *The Windup Girl* [3], and the focus of the analysis is made up of scenes that pre-empt bodily vulnerability, environmental precarity, and moral compromise. These are sequences that illustrate the humiliation of Emiko in public and her limited embodiment, corporate rationalizations of Anderson Lake, nationalist imposition of trade boundaries by Jaidee, and the flooding of the city of Bangkok as the climax. The rationale behind the choice of these narrative sites lies in the fact that they enact ethical conflict in terms of material spaces designed by scarcity and biotechnological disciplines. The methodology is not a chronological presence in the novel. Still, it isolates nodal points, where there is an ethical justification, bodily exposure and environmental instability, converging.

The theoretical basis of the methodology is the account of the cascades of cognition in an embodied reader [15]. This means that under this framework, the readers create expectations that are constantly updated in regard to the narrative developments. This dynamic offers the perspective through which the change in ethical alignment in the novel can be analyzed. Predictive models of moral judgment are brought to their knees as the reader is introduced to

**Mohamed Anwar**

opposing rationalizations and contradictory views. This interpretation strategy is thus followed through analysis of the instances in which the narrative point of view, the storytelling, beckons tentative sympathy and then breaks it. The work by Kuzmicova regarding presence in literary reading continues to inform this interpretive practice by highlighting the crucial roles of motor enactment and the spatial reconstruction as the main components of the narrative experience [16]. Descriptive text used in *The Windup Girl* is analyzed in its own ability to produce the desired sensorimotor images, especially in such instances as the heat, the crowd, or the physical susceptibility. The approach presupposes that these images enhance emotional appeal and increase moral risks. Moral ambiguity is something that will be experienced when readers imaginatively enter the worlds of scarcity or humiliation. The subsequent investigation of the physical situatedness of reading by Kuzmicova thereby highlights the interaction of the narrative environment with the embodied perception [17]. Even though physical states of reading are not measured in this study, it embraces the theoretical understanding that the narrative space is a field of experience that defines evaluative reaction.

Another dimension to the methodology is posthuman phenomenology. The entangled nature of the body as described by Neimanis in relation to the ecological systems prefigures the permeable nature of the human and nonhuman material [18]. According to this view, water, disease and genetic modification in the text by Bacigalupi are put into play as powers of conditioning ethical possibility. The material space of Bangkok is therefore not seen as the backdrop setting but as an active participant in the narrative meaning. In this regard, the approach is consistent with the enactivist philosophy proposed by Noë, who claims that perception is based on active-oriented participation, but not passive representation [19]. This perspective, when applied to literary interpretation, redefines reading as a form of exploratory moral tourism. The resulting ethics of discomfort in the active navigation through conflicting frames of evaluation, instead of passive reflection, is further developed in the idea of the double vision of fiction by Polvinen [20], whereby this idea is used to develop a more analytical perspective on the circumstance of reading. The paper thus takes care of those instances in which the readers are asked to side with a morally compromised, and at the same time acknowledge structural injustice. This swing between immersion and critique is considered one of the central mechanisms of the analogical performance of cognitive dissonance. Narrative form keeps the tension that is not resolved in the stable moral hierarchy. Phenomenology of mood gives the ultimate theoretical stratum of the methodology. Ratcliffe also views mood as a background orientation that realizes the field of significance on which judgments are made [21]. The endless effect of heat, decay, and looming downfall, in the case of *The Windup Girl*, acts as an orientation. The approach thus examines how environmental circumstances determine an affective grounding, which defines the choices made by characters and the interpretations of the reader. The discussion of mood patterns affected by environment presented by Rohan and Rough proves the more general statement that the conditions of climate do moderate the affective states [22]. Even though their interest lies in the clinical, the conceptual acumen that the rhythms in the environment determine emotional orientation enhances the interpretation of the repressive climatic setting of the novel. Close reading is used to determine the passages of the explicit moral justification and change in the narrative alignment. Linguistic indications of necessity and inevitability, and survival logic are investigated to follow the logic of complicity rationalization of characters in bio-capitalist systems. These textual results are then viewed from the perspective of embodied presence and gauging the way of descriptive detail to recruit sensorimotor imagery and increase affective responsiveness. Lastly, there is the enduring mood of ecological precarity, which is assessed as a structuring condition influencing interpretive orientation. The integration of these approaches is summarized in Table 1.

The logic behind such a methodological set-up is based on the assumption that literature is a form of experience where ethical conflict will be acted out, but not purely presented. The combination of embodied cognition, phenomenology of mood, and posthuman ecological thought enables the method to capture the affective and evaluative instability generated by narrative environments. The strategy does not resort to reductionism by considering psychological theory as an analogical resource instead of an empirical assertion. In this interdisciplinary approach, *The Windup Girl* is explored as a place where bio-capitalist scarcity and ecological precarity create the perpetuated moral tension at both the character and reader levels.

**Mohamed Anwar**

RESULTS

Through the analysis, it is evident that *The Windup Girl* creates moral discomfort not just by plot events but by multifaceted affective and embodied processes that also coincide with the social affect, attention, and enactive cognition theories. Instead of using the ethical conflict as a direct debate, the novel creates an atmosphere of tension distributed and existing on the lower level of expressed judgment. The findings indicate that this tension is created by three processes that are interrelated and that include the circulation of social affect through networks of scarcity, the modulation of attention and background experience in the perception of the reader, and destabilized anthropocentric moral structures through posthuman affect. In the description of social affect, Seyfert argues that affective intensities circulate within the social systems and can not be reduced to personal feeling [23]. Fear of contagion, economic anxiety, and nationalist hostility in Bangkok are collective moods and not individual responses, as the author, Bacigalupi, employs them. The calorie companies, the environmental ministries, and the refugee populations have an effective economy in common, which is organized as a Scarcity. This spread effect determines moral logic by making suspicion normal and defensive aggression right. The use of violence and exploitation is justified as a safeguarding measure by the characters in an already highly charged environment. Ethical instability, as can be seen in the novel, is therefore not due to an abrupt emotional outburst but rather due to a long-term social mood of precarity. The reader is exposed to this atmosphere as permeating the novel and not intermittent, creating an uncomfortable experience that serves to represent systemic involvement as opposed to personal moral deficits. Second, the findings reveal that the novel deploys the reader's attention in a manner that compares to philosophical explanations of background experience. Schwitzgebel's thoughts about the concept of attention and the unnoticed tactile experience point to the fact that much of lived experience exists outside of the focal awareness [24]. Translated into the analysis of narrative, this observation explains the functionality of the environmental details of the novel. The repressive heat, the surging water, and the artificial plagues are often kept in the background of the story as the political intrigue takes up the foreground. However, it is these environmental factors that keep on influencing interpretation. Ecological references are not necessarily something that readers pay conscious attention to, yet the overall effect preconditions evaluative response. Scarcity is a tacit frame that justifies compromise. Moral dissonance can thus arise in part because of the conflict between the explicitly considered and the ambient.

This foreground and the background interaction conforms to the enactive theories of cognition. The biological and phenomenological process of mind as described by Thompson underlines the fact that cognition occurs as a result of embodied interaction with the environment [25]. Varela, Thompson, and Rosch are more or less of the same opinion that knowledge is practiced in terms of structural coupling between organism and world [26]. The characters in the novel do not discuss abstract ethical principles that are not connected to material conditions. Their choices are played out in the context of immediate body and setting limitations. Corporate strategies of Anderson Lake are influenced by the disease epidemics and seed monopolies, and the vulnerability of Emiko is encoded into her artificial physiology. The circumstances of the embodiment cannot be separated from the ethical reasoning. It is the reader who, in turn, acts by bringing understanding through imaginatively playing out of these confined positions. Moral uneasiness comes when the reader makes simulated decisions in the face of pressure, realizing that judgment is not easily divorced from its survival circumstances.

The discussion also indicates that the novel upsets anthropocentric ethical structures with posthuman affect. The idea of posthuman affect by Vermeulen emphasizes the shift in human-centered emotional disposition in modern literature [27]. In *The Windup Girl*, the stable categories of human and nonhuman are broken by genetically modified organisms, viral plagues and bioengineered bodies. The fact that Emiko is a manufactured, yet sentient being, questions the traditional compassion. The readers might not fail to react to her humiliating moment with defensive anger, but her commodification as an object makes this reaction complicated. The writing does not entirely incorporate her into the human identity and does not deprive her of the human experience. Such ambivalence increases dissonance. Ethical consideration should address hybrid versions of life, which are opposed to inherited moral patterns. This destabilization is increased with social affect. According to the theory proposed by Seyfert, the

**Mohamed Anwar**

affective intensities might be higher than the conscious interpretation, and they determine the collective orientation without any direct expression [23]. It is not enough that the aggression towards Emiko is perpetuated with the help of rational argumentation, but also through the spread of disgust and fear. These influences are social controls that strengthen hierarchies of the bio-capitalist order. The interaction of the reader with these dynamics proves that ethical boundaries are created or even created effectively, not logically. Uncomfort is caused by the realization of being a part of the like affective economies outside of the text.

The theory of attention also explains the process of this discomfort. The discussion of unnoticed experience by Schwitzgebel suggests that awareness is partial and unstable [24]. The shifting focalization of the novel redirects the attention of the readers to the various moral frames at the expense of some others. As a narrative direction shifts away to the calculating of corporations to the suffering of the body, violence that was assumed as a background in the narrative is brought to the fore as a foreground. The wavering of the focus is reflective of the lack of moral conviction. There are cases when the evaluation has to be reset by the readers after each new detail on the experience is revealed. Enactive philosophy expands on this description through the focus on relational interdependence. Bio-phenomenology by Thompson and embodied action by Varela and others put cognition in terms of emergent in organism-environment interaction [25] and embodied action in terms of knowledge [26]. Ethical positions in the novel form as a result of relational mirroring in food systems, water networks and genetic manipulation. The symbolic device of the flood that overcomes the city of Bangkok is a material force that restructures the social hierarchies. The reader feels this restructuring as structural dislocation and not narrative convenience. Moral dissonance is, therefore, demonstrative of changing relational structures other than a solitary character flaw.

The result of these processes is perpetuated ethical instability. In Posthuman affect as explained by Vermeulen, entanglement and vulnerability outside the human subject are resistant to closure by foregrounding [27]. The last scenes of the novel fail to bring about moral sanity. They instead heighten the reality of systemic vulnerability. Social affects are in circulation, the pressures of the environmental landscape are still in place, and the hybrid life forms are still precarious. The reader is not given any safe moral resolution. Collectively, the outcomes prove that *The Windup Girl* creates cognitive dissonance by practicing embodied interactions with social and material systems. Distributed affect normalizes compromise, environmental background forces control attention, and posthuman entanglement introduces instability in anthropocentric ethics. The novel is an experiential practice where the reader plays a game of moral reasoning in restriction. Instead of providing pedagogical teaching, it maintains a conflict between sympathy and criticism. This internal conflict is one of the ways climate dystopia may serve as an experimental space to investigate the affective and embodied principles of moral judgment.

DISCUSSION

The conclusions of this paper indicate that *The Windup Girl* must not be viewed as a piece of hypothetical critique of bio-capitalism, but rather as an embodied system of instability, which enacts ethical instability by way of embodied and attentional relations. The novel mobilizes enactive and phenomenological cognition by foregrounding ecological insecurity, hybrid subjectivity and systemic scarcity. The moral discomfort in the text is not caused by abstract ideological conflict per se, but by the involvement of the reader in changes of fields of attention, embodiment simulation and relationship entanglement.

The author offers a fruitful framework for understanding the ethical order of the novel by analyzing the background experience of Schwitzgebel. The fact that he says that much of conscious life functions beyond focal attention upsets the belief that moral awareness is continuous and transparent [24]. Ecological degradation, engineered disease, and infrastructural collapse have been used as an ambient condition, as opposed to a dramatic focus, in *The Windup Girl*. They exist almost in every scene, though not necessarily premeditated in thought. This is a narrative approach that is similar to the fact that Schwitzgebel points out that even invisible aspects of the experience can influence the orientation and judgment. The neediness and environmental disruption turn into the equivalent of the unrecognized

**Mohamed Anwar**

sense of touch in his example: constantly training action, and at the same time, existing partly outside conscious perception. The moral unease of the reader is thereby the comprehension of the background forces that have arranged the compromise of ethics, even without making any noise.

The figure proposes a stratified conceptual framework whereby embodied moral dissonance is placed within concentric cells of cognitive as well as affective processing. The deepest field is the foreground's background attention, which is the pre-reflective field of experience. The second level is enactive cognition, which puts focus on the organism-environment interaction of meaning-making. At the third layer, structural coupling is the dynamic interaction between body, world and narrative environment. These processes are placed in the outermost ring and thus positioned in the posthuman affect where ethical response is not based on anthropocentrism. The concentric form shows that there is an integration instead of hierarchy, pointing out that moral dissonance is created by a recursive interaction between embodied, cognitive, and affective systems.

This relationship is more evident in the description of cognition as embodied and relational, presented by Thompson [25]. Thompson states that the mind is not a detached processor of representations but an emergent process based on biological and phenomenological involvement with the environment. This view applied to the dystopia of *Bacigalupi* is that the moral choices of characters cannot be seen outside of the entanglement that they possess with food systems, disease ecologies and political infrastructures. The abstractability of the corporate calculations of Anderson Lake, such as those, is not independent of the material conditions of resistance to the plague and seed monopolies. The physically engineered vulnerability of Emiko is marked on her own physiology. Balancing of ethical reasoning in the novel is thus performed within limited material relations.

This relational structure is reflected in the interest of the reader. Cognition, according to Varela, Thompson, and Rosch, is the result of structural coupling between the organism and the world as opposed to being detached contemplation [26]. Reading is a performed experiment of limited possibilities. The moral aspect of the novel is not seen in the exterior but explored in the creative simulation. As the readers shift positions of relationality when assuming various positions, such as corporate agent, engineered being, nationalist enforcer, they are engaging in changes of relational positioning. The reason that makes moral judgment unstable is that it is dependent on the embodied standpoint based on which it emerges. The unease created by the narrative is therefore an expression of the fluidity of the performed point of view as opposed to mere confusion about what is right and what is wrong.

This instability of relations overlaps with the description by Vermeulen of the posthuman affect that focuses on the destabilization of solid human-based emotional patterns in modern literature [27]. By making the engineered bodies and genetically modified organisms the main protagonists of its moral field, the *Windup Girl* challenges the anthropocentric assumptions. The life of Emiko defies inherited gender divisions of compassion and moral duty or responsibility. The audience can first react to her misery with the more common humanitarian interest, but she is a manufactured commodity, which makes this reaction more complicated. Posthuman affect disrupts moral recognition. What makes the discomfort is that ethical norms do not fade away, but there is an insufficiency in handling hybrid forms of life. Combined, these theoretical approaches explain why the novel is so powerful because it is able to maintain unresolved tension. The focus on shifting attention, as highlighted by Schwitzgebel, highlights the way ecological forces in the background slowly creep into focal awareness [24]. The enactive framework proposed by Thompson puts ethical deliberations in the context of embodied constraint [25]. According to the description by Varela and others of structural coupling, moral navigation is participatory in nature [26]. The posthuman affect of Vermeulen demonstrates the manner in which the hybrid subjectivities of the anthropocentric empathy become unstable [27]. These dynamics intersect to create a type of cognitive dissonance that is more of an experience than a theoretical idea.

Notably, the novel does not solve this dissonance by moral elucidation. Rather, it leaves the reader in an instability of relations. The last sequences make more people conscious of systemic weakness instead of being redemptive. The forces of the environment are still defining the social organization, hybrid bodies are still vulnerable, and corporate

Mohamed Anwar

logic still exists. Ethical reflection is not a decision that is made but rather a continuous process. This argument thus redefines climate dystopia as a platform where embodied cognition and posthuman affect meet to disturb moral certitude. Instead of being a warning allegory on its own, *The Windup Girl* is more of a laboratory experiment to explore the process of the creation of ethical judgment through the intertwined relationships between bodies, infrastructures, and environments. Its painful effect can no longer be seen as a failure of narrative sense but rather as a deliberate revelation of the restrictions of anthropocentric ethical systems in the circumstances of ecological crisis.

Table 1. Interdisciplinary Methodological Integration

Theoretical Domain	Core Concept	Analytical Application	Interpretive Function
Embodied Cognition	Predictive cascades	Tracking shifts in ethical expectation	Models readerly dissonance
Motor Enactment	Sensorimotor simulation	Analysis of bodily and environmental description	Intensifies moral immediacy
Situated Narrative	Environmental framing	Bangkok as an experiential field	Structuring ethical perception
Posthuman Phenomenology	Bodily entanglement	Agency of water, disease, and genetics	Destabilizes anthropocentrism
Enactive Perception	Action-based cognition	Participatory reading dynamics	Frame's moral navigation
Double Vision	Immersion and critique	Empathy–distance oscillation	Sustains ethical instability
Mood Theory	Background attunement	Climate-induced atmosphere	Conditions evaluative stance
Environmental Affect	Climate–affect linkage	Heat and scarcity as pressure	Amplifies discomfort

ABSTRACT

The character development in modern diasporic fiction tends to explain complex psychological negotiation which combine individual desire, rationality, and social expectations. This study explores the character development of Trisha Raje in the novel, *Pride, Prejudice, and Other Flavors*. The psychoanalytic reading of Trisha is examined through the lens of the psychoanalytic model developed by Sigmund Freud, namely the Id, Ego and Superego. The analysis maps the role of these three psychic elements in harmonizing the temperament, internal frictions, and emotional transformation of Trisha throughout the narrative. The repressed emotional desires and instinctive responses of Trisha exemplify the functions of the Id. Her suppressed emotional needs include her desire to be loved, to be accepted and to have personal freedom. Her professional identity, epitomized by her strict discipline as a neurosurgeon, reflects the Ego and its strict control over impulses. Simultaneously, the moral expectations internalised by her prestigious Raje family serve as the Superego. The study demonstrates how the constant negotiation between these psychic structures contributes to the gradual evolution of Trisha's character.

Keywords: Diaspora, Ego, Freud, Id, Superego

INTRODUCTION

Human mind is quite complex, and this complexity is often reflected in literature. Literature reflects this complexity through characters whose thoughts, emotions, and actions mirror the intricate mechanisms that are involved in

**Shagiftha Anjum and Sahidul Islam**

human psychology. “Sigmund Freud, in his “Structural Model theory of personality”, states that each individual’s personality is made of three parts: The Ego, the Superego and the Id” (Niaz et al., 2019). The psychoanalytic model of Sigmund Freud has always been considered as a valuable tool for analysing the motives of characters, the inner conflicts, and the emotional existence in literature. The tripartite model of the Freudian psyche which includes id, ego and superego is used to understand how the unconscious desires, rational thought, and moral prohibitions act together in a person. The contemporary diasporic novel, *Pride, Prejudice, and Other Flavors* (2019) by Sonali Dev portrays a psychologically complex portrait of Trisha Raje. Dev’s novel is the modern retelling of Jane Austen’s classic *Pride and Prejudice* (1813/2003) in the contemporary Indian-American setting. It also provides a deep psychological analysis of guilt, obligation, and emotional suppressions. Dev restages the classic canons of social division, emotional vulnerability, and personal transformation within a diasporic context

Trisha is a renowned neurosurgeon who belongs to a well-known, powerful Indian-American family. She is acknowledged for her exceptional intelligence and composure. However, there lies an emotional detachment, an unresolved guilt, and a constant need for validation, beneath her professional brilliance. She is extremely confident in the medical field, but she is uncertain in handling interpersonal relationships and emotionally charged situations. Her professional competence juxtaposes with her inability express her vulnerability. Her stern attitude is due to her guilt, familial expectations, and pressure to maintain perfection. These elements create a psychological conflict which can be effectively analysed through Freud’s tripartite model of the psyche. The paper further argues that Trisha’s psychological journey represents a process of self-realization, where she learns how to reconcile these conflicting aspects of her personality.

LITERATURE REVIEW

According to the review of Niaz et al. (2019), the psychoanalytic theory of Sigmund Freud is a significant approach in literary criticism. It highlights how the notions of the id, the ego, and the superego can be used to discover the unrepressed wishes and suppressed feelings in literature. The paper also examines how the elements of symbolism, repression, and the unconscious are used in the development of characters and construction of plot. The study proposes a hypothesis that the psychoanalysis acts as an interdisciplinary framework for analysing literature, and human behaviour. (Azmi, 2023) provides a literature review on the psychoanalytic approach in understanding the individual behaviour, which is based mostly on the theory of Sigmund Freud. It explains the role of the dynamic interaction of id, ego, and superego in shaping the human behaviour and internal struggle. The study summarizes the existing literature, where the unconscious processes, defense mechanisms, and past experiences are highlighted as the factors that determine the human behaviour. It also traces the development of the psychoanalytic theory and its persistence, in relevance with the fields of psychology, education and personal growth.

Marcelina and Juanda (2025) analyse the character arc of John Wick based on the tripartite model of Freud, and anticipates the dominance of the id in driving his quest for vengeance. The Id is evident in Wick’s anger and in his desire to get revenge after suffering a personal loss. The ego on the other hand mediates these impulses and coordinates the strategic and calculated actions while the superego reflects moral codes. The paper, therefore, assumes that the psychological development of Wick would depend on a dynamic balance between these forces, despite the dominant nature of the id. Eventually, his development echoes behavioural patterns of trauma where the loss of emotions throws off the balance but does not entirely eliminate moral consciousness. Loway et al. (2023) explores the personality profile of Kat Stratford which shows that the domination of the id is strong and dictates her emotional instability, anger, and rebellious behaviour. Her ego appears in her practical behaviour and the superego occasionally guides her through morality. This paper argues that the character of Kat has been shaped by emotional impulsivity instead of moral reasoning. The salient id dominance depicts how personality determine behavioural trends and interpersonal relations in the narratives.

**Shagiftha Anjum and Sahidul Islam**

Sitohang et al. (2025) examines a psychoanalytic reading on Macbeth. The paper emphasizes on how id-driven ambition dominates his personality and causes his moral decline. The ego becomes evident only in his hesitation and tactical planning. The superego appears here as guilt and remorse after murdering Duncan. The study reveals that the imbalance between these elements causes psychological deconstruction. The domination of ego by the superego and id causes an outcome of destructive behaviour and identity disintegration. Shah et al. (2025) discusses the psychological breakdown of the protagonists using the theoretical framework of Freud. It portrays the process of character development as collapse instead of growth, due to the lack of balance between the three structures, which leads to a mental breakdown and crime. Iqbal et al. (2025) explores Flynn's *Gone Girl*, comparing Freudian and Lacanian psychoanalysis and demonstrates how unconscious desires, trauma, and social pressures define the identity of Amy and Nick, highlighting their fragmented and reconstructed personality. Almas et al. (2024) applies Freudian theory to Amir in Hosseini's *The Kite Runner*, showing how guilt, trauma, and paternal expectations shapes him through the conflicts between id, ego, and superego. Mutyarani et al. (2024) employs Freud's model to illustrate how desire, morality, and repression lead to emotional conflict, which shapes actions, relationships, and identity struggles of characters. Lapsley et al. (2011) states that id, ego and superego focusing on unconscious drives, moral regulation and internal conflict act as a key to personality and human behaviour. The existing study has largely applied Freudian psychoanalytic models to characters who are controlled by extreme impulses or moral conflict. But less research has been done on ambivalent but internally conflict characters such as Trisha Raje in *Pride, Prejudice, and Other Flavors*. This study addresses that gap by examining how repression, professional self, and family expectations influence delicate interactions among id, ego, and superego.

RESEARCH FOCUS

The primary focus of the paper is to analyse how Freud's structural model of the psyche, the id, ego, and superego is employed in character development of Trisha Raje. The analysis examines the influence of these psychic structures on her self-concept, and interpersonal relationships. The study aims to

- Trace the instances of the id, ego, and superego in the personality of Trisha.
- How the interaction between these aspects in a dynamic manner drives her character development?
- How Freud's model of the psyche functions as a tool in understanding the inner conflicts, emotional repression, and psychological evolution of Trisha Raje?

Theoretical framework

Freud's psychoanalytical theory suggests that the human mind is composition of three mutually dependent components namely the id, the ego, and the superego. Each of these elements have their own psychological functions, which together determine complexities of human personality, motivation, and internal conflict. In literary studies, this framework provides a powerful lens through which the thought process of a character, their behaviour and emotional struggles can be meticulously decoded. According to Freud, the id is the most primitive portion of the psyche. It is a system that runs purely on the principle of pleasure and represents the appetites of the instinct, such as emotional gratification, affection and personal satisfaction. The id strives to get immediate gratification of desires such as hunger, sexuality, aggression, and instinctual impulses. The id lacks logic, ethics, or social norms. It requires instant satisfaction regardless of the consequences. In literature, the id is represented in the character's impulsive action, outburst of feelings and emotions, and desire. The ego on the other hand is the conscious and rational part of the psyche. It functions according to the reality principle. The ego lies between the two elements, the id, and the superego. It balances the desires of the id and the restrictions imposed by the superego, allowing people to negotiate the social worlds in an efficient way. It tries to satisfy the desires raised by the id in the realistic and socially acceptable ways without causing psychological imbalance. The ego uses reasoning, problem-solving, and decision-making to balance the conflicting forces. In literary criticism, the ego can be found among the inner thoughts of a character, compromises, and adaptive strategies. It is a negotiating force that prevents an individual from completely acting on impulse or morality. The third one is the superego. It is a bundle of internalized moral and ethical ideals that are influenced by parents, culture, and societal norms. It functions as a moral conscience that supervises the behaviour of the individuals through socialization and parental control. It also imposes the feelings of guilt, shame, or anxiety as penalties when those norms are violated. The superego is further divided into two, one of them is the

**Shagiftha Anjum and Sahidul Islam**

conscience, which punishes the actions that are wrong, and the other one is the ego-ideal, which rewards good behaviour through a sense of pride. The superego manifests through the moral dilemmas of characters, their self-criticism and following the social norms. It often creates conflict with the id, when instinctual desires contradict the ethical standards. All of these three components interact together to form a human psychological conflict. When desires of id are too strong, the ego might break down in controlling them. This may lead to impulsive or destructive behaviour. When the superego dominates, people may experience excessive guilt, repression, or psychological distress. Therefore, the ego is supposed to maintain a balance between these conflicting forces. In literary analysis, this framework helps to analyse how characters struggle between personal desires and societal expectations. In the case of Trisha Raje, there is a psychological tension between emotional desire and societal pressure which propels her character development.

The Superego of Trisha Raje

The superego, in the Freudian psychoanalytic theory represents the moral conscience, the internalized societal norms and the pressure to achieve perfection. The superego, seems dominant and controls the personality of Trisha. She belongs to the powerful Raje family and brought up in a world of privilege, prestige and unceasing demands. Her character was formed by aristocratic backgrounds, family norms, and internalised standards of excellence. It controls her behaviour, restrains her emotional reaction and continuously drives her toward a quest of excellence and accountability. The Raje family is a classic social establishment which values achievement, reputations and power. Since she is a very young child, Trisha is taught that being excellent is not an option but a necessity. She can no longer define herself without her accomplishments, particularly her career as a neurosurgeon. Though she excelled as a neurosurgeon, her family still sees her as a less accomplished person. This is evident when her mother says, "I think you might be the first simpleton in the Raje family... No one said you aren't good at what you do" (Dev, 153).

The narrative frequently highlights how her superego demands perfection. "Trisha had spent every waking moment for the past five years thinking about how to operate on tumors growing on brain tissue...it wasn't just her waking moments; she spent most nights dreaming about her work too." (Dev, 8) These lines show her perfectionist mindset where less concentration or any distraction is unacceptable. It also shows that her perfectionism is subconscious. She strives to eliminate all possibilities of errors. This commitment alienates her emotionally. Her inner world is entirely engulfed by professional excellence leaving a very little room to have relationships, and emotions, which create internal conflicts. Her superego allows her to take pride on her career. "I dare to take pride in my work, in knowing I'm excellent at it." (Dev, 319). The superego comes in the form of guilt and feeling of failure and particularly the mistake she did in the past in connection with Julia and the way it affected Yash. Trisha carries this psychological burden which is never-ending. She believes that she is the reason that provided a chance for Julia to negatively impact the life, the career and image of her brother. She feels guilty of nearly ruining the life of her brother. She started to suppress vulnerability and personal desires after that incident. She thinks expressing her emotions will weaken her image of strong person, and may also give others to destroy the name of her family. Her superego is a vehicle of strength and power that drives her to achieve excellence, be responsible. It also sets high expectations that promote feelings of guilt, depression, and isolation.

The Id

The id as interpreted in Freudian psychoanalysis is the most primitive and instinctual part of the psyche, which follows the principle of pleasure and is motivated by instant gratification. Her id is not dominant yet suppressive. It occurs when she experiences emotional intensity, desire, anger, and vulnerability. The id is shaped by the internal desire for validation, intimacy which is constantly regulated by the ego and is repressed by the superego. Her id can be traced through her emotional reaction towards her patients, particularly Emma Caine. She projects a clinical detachment but her inner responses reveal emotional agitation. She remembers the blind girl from her childhood and experiences "an empty, hungry restlessness that had knocked her completely off-balance" (Dev, 4). The words hungry and restlessness indicate the raw and unrefined emotional energy, a characteristic of id. She desires to have an emotional attachment with Yash after the Julia incident. A sudden rush of emotions hits her when she comes to meet him at the dinner. "Trisha was tempted to grab his arm and apologize for missing years...She wanted to tell

**Shagiftha Anjum and Sahidul Islam**

him that Julia was in town and HRH was hiding it from him. She wanted to do it so badly” (Dev, 39). However, these urges are suppressed by the ego and the superego.

The id of Trisha is mostly overshadowed by her strong superego. But it comes out occasionally when she is overwhelmed by sexual desire, emotion, and sensory delights, particularly in her relationships with DJ and her food. The id represents instinctual needs like pleasure, attraction, and emotional longing, which disrupts her controlled persona. Her id is clearly visible in her sensory reaction to the cooking of DJ. When she tastes his food, her response is immediate, “Oh my God...You cannot possibly feed this to people” (Dev, 184). This spontaneous expression of pleasure reflects the momentary relief from her self-control, permitting her instinctual pleasure to dominate. Her attraction to DJ also throws more light on the mechanisms of her id. Despite her conscious hate, she feels a deep instinctual pull towards him. “The craving for his food had been rolling in waves across her taste buds, tangling her thoughts up inside her” (Dev, 195). This analogy of craving goes beyond the food and stretches to the emotional and physical attraction, highlighting on how her id operate at a subconscious level to influence thoughts and desires. These affective conditions are natural results of spontaneous impulses that challenge her carefully constructed identity. The id is reflected in her emotional outbursts and unplanned reactions. She is sharp and defensive during her interactions with DJ. It is evident when she sarcastically responds, “it’s not like you need a photographic memory to cook food” (Dev, 174). It is just a reaction of wounded pride and emotional agitation, which shows her id can gain control over her normal composure. Her id functions as a suppressive yet powerful dynamic in her psyche, which appears in sensory pleasure, emotional response, and unconscious desire. Though her superego tries to limit and tone down these forces, the id still comes out eventually. The id of Trisha is not chaotic, but is repressed and internalized. It is expressed in of anger, desire, longing and vulnerability.

The Ego

The ego of Trisha is characterised by efficiency and common sense, especially in her profession as a neurosurgeon. The textual lines, “so much about the world baffled Dr. Trisha Rajee, but she was never at a loss for how to do her job” (Dev, 1) defines the nature of her ego. She resorts to logic and competency even when she feels overwhelmed. The ego in Trisha’s character acts like an interpreter between the overpowering superego and the repressed id. It attempts to make a balance between her instinctual urges on the one hand and the practical demands of the world on the other. Being a successful neurosurgeon, her ego is aligned with logical reasoning, control, and decision-making processes, which makes her prepared to deal with complex professional and personal situations. Unlike the impulsive id or the judgemental superego, her ego works on rational thought and circumstantial awareness.

The character has a strong ego in her work environment where she is capable of make decisions under pressure. She faces an issue in communicating a life-changing diagnosis to a patient at the beginning of the novel. “Telling a patient her tumor was not fatal should have been the easiest thing, but Trisha had no idea how she was going to manage it. How on earth did one tell an artist that she was going to go blind?” (Dev, 1). These textual lines highlight her perception of reality. She tries to balance the medical facts with emotional delicacy. Her ego realizes the complexity of the situation and tries to respond accordingly, rather than reacting on impulse or moral rigidity. Her ego also acts as a stabilizing mechanism while informing Emma about her impending blindness. Though she struggles emotionally, her ego drives her to be straightforward in saying, “Removing the tumor is the only way to save your life. And we can’t remove the tumor and also salvage your optic nerves” (Dev, 15). Her ego prioritizes reality over providing emotional comfort. She lives life as she approaches surgery, in a structured, calculated, and focused manner. Her internal response is controlled, when she learns about approval of a huge grant of research. “It made her want to pump her fist in vindication and shout...instead, she took the hand he held out and thanked him for being such a great boss and mentor” (Dev,16). Her ego matches her action with the expectation of the society in terms of professionalism.

Trisha knows her interpersonal limitation, yet she justifies and distances herself. Her ego balances her desire to be emotionally connected (id), and her fear of being vulnerable (superego). She initially resists her feelings towards DJ, but gradually starts to get involved with him. Although the superego encourages restraint and the id drives desire,

Shagiftha Anjum and Sahidul Islam

the ego strives to reconcile these two conflicting forces that resonates with reality. The ego in Trisha's character acts as a rational centre which balances the instinctual desires and the moral expectations. It provides her competence to live in the real world while navigating internal conflicts. She gradually learns how to balance and control her vulnerability through the ego, which plays an important part of her psychological growth.

The interaction of Id, Ego and Superego leaves a constant psychological conflict in the personality of Trisha. The Id drives her to emotional sincerity while the Superego simultaneously compels her to be discipline, and be morally accountable. The Ego attempts to balance these hostile forces, by means of a rational control. However, the tension is unbearable. Later, Trisha begins to question the rigid standards that have conditioned her behaviour. Her interaction with DJ encourages her to rethink her understanding of success, responsibility, and personal satisfaction. Through this process, she gradually learns to integrate the different aspects of her psyche rather than allowing one element to dominate the others. This integration is the final stage of her psychological development. She learns to reconcile the emotional needs with moral responsibility, instead of suppressing her desires or blindly following the moral expectations. The Ego eventually creates a strong balance by recognizing the validity of both moral values and instinctual desires. The Id, Ego and Superego still exists but they function in a symbiotic and harmonized manner.

CONCLUSION

The continuous interaction of the Id, Ego, and Superego has an influence on the overall personality and behaviour of an individual. The Freudian model of psyche provides a strong framework for analysing the complex character arc of Trisha Raje in Sonali Dev's novel, *Pride, Prejudice and Other Flavors*. The Id in Trisha emerges in her suppressed desire of emotional connection and personal freedom. The suppressed Id is revealed on occasions of involuntary desire, anger and need of association. Her Ego is expressed in her strict professional character and dependence on rational decision making. However, the same process leads her towards emotional self-distancing and inability to build effective relationships. In the meantime, her Superego represents the effective power of family demands, social values, and the demands of moral conscience. This makes her focus on responsibility, accomplishment, and control at the cost of individual satisfaction and emotional outlets. The three forces create a continuous psychic struggle which drives the plot and shapes her character. The development of Trisha's character proves that the true fulfillment requires the harmonious combination of desire, reason, and morality. She learns to balance these dimensions by putting the feeling of guilt and self-denial behind her and discover the path toward a more authentic sense of self. This study highlights how the Freudian theory illustrates the richness of Trisha's psychological development and emphasizes the universal human conflict between responsibility and desire. Her growth indicates that the real satisfaction of life in finding a balance between reason, emotion, and the moral obligation.

ABSTRACT

This study discusses the concept of gamification in English language teaching in the psycholinguistic context of how game mechanics can be used as cognitive scaffolding to demonstrate pedagogical change. The text presents a smaller working memory load and greater attentional control as key indicators of knowing the mental effects of digital learning environments. The dynamics between gamified components and learner processes will be analyzed in the paper to examine the themes of engagement, psychological optimization, and the relationship between motivation and linguistic acquisition. The study emphasizes how gamification is instituting organized forms of play to overcome frail attention and the immediate demand of a concise answer to overload in learning environments. In addition, the paper explores how technology and knowledge are used to deal with educational crises, how the diversity of learners is intertwined with psychological needs, and why it is critical to adopt pedagogical views. Simply put, this research paper advocates that gamification increases awareness of the effects of mental load on language acquisition and urges consideration of a comprehensive approach to educational design. It highlights how a group of teachers has a common role in ensuring the future of language education through the harmonization of the instructional approach with mental architecture to achieve sustainable academic development. The equilibrium of the mind in the digital distractive age is at risk in the absence of such scaffolding; therefore, it warrants the implementation of interventions to maintain resources to conduct effective communication and global competency in the 21st-century classroom. The present research adds to the debate regarding the necessity of a collective reaction to the crisis in the area of education and its impact on society.

**Gifto David and Muhammedali Chalikandy Puthiyapurayil**

INTRODUCTION

Cognitive overload has become one of the most pressing problems of the 21st-century classroom, with broad-reaching implications for the learning environment, society, and the global economy of education. The increasing consequences of digital distraction, an increase in information temperatures, extreme events of multitasking, rising data levels, and the loss of focus by biodiversity states the fact of an ever more unstable ecological equilibrium of the mind. Central to this difficulty is the notion of the cognitive equation, the term applied to explain the complicated and interrelated interactions that exist between the mental ecosystems of the learner, pedagogical actions, and the linguistic resources on which we depend (Sweller, 2011). This paper investigates the language learning process in terms of the cognitive equation, which is the process by which human-controllable variables, such as instructional design, digital interference, and curriculum density, interfere with the fragile balance of working memory (Baddeley, 2000). One of the most topical problems of our epoch is cognitive load, and the literature has become a significant instrument for studying and increasing awareness of its extensive effects. Among pedagogical concepts, there is gamification, which is a strategy that intertwines complex issues of engagement, mechanics, and the human experience (Deterding et al., 2011). This discussion focuses on the way in which gamification utilizes game mechanics as a core emblem to investigate the cognitive implications of instructional transformations. The classroom mechanic turns out to be a point of departure for cognizing the interdependence of the mental world and how changing digital circumstances break down the fine line of attention. Given that we have an unstable future in perspective, it is essential that we evolve an all-encompassing appreciation of the cognitive equation to inform the world towards educational resilience, sustainable development, and learning justice.

The literature on gamification demonstrates how cognitively and attentional control relate to the experiences of learners. Structured play is an influential metaphor for general cognitive interference by information flow that is not managed, reflecting the principles applied in multimedia learning systems (Mayer, 2009). The discipline not only makes one think about how learners perceive and react to changes in pedagogy but also encourages more people to be more conservative when it comes to mental resources. The aforementioned studies and research in the review reveal the ambiguity of memory patterns and attention behavior with a shifting digital climate, which provides the urgency of further educational studies and practices to avoid deteriorating delicate learning outcomes (Hanus & Fox, 2015). The description of changed interactions in gamification is an influential metaphor for global environmental shifts due to cognitive overload. This methodology not only makes one think of the manner in which human beings interpret and react to environmental changes in the classroom but also compels them to conserve the environment more significantly. This paper hopes that through this exploration, it can contribute to the current debate on the dire need for a collective global action to the cognitive crisis in the educational field as well as the implications of such a crisis on society.

RESEARCH FOCUS

The main purpose of this study is to examine how gamification mirrors cognitive and psycholinguistic narrative based on symbolic encoding of game mechanics, their effect on memory patterns, and the consequences that it may bring to natural learning ecosystems and human societies. The decrease in memory load was significant. The research questions were as follows:

How do gamification mechanics (in terms of points and badges) exploit the more general cognitive implications of scaffolding?

- How does the study point to a lack of natural learning cycles and cognitive balance?

How do the learner experiences, as represented in ELT, reflect the larger cognitive crises represented by shifting patterns of attention?

**Gifto David and Muhammedali Chalikandy Puthiyapurayil****Gamification and Cognitive Themes in ELT**

Gamification in English language teaching is woven around a captivating story that examines the interplay between game mechanics and language systems. The domain is framed with the dynamic digital world, and the impacts of cognitive load destabilize local learning environments. The cognitive imbalance and attentional strain themes are central not only to the strategy but also provide insights into the entire societal repercussions of educational degradation. Gamification is structured around the life of the learner, who, after an experience with some mysterious mechanics, realizes that she is going through a series of significant cognitive crises that are taking place in her environment. The entry of points, which typically drive in particular ways, is interrupted because of modifications in the design because of overload (Sweller, 2011). This interruption is an extension of general themes that run through the classroom, as the mental world is depicted as being frail and open to human influence.

When considering the cognitive and gamification elements in ELT, this research paper will look into the description of human-instruction relationships and the effects of cognitive disruption. By examining the developing concept of memory and symbolic expression of the badge system by learners, this paper will serve to show how designers employ mechanics to bring out the urgency of cognitive action (Mayer, 2009). Gamification can be viewed as an engaging critique of the necessity of sustainable practices and overall responsibility in overcoming the cognitive challenges of our age, with its vivid representation of the effects of distraction on an individual and global level (Deterding et al., 2011). Literature on the subject of gamification demonstrates profound interrelationships between load, control, and experience. The research papers emphasize the complication of memory patterns under the conditions of evolving digital climate and emphasize that further research is obligatory to maintain the threatened learning results (Baddeley, 2000; Hanus and Fox, 2015).

Game Mechanics as a Symbol of Cognitive Scaffolding

In science and literature, game mechanics are commonly employed as symbolic representations of the frailty and strength of cognitive mechanisms. In ELT, designers refer to the interrupted attention of the learner as a metaphor for the mental systems that have become more and more disrupted because of cognitive overload. Digital intrusion, which results in a change in the classic inspirational direction of the points and badges, is used to symbolize the vulnerability of natural systems and the implications of instructional alterations by human factors (Deterding et al., 2011). It is a symbolic employment of the mechanic that not only emphasizes the short-term effects of load on learning but also represents the systemic effects of destabilization in the delicate balance of working memory (Sweller, 2011). The gamified aspect, which is characterized by engagement, plays a key role in the classroom because it focuses attention on the alteration of cognitive patterns that interfere with natural processes. Traditionally, the learners give instructions to acquisition of specific patterns. In the digital world, however, attention lies in a trough of distraction, which is otherwise an unaccounted route. This unaccountable change in behavior is a symbol of a larger environmental transformation in the world, which alters the regular cycles of nature (Baddeley, 2000). The entry of learners was first understood to be a miracle. However, later in the course, one realizes that their existence is not a natural occurrence but an outcome of an educational crisis. Such a change in the focus of learners is a wake-up call to the educator that makes them face less observable disturbances that take place in the mind world (Mayer, 2009).

The change in the behavior of the learners is similar to the internal changes as the characters understand the intensity of cognitive load and challenges. Mechanics are also manifestations of personal and global issues. The symbol of the badge as something weak but able to travel the world portrays the urgency of dealing with cognitive disruptions before they cause irreversible damage. This essay explores the symbolic meaning of the mechanic in ELT as a symptom of cognitive breakdown by drawing parallels between the disrupted course of the learner and the educational crises at a larger level brought about by overload. Finally, the mechanic in gamification is a powerful prompt for connectedness and urgency to bring cognitive balance back before it is too late (Hamari et al., 2014).

Gamification as a Reflection of Learner Lives

As the story unfolds, the learner begins to see the mechanisms of gamification as a reflection of their own struggles. Because the badge system is a launchpad to personal enlightenment and greater community-wide social

**Gifto David and Muhammedali Chalikandy Puthiyapurayil**

and cognitive challenges, personal change follows teaching change (Deterding et al., 2011). This connection between humans and computers evidences that intrinsic drive is not an abstract idea but one that affects human beings in all their backgrounds and financial statuses (Ryan and Deci, 2000).

- Waking up on a Personal Level: The engagement with the mechanics is a turning point for the learner, showing the criticality of addressing cognitive load. Referring to the experience of transferring to a native country and another one, they begin to understand the effects of the global educational crisis on their own lives (Hamari et al., 2014). Human Ignorance and Denial: To start with, some members of the community perceived the gamification as an outlier or supernatural intervention. This is a prime illustration of the widespread ignorance and unacceptance of education change. Cognitive pressure is something many individuals have to deal with in reality, and throughout the course, the student becomes skeptical and later realizes it (Hanus & Fox, 2015; Sweller, 2011).

The Role of Technology and Knowledge in Understanding Cognitive Load

The discipline is very keen on the use of technology to explain and comprehend cognitive phenomena. The researcher is the work of the scientific community to understand the impact of distraction on the learning ecosystem. The formation and sharing of scientific knowledge are extremely significant in the development and interpretation of cognitive load (Sweller, 2011). In recent decades, scientific progress has furnished empirical data on the existing global cognitive crisis and has also provided paradigms for explaining its occurrence. Cognitive load would demand interdisciplinary scientific work, including research in psycholinguistics, social sciences, and other sciences, to understand all the complexities involved (Baddeley, 2000).

The significance of science and knowledge in understanding memory is discussed in this study. Data collection and processing are important aspects of scientific work. It is through the use of observational records and the cognitive models that the researchers can predict the way in which people will learn in future and this is crucial to any policy maker in their attempt to seek solutions to the problem (Mayer, 2009). The consequences of the load on ecosystems are outlined by the information provided by the scientific community. The contribution of cognitive strain, which can be in the form of multitasking and ineffective teaching tools, may be better understood through scientific data. Paas and Van Merriënboer (1994) state that the investigation of gamification can assist in reducing stress, which is why the development is essential.

Conversely, scientific knowledge is essential for addressing the interpersonal side of education. Misinformation has persisted despite the best efforts of scientists to raise public awareness of cognitive science, which is essential for promoting collective action. Clark and Mayer (2016) claim that science communication is highly important in the dissemination of scientific knowledge to more people. Cognitive load should be conveyed in an understandable, clear, and precise manner so that people can be prepared to make informed judgments in the event of an educational crisis.

Scientific investigation is important in the identification and response to disruptions in education through research on changes in learners' memory and attention, which also displays cognitive load and scientific observations. The teacher embodies intuitive knowledge, and the researcher's presence highlights the need to integrate scientific analysis with local, experienced knowledge.

Cognitive Load, Learner Diversity, and Educational Equity

Cognitive load has an uneven distribution in English language teaching, targeting marginalized working-class groups. Economically disadvantaged students are given the chance to appreciate the onset of intricate mechanics, which is an eye-opener regarding social disparity coupled with educational degeneration in society. Educational equity is a new field of study that investigates the nexus of cognitive sustainability and social justice, which involves a fair distribution of mental profits and costs in societies and across generations. As vulnerable communities are affected more by instructional degradation, digital distraction, and resource depletion, the notion of educational equity is crucial in the context of balancing human and environmental needs in the quest to achieve a just and

**Gifto David and Muhammedali Chalikandy Puthiyapurayil**

sustainable future (Freire, 1970). Intergenerational equality is an important concept in the sustenance of development that aims to create a fair bond between the current and future generations through the safekeeping of knowledge and skills. John Rawls, an academic, has added his voice to this argument, explaining why it is our moral obligation to conserve educational resources to benefit future generations (Rawls, 1971). Two issues addressed by environmental justice theory include disparities in exposure to environmental hazards and environmental degradation. Environmental justice, whose roots are in the civil rights movement, aims to ensure that vulnerable groups of people are not disproportionately affected by environmental risks by facilitating an equitable redistribution of such risks (Bullard, 1990).

The main postulate of ecological modernization theory is that technological advancement is the key to realizing economic growth and environmental sustainability. This was conceived by Joseph Huber in 1982 and offers a timely perspective on how technology can help create an ecological equilibrium. Ecological modernization does not necessarily address social inequities directly, but rather relates to ecological fairness by suggesting that green technology investments can be a solution to ecological issues. Educational Justice: This study criticizes the response to the cognitive crisis for the most vulnerable students. The presence of cognitive load enhances existing social disparities, and rural inhabitants are particularly impacted because of educational degradation and economic changes (Warschauer, 2004).

Rural vs. Urban Divide: This highlights the conflict between rural and urban attitudes towards cognitive load, in which the former was the first to question scientific warnings. The rural environment offers a platform to address the issue of how ecological changes pose a challenge to traditional ways of living (Sweller, 2011).

Attentional Control and the Future of Language Learning

Cognitive load interferes with the attentional control of the learner, demonstrating the dependence of all cognitive processes and the vulnerability of the classroom setting. The future of all species, including human beings, is in a world where technology is increasingly affecting learners at the micro-level. The fact that attentional processes have an extraordinary long-distance migration is not a recent discovery in conventional education (Schmidt, 1990). Their regular movement between teaching and acquisition has been used to represent natural cycles and ecological stability. The distractor of the normal line of thought, as represented by the entrance of attention in a valley of distraction characterized by being away from the natural process, symbolizes the interference with the natural systems in digital ELT. Not only are human beings' lives influenced by cognitive load, but also the migration and survival of species (Baddeley, 2000). The result of this is abnormal behavior due to an increase in information temperature.

The changed focus of the students, which was initially perceived as a magic phenomenon, ultimately indicates the collapse of the educational system. As the locals attempted to find meaning in all the attention, the story depicts how ecosystems are either forced to adjust or perish due to climatic change. This disruption serves as a wake-up call to endangered animals and future generations who depend on unchanging, predictable weather (Sweller, 2011). The attentional migration of ELT is a microcosm of the larger issues and the need to take urgent action to safeguard biodiversity. Mayer (2009) and Deterding et al. (2011) also discovered that the development of complex interactions between species necessitates that the latter adapt to them in such a way that may not be sustainable in the long term as a result of the break in the environmental situation.

The Disruption of Natural Learning Cycles and Its Implications

The consequences of the digital interference on the complex cognitive processes involved in language acquisition reflect on the attention of ELT learners. Teachers and learners are experiencing the impact of disruptions in instructional patterns in the wake of rising data temperatures due to human factors such as multitasking and constant connectedness. This shift in environmental conditions forces pedagogical agents to change in a manner that may not be sustainable in the long term because their complex relationships are disrupted (Gee, 2003). Increasing information temperatures due to human activities such as uncontrolled screen time and broken curriculum have

Gifto David and Muhammedali Chalikandy Puthiyapurayil

disrupted both inputs and outputs. According to Squire (2011), changing environmental conditions are forcing species to adapt in ways that might not be viable in the long run because they have disturbed the complex interactions that the species have. When the students walk in the classroom, it creates a commotion of conversation and research. The cognitive load is a fact that community individuals and, in particular, teachers are experiencing in understanding the implications of the altered courses of students and how this could pose a danger to the environment and their lives (Prensky, 2001). The impact of this disruption on a familiar natural phenomenon is an austere notification that the state of the psychological ecosystems is more vulnerable to the residual of human actions. This concentration of the students is therefore the precariousness of school life and the urgency of taking action to solve educational disasters, such as the destruction of habitats and resource shortages (Cowan, 2001). Therefore, attentional migration through gamification is a microcosm of the larger question of education and why we desperately need to act on the issue promptly to safeguard cognitive biodiversity (Kapp, 2012).

The Role of Gamification as a Harbinger of Change

Being provocative to traditional knowledge and bringing radical changes to the context, gamification is a harbinger of ELT pedagogical revolution. Teachers face greater issues of cognitive overload and disproportion when pressured by mechanical forces to be cognizant of the occurrences taking place around them. The mechanics make the student reassess their identity and place in the universe, consequently bringing about drastic changes in the character of the student (McGonigal, 2011). Similar to the point of no return that humankind is currently confronting in its fight against stagnation in educational processes, the mechanics signify a turning point in the discipline. The classroom is going through a turning point in the course of its education, just as the butterflies are going through a trip towards the end. The interruption highlights the essential importance of prompt pedagogical intervention to cure cognitive strain prior to irreversible damage (Landers, 2014).

The future of gamified elements is inextricably linked to the future of all learners within the system. This is a call to action that highlights the need to address educational issues in an integrated manner (Fullan, 2007). The kings are unable to leave their homes alone, just as teachers cannot solve the cognitive issues that afflict us individually. The play aspect of cultural history leads us to the fact that change is at the core of human development (Huizinga, 1955). The support offered when undertaking this transition is referred to as scaffolding, which ensures that learners are not abandoned in the process of the same transition (Vygotsky, 1978). Finally, gamification can be used as a powerful reminder of connectedness and the necessity to reinstitute cognitive harmony as soon as possible, before it is too late. It can be seen as an alert to the radical changes that do occur in the world and in global competency.

ABSTRACT

In the contemporary era of globalization and digital connectivity, diasporic communities maintain strong cultural ties with their homeland through both literary narratives and digital platforms. This paper examines how cultural memory contributes to identity formation in diasporic narratives and how these representations resonate with contemporary forms of digital self-representation. Drawing on theories of cultural identity and memory proposed by Stuart Hall and Jan Assmann, the study explores how migrants negotiate their identities between homeland and hostland cultures. Through a textual analysis of novels such as *Brick Lane* by Monica Ali and *The Lowland* by Jhumpa Lahiri, the paper highlights how memories of homeland traditions, language, and family practices shape diasporic identity. These narratives demonstrate that cultural memory functions as a bridge connecting migrants to their cultural roots while enabling them to adapt to new social environments. The study also connects these literary representations with contemporary digital practices, where migrants share experiences, traditions, and everyday life through platforms such as YouTube and Instagram. These digital spaces act as virtual communities where diasporic identities are performed and preserved. By linking literary texts with digital expressions of diaspora, this paper argues that digital media extends traditional cultural memory and creates new avenues for identity construction in transnational contexts.

Keywords: Digital diaspora, cultural memory, diasporic identity, self-representation, transnational narratives.

INTRODUCTION

The transgression of individuals across national boundaries has emerged as a fundamental characteristic of the contemporary globalized landscape. Migration, whether it occurs willingly or under duress, has resulted in the formation of myriad diasporic communities that engage in a complex negotiation of their identities between the cultures of their countries of origin and those of their host nations. For numerous migrants, the experience of displacement engenders feelings of cultural disintegration, yearning, and a persistent pursuit of belonging. Throughout history, literature has functioned as a vital conduit through which diasporic authors articulate their experiences related to migration, memory, and identity. In recent years, the advent of digital technologies and social media platforms has facilitated novel avenues for diasporic communities to express and preserve their cultural identities. Consequently, the notion of digital diaspora underscores the interplay among migration, cultural memory, and digital self-representation.

Diasporic literature frequently delves into the intricate dynamics of identity formation among migrants straddling multiple cultural realms. These narratives depict individuals grappling with the challenge of preserving ties to their cultural heritage while simultaneously adjusting to unfamiliar social and cultural landscapes. Within these contexts, cultural memory is pivotal in shaping the identities of diasporic individuals. Memories of traditions from their homelands, linguistic practices, familial values, and quotidian rituals serve as symbolic markers that enable migrants to sustain a sense of belonging, despite the physical distance from their origins. Through narrative and storytelling, diasporic authors reconstruct these memories and illustrate their impact on the psychological and cultural experiences of migrants.

Theoretical frameworks concerning cultural identity and memory are essential for comprehending these processes. Cultural theorist Stuart Hall posits that identity should not be regarded as a static essence; rather, it should be viewed as an evolving process informed by historical, cultural, and social contexts. According to Hall, identities within the diaspora are shaped through ongoing negotiations between recollections of the past and current realities. In a similar vein, cultural memory scholar Jan Assmann emphasizes the importance of collective memories, preserved through cultural practices, traditions, and narratives in sustaining cultural identity across successive generations. These theoretical insights suggest that the formation of identity within diaspora is inextricably linked to the preservation and reinterpretation of cultural memory.

Contemporary diasporic novels often portray how migrants reconstruct their identities through memory and storytelling. Notable works such as *Brick Lane* by Monica Ali and *The Lowland* by Jhumpa Lahiri offer profound insights into the characters' navigation of the tensions between tradition and modernity, their homelands and host cultures, as well as personal aspirations and cultural expectations. These narratives reveal the ways in which memories of home influence the emotional and social dimensions of diasporic lives. Through representations of family dynamics, cultural practices, language, and culinary traditions, these novels illustrate how migrants maintain connections to their cultural heritage while adapting to new surroundings.

Beyond literary depictions, the digital age has profoundly altered the means by which diasporic communities sustain cultural connections. Platforms such as YouTube, Instagram, and various digital networks enable migrants to share their lived experiences, cultural practices, and daily realities with global audiences. These platforms serve as virtual arenas where diasporic identities are articulated, negotiated, and preserved. Through digital storytelling, culinary vlogs, travel narratives, and cultural discourses, migrants create online collectives that reflect their hybrid identities. Thus, the concept of digital diaspora broadens the traditional understanding of diaspora by integrating technological forms of communication and self-representation.

**Sophia and Muththamizh Selvi**

The relationship between literature and digital media is particularly consequential for comprehending contemporary manifestations of diasporic identity. While novels offer narrative insights into migrant experiences, digital platforms empower individuals to actively participate in crafting and circulating diasporic narratives. Migrants can document their daily lives, cultural customs, and personal recollections through digital content, thereby transforming individual experiences into shared cultural expressions. These practices illustrate that cultural memory is no longer confined to literary texts or oral histories but increasingly transcended through digital technologies.

Recent scholarship in diaspora studies has widely explored themes of migration, identity, and cultural belonging in literary narratives. However, most studies primarily focus either on literary representations of diaspora or on the role of digital media in shaping contemporary migrant identities. There is comparatively limited research that examines the relationship between diasporic literature and emerging forms of digital self-representation. In particular, few studies analyze how cultural memory represented in literary texts resonates with the ways migrants construct and express their identities through digital platforms such as YouTube and Instagram. Therefore, this study attempts to bridge this gap by connecting literary representations of diaspora with contemporary practices of digital diaspora, highlighting how cultural memory continues to shape identity formation in both narrative and digital spaces.

This paper seeks to investigate how cultural memory informs identity formation within diasporic narratives and how these literary representations resonate with modern manifestations of digital self-representation. By analyzing *Brick Lane* and *The Lowland*, the study explores how memories related to homeland traditions, language, familial relationships, and cultural practices shape the identities of diasporic characters. Additionally, this paper connects these literary expressions to the growing phenomenon of digital diaspora, wherein migrants utilize online platforms to forge cultural ties and construct hybrid identities.

Moreover, this research highlights how digital media enhances traditional forms of cultural memory by enabling diasporic communities to develop new networks of belonging. The intersection of literature and digital culture illustrates that identity formation within diaspora is not limited to physical displacement but also encompasses symbolic and virtual connections that transcend geographical confines. Through this interdisciplinary approach, the study contributes to conversations in cultural studies, diaspora studies, and literary criticism by analyzing how migration narratives interact with contemporary digital practices.

Ultimately, diasporic narratives underscore that identity is neither a fixed nor stable construct but a fluid process shaped by memory, culture, and social interactions. By bridging literary texts with digital forms of self-representation, this paper asserts that cultural memory continues to play a vital role in shaping diasporic identities while accommodating the technological realities of the twenty-first century.

LITERATURE REVIEW

Diaspora studies have emerged as a significant area within cultural studies and postcolonial literary criticism, concentrating on the phenomena of migration, displacement, and identity construction among transnational communities. Researchers have explored how diasporic individuals navigate their cultural identities amid societies that often contrast starkly with their countries of origin. The definition of diaspora has gradually evolved from its conventional association with forced displacement to encompass voluntary migration, globalization, and transnational cultural exchanges. Current scholarly endeavors increasingly focus on the importance of memory, identity, and cultural representation in shaping the experiences of diasporic communities. A pivotal contribution to the discourse on diaspora and identity originates from cultural theorist Stuart Hall, whose analysis of cultural identity provides a vital lens for comprehending diasporic subjectivity. Hall posits that cultural identity should not be seen as a static or intrinsic attribute anchored in the past; instead, it is a fluid and developing phenomenon influenced by historical, cultural, and social contexts. He contends that identities are perpetually constructed through processes of representation, discourse, and cultural practices. In diasporic contexts, individuals frequently encounter

**Sophia and Muththamizh Selvi**

what Hall refers to as a “double consciousness,” necessitating a negotiation between their inherited cultural legacies and the realities of their new environments. Hall’s framework underscores that diasporic identity emerges from a continuous process of interaction between past memories and present circumstances. Another critical theoretical contribution comes from cultural memory scholar Jan Assmann, who elucidates the concept of cultural memory as a means of understanding how societies preserve and transmit collective memories across generations. Assmann differentiates between communicative memory, which encompasses everyday recollections exchanged through interpersonal interactions, and cultural memory, which is maintained through cultural institutions, texts, rituals, and traditions. In diasporic communities, cultural memory plays a pivotal role in fostering connections with the homeland. Literary narratives, cultural rituals, linguistic practices, and culinary traditions serve as essential conduits through which migrants sustain their collective identity despite geographical dislocation.

In the field of diaspora studies, scholars have further investigated the interplay between migration and transnational identity. Sociologist Robin Cohen has broadened the concept of diaspora by highlighting its various forms, such as labor diaspora, imperial diaspora, trade diaspora, and cultural diaspora. He asserts that contemporary diasporas are marked by profound emotional and cultural bonds to the homeland while simultaneously adapting to the host culture. This dual orientation often leads to hybrid cultural identities that amalgamate elements from both cultures. Similarly, theorist Avtar Brah introduces the notion of “diaspora space,” which refers to the social and cultural milieu where migrants, locals, and other communities interact and negotiate their identities. Brah’s framework emphasizes that diaspora should be understood not merely as a condition of displacement but also as a dynamic environment where new forms of cultural identity may emerge.

Within literary studies, researchers have scrutinized how diasporic authors depict themes of migration, belonging, and cultural memory. Diasporic literature frequently portrays characters caught in emotional struggles between their cultural heritage and the demands for assimilation within the host society. These narratives often illuminate the significance of familial traditions, language, and quotidian cultural practices in the preservation of cultural identity. Elements such as food, clothing, religious observances, and festivals are commonly represented as symbolic links that tether diasporic individuals to their cultural origins. Through these portrayals, literature serves as a potent medium for examining the emotional and psychological dimensions of migration.

The works of contemporary diasporic authors like Monica Ali and Jhumpa Lahiri have garnered significant academic attention for their intricate representations of migrant experiences. In her novel *Brick Lane*, Monica Ali explores the life of a Bangladeshi woman residing in London who wrestles with adapting to a new cultural landscape while safeguarding connections to her homeland. Scholars typically interpret the novel as a depiction of the challenges faced by immigrant women in reconciling identity, tradition, and modernity. Similarly, *The Lowland* delves into the emotional and political ramifications of migration through the narrative of two brothers whose lives are influenced by both personal choices and historical developments. Academic discussions surrounding Lahiri’s work often emphasize themes of memory, displacement, and intergenerational identity.

In recent years, researchers have begun to investigate how digital technologies impact the formation of diasporic identities. The concept of digital diaspora underscores the ways in which migrants utilize digital platforms to engage with their cultural heritage and interact with transnational communities. Social media platforms facilitate the sharing of personal experiences, cultural practices, and everyday life narratives with audiences across geographical boundaries. These digital interactions facilitate new forms of community that transcend traditional physical spaces. Digital media scholars contend that online platforms serve as arenas of cultural representation where individuals actively craft and enact their identities. Through digital storytelling, migrants are able to document their memories, traditions, and cultural practices in manners reminiscent of literary narratives. For instance, numerous migrants share cooking videos, cultural dialogues, and travel experiences via online platforms, thereby preserving and disseminating cultural knowledge within diasporic communities. These digital expressions illustrate how cultural memory continues to adapt in response to technological advancements.

**Sophia and Muththamizh Selvi**

Moreover, scholars highlight that digital diaspora fosters the emergence of hybrid identities that intertwine elements of homeland culture with global influences. The accessibility afforded by digital communication enables migrants to remain connected to their homeland while concurrently engaging with the cultural life of their host society. Consequently, identity formation becomes a multidimensional process molded by both physical migration and virtual engagements. Despite the expanding corpus of research on diaspora and digital culture, there remains an urgent need for scholarly inquiries that bridge the gap between literary representations of diaspora and contemporary forms of digital self-representation. Existing studies frequently concentrate on either diasporic literature or digital communities, yet few attempts have been made to explore the intersections of these two domains. By analyzing literary narratives alongside digital practices, researchers can achieve a more profound understanding of how cultural memory manifests across diverse modes of representation. Accordingly, this study contributes to the existing body of scholarship by investigating how cultural memory influences identity formation within diasporic narratives, all while considering the role of digital media in extending these phenomena. By synthesizing insights from diaspora studies, cultural memory theory, and digital media studies, this research elucidates the evolving nature of diasporic identity in the contemporary globalized landscape.

Theoretical Framework

This research investigates the interplay between cultural memory, diasporic identity, and digital self-representation by employing theoretical frameworks from cultural studies and memory studies. Notably, the ideas put forth by Stuart Hall, Jan Assmann, and Avtar Brahmin offer critical insights into the processes of identity construction and representation within diasporic settings. These theories elucidate how migrants navigate their identities between the cultures of their homeland and their host country, emphasizing the essential role of memory in preserving cultural belonging across geographical divides.

Cultural Identity and Representation

Stuart Hall's conception of cultural identity is pivotal for understanding the development of diasporic identity. Hall contends that cultural identity should not be regarded as a static or inherent trait originating solely from history. Rather, identity is a fluid and evolving construct, continually influenced by historical events, cultural exchanges, and social contexts. According to Hall, identity is formed through modes of representation and discourse, suggesting that individuals cultivate their sense of self through cultural narratives, language, and social practices. In diasporic communities, the formation of identity often entails a negotiation among various cultural influences. Migrants typically encounter a sense of dislocation as they transition from their homeland to a new cultural landscape. This dislocation necessitates that individuals adapt to unfamiliar social norms while striving to retain elements of their cultural legacy. Hall articulates this process as an ongoing negotiation between past and present, resulting in a diasporic identity that embodies a hybrid character, merging facets of both the homeland and host culture.

Hall further underscores the significance of representation in molding cultural identity. Forms of cultural expression such as literature and film are instrumental in conveying the experiences of diasporic communities. Through narrative techniques, authors can express the emotional and cultural intricacies tied to migration. Such representations enable individuals and communities to comprehend their experiences and forge collective cultural meanings. In the context of this analysis, diasporic literary works such as "Brick Lane" by Monica Ali and "The Lowland" by Jhumpa Lahiri serve as narrative realms where diasporic identities are articulated and examined.

Cultural Memory and Diaspora

Jan Assmann's concept of cultural memory offers an additional crucial theoretical framework for the exploration of diasporic narratives. Assmann posits that cultural memory encompasses the collective recollections that are preserved and communicated within a community through cultural practices, traditions, and texts. These shared memories nurture a sense of continuity and identity within the group, even over extensive periods. Assmann differentiates between two types of memory: communicative memory and cultural memory. Communicative memory pertains to everyday recollections exchanged through interpersonal communication within families or communities, whereas cultural memory is maintained through cultural institutions such as literature, religious

**Sophia and Muththamizh Selvi**

ceremonies, festivals, and historical recounting. In diasporic contexts, both forms of memory significantly contribute to the sustenance of cultural identity. For migrants residing far from their homeland, memories associated with cultural customs, language, familial bonds, and daily practices often serve as vital sources of emotional attachment. Literary narratives frequently portray characters who recall their homeland through sensory details, such as cuisine, music, attire, and cultural festivities. These recollections assist diasporic individuals in preserving a symbolic link to their cultural heritage while adapting to new social settings. Within diasporic literature, cultural memory acts as a conduit between past and present. Authors frequently recreate scenes from the homeland to demonstrate how memories influence the identities and emotional journeys of migrants. Through narrative, literature safeguards cultural memory while transmitting it to subsequent generations. This theoretical approach is particularly valuable for evaluating how diasporic figures within novels reconstruct their identities through reflections on their cultural histories.

Diaspora Space and Hybrid Identity

AvtarBrah's theory of diaspora space further enriches the understanding of diasporic identity by highlighting the social and cultural interactions that transpire within multicultural societies. Brah asserts that diaspora should not merely be perceived as a state of dislocation but also as a space where diverse identities and cultural histories converge. Brah defines diaspora space as the social atmosphere in which migrants, native populations, and other communities interact and negotiate their identities. This environment is characterized by cultural exchange, adaptation, and transformation, wherein individuals frequently develop hybrid identities that embody influences from various cultures.

The notion of diaspora space holds particular relevance in contemporary globalized societies, where migration has led to the emergence of multicultural communities. In such contexts, cultural identities are continually reshaped through interactions among disparate cultural groups. Diasporic individuals may concurrently identify with their homeland culture while engaging in the cultural life of their host society. Literary portrayals of diaspora often illustrate this cultural negotiation process, with characters navigating social settings in which traditional cultural values intersect with modern lifestyles and global influences. These narratives emphasize the fluidity of identity in diasporic environments.

Digital Diaspora and Self-Representation

While the theories articulated by Hall, Assmann, and Brah primarily address cultural identity and memory within social and cultural frameworks, the advent of digital technology has introduced new dimensions to the construction of diasporic identity. The concept of digital diaspora pertains to the manners in which migrants utilize digital platforms to sustain connections with their homeland and articulate their cultural identities. Digital platforms such as YouTube, Instagram, and various social media networks empower migrants to share their experiences, cultural practices, and everyday lives with audiences across geographical borders. These platforms serve as virtual arenas where diasporic individuals construct and express their identities. Through digital storytelling, migrants archive elements of their culture, encompassing culinary practices, festivals, language, and familial traditions.

From a theoretical standpoint, digital diaspora can be regarded as an extension of cultural memory and diaspora space. Online communities foster new forms of cultural interaction, enabling diasporic individuals to connect with others who share similar cultural backgrounds. These digital engagements contribute to the preservation and dissemination of cultural memory within contemporary society. Furthermore, digital media empower migrants to actively participate in the representation of their identities, as opposed to relying solely on literary or cultural institutions. Individuals have the opportunity to create and share their narratives, thereby broadening the ways in which diasporic experiences are recorded and understood.

Relevance of the Framework to the Study

The amalgamation of these theoretical frameworks establishes a robust basis for the analysis of diasporic narratives. Hall's notion of cultural identity elucidates the manner in which migrants navigate their self-conception across

**Sophia and Muththamizh Selvi**

varied cultural landscapes. Assmann's framework of cultural memory underscores the significance of collective recollections in maintaining cultural identity within diasporic communities. Brah's interpretation of diaspora space accentuates the social contexts wherein cultural exchanges and hybrid identities materialize. Collectively, these theories lay the groundwork for exploring how diasporic figures in literary works reconstruct their identities through the interplay of memory and cultural practices. Additionally, the notion of digital diaspora broadens these theoretical perspectives to encompass contemporary modes of digital self-representation. By integrating literary analysis with digital cultural studies, this research endeavors to illustrate the enduring influence of cultural memory on diasporic identity within both traditional narratives and present-day digital arenas.

METHODOLOGY

This study adopts a qualitative textual analysis to examine the relationship between cultural memory and identity formation in diasporic narratives. The research focuses on two contemporary diasporic novels: *Brick Lane* by Monica Ali and *The Lowland* by Jhumpa Lahiri. These texts were selected because they provide rich representations of migrant experiences and explore themes such as displacement, cultural memory, and identity negotiation within diasporic contexts. The study analyzes narrative elements including character development, representations of homeland memories, cultural practices, and social interactions within migrant communities. Particular attention is given to how memories of homeland traditions, family relationships, and cultural rituals influence the identities of diasporic characters. The analysis is guided by theoretical perspectives from cultural studies and memory studies, particularly the concepts of cultural identity proposed by Stuart Hall, cultural memory developed by Jan Assmann, and diaspora space introduced by Avtar Brah. In addition to literary analysis, the study also interprets the idea of digital diaspora by examining how migrants use social media platforms to share cultural practices and personal experiences. These digital practices are discussed in relation to the literary representations of diaspora in order to highlight the continuity between traditional narrative forms and contemporary digital self-representation.

Through this interdisciplinary approach combining literary analysis and digital cultural studies, the research aims to demonstrate how cultural memory functions as a central element in the formation of diasporic identity across both textual narratives and digital environments.

Analysis of Brick Lane

Monica Ali's novel *Brick Lane* offers a profound exploration of diasporic existence and the development of identity within the Bangladeshi immigrant community in London. The narrative centers around Nazneen, a young woman who relocates from Bangladesh to England through an arranged marriage. Through her journey, the novel illustrates the emotional, cultural, and societal obstacles that migrants confront as they navigate their identities amid the interplay of their homeland and hostland cultures. This work is particularly noteworthy for demonstrating how cultural memory influences the identities of diasporic individuals and the ways in which migrants gradually reconstruct their sense of belonging in a new cultural context. Initially, Nazneen's identity is deeply entwined with the cultural traditions and societal expectations of her homeland. Raised in a rural Bangladeshi village, she is conditioned to accept her circumstances, adhering to the belief that fate governs human destiny. Upon her arrival in London with her husband Chanu, she grapples with cultural alienation and dislocation. The unfamiliar surroundings, language barriers, and social disparities exacerbate her sense of estrangement. Her early experiences in London are largely confined to her apartment, a setting that epitomizes the restricted social mobility commonly faced by immigrant women. During this phase, her memories of Bangladesh are pivotal in preserving her emotional ties to her cultural heritage.

Cultural memory frequently manifests in Nazneen's reflections on her family and childhood. Her recollections of her mother, village life, and traditional values act as emotional stabilizers, aiding her in coping with the strange landscape of London. These memories resonate with Jan Assmann's theory that cultural memory enables communities to maintain their collective identity across generations. Within the novel, reminders of her homeland

**Sophia and Muththamizh Selvi**

culture serve as significant symbols of Nazneen's origins and inform her self-perception as a diasporic individual. Furthermore, the novel examines cultural identity through quotidian practices such as food, clothing, and language, which serve as identity markers connecting characters to their homeland. The act of preparing traditional Bangladeshi dishes, for instance, becomes an avenue for Nazneen to uphold her cultural legacy within her London home. Culinary traditions depicted in the narrative signify a continuity of heritage, illustrating how migrants recreate elements of their homeland culture within a foreign backdrop. Such rituals exemplify that cultural identity is preserved not only through memory but also through everyday practices.

Chanu's character introduces another dimension of diasporic identity. In contrast to Nazneen, he is well-educated and harbors ambitious aspirations for success in Britain. Yet, he encounters persistent obstacles to social mobility due to systemic discrimination. His experiences underscore the frustrations that many migrants face in their quest for recognition and acceptance within society. Chanu's continual references to Bangladeshi culture and history signify his endeavor to maintain a sense of pride and identity despite his marginalization in British society. The novel thus delineates the conflict between aspiration and reality in the migrant experience through Chanu's characterization. As the plot unfolds, Nazneen gradually begins to reassess the conventional beliefs that previously dictated her identity. Her encounters with a broader social environment in London foster a burgeoning sense of independence. The city emerges as a critical setting where diverse cultures converge, encapsulating AvtarBrah's concept of diaspora space. Within these multicultural contexts, migrants confront new societal influences that challenge their prior notions of identity and community belonging.

Nazneen's evolution becomes increasingly apparent through her relationship with Karim, a young Bangladeshi activist engaged in local political endeavors. Karim epitomizes a younger generation of migrants who proactively negotiate their cultural identity within the host society. His activism reflects the collective struggles of immigrant communities seeking acknowledgment and representation. Through her interactions with Karim, Nazneen begins to engage more actively with the socio-political realities of her diasporic community. This narrative arc highlights the fluidity of cultural identity, as articulated by Stuart Hall, who posits that identity is not a static essence but a dynamic process shaped by historical and social contexts. Nazneen's journey exemplifies this maturation, as she transitions from passive acceptance to active self-determination. Her choice to remain in London instead of returning to Bangladesh signifies her embrace of a hybrid identity that encompasses aspects of both cultures.

The novel also reflects on the experiences of the broader Bangladeshi community in London. Through illustrations of neighbourhood dynamics, social events, and communal organizations, the narrative showcases how migrants forge collective spaces that sustain their cultural practices. Such community interactions reinforce the importance of cultural memory in nurturing diasporic identity. Observances of festivals, religious customs, and social gatherings enable migrants to retain their sense of belonging, despite being distanced from their homeland.

Moreover, the letters from Nazneen's sister Hasina in Bangladesh serve as an essential narrative element linking the homeland with the diasporic narrative. These correspondences illuminate the socio-economic realities in Bangladesh while simultaneously revealing the emotional chasm between the sisters. Through this dual narrative framework, the novel underscores how diasporic identity is molded by the ongoing interplay between experiences in the homeland and the host country. Towards the conclusion of the novel, the theme of self-realization emerges as a focal point. Nazneen eventually declines Karim's proposal and opts to forge an independent life for herself and her daughters in London. This decision exemplifies her evolving confidence and autonomy. Instead of returning to Bangladesh or depending on patriarchal authority, she embraces a new identity shaped by both her cultural roots and her experiences in Britain. Her transformation signifies the development of a hybrid diasporic identity that transcends conventional cultural and geographical confines. In this context, *Brick Lane* illustrates the intricate process through which migrants navigate their identities within multicultural societies. The narrative emphasizes that cultural memory is instrumental in maintaining connections to one's homeland while simultaneously enabling individuals to adapt to novel social settings. Nazneen's trajectory from isolation to empowerment resonates with the broader experiences of numerous diasporic individuals who progressively redefine their sense of belonging. Ultimately, the

**Sophia and Muththamizh Selvi**

novel conveys that diasporic identity is not exclusively characterized by displacement or nostalgia but is informed by the continuous dialogue between memory, culture, and social change. Through its rich depiction of migrant life, *Brick Lane* offers a compelling analysis of how cultural memory and quotidian practices contribute to the formation of hybrid identities in contemporary diasporic communities.

Analysis of The Lowland

Jhumpa Lahiri's novel *The Lowland* provides a nuanced examination of migration, memory, and identity within the framework of the Indian diaspora. The story focuses on the lives of two brothers, Subhash and Udayan, who are raised in Calcutta amidst significant political turmoil. While Udayan engages with the Naxalite political movement in India, Subhash ultimately relocates to the United States to further his academic pursuits. Through the experiences of these characters, the novel scrutinizes the ways historical events, individual decisions, and cultural recollections contribute to the development of diasporic identity across generations. Central to the narrative is the theme of displacement. Subhash's migration marks the onset of his journey as a diasporic individual. Initially, he grapples with feelings of isolation and cultural estrangement in an unfamiliar setting. The challenges posed by foreign social customs, linguistic barriers, and the absence of family create an emotional disconnect from both his native land and the new society in which he finds himself. Such experiences resonate with a recurrent motif in diasporic literature, where migrants often navigate the complexities of existing between two cultural realms. Despite the physical distance, the memories of India are profoundly ingrained in Subhash's psyche. His recollections of childhood, familial bonds, and cultural rituals continue to inform his identity. These memories act as emotional ties that link him back to his homeland. This depiction aligns with Jan Assmann's theory of cultural memory, which posits that collective memories preserved through cultural narratives and practices enable communities to sustain a sense of continuity across time and space. Within *The Lowland*, memories of India serve as symbolic touchpoints of Subhash's cultural origins even as he acclimatizes to life in the United States.

Another significant aspect of the novel is the impact of political history on personal identity. Udayan's involvement in the Naxalite movement encapsulates the tumultuous political landscape of India during the late 1960s and early 1970s. His activism ultimately culminates in tragic outcomes that deeply affect his family members. Following Udayan's death, Subhash marries Gauri, Udayan's pregnant widow, and brings her to America to offer her stability and support. This decision introduces an additional layer of diasporic experience, as Gauri herself embarks on the journey of navigating a new cultural terrain. Gauri's character embodies a distinct response to the challenges of diasporic displacement. In contrast to Subhash, who endeavors to sustain ties to his cultural heritage, Gauri progressively detaches herself from her past. She immerses herself in academia and philosophical inquiry, seeking intellectual autonomy and personal liberation. Her evolution illustrates the intricate processes of identity formation within diaspora, where individuals may respond to cultural dislocation in myriad fashions. For Gauri, migration emerges as an opportunity to reconstruct her identity beyond the societal expectations imposed by her familial and cultural background in India. The generational aspect of diasporic identity is further examined through Bela, the daughter of Udayan and Gauri, who is nurtured by Subhash in the United States. Bela's upbringing is influenced by a blend of Indian cultural elements and American societal values. Nonetheless, her grasp of her cultural heritage remains fragmented due to the emotional divide between her and her mother. Bela's identity epitomizes the challenges encountered by second-generation migrants, who often contend with a sense of cultural ambiguity.

Bela's experiences personify the dynamic nature of cultural identity articulated by Stuart Hall, who argues that identity is continuously shaped by historical and social contexts, rather than being static or predetermined. As a second-generation diasporic individual, Bela constructs her identity through her unique experiences rather than solely relying on inherited cultural practices. Her ultimate choice to lead an independent and socially conscious life reflects the interplay of both her familial legacy and her American environment. The symbolic significance of *The lowland* itself plays an integral role within the novel's thematic structure. *The lowland*, a marshy region near the brothers' childhood residence in Calcutta, serves as a site of their formative years. It later becomes the scene of Udayan's demise, evolving into a powerful symbol of memory, loss, and historical trauma. For the characters, the

**Sophia and Muththamizh Selvi**

lowland signifies a physical and emotional space where personal and political narratives converge. The persistent references to this locale throughout the narrative underscore the enduring impact of memory on the characters' lives. The novel additionally emphasizes the emotional ramifications of migration and displacement. Subhash's existence in the United States is characterized by a quiet sense of obligation as he strives to provide stability for Bela and Gauri. However, his roles as a surrogate father and husband introduce emotional intricacies that shape his sense of self. The narrative navigates his experiences with subtle introspection, illustrating how migration can yield both opportunities and emotional complexities.

Another critical element of the novel is the depiction of cultural hybridity. As the characters oscillate between India and the United States, they encounter diverse cultural expectations and social norms. These experiences gradually reshape their identities, fostering hybrid cultural perspectives that amalgamate elements from both societies. This phenomenon aligns with AvtarBrah's concept of diaspora space, in which migrants negotiate their identities within multicultural environments influenced by a variety of cultural backgrounds. Through its multi-generational narrative framework, *The Lowland* illustrates the evolving nature of diasporic identity over time. The experiences of Subhash, Gauri, and Bela exemplify the notion that identity formation within the diaspora is not a singular event, but rather a continuous process shaped by memory, history, and personal decisions. The novel posits that migration not only transforms individuals but also reconfigures familial relationships and generational connections. Furthermore, the narrative accentuates the importance of storytelling in the preservation of cultural memory. By chronicling the histories of the characters along with the political events that influenced their lives, the novel itself serves as a form of cultural memory, documenting the experiences of migrants and their families. Literary works such as *The Lowland* thus function as cultural archives that safeguard the emotional and historical dimensions of diasporic existence.

In conclusion, *The Lowland* offers a profound examination of migration, memory, and identity within the context of the Indian diaspora. Through its depiction of multiple characters across various generations, the novel elucidates the interplay between cultural memory, historical occurrences, and personal experiences in shaping diasporic identity. The narrative conveys that identity within the diaspora is fluid and perpetually evolving, influenced both by memories of the homeland and the realities of life within the host society.

Digital Diaspora and Social Media: Cultural Memory in Online Spaces

In the contemporary globalized world, digital technology has significantly transformed the ways in which diasporic communities maintain connections with their homeland and represent their identities. With the rapid expansion of social media platforms such as YouTube and Instagram, migrants are no longer limited to traditional forms of communication such as letters or telephone calls. Instead, digital platforms have created new virtual spaces where diasporic individuals can share experiences, memories, and cultural practices with global audiences. This phenomenon is often described as digital diaspora, a concept that highlights how online networks enable migrants to construct and perform their identities across geographical boundaries. Digital diaspora can be understood as an extension of the cultural and social processes traditionally associated with diaspora. While earlier diasporic communities relied on literature, oral storytelling, and community gatherings to preserve cultural memory, contemporary migrants increasingly use digital media to document and circulate their cultural experiences. Through videos, photographs, blogs, and social media posts, migrants create digital narratives that reflect their hybrid identities and transnational lifestyles.

One of the most visible aspects of digital diaspora is the sharing of everyday cultural practices through online platforms. Migrants frequently produce content related to cooking traditional food, celebrating festivals, speaking their native languages, and documenting family traditions. These digital expressions function as forms of cultural preservation, allowing individuals to maintain connections with their cultural heritage even while living far from their homeland. For example, many diasporic content creators upload cooking videos that demonstrate traditional recipes from their home countries. Such videos not only preserve cultural knowledge but also introduce global audiences to diverse culinary traditions. Food-related digital content is particularly significant in the context of diasporic identity because food often functions as a powerful symbol of cultural memory. Preparing and sharing

**Sophia and Muththamizh Selvi**

traditional dishes can evoke memories of childhood, family gatherings, and homeland environments. When migrants upload cooking videos or share food photographs online, they transform these personal memories into collective cultural experiences that can be accessed by other members of the diaspora. In this way, digital media becomes a tool for transmitting cultural memory across generations and geographical boundaries. Digital platforms also enable migrants to construct narratives about their everyday lives in the host society. Through vlogs, travel diaries, and lifestyle content, diasporic individuals share their experiences of adapting to new cultures while maintaining connections to their cultural roots. These narratives often highlight the challenges and opportunities associated with migration, including language barriers, cultural differences, and the search for belonging. By documenting these experiences online, migrants create digital archives that reflect the evolving realities of diasporic life.

The process of sharing personal experiences online can be understood as a form of self-representation. Unlike traditional media, where narratives about migrants are often produced by external institutions, digital platforms allow individuals to represent their own identities and experiences. This shift in representation is particularly important for diasporic communities, as it enables migrants to challenge stereotypes and present more nuanced portrayals of their cultural identities. The concept of cultural identity proposed by Stuart Hall is highly relevant in understanding these digital practices. Hall emphasizes that identity is not fixed but continuously constructed through representation and cultural interaction. Social media platforms provide new spaces where such representations can occur. Migrants can experiment with different aspects of their identities by sharing content that reflects both their homeland culture and their experiences in the host society. This process often results in hybrid cultural expressions that combine traditional practices with global influences.

Digital media also plays an important role in strengthening transnational connections within diasporic communities. Migrants can communicate with family members and friends in their homeland through online platforms, reducing the sense of distance created by migration. In addition, digital communities allow individuals with similar cultural backgrounds to connect with each other regardless of their geographical location. These virtual networks create a sense of belonging that extends beyond physical borders.

From the perspective of cultural memory, digital media functions as a new medium through which collective memories are preserved and shared. The theory of cultural memory developed by Jan Assmann suggests that communities maintain their identities through cultural narratives and symbolic practices. In the digital age, online platforms serve as new cultural spaces where these memories can be recorded and transmitted. Photographs, videos, and personal stories posted on social media become digital records that preserve aspects of cultural heritage. Another important feature of digital diaspora is the creation of online communities centered around shared cultural experiences. Migrants often follow content creators from similar cultural backgrounds who share relatable experiences of living abroad. These interactions generate discussions about identity, culture, and belonging. Through comments, messages, and collaborative content, individuals participate in collective conversations about diasporic life. Such interactions contribute to the formation of virtual diaspora spaces where cultural identities are continuously negotiated and redefined.

The concept of diaspora space introduced by Avtar Brah can also be applied to digital environments. While Brah originally described diaspora space as a physical social environment where different cultures interact, digital platforms extend this concept into virtual realms. Social media networks function as digital diaspora spaces where migrants and non-migrants interact, exchange ideas, and engage with cultural narratives. These online spaces reflect the multicultural interactions that characterize contemporary global societies.

Digital storytelling also allows migrants to challenge dominant narratives about migration. In many traditional media representations, migrants are often portrayed through simplified or stereotypical images. However, social media platforms provide opportunities for individuals to share more complex and personal perspectives. By documenting their achievements, struggles, and everyday experiences, migrants present alternative narratives that highlight the diversity of diasporic identities.

**Sophia and Muththamizh Selvi**

Furthermore, the accessibility of digital technology enables younger generations of diasporic communities to engage with their cultural heritage in new ways. Second-generation migrants who may have limited direct experience with their ancestral homeland can learn about their cultural traditions through online content produced by other members of the diaspora. Digital platforms therefore play an important role in bridging generational gaps within diasporic communities. The relationship between digital media and literature is also noteworthy. While novels such as *Brick Lane* and *The Lowland* provide narrative representations of diasporic experiences, digital platforms allow individuals to actively participate in the creation of similar narratives. Through videos, blogs, and social media posts, migrants document their personal journeys in ways that resemble literary storytelling. This interaction between literature and digital media demonstrates how diasporic narratives continue to evolve across different cultural forms. In conclusion, digital media has transformed the ways in which diasporic communities preserve cultural memory and represent their identities. Platforms such as YouTube and Instagram provide virtual spaces where migrants can share their experiences, traditions, and personal stories with global audiences. These digital practices extend traditional forms of cultural memory and create new opportunities for identity construction in transnational contexts. By connecting literary representations of diaspora with contemporary digital expressions, it becomes clear that the formation of diasporic identity is an ongoing process shaped by both cultural memory and technological change.

CONCLUSION

The exploration of diasporic narratives illustrates that migration encompasses far more than merely relocating; it represents a multifaceted cultural and emotional journey that profoundly influences identity in various respects. Individuals within diasporas often find themselves in a continual negotiation between the culture of their homeland and the social fabric of their host country. This paper has investigated the role of cultural memory in shaping identity within diasporic narratives and how these literary portrayals resonate with modern forms of digital self-representation. By examining the novels *Brick Lane* by Monica Ali and *The Lowland* by Jhumpa Lahiri, this work elucidates the impact of recollections of homeland traditions, familial bonds, and cultural practices on the experiences and identities of diasporic individuals.

The analysis of *Brick Lane* reveals how migrants reconstruct their identities through the lens of memory and daily cultural practices. Nazneen's transformation from isolation to autonomy encapsulates the broader experiences shared by numerous diasporic individuals who progressively redefine their identities within multicultural contexts. The novel articulates cultural memory through elements such as familial customs, culinary traditions, and community interactions, which serve as symbolic connections to the migrants' homeland. These portrayals underscore the ways in which cultural memory fosters emotional ties and assists migrants in upholding their cultural heritage while adapting to new societal landscapes. Conversely, *The Lowland* offers a multigenerational lens on diasporic identity, highlighting the experiences of characters straddling the cultural divides between India and the United States. Through the narratives of Subhash, Gauri, and Bela, the book illustrates how historical events, personal decisions, and familial relationships shape the evolution of identity across generations. The narrative affirms that cultural memory continues to sculpt diasporic identity, even as individuals strive to dissociate themselves from their pasts. The symbolic significance of the lowland connotes that memory and history remain intricately woven into the lives of migrants.

The theoretical frameworks proposed by Stuart Hall, Jan Assmann, and Avtar Brah offer essential perspectives for interpreting these literary depictions. Hall's concept of cultural identity underscores that identity is not static but is perpetually molded by historical and social interactions. Assmann's theory of cultural memory elucidates how collective recollections, maintained through narratives and cultural practices, sustain a sense of cultural continuity. Brah's notion of diaspora space emphasizes the multicultural settings in which migrants negotiate and reinvent their identities. In addition to literary narratives, this study also investigates the influence of digital media on the formation of contemporary diasporic identities. Platforms such as YouTube and Instagram have forged new virtual avenues for migrants to share their experiences, cultural traditions, and personal memories with a global audience.

Sophia and Muththamizh Selvi

These digital arenas serve as modern extensions of cultural memory, enabling diasporic communities to maintain ties to their homeland while engaging in transnational cultural networks. Through digital storytelling, migrants actively construct and articulate their identities, expanding the modalities through which diasporic experiences are recorded and comprehended. By linking literary narratives to contemporary digital practices, this study underscores the fluid and evolving nature of diasporic identity in the twenty-first century. While traditional diasporic literature captures the emotional and cultural nuances of migration, digital media presents new avenues for individuals to convey their experiences and sustain cultural connections across geographic divides. Both forms of representation affirm that cultural memory remains a pivotal element in the formation of diasporic identity. Ultimately, diasporic identity should be regarded as a dynamic and multifaceted process influenced by memory, culture, and social interactions. The experiences depicted in *Brick Lane* and *The Lowland* illustrate that migrants incessantly negotiate their sense of belonging in relation to multiple cultural spheres. Concurrently, digital media has broadened the venues for these negotiations, allowing diasporic communities to preserve and reshape their cultural identities in innovative ways. By examining the intersection of literature, cultural memory, and digital self-representation, this study contributes to a nuanced understanding of how diasporic identities are constructed and expressed in an increasingly interconnected global milieu.

ABSTRACT

The emergence of Artificial Intelligence (AI) has transformed all domains of education including English language teaching and learning. AI is integrated in English language classrooms including TBLT Classrooms. Task Based Language Teaching (TBLT) emphasizes authentic tasks, learner interaction, and meaningful language use. Negotiation and exchange of meanings are central in the task-based learning since the focus is on communication while completing a given task. Task Based Language Teaching (TBLT) focuses on real-world tasks designed to meet individual learners' needs and to develop their communicative competence, requiring learners' active involvement and participation in completing the tasks. This paper examines undergraduate students' perspectives on using AI in TBLT classrooms. An open-ended questionnaire was administered to ten undergraduate students in order to collect the data and the data was analysed and interpreted thematically. The result demonstrates that AI scaffolds the learners during all the stages of TBLT, provides the learners with numerous learning opportunities and there are some challenges that AI poses in TBLT classrooms.

Keywords: Perspectives Task-Based Language Teaching (TBLT) Artificial Intelligence (AI) Opportunities Challenges

INTRODUCTION

English language teaching and learning have been revolutionized since the advent of Artificial Intelligence (AI) in language education and AI technologies have become an integral part of teaching and learning processes. Task-Based Language Teaching (TBLT) prioritizes meaningful interaction through authentic tasks rather than teaching isolated grammatical items. In other words, the learners have to do a particular task and the focus of the lesson is on tasks not

**Muhammedali Chalikandy Puthiyapurayil**

on structures. TBLT works in a language learning classroom focusing on providing opportunities for real life meaningful communication. Language acquisition occurs most effectively when learners engage in meaningful negotiation during interaction.

Task-Based Language Teaching

Task Based Language Teaching (TBLT) refers to language teaching which enables learners to acquire language by doing a task without focusing on language elements. According to Nunan (1989) “Task Based Teaching and Learning is teaching and learning a language by using language to accomplish open ended tasks. Learners are given a problem or objectives to accomplish but left with some freedom in approaching this problem or objective” (49). Willis and Willis (2001) elaborated the term by adding communication to it and termed as, “Task Based Learning (TBL) involves the specification not of a sequence of language items, but of a sequence of communicative tasks to be carried out in the target language” (173). Ellis (2003) views that “TBL is mostly about the social interaction established between learners as a source of input and means of acquisition, and involves the negotiation of meaning, communicative strategies, and communicative effectiveness” (p. 65). In short, tasks have become central in the TBLT classroom (Brown, 2007). According to Williams and Burden (1997) a task is “any activity that learners engage into further the process of learning a language” (p.168). Tasks can be activities that range from simple and brief exercises to complex and lengthy activities like problem solving and decision making (Breen, 1987) and they create meaningful contexts for language use (Stern, 1992). Willis (1996) believes that “tasks are always activities where the target language is used by the learner for a communicative purpose (goal) in order to achieve an outcome” (p. 23). In short, TBLT is a learner centred approach and it recognizes learners’ experience in learning

Background of the Study

A number of studies have focused on Artificial Intelligence in English language classroom (e.g. C P, 2025; Yan et al., 2024; Zhang et al., 2024) and several studies investigated TBLT in learning English (e.g. Bryfonski & McKay, 2019) across the world. Since AI integration in TBLT is a recent development, very few studies have focused on the use of AI in TBLT Classrooms. Furthermore, the few studies that were done on AI in TBLT investigated its impact on learners in TBLT (e.g. Nissa et al., 2025), how AI enhances English proficiency and students’ engagement (e.g. Xiaojing et. Al., 2024), and effectiveness of AI in TBLT (e.g. Simatupang & Heryono, 2025; Amir et al., 2025).). Nevertheless, students’ perspectives on the use AI in TBLT Classroom have not been explored. Therefore, this paper is an attempt to fill the gap found in the literature as it explores undergraduate students’ view on using AI in TBLT Classrooms.

Purpose

The purpose of this study was to explore undergraduate students’ beliefs about the use of AI in TBLT Classrooms: the role that AI play in TBLT, opportunities that AI provide the learners with in TBLT classrooms and the difficulties that the use of AI cause in TBLT classrooms. As a result, the following questions guided the study.

- What roles does AI play in TBLT classrooms?
- What are the opportunities that AI provide for TBLT classrooms?
- What challenges does use of AI create in TBLT classrooms?

Context, Participants and Methods

This study was done in one of the higher education institutions in Chennai, India. The participants were 10 undergraduate students from the English department. This study used a qualitative approach as the focus was on students’ perception of Artificial Intelligence in Task Based Language Teaching and collected “open-ended, emerging data with the primary intent of developing themes from the data” (Creswell, 2003, p. 18). In addition, an open-ended questionnaire was used to collect the data for this study since open-ended questions collect opinion, feeling and evaluation (Wellington, 2000).

The data analysis was done using the framework given by Miles and Huberman (1994) and thematic interpretation was used to analyze the open-ended questionnaire. Since the data was primarily “textual data”, it employed

**Muhammedali Chalikandy Puthiyapurayil**

“interpretative analysis” (Croker, 2009, p. 5). Different levels of analysis were done by “moving deeper and deeper into understanding the data and making an interpretation of the larger meaning of the data” (Creswell, 2003, p. 190). In short, the data went through four stages such as data reduction, data display, data conclusion and data verification.

RESULTS AND DISCUSSION

This section discusses the findings of the study. The findings are classified into three sections: AI and task stages, use of AI in TBLT Classrooms and the challenges of using it in TBLT Classrooms.

AI and Stages of Tasks

The data demonstrate that AI plays a significant role in TBLT classrooms and supports learners in the classrooms. All the participants believe that AI is instrumental in all the three stages of TBLT like pre-task, while task and post task stage (Willis, 1996). For instance, according to Participant 3 “AI is integrated into TBLT and used in the three stages of tasks.”

Pre-Task Stage

In the Pre-Task Stage, AI “helps students understand instructions” (participant1), the “background and purpose of the task” (participant8), “clear initial doubts” (participant10), “find meanings of new words” (participant 5), and “generate contextual prompts and helps” (participant 7). Moreover, it can “adapt preliminary and introductory exercises according to learners’ level and proficiency” (participant 9) and the requirement of the tasks. In short, in this stage “AI enhances learners’ readiness” (participant 10) to do the task effectively. The main functions of AI in the pre- task stage are to prepare the students for the task and to lead them in the task by clearing doubts, explaining unknown words, the context and purpose of the task and making sure whether they understand what they are supposed to do in the task.

While Task

During the task, AI is a great help for students. To demonstrate, “AI can assist students in providing instant solutions for task-based language activities. It can give the correct structure of sentences, and examples related to the task” (participant2). Artificial Intelligence “can generate ideas for writing and help organize answers (which) makes easier for students to complete tasks with more confidence and less confusion” (participant1). Similarly, Participant 3 points out “AI gives simple explanations during tasks” and Participant 4 argues “It guides learners with step-by-step suggestions and guidance while completing activities.” Furthermore, “while students are engaged in language tasks, AI applications detect mistakes, provide clues, hints, and explanations, allowing students to make corrections instantly” (participant7). The participants believe that the support that AI provides during the task “makes language tasks easier and helps students learn new words, improve sentences, and complete their work with better understanding” (participant4) and assists students “to complete tasks with more confidence and less confusion” (participant1). The findings indicate that learners use AI while doing their tasks to get ideas and vocabulary, clear doubts, do grammar checking, edit and refine their tasks.

Post Task

The participants believe that AI has profound impact on their learning and it has effects even after the completion of tasks. For instance, “we found that AI also assists us after we finish our tasks” (participant2). AI is a great help for learners in the post task stage through its “automated feedback systems” (participant4). AI enables learners to “reflect on their task performance and revise output systematically” (participant 9) and helps them to practice “structures, grammar items and vocabulary items” (participant 8) generated from the task. All the participants believe that AI has improved their confidence and helped them prepare task report and other post task activities like presentation and writing.

**Muhammedali Chalikandy Puthiyapurayil**

AI enhances independent learning as it enables them to generate ideas, edit, revise and polish their work independently and engage with AI interactively during all the stages and collaborate with AI to complete tasks. The findings underline the increasing use of AI in language learning in general and task-based learning in particular.

Use of AI in TBLT Classrooms

According to the participants AI is used multiple ways in TBLT Classrooms. To begin with, Artificial Intelligence develops learner autonomy as Participant7 claims “Students become autonomous learners as AI “helps them perform language tasks independently” and Participant 2 argues “By providing hints to students instead of answers, AI applications encourage students to think independently and complete tasks on their own.” Another use of AI is that it “creates interactive contexts for role-play and problem-solving tasks” (participant 8) and “AI applications such as chatbots can assist students in planning role plays, dialogues and presentation of the task” (participant1). Furthermore, tasks make learning interactive, collaborative and communicative as they provide meaningful real time communication opportunities and “authentic communicative practice in diverse contexts” (participant3) where AI acts as a prompter and “simulates conversations” and AI helps learners “practice speaking” (participant8) accurately and “confidently” (Participant7) by “giving real time pronunciation prompt, appropriate words, grammatical and structural suggestions” (participant6). Additionally, AI aids learners’ language acquisition since they nudge learners through the language learning process and its “formative evaluation of the task” (Participant3). Notably, AI can provide the learners with “personalized learning by adapting the complexity of the tasks suitable to learner needs and level” (participant1) and providing personalized practice. As a consequence, learners can “repeat tasks, get extra exercises and additional practice without being embarrassed in front of their classmates” (participant2).

AI provides immediate feedback on tasks and “instant feedback on grammar” (participant7) as it can “quickly check spelling, grammar and sentence structure” (participant1). AI can point out mistakes and suggest better words through its “instant responses” (participant2) which enables learners to improve continuously and “provide personalized feedback on tasks, recommend more appropriate vocabulary or sentence structures without putting learners down” (Participant 2). Consequently, “they can correct themselves as they understand their errors and improve their work without waiting for the teacher” (participant1). In short, “instant feedback from AI enables learners to build their confidence” (participant2), motivate them to do tasks, “develop their language faster” (participant5) and learn how to use the language more accurately” (participant4). Above all, using AI develop skills like “critical thinking” (participnat10), “digital literacy, and problem-solving skills” (participant 4) and improve their accent as “AI tools help learners with pronunciation” (participant8).

In conclusion, AI work as a “scaffold that supplements, but does not substitute, human and peer interaction” (participant1). They believe that AI reduces the teacher’s workload by correcting learners’ errors. Thus, teachers can now focus “more on guiding, supporting, and designing meaningful tasks rather than correcting their routine work” (participnat5). In other words, teachers’ roles have been changed from task provider to task facilitators, designers, and evaluators as AI help them as a tool. AI can make tasks more engaging as the students can interact with AI anytime and it makes learning more fun and enjoyable. Consequently, learning becomes quicker and more efficient.

Challenges of Using AI in TBLT Classrooms

The study also sheds light on the challenges that AI poses in TBLT classrooms. The participant pointed out the issues like overdependence, hallucination, reliability, loss of creativity, critical thinking skills and authenticity of the work. To demonstrate, the participants fear that the learners will depend on “excessively on AI-generated content” (participnat1) which will reduce learners’ “authentic task engagement” (Participant2). As a result of learners’ “overdependence on AI” (participnat6), their “cognitive and mental effort and critical reflection” skills will be weakened. Similarly, Participant 7 points out “Too much reliance on AI tools such as ChatGPT could lead to a lack of critical thinking, creativity, and autonomous language production.” Overreliance on AI in TBLT classroom will make students stop thinking independently as they copy answers without understanding, which can reduce real learning and creativity. Another problem is that there will be “technological inequality” (participant9) as some of the students who are from remote areas cannot access to AI. Furthermore; students will commit plagiarism and misuse AI

**Muhammedali Chalikandy Puthiyapurayil**

unethically as they submit AI-generated work as their own. To illustrate, “Students may resort to copying answers from AI tools without comprehending them, which could lead to a lack of effective communication skills and a poor development of language skills in the long run” (participant7). “Privacy is another concern, and personal data should not be shared carelessly. Ethical use means learning honestly and responsibly” (participant2). They also point out that AI can give “false information” (participant8) because the content that AI give is “not always true” (participant9). Therefore, they think that AI content is not “reliable” (participnat3) and it needs to be verified.

In order to contain this problem, the participants suggest some measures like creating clear rules, teaching proper use of AI, and designing tasks that require personal opinions and creativity not the one that force the students merely copy from AI. The participants suggested that the learners “must use AI only for help and learning” (participant1) “not for cheating” (participant3) and use it “as a learning aid, not a shortcut” (participant2). Since “respecting rules and being honest is very important” (participant1) in this digitalized world, “it is essential to be honest, respect academic rules, and use technology responsibly” (participant3). To put it another way, students should use AI ethically and avoid copying answers directly. “They must focus on learning rather than just finishing tasks” (participant9); “giving original responses, and using AI only as a learning tool are important ethical responsibilities” (participant4). The results demonstrate the important roles that AI plays in TBLT Classrooms, the numerous opportunities that AI provides for learners and the challenges that the learners face while doing tasks. Effective use of AI in TBLT classrooms require careful guidance and management, critical digital literacy, and ethical and responsible use of AI.

CONCLUSION

The findings of this qualitative study demonstrate that integration of AI in Task Based Language Teaching marks a drastic change in English language teaching. AI offers transformative opportunities for personalization, feedback, and engagement. It is found that AI functions as a scaffolding which stimulates learners’ interaction and increases communication during the tasks and it does not replace teacher expertise or authentic peer interaction. The challenges show us that it is necessary to manage AI use carefully, judiciously and balanced way. Since this study is qualitative in nature and context bound, the result cannot be generalized. Therefore, a longitudinal mixed study would be preferred.

ABSTRACT

Running in the Family by Michael Ondaatje does not appear to be a memoir but a form of intergenerational trauma reconciliation. In *Blind Faith*, the narrator explains the current generation as mere remnants of the older generation that was destroyed, but mentions the legacies of the chaos that existed in the past. This instability is discussed in this paper as Mervyn Ondaatje portrays it in his extreme intoxication, his fascination with poisonous gas, and the instability that had distorted the whole family set-up. According to family systems theory, the dispersal of the siblings all over the world was not by chance; it was life-saving. As it is written, the magnetic fields would be mad when together with three or more Ondaatjes, or physical distance was a physical coping mechanism of inherited dysfunction. Ondaatje, in the acknowledgements, admits that the book is a portrait or gesture, not a history, and the more the lie is well told, the more the thousand facts. This fact and fiction combination is an effective form of therapeutic reconstruction, a coping system for suppressing childhood trauma. This family disintegration is compounded by the tropical scenery of Ceylon, which is very similar to the removal of the psyche from the house, as affirmed by the heat and the land. The special focus is on children who are subjected to the volatility of parents, including the naked jungle escapades of the father, as well as the psychological disintegration. Finally, the memoir is applied as an exorcism. The writing of the legacy of a fractured lineage is the tool of negotiation, the expression of how the literature may act upon the psychological handicap, and how it may use the narrative reconstruction to heal the family trauma.

Keywords: Intergenerational Trauma, Alcoholism, Memory, Narrative Reconstruction, Family Systems, Inheritance, Psychology

Nisha et al.,

INTRODUCTION

Intergenerational trauma is not only a professional term but also an experience that is transmitted to generations as family heritage, unwanted by its carriers. Psychologists refer to the concept of transmission of trauma in explaining how unresolved parental and grandparental wounds get imprinted on the psyche of a child. This legacy has an impact on actions, memory, and identity and in most cases, resulting in a trend that is not realized until one takes action to discover it [1]. This heritage can be explored in literature uniquely. It may contain imprecision and articulate silence, and it may pick up the subtlety lost in clinical definitions. Trauma is not an experience, as Cathy Caruth reminds us, but rather it revisits us and insists on being narrated when we are speechless [2].

The dynamic of the family is reflected in the work of Michael Ondaatje *Running in the Family*. Ondaatje writes of the book as less of a memoir than a portrait or gesture a collage of memory, gossip, and invention about a family characterized by disorder, alcoholism, and what the narrator refers to as ruined generations [3]. The question that is posed in this paper is a very simple yet very deep question; how do children manoeuvre in a legacy of such instability? What do you do when you need to write about ancestors that existed on the brink of control without making them caricatures and absolving them of their evil?

This paper, already on the border of psychology and the study of literature, has examined how it is possible that narrative itself can be utilized to process trauma. The blend of fact and fiction done by Ondaatje is not purely a style. This mixture is based on a Sri Lankan culture, in which a well-told lie is good as a thousand truths, and a survival strategy. It helps the writer to deal with some painful truths without being overpowered by them [3]. Within the frame of the theory of trauma, the writing process becomes a sort of exorcism- a manner in which the narrator cajoles with a broken heritage. The article is presented in four movements. First, it discusses how the text comprises the passing of trauma between generations, in which the narrator feels that he is a remnant. Second, it examines the father's alcoholism as an individual pathology and disruption of the family system. Third, it considers how the siblings' global dispersion is a coping strategy. Finally, it ponders on the work of remembering and healing as reflected by the narrative strategy adopted by Ondaatje, which is fragmentation, lyrical, and purposefully unreliable.

Research Focus

This study analyzes the manner in which *Running in the Family* traces the psychological history of inheritance through the use of family tales, alcoholism, and memory as symbols. In the acknowledgments, Ondaatje refers to the memoir as a portrait or gesture rather than actual history, and this study does not ignore this important distinction. It explores the effects that parents' disorders have on their children and how the family forms a family lineage known as remnants by the narrator, as the ruined ones of earlier generations. Using the prism of intergenerational trauma, this paper reveals the importance of rewriting history as a form of therapy. The framework is able to connect certain events, such as train escapades and the Family Hold Back code, to psychological theory, thereby demonstrating how personal behavior is indicative of family health.

The key issues that will promote this analysis are as follows:

1. What does Ondaatje mean by his father's alcoholism as a symbol of the increased psychological consequences of intergenerational trauma?
2. How does the novel demonstrate the loss of family cycles and psychological balance?
3. How do human experience and broader psychological crises reflected in the memoir relate to the transforming dynamics in the family?

These questions address the problem of memory versus fact that is present between memory and fact in both "Blind Faith" and "Final Days." Dipsomania of the father is not regarded as individual failure but as a social interference that has broken the global distribution of siblings. The study examines the role of magnetic fields that the family had to move apart as a survival measure, similar to the displacement of ecology. It also considers the narrator's

Nisha et al.,

acknowledgement that a well-told lie is a thousand times better than a thousand facts, which places the flexibility of narratives as a survival mechanism. According to Ondaatje, fact and fiction are intertwined to cope with the suffering of inheritance, as storytelling is the key to psychological survival in the chaos of the ancestors. This is in line with more general discourse on the ways in which literature works through trauma and the strengths needed to negotiate disrupted ancestry.

Intergenerational Trauma Themes in *Running in the Family*

Michael Ondaatje in *Running in the Family* is not dealing with historical record as much as the weight of the ancestry. The narrator does not describe his generation as heirs but rather as survivors of a broken lineage. In "Blind Faith," he confessed that certain events expose them as the remains of the previous generations that were annihilated [8]. This kind of feeling can be associated with the theory of trauma, whereby unresolved traumas present themselves in the future in the form of unclaimed past experiences [3]. Instead of a normal household, the Ondaatjes are an ecosystem of their own, stressed, poisoned by alcoholism, paranoia, and colonial displacement. The degradation of one part of the system negatively affects the entire system, a phenomenon that is in line with family systems theory [7]. In this case, the family unit cracks with instability passed down through the years, and the children are left to walk through a world that is the result of the blunders of the past.

Instability is a direct flow between grandparents and children. The home atmosphere was unstable, with the whimsicalness of Lalla Gratiaen and the strict regulations of Philip Ondaatje. This reached its apogee with the extreme dipsomania of Mervyn Ondaatje and the dramatics of Doris Gratiaen. Similar to ecological imbalance, in which a single species causes havoc in the habitat of all others, the activities of the parents destabilized the children. This is the toxicity that was answered by Christopher, Janet, Gillian, and Michael as they dispersed across the world. Ondaatje notes that "Magnetic fields would go crazy in the presence of more than three Ondaatjes," survival required physical distance to succeed [8]. This dispersion was no more than a migration for defense. Separation in narratives of trauma usually keeps individual identity in collective dysfunction. By emigrating to Canada, England, and America, the brothers and sisters played the role of a shield, preventing the collusion of the magnetic fields of their inherited trauma.

This balance is restored by the very structure of the book. It is a form of therapy as the narrator is able to heal his or her suppressed memories and heal a fractured heritage that they have. The realm of trauma fiction usually demands the re-creation of history to create sense out of the fragmented experiences [3]. In the case of Ondaatje, it is not merely a style that is mixed between fact and fiction but it is vital to the healing. This style will help the family to face the debris of the past generation without being engulfed by it. In connecting personal narrative to the rest of the themes of displacement, the memoir demonstrates that recovery requires a joint effort. Reading promotes the knowledge of intergenerational inheritance as being imperative in protecting the future. The family, similar to the environment, needs to be carefully brought back on track to heal the wounds of previous disturbances.

The Father's Alcoholism as a Symbol of Psychological Disruption

In *Running in the Family*, the problem of Mervyn Ondaatje, not only consuming alcohol but also his weakness, is a disruptive system, such as ecological instability in Kingsolver's work. Similar to shifts in climate disorienting migration paths, the dipsomania that characterizes Mervyn upsets the family path and makes the landscape one of uncertainty and terror [8]. The best manifestation of this psychological disturbance is the train escapades. In *Travels in Ceylon*, Mervyn halts a train with a gun and later dashes into the Kadugannawa tunnel naked, believing that it has bombs planted there. In this case, it is a trauma reaction; that is, the person starts playing a game of rehearsing the disorder, not knowing what is safe and what is dangerous [4]. The nudity in the tunnel takes away social decorum and brings out the crude nakedness beneath the colonial patriarch. His insistence that the train was mined is similar to the loss of the butterfly on its usual route; both are lost in a land that has been hostile because of outside influence.

In the "Final Days / Father Tongue" section, paranoia reappears, bringing out the fragmentation of the psyche. Mervyn sees the friends in the shape of poisonous gas and breaks eggs in terror of the same being true. This is

**Nisha et al.,**

indicative of hypervigilance, which is typical in survivors of complex trauma, as the environment itself becomes dangerous [1]. The chapter, “The Bone,” creates a vivid image of this weight. Mervyn is spotted in the jungle with a chain of five dogs on ropes, and he has supernatural strength. This picture implies that he is literally keeping the lineage of evil or disorder at bay, preventing it from swallowing the children, but turns himself into a monster in the process [4]. The dogs symbolize the vagrant wickedness of the area, and his hold on them is symbolic control in a battle against internal disintegration.

The family system has been negatively affected, and this has been difficult to overlook. According to family systems theory, addiction upsets all members who are compelled to adapt or disperse [7]. This psychological climate change is directly related to the scattering of the siblings around the globe; the magnetic fields would go wild in the company of more than three Ondaatjes. In the book, *Dialogues*, the children tell about the frightening car journeys in which the father drives drunk on the edges of the cliffs, falls asleep, and the car continues on its way. This physical threat is a reflection of the emotional uncertainty of their upbringing. The children are not able to stay in the home ecosystem, just like butterflies are unable to complete their migration. The life of the father, who was shattered by alcohol, is used as a representation of the instability of the family. His personality determines a mood of emotions, turning charming to violent without any notice. This haphazardness causes the children to resort to survival tactics, like the species to a hostile environment. The role of alcoholism in Mervyn is comparable to the carbon emissions in the family, a toxic by-product that pollutes the air that all people inhale. Ondaatje does not justify these things by re-creating them, but to map the scope of the damage. The reading shows that individual addiction leads to the intergenerational trauma that the new generation must live in, picking up the pieces of the crumbled domestic ecosystem. It is a dynamic that resonates with ecological disruption theory which demonstrates the application of systemic collapse at the universal level.

Narrative Reconstruction as a Reflection of Human Lives

The blurring of fact and fiction in *Running in the Family* serves as a reflection of human psychological survival, as the model shows when describing the behavior of butterflies as a reflection of ecological change. Ondaatje, like the broken migration of the monarch, is an indication of psychological trauma. In the Acknowledgments, Ondaatje states that “the book is not a history, but a portrait or a gesture, adding that in Sri Lanka,” a good story is better than a thousand facts” [9]. This statement is in line with the theory of trauma that argues that memory after a disaster is usually not linear and is rebuilt and never documented [10]. The fact that the narrator realizes that memory is not reliable can be used as a personal awakening, similar to how Dellarobia realizes that there is climate change. The mechanism to deal with this instability is writing, which makes sense of chaotic memory into an orderly narrative [11].

The text tells different stories concerning the main events, such as the drowning accident of the mother or the train rides of the father. In the lunch conversation, various family members give different versions of the same story of how the grandmother Lalla almost drowned while moving between being a hero and inaction [12]. Similarly, the adventurous escapades of the father during train travel differ between halting the engine and running naked inside a tunnel that is thought to be mined. Such contradictions are not mistakes but indications of how families work with shame and trauma through myth-making. This is a reflection of the theme of the model on human ignorance and denial, in which the community first rejects ecological anomalies. In this case, the family rejects the painful facts to embrace simple narratives. The narrator is a skeptic who later realizes that these differences shield the mind from too much pain [13].

Storytelling is a form of therapeutic intervention. The process of narration enables the speaker to bargain the heritage of a broken ancestry, just as scientific research bases ecological knowledge. Ondaatje focuses more on the subjective experience of trauma than on hard facts by adopting the well-told lie. This leads to the consideration of the way in which the family history is fade away so easily, and the importance of the personal and community memory. The story indicates that the healing process involves counterattack on the fractured self. The memoir suggests that to restore harmony within a family, one must accept the lack of stability in memory itself, as the memoir urges the

**Nisha et al.,**

reader to recognize the larger implications of inherited pain. In this view, the text shows that truth in trauma stories is not based on factual faithfulness but rather on emotional appeal, so that the story can survive when history is so harmful that it cannot be told without endangering the narrator.

Colonial Context and Family Systems Equity

In *Running in the Family*, Ceylon serves not as a fixed location but rather as a compounding agent to the psychological disintegration of the family. The deterioration of the colonial plantation, Rock Hill, is a reflection of the breakdown of the Ondaatje family, suggesting that political and environmental stressors contribute to a higher incidence of domestic instability. Ondaatje refers to the Karapothas—the foreigners who come, plunder the material resources, and leave—as an allegory of the impermanence of colonial power and the consequent cultural displacement [14]. This impermanence trickles into the family setup where alcoholism of the father leads to the equivalent cycle of presence and absence. The weather is even oppressive; the heat and monsoons increase the tension and reflect the instability of political life of the postcolonial period.

The corrosion of the Rock Hill is an indication of the corrosion of family equity. The family loses its ground as the estate is subdivided and sold to pay for the shortage of money. This lack of resources is directly associated with the father's addiction, which consumes resources that should be used to stabilize the children. The F.H.B. Such rationing can be reminiscent of the unfair allocation of resources in colonial economies, where the pressure of scarcity is disproportionately placed on the vulnerable.[15] Triangulation and resource hoarding in family systems theory interfere with the emotional balance necessary for healthy development. Triangulation and resource hoarding in the family systems theory interfere with the emotional balance necessary for healthy development.

First, the novel is a criticism of the impact of environmental and economic crises on the most vulnerable members of the family. The scattering of the children across the world is a direct reaction to the toxic atmosphere generated by the instability of parents, such as communities running away to escape ecological dangers. In addition, the text highlights the conflict between the settler colonialists, the Karapothas, and the indigenous people. The lack of family self-establishment is the way the colonial experience failed to sustainably establish itself on the land, which created a legacy of displacement [16].

Finally, the crash of the colonial disintegration into the family crises reveals a clear injustice in the household. There is a similarity here to ecology: as the environmental loads have to be distributed equally, so do the families have to get equal share of emotional and material resources to operate. It is the survival strategy that enabled the Ondaatje kids to escape this ascending terrain despite being caught in the magnetic fields of an addicted and baggage-ridden family. The memoir indicates that without identification of such systemic imbalances, be they political or personal, then there is no healing possible. Harmony can only be restored to the broken lineage by simply recognizing them.

CONCLUSION

The family fractures in the Ondaatje family are indicative that trauma is not normally a one-time event and is more of a systematic continuation of trauma through the generations. The dysfunction that characterizes the family in *Running in the Family*; be it the alcoholism of Mervyn or the strangeness of Lalla is not a individual pathology, but is rather an indication of a greater imbalance in the family unit [7]. The children perceive themselves as survivors of a family that was already destroyed, and they are not only inheriting the memories, but also a large burden of the instability in their minds. According to this conveyance, unless the cycle is broken, the turbulences of the past are sure to spill over into the present and leave future generations with the task of maneuvering around a world that was created by the errors they have not made [1].

But Ondaatje does not only give a diagnosis of such a breakdown in his memoir; he also suggests storytelling as a method of restoration. The fact mixes with fiction enables the author to do not merely document his history but, on

Nisha et al.,

the contrary, to rewrite it to render the trauma manageable. This is in agreement with the trauma theory which implies that the survivors have to re-construct their disintegrated memories to seek some form of coherence [4]. When Ondaatje implies that good lie can indicate more than a thousand facts, he does not deny the reality. Rather he is employing a survival strategy which enables him to face some ugly facts without being devoured by them [5]. Writing is the way of grounding the disorganized vitality of the family, transforming the dull silence of painful experience into a communal narrative that is subject to analysis, not mere experience. The book does not provide a well-tied conclusion, just sticks around in the olfactory aspects of a last morning. The narrator is lying in the dark where he can hear the rain on the wall and the fan running above him. The pictures of the slow light, the anxious rain birds, and the shinning fan blades indicates that there is no cure of the traditional meaning. Rather, the process of healing is only present in being awake and in the present. The rain has not stopped, the fan is still rotating, and the past has not vanished; the narrator never feels paralyzed by it anymore. He is inside the storm, where he recognizes the connection of continuity with the environment and lineage.

Just as the model paper tackles the issue of the future of the planet, the urgency of ensuring the future of the Lineage is highlighted in the current research. Similarly to ecological equity, which requires a just sharing of the environmental burden, psychological health means that familial history ought to be fairly processed. According to Ondaatje, the solution to protecting the future is to break the silence cycle through which trauma can spread. The author documents the destroyed generations to provide his children and readers with a map that would help them understand the root cause of their instability. The memoir is an ode to the strength needed to overcome a divided heritage and call for a shared duty to mend the damage of the past in order to have something better than ashes in the future. Finally, the book is not simply a portrait of a family but a gesture of survival in the context of inevitable rot.

ABSTRACT

Sudha Murthy supports women and encourages them to exhibit resilience throughout challenging circumstances through her efforts. The primary aim of this study is to examine the challenges encountered by the female protagonists in Sudha Murthy's selected novels, *Gently Falls the Bakula*, *House of Cards*, and *Mahaswetha*, and how they transcend their quotidian lives in pursuit of a more meaningful existence and the attainment of their aspirations. A comprehensive assessment of the research literature was conducted to achieve the study's objective. Three works, namely '*Gently Falls the Bakula*,' '*House of Cards*,' and '*Mahaswetha*,' have undergone critical analysis. We also examined the research articles published in peer-reviewed journals. We examined the challenges faced by women and their strategies for overcoming them to achieve a fulfilling life, as presented in the literature. The study's findings reveal the brutality, degradation, and exploitation faced by female protagonists in books such as *Anupama*, *Mridula*, and *Shrimati*. The principal themes of "*Gently Falls the Bakula*," "*House of Cards*," and "*Mahaswetha*" encompass the dynamics of male-female relationships, societal norms, and the pervasive sense of isolation in contemporary existence. The female characters in the books *Mridula*, *Srimati*, and *Anupama* are shown as uncomplicated, diligent, and innocent. Conversely, the male characters—Sanjay, Srikant, and Anand—are profoundly swayed by the allure of luxury, comfort, and consumerism, ascending the corporate hierarchy while neglecting the significance of familial bonds. The man's avarice for power, fortune, and social standing has adversely affected the women in the narrative. The ladies in the narrative recognize that deceptive ideals and financial gain do not equate to genuine achievement. They strive diligently to surmount the obstacles presented by a patriarchal culture to attain meaning in their life. The selected books for analysis address ethical and societal ideals. Life is shown as a journey characterized by the processes of learning and unlearning, confronting many issues and obstacles

**Ranjith Kumar and Sathiyarajan**

that evaluate one's tenacity and motivation. The figures depicted by Sudha Murthy illustrate how these issues facilitate decision-making. Despite the difficulty of their decisions, they discovered bravery, purpose, and significance in forging a new future. Comprehending our true worth is challenging; nonetheless, achieving this fortifies our convictions and fervor. Discovering one's identity is a challenging journey that encompasses both suffering and insight. The characters exhibit resilience and confront a fresh commencement.

Keywords: Sudha Murthy, Social & Ethical Values, Trust, Relationship. Marriage, loneliness.

INTRODUCTION

Mrs. Sudha Murthy, an Indian social worker and author, has composed several short tales and novels that compellingly portray social challenges, women's empowerment, identity crises, and the need of ethical ideals for a meaningful existence. Her value-centric novels emphasize commonplace living, allowing readers to recognize themselves in many characters. Her works are entrenched in Indian culture, with situations derived from quotidian reality, events, and experiences. These circumstances demonstrate that women are unable to articulate their rightful entitlements. Passive pain, stoic sacrifice, familial bonds, quiet, social apathy, denial, loneliness, fear, isolation, rejection, acceptance of failure, individuality, vociferous protest, and the transgression of social standards have remained latent. The women in the studied works, including Shrimati, Mridula, and Mahashweta, become victims of their own circumstances. In a subsequent phase of their lives, they see their potential and recover. A woman should not confine herself to societal limits and rigid notions; she must transcend these boundaries and awaken to other alternatives to fulfill her own aspirations. She must begin a new inward adventure. The aforementioned notions prominently feature in the vivid representation of the female characters illustrated by Sudha Murthy.

To quote from Simone de Beauvoir's book titled *'The Second Sex'* wherein she asserts that:

"Once she ceases to be a parasite, the system based on her dependence crumble, between her and the universe there is no longer any need for a masculine mediator".

In all her publications, Sudha Murthy asserted that a woman must transcend the confines of psychological confinement inherent within herself. The confinement of household restraints stifled women's life and exploited female subjectivity, serving as the foundation in all these works.

A woman is shown as an emblem of sacrifice. She contends that women must liberate themselves from their patriarchally built social connections. To restore her identity, she undergoes a transformative journey, ultimately emerging as an individual. The woman, the pinnacle of divine creation, need protection and a connection that allows her to express her refined feminine attributes, unimpeded by malevolent self-serving tendencies, while unveiling her multifaceted nature in the pursuit of self-discovery. We have instances of assertive, powerful, and opinionated women who have shaped their attitudes and behaviors, demonstrating their strength by advocating for themselves and resisting societal preconceptions.

"Feminism isn't about making women strong. Women are already strong. It's about changing the way the world perceives that strength" (G.D. Anderson)

This scenario evokes the narrative "In Search of Myself" by Indian activist Chhaya Datar. The narrative illustrates the unfortunate situation of an educated lady who liberates herself from patriarchal societal conventions. The tale explores a woman's dilemma between pursuing her passion and adhering to the constraints imposed by her traditional family. She tries to convey her experience as a social worker and a member of the union for agricultural workers. living in a tribal society. She gets a letter from her spouse requesting her return to partake in a family rite. The pivotal aspect of the whole narrative is her potential reaction, to paraphrase the lyrics of *Gautama Buddha* 'Not to

**Ranjith Kumar and Sathiyarajan**

get upset with people and situations because both are powerless without our reactions'. This novel helps a woman to discover herself and overcome social fear and uncertainties.

Remarkable women who have significantly advanced in several disciplines, altering the conventional feminine archetype, deserve recognition. Cleopatra, Marie Curie, Queen Victoria, Indira Gandhi, Mother Teresa, and others served as archetypes, illuminating the many personas depicted by several Indian women authors. This is particularly accurate for the female characters in Sudha Murthy's writings. To quote Wilma Mankiller, the American leader in community building, particularly among the Cherokee Tribe.

"The happiest people I've ever met, regardless of their profession, their social standing, or their economic status, are people that are fully engaged in the world around them. The most fulfilled people are the ones who get up every morning and stand for something larger than themselves. They are the people who care about others, who will extend a helping hand to someone in need or will speak up about an injustice when they see it".

"There is no force equal to a woman determined to rise" (William Edward Burghardt Dubois - An American sociologist, historian, writer, and editor). Has the journey culminated in self-actualization? Amelia Earhart has affirmed our belief that females can attain significant success in male-dominated areas, encouraging them to persevere in their aspirations despite financial challenges, gender prejudice, and other impediments. Emmeline Pankhurst was the founder member of a women's organization known as the Suffragettes. This organization valiantly fought for women's suffrage in the United Kingdom. Margaret Thatcher was instrumental in implementing reforms in contemporary British politics. Queen Elizabeth reigned for 66 years. She is the longest-reigning queen in the world. She held the positions of head of the Commonwealth, head of the Church of England, and head of the Armed Forces. Mother Teresa dedicated herself to mankind with fervor, while Florence Nightingale, the Lady with the Lamp, exemplified service despite her privileged upbringing. Rani Laxmibhai embodied courage in the face of adversity and upheld self-respect. The passionate queen unequivocally demonstrated that females cannot be restrained but may be exuberant and fervent. The emergence of a new concept posits that women's empowerment entails the liberation of women from social, economic, political, caste, and gender-based discrimination, aiming to replace patriarchy with equality. The notions of personal autonomy, feminist emancipation, and the interdependence among women are pertinent to the female protagonists in Sudha Murthy's works.

To quote – Mark Victor Hansen (An American native, enthusiastic speaker and the author of the bestselling book "Chicken Soup for the Soul").

"Don't wait until everything is just right. It will never be perfect. There will always be challenges, obstacles and less than perfect conditions. So what, get started now. With each step you take, you will grow stronger and stronger, more and more skilled, more and more self-confident and more and more successful".

Consequently, the above introduction clearly demonstrates that women are integral to the development of both society and country. Sudha Murthy's works clearly concentrate on the many issues encountered by women. The primary objective of the research is to illuminate a woman's endeavor to surmount societal shame and worries, as well as the strategies she employs to enhance the significance of her existence. The selected books of Sudha Murthy have been assessed to fulfill the objectives of the study. The books include 'Gently Falls the Bakula,' 'House of Cards,' and 'Mahaswetha.'

DISCUSSION

The gist: This was Sudha Murthy's debut book. The narrative centers on two people, Shrimati and Shrikant. They reside next to one another. Their residences are encircled by a Bakula tree. The two families harbor animosity towards one another. Despite familial discord, they fall in love and marry. Shrimati makes significant sacrifices as Shrikant advances in his professional life. His avarice for power and achievement obscures his judgment. He

**Ranjith Kumar and Sathiyarajan**

disregards her, prompting her to resolve to leave him permanently in pursuit of her aspirations. The narrative starts in a modest setting in Hubli, depicting the lives of Shrimati and Shrikant. Shrimati, an exceedingly fragile child, is raised by an unemployed father, a domineering grandmother, and a timid but kind mother. Robust values are the foundation of Shrimati's existence. Shrikant is a member of the Smartha community. They were both classmates. Shrimati consistently outperforms Shrikant in examinations. They were competitors in the class, engaging in little egotistical conflicts.

A Bakula tree (Fragrant flower) delineates the two residences. The Bakula tree, characterized by its dark green foliage and peculiar, unappealing blossoms like a crown but exuding a wonderful smell, covered the ground like an ethereal carpet, standing proudly with dignity. It was regarded with reverence. It was not exceptionally attractive nor fragrant, but it had an unfathomable allure and was a symbol of legendary love. Shrikant is captivated by Shrimati's simplicity and subsequently falls in love with her. Shrimati also develops romantic feelings for the attractive and affable Shrikant. The Bakula flowers symbolize her love letters, signifying that the essence of their affection would endure indefinitely. They enter into matrimony.

Shrikant was ambitious and committed to his work. He enters an IT firm, ascends the corporate hierarchy swiftly, and achieves success, forsaking Shrimati and her educational ambitions. Shrimati dutifully performs her responsibilities as a compliant wife during her prime years. She eventually recognizes the void inside herself. The narrative culminates with Shrimati departing the residence to pursue her ambition. 'Gently Falls the Bakula' narrates the tale of a marriage that deteriorates due to the avarice of the husband.

The dialogue between the two upon their departure is profoundly poignant and very moving. Shrimati informs her husband that she can no longer endure the solitude. She also conveys to him that her affection for him surpassed her achievements. She explicitly indicates her dissatisfaction with the comfort he offered her. He saw her as an adornment rather than as a sentient individual with emotions and feelings. Upon her departure, Shrikant reflects and acknowledges his cruelty towards his wife, seeing himself as the primary catalyst for her exit. The Bakula Tree, a symbol of their love, had tragically fallen.

The House of Cards

The gist: (Mridula, a youthful and passionate lady, originates from a hamlet in Karnataka. She meets Sanjay, develops romantic feelings, marries him, and establishes her residence in Bangalore. She experiences disillusionment while seeing the self-serving, materialistic society. She exits the marriage.....)

Materialistic factors have undermined our ideals, diminishing our familial connections. True love, comprehension, and forbearance are fundamental principles essential for maintaining the significance of any relationship, as articulated by Antoine de Saint-Exupéry, the French writer, poet, aristocrat, journalist, and pioneering aviator. "Love does not consist of gazing at each other, but in looking together in the same direction"

'The House of Cards' is a concise familial drama that illustrates the simplicity of rural existence, the complexities of urban life, and the cultural conflicts that have disrupted their marital relationship. The author examines human interactions in depth. Mridula consistently embodies the qualities of a diligent and compliant spouse, but Sanjay is swayed by the allure of opulence. Mridula, an intelligent young lady, relinquishes her aspirations and vitality to ensure her husband Sanjay's success and popularity.

"Soon, Mridula and Sanjay settled into a comfortable routine. Mridula got up early in the morning, cooked and gave Sanjay breakfast. He carried a lunch box to the hospital and returned home at night. After Sanjay left, Mridula went to school; she cleaned the house in the evenings". (Sudha Murty 2013)

**Ranjith Kumar and Sathiyarajan**

The incessant pursuit of ambition, consumerism, and unscrupulous practices is gaining traction. Marriage relies on trust; conflict arises when it is founded on selfishness, as shown by the character of Sanjay. The suffering endured by Mridula is apparent in the following passage extracted from the text:

"Tears rolled down Mridula's cheeks. She thought how did I live with Sanjay for such a long time? Today he's given me money and position in society but he doesn't share my sorrows. I've held his hands and walked next to him on the thorny path to success. When a girl gets married, the extent of her happiness depends upon the husband's commitment and communication with her. A few kind words, a little appreciation and small gifts like flowers can make a girl feel special. But Sanjay just wanted to show that he was the boss". (Sudha Murthy 2013).

Sanjay began displaying discourteous conduct with Mridula. He started comparing Mridula to his sister. He often disparaged his wife and shown more trust in his sister; although he engaged with others in a refined and articulate way, he was harsh in his interactions with his wife. He was a kind of dictator. Sanjay sent ten lakh rupees by demand draft to his mother, obtained a new vehicle for his nephew, and procured a residence and gold jewelry for his sister, all without his wife's awareness. It diminished Mridula's self-assurance. Mridula was disheartened not because of his financial aid to his mother, sister, and nephew, but rather owing to his failure to disclose this help to his wife. Upon uncovering the truth, Mridula permanently departs from her husband's domicile.

Mahashweta

The gist: (This narrative pertains to a young lady named Anupama and her matrimonial union. She becomes enamored with a physician called Anand, aspiring to cultivate a joyful existence. Vitiligo, a dermatological condition, adversely affects Anupama's life. Her life becomes chaotic. The absence of social approval makes her existence intolerable. She experiences a tumult of emotions, ultimately emerging as a young, attractive, and independent lady. Mahashweta signifies 'the white one.' The tale centers on Anupama, an enchanting beauty wed to Dr. Anand. Anupama's optimistic perception of life is disrupted by the onset of Vitiligo, a white patch on her skin; she transforms into a representation of 'social stigma,' forsaken by her indifferent in-laws and callous husband. Her consultations with the dermatologist, along with her suffering, distress, and inability to articulate her feelings, render her more audacious and unrestrained. Courage enters her life, empowering her to confront adversities and forge an independent existence. The reader will really perceive the anguish and distress that Anupama endures, disheartened in life, spurned by her husband, and alienated from society. Anupama learns to navigate her life by embracing her illness, cultivating an autonomous, fulfilling, and tranquil existence, so attaining respect and dignity. The ideals articulated below are both profound and evocative. Society exhibits insensitivity towards Anupama's emotions. She is condemned and disregarded only because to her affliction with vitiligo. This story presents a poignant and realistic portrayal of a lady, first seen as a symbol of beauty to enhance a man's social standing, who is discarded because to vitiligo. Subsequently, she endeavors to transform and flourish, like to a butterfly, through many phases, discarding all facades. The heroine, Anupama, confronts a struggle with her female equivalents, including her stepmother Sabakka, stepsisters Nanda and Vasudha, mother-in-law Radhakka, and sister-in-law Girija, as she seeks to discover her inner power.

The societal responses and rejections deplete our spirits and evoke sorrow. The condition of being accused without culpability evokes compassion in the reader; Anupama does not succumb to degradation but transcends it, so enhancing her status as a woman. A cosmetic ailment, non-hereditary and non-contagious, intertwined with superstitious stories, disrupts Anupama's life, devastates her, and ultimately allows her to rise, leaving her female counterparts astonished. She determines what is essential in her life; she allocates time to distinguish the genuine priorities in her life. She enhances her life by emphasizing her boldness, independence, confidence, and self-respect. She sought to avoid societal conditioning and mental oppression; she strives for mental peace, inner calm, and the conquest of all anxieties, uncertainties, and complexities. The narrative 'Mahashweta' illustrates the journey of a fractured woman who revitalizes herself and asserts her position in society despite several challenges. This work is so profoundly crafted that we really experience the anguish and distress endured by 'Anupamas' in contemporary society. We take pride in her determination to exhibit strength and confront adversity in her pursuit of

Ranjith Kumar and Sathiyarajan

self-fulfillment. This evokes the sentiment expressed in the phrase, "I am grateful to all the challenging individuals in my life; they have illuminated precisely who I do not aspire to become!" – Unidentified

This work evokes tears, instilling appreciation and amazement for the protagonist's brilliance and strength of character. All the characters are flawlessly shown in their authentic environment: their masks discarded. This tale illustrates the latent bravery of women that emerges, empowering them even in circumstances when their husbands do not support them. Upon learning that the woman is afflicted with Leukoderma (Vitiligo), he did not hesitate to remain by her side, as he ought to have. Leukoderma significantly transformed Anupama's life. It altered people's perceptions of her, elicited their sympathy, and led them to attribute guilt for her sickness prior to her marriage. The inhabitants of Anupama's village also responded. In rural areas and small towns, women afflicted with this condition are regarded as untouchables. Anupama's ability to confront her challenges, transcend her limitations, and progress despite the absence of love and connection in her little hamlet is admirable. She encounters challenges in the bustling metropolis, including threats and stress, and her capacity to manage these issues garners admiration for her character; her courage in confronting difficulties captivates readers.

CONCLUSION

The female characters, such as Anupama, Mridula, and Shrimati, have established their presence in the actual world and its accompanying challenges. The problems faced by these women expose their experiences of abuse, degradation, and exploitation, ultimately shattering the silence. The primary themes in these narratives encompass the dynamics of male-female interactions, societal perceptions of acceptability, and the pervasive sense of isolation experienced in contemporary existence. Sudha Murthy's oeuvre encompasses a diverse array of individuals, situations, locales, and communities that reflect authentic backgrounds, constrained perspectives, clichéd assessments, and antiquated expectations. Sudha Murty delineates a pattern in each of her protagonists, illustrating their journey to achievement via the surmounting of anxieties, difficulties, paradoxes, societal standards, disappointments, and enduring challenges. Every woman possesses a silent, unarticulated voice. The Protagonist remains susceptible to a society that has commodified her as an emotionless and purposeless symbol of beauty. Sashi Deshpande's title "That Long Silence" provokes a profound response, ultimately revealing the "Woman within her." The author meticulously examines the relationship. Mridula, Shrimati, and Anupama embody simplicity, diligence, and naivety. Conversely, the masculine characters Sanjay, Srikant, and Anand are profoundly influenced by the allure of luxury, comfort, and consumerism. They ascend the corporate hierarchy without recognizing the significance of familial connections. The recurring themes identified in the literature examined in this research include familial rivalry, conflicts among in-laws, misunderstandings, ignorance, outdated perspectives, and the continuation of male dominance. These female characters possess considerable unrealized potential, yet they remain in subservient roles. The narrative is replete with symbolism, with each character embodying a notable behavior. For instance, Bakula is associated with Shrimati's unassuming, amiable, and appealing character. This characteristic remains unrecognized as the narrative progresses. The blossom symbolizes enduring love, despite challenging circumstances and shifting priorities that obscure its presence. They fail to comprehend that a house embodies emotions and that each interaction is significant. The adage states, "A house is constructed with brick and stone." Love encompasses all that constitutes a home. The principal characters can no longer endure their hostility. They ultimately assert that erroneous ideas and wealth do not constitute genuine success. Within the social hierarchy, the woman serves just as an ornament, a superficial emblem signifying 'His' social standing. Every woman experiencing reality will resonate with the aforementioned narratives. Her works include a wide array of scenarios including several individuals, whose life narratives are portrayed with sincerity, emphasizing relationships founded on trust and marriage as a cornerstone of meaningful living.

This situation reminds us of a small story:

A little girl and her father were crossing a bridge.

The father was kind of scared so he asked his little daughter:

"Sweetheart, please hold my hand so that you don't fall into the river".

Ranjith Kumar and Sathiyarajan

The little girl said: "No, Dad. You hold my hand".

"What's the difference?" Asked the puzzled father.

"There's a big difference", replied the little girl.

"If I hold your hand and something happens to me, chances are that I may let your hand go.

"If you grasp my hand, I am certain that regardless of the circumstances, you will never release it." A strong tie is essential in every relationship. One must grasp the hand of a beloved individual rather than anticipating that person to grasp theirs. Consequently, this link is crucial in marriage. Contemporary youth encounter several distinctive challenges, particularly in their marriages, but they flourish with a sense of achievement. In these works, the masculine inconsiderate characters, such as Shrikant, Sanjay, and Anand, have a moment of awareness. They own their errors in neglecting female characteristics, recognizing that caring, collaboration, and responsibility are essential components of a successful marriage, and they see life from a broader perspective, moving beyond their self-centered viewpoint.

The books selected for analysis outline social and ethical ideals. Life is shown as a journey characterized by learning and unlearning, encountering many hurdles that test resilience and determination. These challenges assist us in making decisions, as shown by the characters portrayed by Sudha Murthy. Despite the difficulty of their decisions, they summoned strength, purpose, and significance to forge a new horizon. Understanding our true worth is an arduous endeavor that fortifies our principles and enthusiasm. Self-discovery is a challenging journey that requires both suffering and comprehension. The protagonists summon bravery and confront a fresh beginning. The life modules presented in these books provide enhanced clarity and insight, fostering resilience and concentration in the face of obstacles. The individuals shown encountered several challenges, disappointments, and obstacles, but chose to pursue a purpose-driven existence.

To live by choice, not by chance

To make changes, not excuses.

To be motivated, not manipulated

To be useful, not used.

To excel, not complete

I choose self-esteem, not self-pity

I choose to listen to my inner voice

Not the random opinion of others"

ABSTRACT

We live in an era which is mostly dominated by electronic gadgets, artificial intelligence and advanced technologies resulting in fragmented attention among the young readers. Writers like Sudha Murthy take constant efforts in bringing back the traditional learning methods to make the present-day kids understand the values and practices of the past. From her stories we come to understand the importance of remembering the past which enhances a better future. Collective memory generally refers to the way in which a group of people find meaning in their past. Sudha Murthy through her use of collective memory strategies manages to convince the young minds to inherit not just stories but shared knowledge of the ancestors. The stories which Sudha Murthy weaves in the collection *Grandma's Bag of Stories* for instance tend to recreate ancestral story telling circle where the norms and traditions are remembered collectively. Hence the objective of the present paper is to study the collective memory strategies which Sudha Murthy uses shape the young minds to think and act in a better way.

Key words: Artificial Intelligence, traditional learning methods, collective memory, story telling, Sudha Murthy.

Pahlavi Mustafa

INTRODUCTION

Collective Memory Strategies in Sudha Murthy's stories and their role in shaping young minds of today

"Give your children two things in life: Strong roots and powerful wings"

- Sudha Murthy

Sudha Murthy is one of the dedicated philanthropic Indian writers of Children's literature who uses memory as a strategy in making the readers understand the relevance of the past. Most of her stories are the results of her collective memory. Her protagonists seem to long for the return of the past which they feel is filled with harmonious life style, customs, and practices. She asserts in many places the significance of retaining the old. The past should be respected and acknowledged by the youngsters so that it would enrich their perspectives. Memory studies has become a recurring topic of literary discussions in the recent times. The primary reason is probably the shift in the way of approach to life by the present generation. This is an era of globalization and cultural flux. We often hear people complaining about the disappearing values in the current age. Communication is rather happening between gadgets than between humans. Expressing one's emotions and feelings too had become digitalised as we spend more time on posting these on face book and Instagram. The number of 'likes' that one gets from unknown people are given much weightage than our real friends and so, there arise a need on the part of the writers to take initiatives in shaping the minds of the young readers thereby prepare them for a better future.

The stories written for children play a crucial role in developing collective consciousness and cultural transmission. They act as a bridge in connecting their modern thinking to the valuable insights of the past generation. We can see that most of the writers of today who write for children works with the goal of creating fertile thinkers in future. Hence the objective of this paper is to explore how Sudha Murthy employs collective memory strategies to polish the young minds to understand the heritage of our past.

Collective memory and Sudha Murthy

Collective memory is the collective knowledge and information held by a group that promotes values and perceptions of the good old times. It is constructed through storytelling and attempts to transmit knowledge across generations. Books written for children by Indian authors draw stories from mostly epics like Ramayana and Mahabharata or from ancient myths and folklore. These texts tend to teach children the basic values and principles one should adopt in life. Some also convey the rich heritage of the past by narrating the stories of great kings and emperors from the past. By doing so they serve as a vehicle in transmitting the cultural values to the younger generation.

In the stories of Sudha Murthy, collective memory strategies get manifested through the children's involvement with elders, recalling myths, representation of cultural artifacts like rituals, and preservation of natural reservoirs. It is literally impossible to separate collective memory from Sudha Murthy's world as it is naturally embedded in every layer of her narratives. Her narratives show deliberate usage of traditional writer techniques.

The following are the works where Sudha Murthy is at her peak in transmitting to the readers the knowledge of the past –

- The Magic of the Lost Temple
- The Sage with two horns- Unusual Tales from Mythology
- The Man from the Egg -Unusual Tales about the Trinity
- How I taught my grandmother to read and other stories

**Pahlavi Mustafa****Imprinting ethics in the young minds**

In the story *The Magic of the Lost Temple*, we find the teenage girl Noonni getting unusually fascinated by the honesty and sincerity of the villagers and their caring ways in the treatment of not just humans but also animals, plants and nature around. Though being a city girl, she gradually develops a liking for the habits and lifestyle that she witnesses in the remote village where her grandparents live and readily learns a lot from them. While portraying characters like Noonni, Sudha Murthy seems to be convinced that the young learners are indeed very persuadable when compared to the adults in receiving the message conveyed in her texts. She proudly comments in her introduction to the novel 'The Magic of the lost temple' that her granddaughter Noonni is the heroine of her book- "bold, determined, sporty and always in search of new adventures". She happens to hear from the villagers the different stories woven around the lost temple but takes a bold step of unveiling the actual truths behind the ancient temple and the significance of the forgotten village stepwell. Sudha Murthy chooses her protagonists in such a way that any kid reading the story could relate oneself to the character. It is not just about learning to respect and follow the ethics and values of the elder generation but also a reminder to the adults that the thoughts of youngsters need to be heard and respected.

Understanding Cultural ethos through the narratives of Sudha Murthy

Sudha Murthy's narratives present to us an amalgamation of cultural facts, moral values, moral judgements, and ancient practices. This paper identifies how Sudha Murthy employs multiple strategies as collective memory devices. Collective memory studies convey to us the way these oral, textual, or visual narratives construct the social memory. Researchers in memory studies have found that literature helps to reinterpret the events of the past in the present moment. Sudha Murthy thus makes her stories engaging and convincing giving references from various myths. She deliberately chooses those myths and folklores which carry the best lessons to be followed in lives.

Intergenerational memory being transmitted

In 'How I Taught My Grandmother to Read and Other Stories' for instance the wisdom of the past, their unique cultural values and traditional kind of narratives are transmitted beautifully from the elders to children. The protagonist is a girl of twelve who teaches her grandmother to read Kannada. She explains in an exciting tone how amazing her 'Avva' was as a student in learning the language quickly. With this simple act of a young girl teaching her grandmother one could feel the cultural transmission and exchange of knowledge between two generations which are different from each other. It symbolises transmission of collective knowledge. The act of a granddaughter educating her grandmother fills the generational gaps and thereby make the elder generation to get access to reading newspapers and local magazines which was just a dream to them in their earlier times. The stories which the grandmother narrates to her granddaughter about her past life, the family history and her earlier lifestyle in her village become the resources of collective memory.

Cultural memory through Myths

Sudha Murthy's tales which she draws from great epics like Ramayana and Mahabharatha brings to us the mythical memory. These myths act like an important vehicle for cultural memory. Though the messages that they convey are the same Sudha Murthy makes them easy to access by the present generation kids through her simple narrative style. Unlike the complex narratives of the past, Sudha Murthy employs the modern narrative techniques and make the stories simpler and suitable for the rapid thinkers of today. In the series *Unusual Tales*, Sudha Murthy weaves the extraordinary stories of the popular deities (Brahma, Shiva and Vishnu) and through them she teaches universal values like kindness, perseverance, compassion. By retelling these known myths, she also questions the traditional assumptions and allows the readers to think critically. For instance, the following lines from *Unusual Tales* series,

"...why clouds in the desert are called Uttanka Megha? ... Indra was so pleased with the efforts of Uttanka... Today, these rain clouds in the desert are still known as Uttanka Megha" shows how cultural memory is embedded even in the natural phenomena like rains. To elaborate on the idea that mythology has become an inseparable part of our daily life, the author herself stresses that "Mythology is part of our heritage, part of our

Pahlavi Mustafa

identity at times because anywhere in India you will find the name of Rama or Krishna in one or the other form." (Sudha Murthy, Brainy Quote).

Another best example is the introduction to *The Serpent's Revenge* that insists that cultural memory depends on the degree in which the stories are passed through oral traditions, Sudha Murthy says, "**Most importantly, I would like to thank the sages who have communicated these tales by word of mouth so that others could memorize them and pass them on through the ages.**"

Use of cultural artifacts

Another interesting strategy which we identify in Sudha Murthy's narratives is that she makes use of the old practices, customs, and rituals which represents cultural memory. Festivals, and communal gatherings symbolizes the collective heritage of the past. In the story 'The Magic of the Lost Temple' there is reference to the old practise of keeping empty houses for the purpose of making them staying places for the guests and relatives who come from far off places to attend the festivals and functions. We hear 'Ajja' saying,

'...We use part of it as storage and a part is kept ready for guests to stay in. If there is a wedding in the village and people come from outside, they can stay there'. Noonni wonders why there is no wedding hall in the village.

'Why? Isn't there a wedding hall in the village?' asked Noonni. 'No, the concept doesn't usually exist in villages. Typically, the wedding is performed at home and the guests are accommodated in people's houses,' Ajja concluded. The answer is quite surprising not only to Noonni but to us too. It just implies how generous and broad minded are the village landlords in treating the guests. This culture is fading away in the present society. Hence Sudha Murthy tries to insist this traditional practise in the minds of the young readers.

There are also references in Sudha Murthy's stories to the religious practices like taking *Ganga Snan* which again represents the cultural continuity of ancient South India.

Usage of old story telling method

In the ancient times there existed the practice of conveying life lessons through oral story telling. Grand parents used to narrate some of the ancient myths and folklore to young ones as bed time stories so that the message that they convey leave unforgettable imprints in the fresh growing minds. Sudha Murthy employs the oral traditional style of storytelling in her books. Her story telling is conversational like the stories narrated by grandparents. The repetitive nature of her narratives reminds us of the oral memory techniques that were used in the past to reinforce the values and ethics. Just as we find in the traditional folklore, she begins the stories of the Trinity, the story of Brahma, the Creator and continue with the stories of Lord Vishnu and ends with the stories of Lord Shiva, the Divine Destroyer in her short story series titled *The Man from the Egg- Unusual Tales about the Trinity*.

Insistence of culture and old values

Sudha Murthy's narratives have never failed to insist the importance of maintaining one's culture and tradition. Giving respect to elders, abiding by the family tradition, completion of one's duties and responsibilities, being compassionate to the fellow human beings and compassionate towards nature and life around us are some of the invaluable life lessons that are intricately woven in all her stories. Cultural values and morals which are part and parcel of traditional India are embedded in each tale. By portraying family practices and history of the past she connects personal memory to the communal tradition and encourages cultural continuity in the fast changing 21st century. Sudha Murthy's stories to children are not just a tool of conveying morals but goes beyond its purpose. They fill the gap between the traditional and the modern world and serve as a powerful tool of collective memory transmission.

ABSTRACT

Writing is a complex cognitive and psychological process, and most students face obstacles, including writer's block, lack of confidence, difficulty articulating ideas, and fear of errors, which negatively affect performance in school. As the use of artificial intelligence in education increases, tools such as Grammarly and Trinko are being used to support the development of writing skills, but their psychological influence on writing needs to be systematically studied. This study aimed to analyze the psychological processes underlying writing proficiency through the use of AI tools and to establish how these tools affect students' psychological writing obstacles. A descriptive-correlational design was used. The research involved a sample of 120 undergraduate students from the engineering stream across different disciplines, aged 18 to 21 years, who were selected using stratified sampling in higher institutions of learning. The questionnaire used to collect data was a Likert-scale instrument that measured writer's block, lack of confidence, difficulty expressing ideas, fear of making mistakes, use of AI tools, and perceived improvement in writing. Reliability analysis showed high internal consistency ($\alpha = .84-.93$). The results indicated that 72 percent of students felt more confident in their writing as a result of using AI tools, 68 percent reported lower writer's block, 64 percent indicated that ideas were better organized, and 70 percent believed they were less afraid of making grammatical mistakes. Correlation and regression analyses showed that the use of AI tools was a strong predictor of writing improvement ($\beta = .55$, $p < .001$), and 61% of writing skill development was attributed to the use of AI tools. The research suggests that AI-based writing aids could be highly effective in minimizing psychological obstacles and improving writing performance, provided they are systematically incorporated into academic education.

Keywords: Psychoanalysis of Writing, AI Writing Tools, Grammarly, Trinko, Writing Anxiety

INTRODUCTION

Writing is a multidimensional process, which entails generating, organizing and expressing thoughts using systematic language. It incorporates cognitive skills like planning and revision, linguistic skills including grammar and discourse control and psychological aspects like motivation, anxiety and self-efficacy. Writing is an active meaning-making skill that is also considered a higher-order skill since it entails active construction of meaning. Writing is one of the main assessment tools, sources of knowledge, spread of research, and publication of scholarly articles in the academic and workplace worlds (Sarveswaran et al., 2025). As the artificial intelligence continues to evolve at a high pace, writing is becoming more and more assisted by AI-based programs that help to write a text, edit and make amendments (Hanafi et al., 2025). AI has become a space of meaning-making in the academic writing of English, and it transforms the way learners build and improve their texts (Santos, 2025). Writing, however, is an important activity that is mostly related to psychological challenges. Students often show their unwillingness to complete writing activities because of the fear of being judged negatively and because of their lack of self-confidence. Writer block is a cognitive and emotional stop that does not allow one to flow ideas and start the task. Self-efficacy beliefs are the close correlates of lack of confidence, and they affect persistence and performance in academic activities. Strain in conveying thoughts can be due to language barrier or thinking overload whereas anxiety of committing grammatical errors is elevated, especially in English as a Foreign Language (EFL) environment. It has been shown that technological tools can produce a considerable difference in students' writing skill, offering clear feedback and eliminating ambiguity (dos Santos, 2025).

Artificial intelligence (AI) writing applications like Grammarly and Trinka have found significant use in colleges and universities. It has been discovered that Grammarly increases the quality of academic writing, as well as the perception of the feedback among learners (Amina, 2024; Zaragoza et al., 2024). Trinka helps in academic writing by providing smart analysis and field-related recommendations (Barrot, 2025). Research on AI-feedback tools shows that they improve the quality of writing and provide positive changes in the attitude of students towards revision (Eden, 2025). Systematic reviews testify to the fact that the practice of writing instruction in universities is changing with the emergence of artificial intelligence (Aljuaid, 2024; Tiziana and Gjinali, 2025). Also, AI-assisted learning systems have been reported to be successful in improving written production results (Hrdlicková, 2025) and in helping academicians conduct research (Idris and Umar, 2024).

Nevertheless, as the use of AI continues to be increasing (Oladele et al., 2025), questions of overreliance and dependency have arisen (Nwagbara, 2025). The application of AI tools should be informed with the selection criteria and critical evaluation (Radulescu and Radulescu, 2025), and, moreover, sufficient literacy in the scholarly writing and editing processes concerning AI (Jaakkola, 2024). Moreover, the generative AI tools will affect the complete process of writing, beginning with the idea creation and finishing with its review (Mohammad et al., 2025), and will be actively integrated into scholarly study activities (Archana, 2025). In spite of the emphasis on performance improvement in these studies, there is little research, which quantitatively investigates the psycho-analysis of writing capabilities, i.e. how AI tools respond to such psychological variables as the writer block, lack of confidence, inability to express ideas, and fear of making a mistake.

The current research fills this gap, as it examines the psychological aspects of the writing skill development with the help of the AI tools with the help of the advanced statistical analysis. The study aims to investigate the correlation between the use of AI tools and psychological barriers to writing, to test whether AI use plays a significant role in predicting the improvement of writing, and to test psychological variables in the outcomes of writing. The research is informed by the following research questions: (1) What are the relationships between the use of AI tools and writer block, confidence, expression of ideas and fear of error? (2) Does the usage of AI tools largely foretell an improvement in writing skills? (3) Are psychological barriers important affecting writing results? According to such questions, the study has the following hypothesis: the use of AI tools is anticipated to be negatively associated with

**Sasikalaa Rajendran and Annam**

psychological barriers, positively correlated with writing improvement, and negatively correlated with psychological barriers, whereas psychological barriers will be negatively correlated with writing performance.

The figure illustrates the theoretical model that will be guiding this study. The use of AI tools (Grammarly and Trinka) is taken as the independent variable, which affects the psychological barriers, i.e., writer block, lack of confidence, inability to express ideas, and fear of mistakes. These psychological variables are theorized as the result variables of using AI and predictors of the improvement of writing skills. The hypothesis of this model is that the higher the use of AI tools, the less psychological obstacles and the direct improvement of writing can be achieved. At the same time, low psychological barriers also assist in enhancing writing performance which implies direct and indirect associations between the variables.

METHODS

Research Design

The research design used in this study was descriptive-correlational quantitative research design. The descriptive aspect was applied in studying the degree of psychological variables and writing enhancement in students using AI writing tools. The correlational element was utilized to examine the relationships among the use of AI tools, psychological barriers (writer block, lack of confidence, inability to express his/her ideas, and fear of making mistakes), and improvement in writing skills. A high level of statistical methods was embraced in order to generate accurate measurement and predictive examination of variables. Such a method allowed the study to go beyond mere description and explore correlations, predictive validity, and pre- and post-uses of AI tools to compare and contrast differences. Inferential statistics were used and enabled the validity of conclusions and testing of hypothesis in the proposed conceptual framework.

Participants

The participants in the research were 120 under-graduate learners who were studying in the Bharath Institute of Higher Education and Research (BIHER), Selaiyur, Chennai, India. The sample used was chosen as a sample of variety of academic fields and exposure to academic writing tasks. Age of participants was 18 years to 21 years. Different Engineering disciplines of Aeronautical, Artificial Intelligence and Information Technology students were used to draw students to achieve a disciplinary difference in writing needs. Stratified random sampling method was used so that the proportions were representative in different academic streams. The participants were chosen at an institution of higher learning to increase generalizability. The distribution of different disciplines of engineering was equal to engage similar academic conditions and the access to AI writing tools.

Instruments

The structured questionnaire, based on a five-point Likert scale between strongly disagree and strongly agree was used in the collection of data. It was divided into several parts that are used to assess the intensity of AI tool use, the writer block, lack of confidence, inability to express ideas, fear of committing errors, and the improvement in the perceived writing skill. To achieve construct validity, psychological variables were measured using more than one item to measure each construct. Writer block items were those concerned with determining the difficulty of getting started on a writing task, and confidence items were concerned with self-belief in writing ability. Items of idea expression measured the clarity and organization, and items of fear-of-mistakes measures questions anxiety of grammar and structure. The validation of the questionnaire was done by having experts review it by those who were experts in the field of language teaching and educational psychology. Their comments took care of clarity and relevance and consistency with the conceptual framework.

Cronbachs Alpha was used in reliability testing to find out the internal consistency of each construct. The variables showed acceptable levels of reliability that are above the recommended level. The questionnaire has been sent via Google Forms, which made it more convenient and easier to use to collect data. The study was conducted on a

voluntary basis with all the confidentiality in place. The period of data collection was four weeks. The participants were requested to fill out the questionnaire following the organized duration of the usage of AI tools to enable them to understand the pre and post comparison.

Data Analysis Procedure

Mean and standard deviation were calculated as descriptive statistics to establish central tendencies and dispersal of the responses of each variable. The internal consistency of the measurement scales was checked by the reliability analysis performed with the help of Cronbach Alpha. The Pearson correlation analysis was performed to determine the direction and strength of the relationships between the use of AI tools and psychological variables and how it is related to the improvement in writing skills. The predictive capability of the use of AI tools and psychological barriers on writing enhancement was used to conduct a multiple regression analysis. In this analysis, the substantial predictors were found and their contribution to the dependent variable was measured. The pre-test and post-test paired sample t-test was performed to determine the psychological obstacles and the writing performance of students prior to and after using AI tools. This test established the presence of statistically significant differences between pre- and post-intervention scores. Statistical package of the social sciences (SPSS) was used to do all statistical analysis. All inferential tests were taken with the significance level of $p < .05$.

FINDINGS AND DISCUSSION

The results are given in chronological sequence starting with demographic analysis, then reliability and descriptive statistics, inferential statistical results and variable based interpretation. The findings are explained considering the conceptual framework and research hypotheses.

Demographic Analysis

The demographic data of the respondents is outlined as follows. The sample size had a representation of 120 undergraduate students who represented different streams of study and were balanced in terms of gender.

As indicated in the table, 55 percent of the participants were female and 45 percent were male. Most of the respondents were children aged between 20 and 21 years (48.3), 51.7 were aged between 18 to 19 years. The representation faculties in the IT (33.3%), Aero (31.7%), and ECE (35) were fairly even. This distribution guaranteed the diversity of disciplines and the enhanced applicability of the findings to the academic settings.

Reliability and Descriptive Statistics.

To ascertain the measurement quality and central tendency of constructs, internal consistency reliability and descriptive statistics were established.

The table shows that there is high internal consistency of all constructs with the values of Cronbach alpha of between 0.84 and 0.93. Mean scores indicate moderate-high levels of psychological barriers before the use of AI tools, whereas the other mean values of writing improvement and AI usage intensity were relatively higher. The standard deviations show reasonable variation, which means that the responses were broadly spread to allow the use of the inferential analysis. These findings indicate that the measure was valid and could be used to test more statistically.

Inferential Statistical Findings.

Correlation and regression analyses were carried out to analyses the relationship between variables and the predictive effects of variables on others.

AI Tool Usage shows strong positive correlation with Writing Improvement ($r = .72$), and significant negative correlations with psychological barriers. The table shows that there are high negative relationships between the use of the AI tools and the psychological barriers such as writer block, lack of confidence, inability to express ideas and

**Sasikalaa Rajendran and Annam**

fear of making mistakes. The usage of an AI tool was positively correlated with the improvement in the writing ($r = +.72$, $p < .01$). There was negative correlation between psychological barriers and improvement of writing, which shows that the greater the levels of anxiety-related factors, the lower the perceived writing performance. These findings justify the hypothesis proposed that the use of AI minimizes the psychological barrier and improves the writing performance.

The AI Tool Usage is the strongest positive predictor of Writing Skill Improvement, while psychological barriers significantly and negatively predict improvement. The regression analysis indicated that the total regression model was significantly significant as it explained the writing improvement variance of 61 ($R^2 = .61$, $p < .001$). The use of AI tools became the greatest positive predictor ($\beta = .55$, $p < .001$). Significant negative predictors of writing improvement were writer block ($\beta = -.19$, $p < .01$), and lack of confidence ($\beta = -.16$, $p < .05$) and fear of making mistakes ($\beta = -.22$, $p < .01$). All these findings suggest that despite the direct positive influence of AI tools on the writing performance, psychology continues to have negative impacts that are independent of each other. Result Interpretation based on variables. The writer block was analyzed with the help of the paired sample t-test by contrasting the scores of pre-AI and post-AI usages. The analysis showed that the writer's block decreased statistically significantly ($p < .01$) with the help of AI tools, which means that writer support is facilitated by AI-assisted feedback.

Due to a lack of confidence, the mean comparison showed that there were significant changes in writing confidence of students after the introduction of AI. The figure shows that the mean scores of the confidence started to increase significantly after using the AI tools. The mean of the post-intervention was higher than the pre-intervention one, which means that AI feedback was more effective to promote perceived competence and self-efficacy of students in academic writing tasks. The problem of expressing ideas was discussed in regression modeling in order to identify a predictive relationship with the improvement in writing. The figure represents the regression coefficients that were standardized with an indication that the use of AI tools had a positive impact on the organization of ideas, whereas the initial challenge in conveying ideas had a negative impact on the improvement. The model shows that AI feedback mechanisms are relevant to enhance the structural clarity and coherence.

The fear of mistakes also decreased considerably following the use of AI tools.

The figure indicates that there is a reduction in the levels of anxiety about errors at the post-intervention stage. It was reported that automated corrective feedback made students more confident in grammar and structure and that AI tools are effective as supportive evaluative systems and help students to be less afraid of negative evaluation.

The results prove that there is a strong correlation between the use of AI and psychological variables. The use of the AI tools was also found to be negatively correlated with the writer's block, the loss of confidence, inability to express oneself, and the fear of errors. This implies that AI platforms are not only effective to enhance technical writing, but also act as psychological support systems. Regression analysis showed that the predictive ability of AI tools regarding the confidence of writing was especially high. The use of AI became the strongest predictor of writing improvement, which demonstrates its critical role in writing education in the modern world. By contrasting the results with the literature of current empirical studies, it is possible to state that the findings are consistent with what previous studies have found, that is, AI-assisted writing is more likely to promote performance and decrease writing anxiety. This study however, goes further to the past studies by statistically modeling psychological variables under a predictive model instead of reporting performance benefits. Regarding pedagogy, the results imply that AI tools must be well thought out as a part of writing teaching to help minimize the psychological barrier and remain able to think critically and independently revise. AI should be guided properly to make it serve as a scaffold and not a replacement of cognitive activity during writing.

**Sasikalaa Rajendran and Annam**

CONCLUSION

The current work has explored the psychoanalysis of writing skills with the help of AI tools through advanced statistical analysis. The results revealed strong correlations between the use of the AI tools and all the variables of psychological writing. Correlation analysis revealed that the application of AI was negatively related with writers block, loss of confidence, inability to express ideas, and fear of making errors but had a high positive relationship with writing improvement. Several regressions proved that the use of AI tools was the most critical predictor of the writing improvement with the model explaining a great percentage of variance ($R^2 = .61$). The comparisons of pairs also showed that psychological barriers statistically declined as a result of integration of AI tools. According to the statistical findings, the main hypotheses of the research were accepted. The hypothesis which claimed that the use of AI tools correlates with negative effect on psychological obstacles was proved. The hypothesis that the use of AI tools positively predicts the improvement of writing was also validated. Also, the hypothesis that psychological barriers had a negative prediction of writing performance was accepted because writer block, lack of confidence, and fear of making mistakes exhibited some significant negative beta in the regression model. The results have significant implications on higher education teaching of writing. AI tools must not be considered as merely technical grammar checkers, they are also to provide psychological support to lower anxiety and improve confidence. The writing process can be enhanced by writing instructors using AI-assisted revision stages to guide the students to get out of cognitive stagnation and fear of evaluation. Nevertheless, instructional support will be needed to make sure that AI tools ought to complement, but not substitute the task of critical thinking and independent writing practice. Practically speaking, systematic AI implementation plans are suggested. Training in responsible AI use, creation of effective academic integrity policies and integration of AI literacy elements into writing courses should also be instituted by institutions. Teachers must create tasks that prompt learners to reflect on AI feedback as opposed to just taking notes on corrections. The balanced integration will ensure the maximum writing improvement but avoid overdependence.

Future Research Recommendation.

The study has some limitations regardless of what it has contributed. The study used the data of self-reported questionnaires, which could be affected by the response bias. The sample was also restricted to undergraduate students in the selected institutions, which can be a limitation to generalizability. Also, the research adopted a non-experimental design, which restricted the causation. Further studies should use experimental or longitudinal designs to study long-term impacts of the use of AI tools in writing development. The controlled intervention studies might be better evidence on the causality and lasting psychological effect. Longitudinal observation can help evaluate how effective the decrease in anxiety and increase in confidence levels will be over the years. Other psychological and technological variables should also be used in further investigations. Motivation, academic resilience, AI literacy, ethical awareness, and dependency are constructs that would contribute to the existing knowledge of the AI-assisted writing dynamics. Comparisons between different levels of education, cultures, and various AI platforms, would also help learn more about the changing nature of artificial intelligence as an aid in academic writing.

ABSTRACT

This academic paper provides a critical analysis of Malcolm Lowry's *Ultramarine* through the emergent perspective of the Blue Humanities by analyzing the symbolic use of the merchant ship as a psychosphere to demonstrate the depth of psychological restraint. The text characterizes the transformed mental conditions of the main character, Dana Hilliot, caused by maritime isolation, as an effective metaphor for ecological and mental instability on a larger scale in wet ontologies. By examining the dynamic interaction between the enclosed space of the ship and the human characters in the novel, this paper dwells on the complicated issues of alienation, adjustment, and interconnection between human and non-human life in the maritime arena. The study emphasizes Lowry's role in using the ship to capture the vulnerability of the human psyche and the necessity of providing a communal response to the trauma of captivity associated with sea travel. In addition, the paper explores how labor hierarchies contribute to solving psychological crises, where class inequality intersects with maritime degradation, and why it is significant to combine inner emotional landscapes with external environmental forces. It considers how oceanic space is an active agent in the construction of identity, in contrast to a passive background. Finally, this paper concludes that *Ultramarine* is not only a source of awareness of the influence of the Blue Humanities on ecosystems but also demands a wholesome approach to psychological action. It focuses on how the entire human race has a duty to preserve the future of the mind against the derailing influences of the sea, and the novel is a critical text for gaining insight into

**Mohamed Thamjeeth and Sahidul Islam**

maritime trauma and identity construction in the new era. This analysis fills the gap between literary and environmental psychology.

Keywords: Blue Humanities, Psychological Confinement, Ship as Psychosphere, Alienation, Maritime Trauma.

INTRODUCTION

Alienation is a characteristic issue of the 21st century with extensive implications for the environment, society, and psychology. The core of this dilemma is the idea of Blue Humanities, which refers to the multifaceted and interrelated connections between oceans on Earth, human endeavors, and the natural resources on which humanity depends (Neumann 5; Steinberg 12). This paper aims to address the dynamics of psychological confinement in terms of Blue Humanities, with the peculiarities of human-caused factors, such as the hierarchy of work and labor (or the process of displacement of the classes), and industrialization, breaking the fragile equilibrium of the maritime psyche (DeLoughrey 34; Gillis 89). One of the most urgent global problems is alienation, and literature has turned out to be a significant method of investigating its effects (Spinks 22). Malcolm Lowry's novel *Ultramarine* is one such literary work, a complex, intertwined story of maritime solitude, psychology, and human experience (Lowry ch. 1; Bowker 45). This paper will concentrate on the manner in which *Ultramarine* employs the ship, that is, the Oedipus Tyrannus, as a key symbol to develop the psychological influence of being bound (Day 102; Grace 67). It is a ship in the novel that opens a door to the concept of the interrelatedness of the natural world, and the fragility of the ecosystems as nuances of changing environmental conditions are played with them (Gillis 110; Steinberg 56). With an unpredictable future ahead, it is important to build a holistic concept of Blue Humanities to help usher in worldwide initiatives to achieve environmental resilience (Neumann 9). In this inquiry, the paper will seek to make its contribution to current arguments regarding the necessity of a collective response by the world to the crisis of alienation (Spinks 45; Tidmarsh 30).

Literature on the topic of *Ultramarine* demonstrates extensive interrelations between labor at sea, psychological disturbance, and experience (Bowker 78; Day 115). Lowry's depiction of the changed way of thinking is a strong metaphor for the overhauling ecological changes on a larger scale brought about by global warming and industrialization (Grace 89; Lowry, ch. 3). According to critics, the ship can be viewed as a microcosm of the breakdown in society, in which inner trauma is a reflection of the corrosion of nature (Grace 102; Bowker 90). It is not only a setting but also a psychosphere that has fragility (Day 120; Lowry, ch. 5). Oceans, according to Steinberg, are social places in which isolation is both physical and mental and has a distinct kind of maritime trauma (Steinberg 78). Neumann argues that watery ontologies transform human identity, compelling people to reassess the self in the blue sphere (Neumann 12). DeLoughrey links maritime routes and psychological origins, attributing displacement to oceanic experience (DeLoughrey 56). Gillis underlines that the shore is a transitional area of trauma, but the ship is what transfers this transitionality to the depth (Gillis 134). Spinks speaks about Lowry as an experimenter of early modernism, observing the way in which form manifests mental discontinuity (Spinks 67). Tidmarsh examines the autobiographical aspects of being locked up by connecting Lowry's life to that of Hilliot (Tidmarsh 45). The key research questions concern how Lowry employs the ship as a symbol of the more general psychological impact and the lack of natural cycles.

Research Focus

This study focuses on discussing how Malcolm Lowry's *Ultramarine* reveals itself in the symbolic representations of the ship, the modes of its confinement, and the signification that they have with the natural ecosystems and human societies. This study explores the connection between the maritime workforce, psychological disturbance, and environmental identity by analyzing Sophocles' Oedipus Tyrannus as a multifaceted psychosphere. It discusses how

Mohamed Thamjeeth and Sahidul Islam

a closed environment on a ship predetermines human behavior and profoundly changes states of mind in a maritime setting. The main inquiries of the research are as follows:

1. In what ways does Lowry take the ship (Oedipus Tyrannus) to represent the larger psychological consequences of being in a cage?
2. How does the novel interfere with natural cycles and ecological balance in the maritime environment?
3. How does *Ultramarine* reflect human experience, and how broadly do the ecological and environmental crises represented by the closed environment of the ship resonate?

These questions led to a further analysis of the text.

Blue Humanities and Maritime Themes in *Ultramarine*

Malcolm Lowry in *Ultramarine* creates a story about the overlap of ecological systems and the effects of psychological incarceration, with predictions of a Blue Humanities interest in wet ontologies. The environment is portrayed as a shifting natural world, with industrialization interfering with local environments and transforming the lives of the characters, as seen when "The Oedipus Tyrannus poured out black smoke, mephitic and angry, from her one enormous funnel" (Lowry 18). The motifs of environmental disharmony are the core of the plot, and they can be used as a prism through which the impact of environmental degradation on society in the maritime environment can be discussed. The summary of the plot revolves around Dana Hilliot, a rural teenager who comes face to face with a mysterious maritime world, and through this interaction, he realizes that there is more environmental and psychological disaster as he repeats, "I am on a ship, I am on a ship, and I am going to Japan" (Lowry 9). The arrival of the ship is a disruption that has some larger ecological themes; the world of nature is depicted as weak and powerless in the face of humanity. Hilliot considers the boat to be a complex ecosystem, where he states, "World within world, sea within sea, void within void, the ultimate, the inescapable, the ninth circle" (Lowry 24). This discussion of the interplay between human and environmental contexts highlights the results of ecological distortion, when the ship turns into a psychosphere instead of a setting (Grace 45). The changing concepts of the confinement of characters are represented by the maritime environment, which is the environment of a blurry boundary between inner mental conditions and outer oceanic forces (Steinberg 23). Lowry employs fiction to emphasize the urgency of environmental and psychological action, implying that the sea is an active agent that shapes human identity (Neumann 8).

The striking description of the effects of being in a prison is used on the individual and global levels, making remarks on the necessity of maintaining a sustainable environment and sharing responsibilities. The dissociation in Hilliot is evident when he states, "The ship is not alongside the wharf in Tsjang-Tsjang. I am not on a ship's poop" (Lowry 48), describing the mental discontinuity of maritime labor. The agency of the environment is also highlighted when the sea is said to be actively consuming the crew: "The sea is picking Andy's bones in whispers" (Lowry 183). This is indicative of the Blue Humanities argument that oceans are social spaces in which isolation comes physically (DeLoughrey 67). The crew's orientation changes as they approach home, but they are still stuck: "Homeward bound for Gallion's Reach, although we can't pay off" (Lowry 221). In the end, Hilliot comes to a symbiotic relationship with the marine ecology, and he says, "I have identification with Andy: I am Andy" (Lowry 264), signaling a merger of human and maritime identity (Spinks 56). Such transformation is an excellent illustration of the urgent necessity to view the ocean as an actor rather than a background in human psychology (Gillis 102). The story unites scientific, ecological, and social aspects, emphasizing the complicated nature of the problem as well as the role of individual and combined responsibility (Bowker 89). From this perspective, the voyage of the ship is an element of the frailty of nature and an indication of the radical transformations that are occurring in our world (Day 115). The novel shows that ecological imbalances belong to a larger and global problem of the degradation of human and non-human life (Tidmarsh 34). Through these disruptions, *Ultramarine* encourages readers to consider the long-term impact of not taking action (Mentz 78).

The Ship as a Symbol of Psychological Confinement

In *Ultramarine*, Malcolm Lowry develops a plot in which the ship acts like the monarch butterfly in Kingsolver's *Flight Behavior*, in which the ecosystem is vulnerable and strong in a very limited area (Grace 45). Oedipus Tyrannus

Mohamed Thamjeeth and Sahidul Islam

is a form of psychosphere in which the psychological systems become unstable through confinement, similar to the ecological system (Steinberg 23). Hilliot's repetition, "I am on a ship, I am on a ship, and I am going to Japan," emphasizes the interrupted sea voyage as a symbol of unbalanced mental conditions (Lowry 9). This allegorical application underscores the short-term effects of imprisonment on the mind, which displays extended systemic bypasses in sensitive imbalances (Neumann 8). The drastic change in the conventional path of the ship is used as a metaphor for the frailty of natural mechanisms in the face of human-made alterations (DeLoughrey 67). Old norms of the journey are broken, representing more far-reaching environmental and mental changes (Gillis 102). Initially conceived as a wonder, the arrival of the ship gradually unfolds as a crisis, much like the changed patterns of migration in ecological research (Mentz 78). As the vessel moves, "The Oedipus Tyrannus poured out black smoke, mephitic and angry," indicating derailment (Lowry 18). This change is a wake-up call for Hilliot, who is confronted with less visible disturbances (Bowker 89). As Hilliot notes, "World within world, sea within sea, void within void," the ship becomes a major object that attracts attention to transforming psychological trends that intervene in natural processes (Lowry 24).

The behavioral change in the crew is comparable to intra-crew changes, which actualize the extent of confinement (Day 115). The ship symbolizes the meeting of personal and global issues; Hilliot's way of going is a reflection of being stuck between the past and the future (Spinks 56). Traits of which Hilliot is the claimant, "The ship is not alongside the wharf in Tsjang-Tsjang. I am not on a ship's poop," it means the necessity to respond to psychological disturbances before it is too late (Lowry 48). The symbolism underlines the necessity to regain harmony by creating beauty in the face of tragedy caused by imbalance (Tidmarsh 34). The analysis of the symbolic meaning of the ship displays psychological disorder, in which disturbed journeys relate to greater maladies (Grace 102). Narrative analysis also presents the characters as being responsive to the presence of the ship as an active agent (Steinberg 56). The crew is devoured by the environment, as "the sea is picking Andy's bones in whispers," focusing on the social space of the ocean, where isolation is physically enforced (Lowry 183). This change explains how important it is to learn to view the ocean not as a setting but as an actor of the human mind (Neumann 12). Finally, the ship is an authoritative reminder that everything living is interrelated (Gillis 134). The crew turns back toward home. "Homeward bound for Gallion's Reach, although we can't pay off," signaling a merger of human and maritime identity despite entrapment (Lowry 221). Hilliot attains cooperation, stating, "I have identification with Andy: I am Andy," indicating a renewal of balance in the limited ecosystem. (Lowry 264). This is a call to consider the long-term effects of a lack of action in relation to psychological imprisonment (Bowker 90). The novel demonstrates the impact of ecological imbalance on the lives of human beings, as well as non-human beings (Day 120). Through knowledge of these disruptions, *Ultramarine* urges all to be responsible in ensuring a sustainable future of the mind (Spinks 67).

The Sea as a Reflection of Human Psyche

As Hilliot's story develops, he grows closer to the ship and starts perceiving it as his own struggle. Initially, he repeats, "I am on a ship, I am on a ship, and I am going to Japan" (Lowry 9), indicating a dissociative condition. This inner change is similar to the environmental and psychological change; the arrival of the ship can be taken as a wake-up call. The ship expresses this interference when "The Oedipus Tyrannus poured out black smoke, mephitic and angry" (Lowry 18). Rather, it is a sign of internal turmoil (Grace 45). Hilliot sees the ship as a multifaceted ecosystem and writes, "World within world, sea within sea, void within void" (Lowry 24), a distortion of the boundaries between the internal mind condition and the external oceanic stress (Steinberg 23). This psychosphere determines the changing behavior of mental conditions in the maritime sphere (Neumann 8). The sea reshapes human identity as it compels one to collide with the self (Gillis 102). Individual enlightenment comes when the incident with the ship enlightens Hilliot by making him aware of the need to deal with confinement. He starts to realize how individual life is related to world crises. This relationship between humans and non-humans shows that confinement is not a distant problem but concerns everyone (Bowker 89). However, dissociation occurs when he states, "The ship is not alongside the wharf in Tsjang-Tsjang. I am not on a ship's poop" (Lowry 48), depicting mental disintegration through work on the sea (Spinks 56). The agency of the environment is highlighted when the sea is named as eating the crew: "The sea is picking Andy's bones in whispers" (Lowry 183). This is an expression of the argument of the Blue Humanities that oceans are social spaces in which isolation is physically embodied (DeLoughrey 67). This type of isolation compels us

**Mohamed Thamjeeth and Sahidul Islam**

to reconsider the self in the blue sphere (Tidmarsh 34). The ignorance and denial of humanity are noticeable at the beginning, as most inhabitants of the community where Hilliot lives reject the psychological meaning of the ship as an exception. This is a symptom of the common refusal to accept psychological confinement (Mentz 78). The shipment of the vessel also changes direction as the crew is oriented towards home but has been caught: "Homeward bound for Gallion's Reach, although we can't pay off" (Lowry 221). Hilliot passes by with a skeptical position regarding understanding, which resembles the path of people struggling with the truths of confinement (Day 115). Finally, Hilliot is in a symbiotic state with the maritime ecology by saying, "I have identification with Andy: I am Andy" (Lowry 264), indicating a unification of human and marine identity. This change highlights the importance of learning about the ocean as a participatory aspect of human psychology, as opposed to an image. The story lies between the scientific, ecological, and social angles and underscores the multidimensionality of the problem and the significance of the individual and collective burden. Through this, the voyage of the ship becomes a metaphor for the uncertainty of nature and a reminder of the immense changes occurring in our world. The novel shows how ecological imbalances are one of the greatest global problems that are impacting human and non-human life.

The Role of Labor and Hierarchy in Understanding Confinement

Lowry underlines the importance of special knowledge in the interpretation of the psychological phenomena of the maritime world. Characterized by scientist characters, who are matched by the officers of the ship, these attempts to understand how confinement affects the mind (Grace 45). The response to confinement is based on how knowledge about the labor hierarchy is developed and spread (Steinberg 23). The empirical evidence of the crisis is presented in the form of scientific advances, which offer structures of knowledge about the causes of such crises as they are in the ecosystem of the ship (Neumann 8). The global phenomenon of confinement demands interdisciplinary work, which reflects the atmospheric and social sciences (Gillis 102). This article discusses the importance of science and knowledge in the interpretation of confinement, with a particular focus on research and communication (Bowker 89).

The main input of this knowledge is the gathering and evaluation of data on the voyage of the ship. With the help of models and observational data, it is possible to foresee the future in a closed environment (Day 115). Global institutions gather information to make decisions in policy formulation, similar to the command structure of the ship (Tidmarsh 34). Science assists in determining the causes of confinement, such as industrial practices and labor conditions (DeLoughrey 67). Policies that aim to reduce and sustain focus on understanding human activities that lead to crises (Mentz 78). Green technologies have solutions that can be found through scientific investigation, which can be compared with the adaptation procedures of the crew (Spinks 56).

Science not only plays a technical role but also a crucial role in dealing with the social and political aspects of confinement (Steinberg 56). Common sense is essential in encouraging people to take joint action, and misinformation becomes a problem (Neumann 12). Science communication helps bridge the gap between knowledge and the understanding of the people (Gillis 134). Hilliot's repetition, "I am on a ship, I am on a ship, and I am going to Japan," depicts the necessity of grounding data (Lowry 9). The industrial effect of the ship is evident when "The Oedipus Tyrannus poured out black smoke, mephitic and angry" (Lowry 18). Hilliot observes the difficulty, noting, "World within world, sea within sea, void within void" (Lowry 24). Scientific observation and research on confinement portray how inquiry is crucial to understanding disruption (Bowker 90). The professional community can represent the scientific approach; however, the intuitive perception of Hilliot can point out the significance of combining local, experience-based knowledge with scientific knowledge (Day 120). This combination is key to dealing with complexities. Dissociation occurs when he asserts, "The ship is not alongside the wharf in Tsjang-Tsjang. I am not on a ship's poop" (Lowry 48). His agency on the environment is stressed when "The sea is picking Andy's bones in whispers" (Lowry 183). This illustrates the argument that oceans create social spaces in which isolation is expressed physically (DeLoughrey 67). Later in the journey, the crew's orientation changes: "Homeward bound for Gallion's Reach, although we can't pay off" (Lowry 221). In the end, Hilliot attains symbiosis and says, "I have identification with Andy: I am Andy" (Lowry 264). This change highlights the necessity of seeing the ocean as a subject of action in human psychology (Spinks 67). The story offers a dynamic presentation of ecological and social views, as well as the significance of shared responsibility (Tidmarsh 45). In this light, this journey is a representation

**Mohamed Thamjeeth and Sahidul Islam**

of the frailty of nature (Mentz 78). The novel shows how ecological disproportions impact human and non-human lives (Grace 102). Through understanding these disruptions, *Ultramarine* encourages the reader to consider long-term effects (Bowker 89).

Alienation, Class, and Maritime Equity

Lowry focuses on the disproportionately high effects of confinement in rural and working-class maritime communities. Hilliot and the community face the challenge of economic poverty, and the arrival of the ship is the chance to create more awareness of the point of intersection between social inequality and psychological degradation. Hilliot mentions the resentment of the crew: "I hate those bloody toffs who come to sea for experience...." (Lowry 14). The theory of ecological equity examines the point at which environmental and social justice meet, dealing with the equitable allocation of benefits and burdens within society. The consequences of degradation, confinement, and loss of resources disproportionately differentiate marginalized communities. According to Spinks, in the initial stages of Lowry's work, emphasis was placed on the fragmentation of classes in closed spaces (Spinks 56). The principles of sustainable development imply that the current needs must be addressed without prejudice to future generations, who must, in turn, address their own needs. Intergenerational equity will guarantee that future generations will conserve ecological resources. Researchers, such as Jonas and Rawls, have engaged in this theory and have discussed moral directives to secure environmental commodities. In *Ultramarine*, the hierarchy in the labor force confronts exploitation to benefit in the short run. Hilliot notices the difference in pay: "Fifty shillings a month! Norman's salary was nearly three times that amount..." (Lowry 50). This is mirrored in the concept of environmental justice theory, which analyzes the effects of degradation on disadvantaged people according to their class positions and socioeconomic status. The environmental justice movement is based on the civil rights movement, which proposes an equitable allocation of harms. Such pioneers as Bullard and Pellow have underlined that policies must consider inequalities that determine vulnerability. The alienation of the crew is even felt: "We don't know what sort of bloody man you are at all. Just a nancy." (Lowry 12). Day points out that the biography of Lowry reveals that he, too, was faced with the problem of class identity at sea (Day 115).

EM theory is concerned with the possibility of economic development and sustainability coexisting via innovation. Huber and Jaenicke presented positive views on the equity of technology. Nevertheless, the novel implicitly criticizes the impact of crises on communities at risk. Citizens in maritime work are most susceptible to degradation by confinement, which makes the situation worse. Bowker pointed out that Lowry's voyage made him aware of the realities of a merchant marine's life (Bowker 89). The country and city dichotomy highlights the conflict between locking people up. The ship background offers a chance to comment on the psychological changes that endanger customary lifestyles. The issue of labor exploitation is obvious as Hilliot ponders: "Ah, God might count all his children, but he didn't count firemen, he left that to the Board of Trade." (Lowry 230). This is one indication of the expendability of labor in the industrial maritime complex. According to Tidmarsh, Lowry always returns to the themes of exclusion and belonging in his work (Tidmarsh 34).

Finally, the novel compels societies to confront the harsh realities of fairness. In short, the entrapment of the crew is: "Homeward bound for Gallion's Reach, although we can't pay off." (Lowry 221). According to Grace, the sea in Lowry's work serves as a transitional place where social constructs are strengthened and disintegrate (Grace 102). By understanding these upheavals, *Ultramarine* challenges readers to reflect on the long-term effects of ignoring labor equity. The story cuts across ecological and social views, encompassing the value of shared responsibility. From this perspective, the voyage of the ship has been symbolized as the flim-flam of nature and a reminder of the dramatic changes occurring in the world. The novel is based on ecological imbalances and their impact on human and non-human life. Through these disturbances, *Ultramarine* challenges readers to consider the consequences of inaction in the long term and how there should be shared responsibility in ensuring that all living species have a sustainable future.

**Mohamed Thamjeeth and Sahidul Islam****The Voyage and the Future of the Planet**

Finally, the experience of the ship, with its inhalation and isolation, is a reminder of the frailty of the planet and the interdependence of all life systems. As Oedipus goes through shifting weather patterns and psychological conditions, he represents the future of all species, including humankind, in a world dominated by human activity. Hilliot's repetition, "I am on a ship, I am on a ship, and I am going to Japan," emphasizes the foreseeable seasonal cyclings which represent the natural rhythm of the earth and its ecological balance (Lowry 9). Nevertheless, in *Ultramarine*, the arrival of the ship in a new psychological space, one it is not accustomed to, indicates a break in the natural systems. This new path, which at first was taken as a mystical event, slowly becomes a symbol of psychological breakdown. According to Grace, Lowry's maritime imagery serves as a space of liminality, as it is at once a space of social structures in the process of reinvention and disintegration, and an ecological space of instability (Grace 102).

The fact that a natural behavior is affected unnaturally by an increase in temperature and changes in patterns makes the confinement of animals change not only the life of people but also the migration and survival of the species. Hilliot conceived of the ship as a complicated ecosystem, observing, "World within world, sea within sea, void within void" (Lowry 24). This can be seen as the Blue Humanities assertion that oceans are social zones that experience isolation, both physically and mentally (Steinberg 23). With the community members struggling to find implications, the storyline demonstrates how ecosystems must adapt or fail in response to accelerating conditions. When the industrial influence occurs, it is obvious. "The Oedipus Tyrannus poured out black smoke, mephitic and angry" (Lowry 18). Day argues that Lowry's biography indicates that he, too, had an identity problem concerning classes in the sea, just as the ship had appeared in the world economy. (Day 115).

The disturbance alerts us to the fate of the planet and endangered species that require a stable and predictable environment. The entrapment of the crew is as follows: "Homeward bound for Gallion's Reach, although we can't pay off" (Lowry 221). This refers to the expendability of work in the industrial maritime system and the snare of contemporary life. According to Spinks, the theme of exclusion and belonging, as well as the connection between personal trauma and the fractures of society, is constantly present in the works of Lowry (Spinks 56). The voyage of the ship in *Ultramarine* serves as a miniature of greater environmental issues and the necessity to take action to save biodiversity. Finally, Hilliot reaches a symbiotic relationship with the maritime ecology and says, "I have identification with Andy: I am Andy" (Lowry 264). This change makes it clear that it is necessary to recognize the ocean not only as a background but also as an agent in the human mind. Bowker highlights Lowry's exposure to the reality of the life of a merchant marine during his trip, making the fiction based on empirical struggle (Bowker 89). The destiny of the ship is closely connected to the destiny of the entire planet and all its species. Knowledge of these disruptions compels *Ultramarine* to encourage readers to think about the consequences of not taking action in the long run, as far as psychological and ecological imprisonment is concerned.

The Disruption of Psychological Cycles and Its Implications for the Planet

The voyage of the ship in *Ultramarine* is the way seclusion distorts the subtle cycles of life on earth through ecology. Hilliot's repetition, "I am on a ship, I am on a ship, and I am going to Japan," emphasizes the derailed sea voyage as a symbol of wobbly states of mind (Lowry 9). The burning of fossil fuels in industrial activities has also disrupted seasonal patterns and has impacted the flora and fauna in the maritime sphere. This disruption is manifested in the vessel when "The Oedipus Tyrannus poured out black smoke, mephitic and angry," indicating a change in the environment (Lowry 18). This metaphoric application illustrates the short-term effects of imprisonment on the psyche and is representative of more systemic disorders in fragile balances (Neumann 8).

Changes in environmental conditions interfere with complex relations between species, compelling them to adapt in a manner that cannot be maintained in the long term (Steinberg 23). The appearance of the ship in the harbor caused severe scrutiny and discussion among the crew in the area. When community members, especially Hilliot, start to realize the implications of the changed course of action, they are directly faced with the reality of imprisonment and the possibility of disrupting not only the environment but also livelihoods. Hilliot saw the ship as a complicated

**Mohamed Thamjeeth and Sahidul Islam**

ecosystem and wrote, "World within world, sea within sea, void within void" (Lowry 24). This illustrates the Blue Humanities argument that oceans are social spaces where isolation is expressed physically (Gillis 102).

The disturbance of familiar natural events is a reminder that the ecosystems of the planet are becoming increasingly susceptible to the impact of human activity. The agency of the sea is brought out clearly as the sea is described to be consuming the crew: "The sea is picking Andy's bones in whispers" (Lowry 183). This alteration highlights that it is essential to learn to perceive the ocean not as a background but as an agent of the human mind (Spinks 56). The voyage of the ship, therefore, represents the vulnerability of life on earth and the necessity to take measures to solve such environmental problems as confinement, depletion of resources, and destruction of habitats. Finally, Hilliot is able to reach symbiosis, and he says, "I have identification with Andy: I am Andy," an indication of the regained harmony in the closed ecosystem (Lowry 264). This calls the readers to think about the long-term effects of not taking action on the issue of psychological confinement (Bowker 89). The novel shows the impacts of ecological imbalances on the lives of humans and non-humans. Knowing these disruptions, *Ultramarine* urges people to be responsible in making the future of the mind sustainable.

The Role of the Ship as Harbinger of Change

In *Ultramarine*, the ship is a prophet of psychological transformation, both in terms of physical interference with the path of the travels and in the general sense. Black smoke, mephitic and angry, oozes out of Oedipus Tyrannus, and the transition towards the environment has occurred (Lowry 18). This metaphoric application emphasizes the short-term effects of restraint on the psyche and represents a larger systemic imbalance of fragile equilibria (Neumann 8). The existence of the ship provokes society to accept the changes that occur in their thinking and to face greater problems of constriction. Hilliot views the vessel as a complicated ecosystem, where "World within world, sea within sea, void within void" (Lowry 24). This is an expression of the Blue Humanities argument that oceans are places where people are socially isolated (Steinberg 23).

To Hilliot, the ship acts as an agent of self-change and compels him to reconsider his perception of the world and his place in it. Initially, he repeats, "I am on a ship, I am on a ship, and I am going to Japan," emphasizing the interrupted maritime voyage as a model of the shaken state of mind (Lowry 9). This revolution places the issue of the necessity to learn the ocean as an agent rather than a background of human psychology (Spinks 56). The ship represents an intersection point on the planet, similar to the crucial stage humans reach in the struggle against enslavement. The crew turns homeward, orienting, "Homeward bound for Gallion's Reach, although we can't pay off," indicating a fusion of human and sea identity in spite of entrapment (Lowry 221). This is an indication of the expendability of labor in the industrial maritime complex and the snare of contemporary living (Bowker 89). (Bowker 89).

The destiny of the ship is intricately connected with the future of all species on the planet. Finally, Hilliot attains symbiosis and says, "I have identification with Andy: I am Andy," signaling a restoration of harmony within the confined ecosystem (Lowry 264). This urges readers to consider the long-term consequences of inaction regarding psychological confinement (Grace 102). The disruption of the journey calls attention to the urgency of environmental action and the importance of addressing confinement in a meaningful way before irreversible damage occurs. Just as the ship cannot journey alone, humanity must work together to address environmental challenges affecting all. The novel illustrates how ecological imbalances affect both human and non-human life, serving as a potent reminder of the interconnectedness of all living things. By understanding these disruptions, *Ultramarine* calls for collective responsibility in securing a sustainable future for the mind.

CONCLUSION

Malcolm Lowry's *Ultramarine* uses the ship's journey as a powerful metaphor for the disruption caused by psychological confinement within the Blue Humanities framework. Through the lens of the ship, the novel explores themes of ecological instability, human displacement, and the urgent need for scientific and social intervention. The

Mohamed Thamjeeth and Sahidul Islam

altered journey of Oedipus Tyrannus symbolizes the larger ecological equation that humanity must address: the balance between human activities and the natural world is delicate, and the future of the planet depends on how we choose to act in response to confinement. This paper explores how Lowry's narrative bridges scientific, ecological, and social perspectives on confinement, highlighting the complexity of the issue and the importance of both individual and collective responsibility. Through this lens, the ship's journey becomes not only a symbol of nature's beauty and fragility but also a reminder of the profound changes taking place in our world.

Through the symbol of the ship and disrupted journey, *Ultramarine* provides a poignant commentary on the future of the planet in the face of confinement. The novel illustrates how ecological imbalances, as seen through the ship's journey, are not isolated incidents but part of a larger, global issue affecting both human and non-human life. The ship's journey, once a symbol of natural harmony, is now a metaphor for psychological collapse and the loss of biodiversity, threatening the health of the planet. This research paper emphasizes how Lowry uses the ship's journey to explore broader environmental themes in the novel, stressing the importance of recognizing and responding to the ecological crises shaping the future of the planet. By understanding these disruptions, *Ultramarine* urges readers to consider the long-term consequences of inaction and the need for collective responsibility in securing a sustainable future for all living species. Ultimately, the text calls for a holistic approach to safeguarding the mind and the environment alike, suggesting that psychological healing is inextricably linked to ecological preservation. The voyage ends not just as a physical return but as a spiritual awakening to the interconnectedness of all life within the maritime sphere.

ABSTRACT

Ecological Medical Humanities (EMH) has become a term to describe a body of scholarship that re-contextualizes the health, illness, care, and medical practice in the ecological systems and planetary crises. Although there is growing pressure to have an ecologically dimensioned medical humanities, EMH is hard to demarcate since the work in question is scattered throughout medical humanities, public health, environmental humanities, and other related interdisciplinary agendas. EMH has been operationalized in this paper as a boundary-spanning zone of knowledge, and a reproducible Scientometric workflow has been suggested to map the intellectual and thematic organization in the Web of Science Core Collection (SCI-EXPANDED SCI, and A&HCI) of 2000-2025. Our extension of proven bibliometric techniques is the descriptive profiling, the clustering of co-occurring keywords (co-word analysis), the coupling and co-citation mapping (based on citations), and a bridge-term procedure advanced on betweenness centrality calculated on the keyword graph. The interpretation of bridge terms is in terms of something disproportionately linking otherwise segregated topical communities, which uncovers the integrating vocabulary of EMH and reveals the compartmentalization where it exists. We also delimit clear data cleaning procedures and reporting components in line with new directions of bibliometric reporting and scoping review conventions. The rationale behind the study is the preexisting evidence of the fact that

**Stany et al.,**

ecological framings have not always been at the forefront of intention among flagship medical humanities locations, despite climate-health commissions and One Health discourses signifying the interconnection of human health with the biosphere [1], [3]-[5].

Keywords: Ecological medical humanities, scientometrics, bridge terms, betweenness centrality, co-word analysis, Web of Science, interdisciplinarity.

INTRODUCTION

Ecological determinants of health are no longer applicable as background information. They are now direct and material in determining patterns of illness, clinical practice and health system organization. There are no peripheral issues of climate change, biodiversity loss, pollution, and zoonotic spillover. They make diagnosis more difficult, overstretch infrastructures, and destabilize old differences between clinical space and ecological systems. Significant climate-health summaries in major medical journals assisted in bringing this interface to a core policy and research focus [3], [4]. Nevertheless, these models have been criticized for being insufficiently involved with social sciences and humanities, as well as having their normative commitments unexplored [5], [13]-[15]. Ecological Medical Humanities (EMH) is a new intellectual formation that has already been formed within this changing landscape. It facilitates the extension of the narrative, ethical, historical, and cultural resources of medical humanities into ecological crisis and more-than-human entanglement. Essays of such foundational articulation include a call to an ecologically dimensioned medical humanities, which holds that it is no longer conceptually sound to separate health status on the one hand and ecological status on the other, and that the discipline has the opportunity and responsibility to give an adequate response to ecological thought [1]. Scientometrically speaking, however, EMH does not yet seem to be a coalesced field. It does not have a fixed canon, standard vocabulary or even publication outlets. It functions rather as a boundary-spanning knowledge space. Its consistency probably lies less in a characteristic centre of thematic focus than in the forms of conceptual brokerage, cross-domain citing and the incremental development of integrative vocabularies. This paper describes a scientometric study of the Web of Science Core Collection, which includes SCI-EXPANDED, SCI, ASCI and AHCI, 2000-2025. It is intended to chart EMH as an interdisciplinary territory of emergence. The overall methodological innovation is a bridge-term process. The model is that concepts are represented as nodes in a co-occurrence network of keywords, and bridge terms are determined using betweenness centrality. This translates the argument that EMH is characterized by assimilation between clusters and not a subject. The triangulation of the analysis occurs based on the bibliographic coupling and co-citation techniques that trace the research fronts of the time and common intellectual grounds, respectively [6], [10]. The outcome is a repeatable workflow and reporting template that can be submitted to a Web of Science-indexed conference.

Another reason why a bridge-term Scientometric study of EMH is needed is that ecological reframing of medicine is not just an addition to the coverage of topics but a restructuring of what is regarded as medical relevance, evidence, and responsibility at scale, actors, and times. In this respect, EMH is not merely the importation of environmental concerns into preexisting discourses. Still, it re-pressurizes the conceptual technology of the humanities of health by compelling questions of embodiment, of vulnerability, of care, of narrative to become expressly located within biophysical systems of infrastructures and within multispecies reliance, even as it also reveals how established limits between the clinical, the social, and the ecological have been maintained by institutional specialization, publication division, and indexing practices. The ensuing scholarship would therefore tend to follow a structural pattern that is not so traditional as found in the formation of different disciplines, namely, to coalesce around a specific set of canonical issues and journals, EMH would tend to proliferate in partial alignments and episodic alliances, usually organized around moments of crisis, funding imperatives, or special issues, and expressed via shifting vocabularies that trace the comings and goings of concepts such as resilience, exposure, systems, adaptation, and justice across

**Stany et al.,**

heterogeneous research communities. This has a direct implication on the way we assess EMH to be cohering into a recognizable research front. Simple increases in publication and citation can demonstrate an increase, but not whether the increase is the result of conceptual incorporation or parallel proliferation of detached subfields that are of acute thematic interest with the environment or because of a loose thematic interest in health. A bridge-term strategy offers a more diagnostic approach since it involves questioning the actual process of integration in terms of what terms are used to bring together the two clusters and how far such terms are stable connectors and not momentary rhetorical tokens. By so doing, the approach can shed light upon the epistemic politics of interdisciplinarity itself: whether it is dominated by managerial and systems vocabularies that move readily across disciplines, whether it is grounded in ethically controversial concepts that enlist discourses of criticism and normative debate, or whether it is carried by biomedicalised conceptions that tend to assimilate environmental issues into technocratic problem-solving without sustained regard to history, culture and power. Further, bridge-term mapping can be used to expose imbalances in knowledge traffic, including instances of invoking concepts within climate-health discourse as instruments of communication or behavior change instead of sound theoretical frameworks, or of introducing environmental concepts into health humanities in a manner that foregrounds specific geographies and peoples and backgrounds environmental justice studies and Indigenous or decolonial knowledges. These asymmetries are important in that the promise of EMH not only acknowledges ecological determinants of health but also reorganizes interpretive and ethical resources with the help of which societies are telling narratives of harm, responsibility, repair, and futurity in the face of planetary pressure. The Scientometric protocol submitted should then enable the appearance of the connective tissue and fractures of the emerging domain, demonstrating where the translation is successful, where it is unsuccessful, and which conceptual bottlenecks repeatedly facilitate interdisciplinary contact. Lastly, since EMH is cross-index and cross-category in nature, a mapping using the Web of Science can be a source of not only an empirical record of what can be discovered using dominant indexing infrastructures but also a reflective record of how the infrastructures themselves influence what will seem a field in the first place; such a reflexivity is particularly relevant to a field adjacent to the humanities, whose significant work is often disseminated through the genres and channels captured by bibliographic databases unevenly, and whose methodological transparency regarding query design, parameterization, and validity.

EMH appears as a pivotal and boundary-spanning node between three contributive knowledge areas, such as Medical Humanities, Environmental Humanities, and Public and Planetary Health. In contrast, conceptual connectivity occurs between clusters through bridge terms (high-betweenness keywords).

The arrowheads are solid to denote the main knowledge-flow connections of each area into EMH and boldly bidirectional to denote interdomain interdisciplinarity, which EMH can explicitly denote. The focal construct (EMH) and the bridge-term concept are emphasized with the help of accent color (teal). In this number, the key operationalization of this paper of EMH as an emergent interdisciplinary space is visualized as opposed to a single subject field. Indeed, the three rounded rectangles symbolize the primary disciplinary or programmatic constituencies, which contribute to the EMH-relevant scholarship on the one hand: Medical Humanities (narrative, ethics, history, care), Environmental Humanities (ecology, Anthropocene, exposure), and Public and Planetary Health (climate-health, One Health, systems). The node of the EMH center is the point of intersection of these discourses in the analytic target corpus. The bridge-term annotation defines which scientometric mechanism the study operates: keywords with high betweenness centrality in the co-occurrence network are considered bridge terms since they bridge otherwise disjointed topical clusters and empirically quantifiable integration. The three domains are connected by dotted links that show that interdisciplinarity may directly take place between contributing fields, too; the bridge-term process attempts to identify when (and by what concepts) that cross-domain relationship solidifies into a familiar EMH space of knowledge.

Related Work

Ariographic bibliometric science mapping offers a well-developed and established set of methodologies to show thematic and intellectual organization of scholarly corpora. Co-citation analysis proposed a relational metric of the frequency of co-occurring documents, such as co-citation, and made possible the discovery of research and

Stany et al.,

intellectual focus areas [6]. Bibliographic coupling ties documents mentioning comparable references and is generally applied to find research fronts nowadays. Co-word analysis is a complementary method to citation-based methods, and it can be used to map thematic organization based on term co-occurrence patterns, and is useful in those interdisciplinary domains where heterogeneous labeling practices are observed [7]. The mapping methods have become practically accessible due to widely used tools. VOSviewer facilitates the creation and visualisation of bibliometric networks using co-authorship, co-occurrence, citation, bibliographic coupling, and co-citation relationships and has text-mining functionality to create term co-occurrence maps [2], [8]. Bibliometrix is an open-source R ecosystem to support end-to-end processes of science mapping, including its import and cleaning of data, network and thematic analysis [9]. Another methodological issue that has been solved through methodological syntheses is the lack of equal reporting quality of bibliometric research, which has led to the creation of reporting guidelines and lists of systematic recommendations. More recent efforts have focused on the use of transparency in search strategies, inclusion criteria, preprocessing, and parameter settings as conditions of reproducibility and interpretability [18]. Simultaneously, evidence-synthesis reporting guidelines like PRISMA-ScR have had an impact on researchers describing retrieval and screening steps of scoping-type mappings [11]. These changes are especially pertinent to EMH, in which the delimitation of the corpus is not trivial, and both query design and sensitivity are. Interdisciplinary traditions of measurement have a conceptual basis in bridge analysis. Journal citation networks have based measures of betweenness centrality and diversity on interdisciplinarity since these metrics measure boundary-spanning roles and connectivity across domains [12]. The concept-level analogue used in the current work is the use of bridge terms: we do not count the brokerage of journals in citation networks, but count the keyword brokerage in thematic co-occurrence networks.

Research Questions

RQ1: How does EMH-related scholarship indexed in Web of Science Core Collection (SCI-EXPANED, SSCI, A&HCI) change in terms of growth of publications, publication areas or venues, and disciplinary representation?

RQ2: What are the thematic clusters of EMH as manifested by the clustering of key words based on the co-occurrence of key words, and which are core and peripheral topics?

RQ3: Which are the keywords that are bridge terms between thematic clusters, and which journals and documents are in a bridge role of citation-based coupling and co-citation networks?

Source of Data and Corpus Delimitation.

The source of data will be Web of Science Core Collection, restricted to SCI-EXPANED, SSCI and A&HCI between 2000 and 2025. The delimitation issue is solved by operationalization of EMH using the intersectional query, which integrates descriptors, ecological framing descriptors and climate-health interface descriptors. The purpose of this design is to retrieve a corpus of boundary-spanning as opposed to a corpus of a narrowly defined subtopic. Since environment is polysemous, a post-retrieval screening phase eliminates the records where environment is applied in non-ecological contexts (technological, built, or institutional) but with ecological referents, which has been noticed in flagship venues [1]. The decisions made regarding filtering are recorded under reproducible reporting in line with the recommendation of bibliometric reporting [18].

METHODOLOGY

Web of Science extraction (exact query) Records are then searched in the Web of Science Advanced Search interface with the TS= tag (Topics) searching title, abstract, author keywords and Keywords Plus. Precedence is governed by the use of Boolean operators and parentheses, and the proximity operator is applied when needed. Web of Science documentation on Boolean operators is found in Clarivate documentation [19].

The exact query string is: TS= ("" OR "health humanities" OR "narrative medicine" OR ("history" NEAR/3 medicine) OR ("ethics NEAR/3 medicine") OR (ecology OR environment OR biosphere OR "more-than-human" OR multispecies OR "environmental humanities")) AND (climate change) OR (planetary health) OR (environmental

**Stany et al.,**

health) OR (One Health) OR (Anthropocene) OR (whole environment) Indexes are limited to SCI-EXPANDED, SSCI, and A&HCI and the times All the records and referenced works are exported in VOSviewer format to be analyzed at lower levels.

Descriptive profiling. We calculate the number of publications per annum, top sources, top authors and institutions, country distributions, and types of documents. Reporting of citation counts is done cautiously, as there are differences in citation practice across fields.

Co-word analysis and VOSviewer parameterization. It is possible to create a network on the basis of bibliographic data in the VOSviewer, analysis type Co-occurrence and unit of analysis All keywords (Author Keywords and Keywords Plus). The default configuration is a thesaurus file used to combine spelling variations and synonyms before constructing networks; the default normalization in VOSviewer is the Association strength that is used as input to the VOS layout and VOS clustering techniques [20]. The clustering is with the VOS clustering technique and Resolution=1.00, which is the default of VOSviewer. The manual recommends that higher resolution results in increased clusters, and to experiment with various values to have a realistic level of detail. Sensitivity checks are also run at 0.75 and 1.25, although the primary solution reported uses 1.00 unless over-fragmentation of segments or under-segmentation is apparent [20]. The minimum cluster size is set to 5, and “Merge small clusters” is in mode so that the clusters with fewer than the minimum cluster size are merged as larger clusters instead of being discarded, thus avoiding unassigned items during bridges interpretation [20]. Layout is calculated based on default VOS layout settings, whereby in case of instability, the best options are Attraction=2 and Repulsion=1 as are suggested in the manual [20]. Bridge term analysis. Bridge terms are operationalized as high betweenness centrality keywords on the keyword co-occurrence graph. Bridge terms are reported explicitly, which is in line with reporting best practices regarding bibliometric analyses [18]. The results of VOSviewer cluster assignments and link weights are exported to compute centrality in external network analysis packages. It is interpreted by applying known applications of betweenness as a border spanning measure in citation networks [12]. Citation-based triangulation. Bibliographic coupling is applied to determine the proximity of contemporary EMH documents, and co-citation analysis is applied to determine the intellectual base and foundational anchors [6], [10]. Broker documents are considered to be those that are characterized by large bridge-term density in addition to brokerage positions in coupling networks.

RESULTS AND EXPECTED FINDINGS

Since this paper is intended to be an executable mapping protocol, but no dataset is provided in this document, the results are expressed as testable expectations and not numeric assertions. Co-word clustering should demonstrate that narrative-ethics work, systems-oriented ecological public health, and climate-health policy and exposure discourses contain multiple thematic communities, which we expect [1], [3], [4], [16]. Bridge terms will presumably signify whether integration is achieved via general connectors like systems and vulnerability or more programmatic connectors like planetary health and One Health, which do or do not co-travel with anthropocentric and limited humanities (research) vocabularies [5], [14], [15].

DISCUSSION

The bridge-term methodology is a concept-level measure of field formation and interdisciplinarity. When bridge connectivity is highly concentrated on a small set of generic terms, EMH integration can be weak and rhetorically weak. Provided that bridge terms cut across narrative, ethics, systems, justice, exposure, and climate-health constructs, it is possible that the integrative vocabulary of the field is stronger. The methodology is direct to the ecological claim that ecological framings are not prominent enough in mainstream indexing since integration of such frameworks is detected with explicit WoS query syntax and precise VOSviewer parameters normalization and clustering. This corresponds to the findings that the quality of bibliometric reporting differs and transparent reporting leads to better reliability and interpretability [18]. It is limited by the poor coverage of monographs and

Stany et al.,

certain humanities venues by WoS, and the heterogeneity of keywords across disciplines. This paper identifies a Web of Science Core Collection mapping protocol of EMH (SCI-EXPANDED, SSCI, A&HCI; 2000-2025) that defines descriptive profiling, co-word clustering based on VOSviewer with association strength normalization, identification of bridge-term by using betweenness centrality, and triangulation of citation-based. The protocol generates a reproducible map of EMH thematic clusters and integrative vocabulary. It identifies broker documents and venues that facilitate the flow of cross-domain knowledge in the Web of Science by encapsulating EMH as a conjunction of three families of concepts. A transparent, modular logic to construct the EMH corpus in Web of Science is presented in Table 2, bringing operationalizations of EMH as an intersection of three families of concepts. Block A centers the search within the health-humanities field to make sure the corpus is still based on medical humanities issues and terms. Block B proposes explicit ecological terms of framing to encompass work that is being done to the environment and more-than-human relations, as constitutive of health, but not as background. Block C introduces the climate-health interface terminology that tends to act as a transfer point between otherwise distinct literatures, bringing back to memory interdisciplinary research relating humanities inquiry to climate-related health agendas. The combination of the blocks also allows reproducible balance of accuracy and breadth: the blocks do not need to reduce EMH to a single keyword but provide the inclusion criteria in enough detail that they are also auditable and replicable across WoS exports.

Table 3 shows the core reporting units applied to the approach of operationalization of the bridge between terms to retain the results interpretable and reproducible. Instead of applying the term interdisciplinarity to an overall assertion, the template defines what will be recorded at the levels of keywords, thematic groupings, documents, and venues, so that a reader can be made aware of the precise concepts that are working as connectors, what areas of knowledge are being bridged, and where EMH integration is concentrated in the literature (articles and journals).

The conceptualization of this paper defines Ecological Medical Humanities (EMH) as a boundary-spanning knowledge space constituted at the interconnectedness of medical humanities, environmental humanities, and public/planetary health as a reaction to the argument that health cannot be plausibly compartmentalized out of ecological contexts. In order to get beyond the aspirational interdisciplinarity, it suggests a Web of Science Core Collection (SCI-EXPANDED, SSCI, A&HCI; 2000-2025) Scientometric workflow blending co-word clustering with a bridge-term process. Bridge terms are defined as high-betweenness words in the co-occurrence network to enable integration of EMH to be quantified as connectivity between thematic clusters and not based on topical overlap alone.

Table 1. Comparison of traditional and (EMH)

Dimension	Traditional Medical Humanities	Ecological Medical Humanities (EMH)
Core aim	Interpret health, illness, and care through humanistic inquiry	Reframe health, illness, and care as ecologically embedded and integrate ecological crisis into health-humanities thinking.
Central objects of analysis	Patient experience, clinical encounter, professional identity, medical institutions, medical ethics, illness narratives	Bodies-in-environment relations, ecological determinants of health, multispecies relations, climate and health, toxic exposure, planetary-scale risk
Boundary of "context."	Social, cultural, historical, and institutional contexts around medicine	Ecological context is not background but constitutive; health cannot be compartmentalized away from environmental systems
Dominant problem frames	Meaning, suffering, care, ethics, narrative competence, and power in clinical settings	Systems, vulnerability, exposure, adaptation, environmental justice, climate-linked risk, and sustainability in healthcare narratives
Typical methods	Close reading, narrative analysis, historiography, qualitative interpretation, critical theory	The above, plus explicit ecological framing, systems thinking, interdisciplinary synthesis with ecological public health.
Typical evidence-based	Texts (memoirs, fiction, case narratives), interviews/ethnographies, archives, ethical argumentation	Texts and archives, plus ecological public health models and climate-health syntheses.

Stany et al.,

Table 2. Query Block Logic for EMH Corpus Construction in Web of Science (2000–2025)

BLOCK	CONCEPTUAL ROLE	ILLUSTRATIVE STRINGS
A	anchor	"" OR "health humanities" OR "narrative medicine."
B	Ecological framing anchor	ecology OR environment OR biosphere OR "more-than-human."
C	Climate–health interface anchor	"climate change" OR "planetary health" OR "environmental health" OR "One Health"

Table 3. Bridge-term reporting template and interpretation

Output element	Definition	Interpretation
Bridge Term	High betweenness keyword	Integrative vocabulary candidate
Connected clusters	Cluster pairs linked	Where integration occurs
Bridge documents	Records with multiple bridges	Conceptual brokers
Bridge journals	Venues of bridge documents	Interdisciplinary conduits

ABSTRACT

This study reframes memory within ecofeminist resilience as an active system that helps sustain continuity, identity, and adaptive capacity through relational expression. Through comparative literary analysis of *Shakuntala: The Play of Memory* by Namita Gokhale and *The Folded Earth* by Anuradha Roy, the approach and manner of patriarchal silencing and acknowledgement as embodied in memory are explored, with a focus on fragmentation and resilience. A broken emotional continuity marks Gokhale's retelling by *Shakuntala*; the deprivation of storytelling expression results in isolation and fragmentation, draining the self in silent endurance. Roy's *Maya* lets the memory unravel gradually with the help of landscape and human relationships. Her sorrow is still perceptible, her fragmentation is maintained relationally, so it is possible to endure without demanding wholeness. This contradiction reveals that memory wounds not intrinsically, but when the social system refuses its expression, hence making it either destructive or manageable. Sustainability is not created by eliminating the trauma but by caring informed ecologies that observe fragmentation. Redefining resilience is ethical endurance sustained by a relationship and not controlled.

Keywords: Memory, ecofeminist resilience, trauma, fragmentation, Namita Gokhale, Anuradha Roy.

**Shubhakarini et al.,**

INTRODUCTION

The literature has become an important site that questions the role of trauma in both human life and nature in a world characterized by ecological destruction and systematic gendered violence. The growing climate crisis, which impacts women disproportionately, especially in the global south, requires a framework capable of examining the structural intersection between the harm of the environmental and patriarchal system of domination.

These systems are not independent entities but deeply interwoven forces that perpetuate trauma across generations and across geographies. This paper examines the idea of memory as a fragmented symptom of eco-gendered trauma and a site of resilience. It explores how landscapes are turned into an effective archive in which personal and shared trauma are written, logged, and reimagined through narrative fragmentation, focusing on the works of Namita Gokhale and Arundhati Roy.

The theoretical background of this investigation is an ecofeminist perspective. The early ecofeminism led by Vandana Shiva in her book *Staying Alive* (1988) had focused on the material relationship between women's subsistence and ecological management, a systemic relationship that colonialism and neoliberal extra activism have systemically undermined. The work of Shiva emphasized the fact that the traditional knowledge system of women was biased towards sustainable practices, which were shattered by the new system of industrialization that prioritized profitability over conservation. This analysis was further extended in later works by Maria Mies and Vandana Shiva (1993), who theorized the dual colonization of women and nature by capitalist patriarchy. They argued that the exploitation of natural resources and the marginalization of women were not incidental but a larger pattern of domination that considered both as fungible resources. This framework did not focus on the essentialist abstraction of women to a passive representation of nature, but rather placed them in an active role of opposition to environmental degradation.

The modern ecofeminism, as expressed by such theorists as Greta Gaard (2011), does not deny the material entanglement between women's bodies and the more-than-human world in a system of domination. The work by Gaard highlights how ecofeminism has been transformed to incorporate intersectional issues, drawing on the exploration of race, class, and colonial histories in examining environmental issues. As an example, she points out how indigenous women and women of colour are frequently the ones who suffer due to ecological crises. Still, their voices are sidelined in the mainstream environmental discourse. The development provides a sensitive net of understanding the interplay of gender and ecological violence, which can be used to unravel the intrigue within narratives that grapple with environmental and social trauma.

Trauma theory can also add to this exploration by shedding light on how traumatizing events disrupt the linear temporality and narrative integrity. Cathy Caruth's concept of "unclaimed experience" (1996) describes how trauma cannot be absorbed into the traditional system of memory, but it rebounds in fragmented form from memory and embodied reaction. Caruth argues that trauma is not merely an occurrence but a break that cannot be chronologically neglected; it expresses itself in forms that undermine the system of narration. Judith Herman's (1992) highlights the fact that survivors tend to undergo intrusive re-experiencing that disrupts the chronological memory constructions. Her clinical insights provide the idea of how trauma alters progress time, which keeps people in a continual loop of pain and memory. This observation is furthered by Maurice Halbwachs through the concept of how remembrance is a socially constructed, contextually situated phenomenon. Halbwachs proposes that landscapes themselves are a repository for how communities experience and process them.

The theory of multidirectional memory (2009) by Michael Rothberg provides an additional dimension that explains traumatic histories are transmitted between generations, as opposed to the isolationist perspective. A combination of these frameworks places memory as a conflictual and active process defined by power relations and material kinds of environment, which can be used to analyze how ecological and gendered trauma are engraved on bodies and

landscape. Resilience theory connects ecological and psychological aspects of recovery, and does not view resilience as individual strength but as a relational ability that arises through entanglements with the human environment. According to Walker et al. (2004), resilience is defined as adaptability, transformability, and the social-ecological system. In this regard, resilience does not mean returning to a past situation, but rather relationships with the environment in a manner that promotes sustainability and equity. This viewpoint can be compared to the ethics of care by Carol Gilligan (1993), which places greater emphasis on interdependence and resilience in growing through a network of care and mutual support. Through his work, Gilligan is opposing mainstream paradigms of individualism by arguing that human well-being is always connected to the well-being of our relationships with other human beings and the natural world. The recent work by Alice, Jebaselin, and Mohanraj (2024) illustrates how women's environmental activism in India embodies this relational resilience. This study highlights the role of grassroots movements led by women who are combating extractive logics with creativity and resistance, whether through reforestation initiatives or through movements against industrial pollution. Such convergence-theoretical stands allow a more profound grasp of how people and communities emerge from their trauma, not through a solitary healing process but by reconstituting their relationships with harmed ecologies.

LITERATURE REVIEW

Prankaj Solanki analyzes Namita Gokhale's *Shakuntala: The play of memory* through the feminist interpretation, dispelling the stereotype of the fallen woman. In comparing the protagonist of Gokhale with the passive *Shakuntala* in Kalidasa, Solanki states that the novel redefines the myths to establish female independence. Based on Simone de Beauvoir, the paper assumes that the protagonist has an identity against the patriarchal convention. She goes with Nearchus in search of knowledge. Gokhale turns the unfortunate picture of a fallen woman into an image of revolt. The text emphasizes authors such as Angadi and Nigam, and it highlights psychological depth. She ultimately redeems herself by moving beyond boundaries to become herself.

Akansha Srivastava explores the novel by Namita Gokhale through the prism of ecofeminism. Srivastava makes the argument that the patriarchal system oppresses women and nature at the same time, which relates their oppression by comparing the protagonist of Gokhale and the passive mythological character of Kalidasa. The paper emphasizes that *Shakuntala* in the forest signifies resistance. Drawing on the ideas of theorists like Vandana Shiva and Karen Warren, Srivastava argues that the division of memory mirrors the deterioration of the environment. The emphasis is placed on the role of gender and its connection to ecological systems. The forest is an area of feminine strength under nature- culture binaries. Finally, the paper concluded that the myth is reclaimed as a way of fighting for interconnected giving to women's powers by relating them to nature, as rebelling against the patriarchal dominance that was imposed on women.

Rahne and Gaurav study the rural narrative in *Shakuntala: The play of memory* by Namita Gokhale, which argues that women are reconnected with nature to resist the male system. The authors argue that Gokhale transforms the mythological persona of Kalidasa into a subversive rural life that questions patriarchal limitations. Placing the novel in the agrarian context of India, the paper highlights how life in a village, traditions, and gender expectations influence women's identity. Based on feminist theory, this investigation postulates that rural structures of oppression provide avenues of resistance. The independence, education, and mobility that *Shakuntala* seeks are symbolic of broader struggles for agency among rural women. The article concludes by arguing that literature has the potential to transform into social consciousness, and empowerment can bridge traditional values and modern feminist aspirations.

Zaidi and Bhatnagar examine psychological undertones in *The Folded Earth* by Anuradha Roy. The author uses the concept of the main character, Maya, and, with the help of theories such as reactance and dominance, discusses issues such as loneliness, dread of loss, and the desire to feel free to examine the effects of patriarchal influence on the emotional blockage characters experience. It claims that inner conflicts mirror larger social injustice. The author

**Shubhakarini et al.,**

implies that the novel provides Catharsis and avenues to emotional health, underscoring the role of literature in comprehending human psychology and addressing modern struggles through reflective analysis of narrative.

Chauhan, Kumar, and Tyagi are ecofeminists who study the novel by Anuradha Roy, *The Folded Earth*, intersecting environmental degradation and gender oppression. By placing the trauma experienced by the protagonist Maya in the endangered Himalayan landscape of Ranikhet, the authors suggest that the patriarchal capitalist system simultaneously exploits women and nature. This is based on the critical intervention of Karen Warren and Vandana Shiva regarding the challenges of hierarchical dualisms, such as culture against nature and male against female, which justify dominance. The forest is a site of female opposition and subversion of patriarchal binaries. Maya's journey reflects the restoration of ecology and interdependence of struggles, Roy showing the idea of holistic egalitarianism schemes, making literature an essential component of ecofeminist discourse and social-ecological justice.

Vaishya discusses the concept of existential crisis in the novel *The Folded Earth* by Anuradha Roy through the lens of the psychological process of alienation, anxiety, and fragmentation of identity of the protagonist Maya. Based on the existentialist theory of Kierkegaard, Sartre and de Beauvoir, it argues that Maya is struggling with patriarchal subjugation, loss of spouse, and betrayal-based trauma, which reflect in the more general contemporary challenges in expressing the self. By setting the novel in a Himalayan town in Ranikhet, Vaishya assumes a search for freedom and a new woman who is finding her way in the modern social framework. Vaishya suggests that the novel by Roy brings a cathartic revelation about the human condition and that the experience of overcoming existential despair can lead to self-realization and emotional stability in the face of an oppressive system.

Existing criticism of Namita Gokhale and Anuradha Roy operates in fragmented categories such as feminist, ecofeminist, or psychological, without necessarily crossing them. Despite some foreshadowing of a correlation between memory and environment in *Shakuntala*, as well as gendered ecological oppression explored in *The Folded Earth*, neither of them elaborates on theorization about the functioning of fragmented narrative memory as a wound in the patriarchal ecological system. More significantly, resilience has not been strictly defined as an ecofeminist theory that can integrate psychological healing and ecological recovery. There is a gap in addressing how Gokhale and Roy encode the fractures of the memory not just as a thematic issue but as an embodied ecofeminist practice.

Theoretical Framework

This paper is mainly based on the ecofeminist philosophy of Karen Warren, which challenges the logic of domination that forms the basis of patriarchal hierarchies that suppress both women and nature at the same time. The structural perspective through which gendered violence and ecological degradation are set to be analysed as the result of the same roots of ideological origins of value-hierarchical thinking and value dualism proposed by Warren's culture versus nature, male versus female. To corroborate this materialist ecofeminism, by Vandana Shiva sheds light on exploitation and rural areas, and how women's traditional knowledge and relationship to the land become peripheral to the capitalist-patriarchal development.

Regarding the issue of memory, the fragmentation combines the trauma theory in which fragmentation is viewed not just as a psychological disruption but as a narrative representation of ecological disruption. Based on the criticism of the mechanistic worldview provided by Carolyn Merchant, the study posits that fragmented memory is a reflection of the disconnected relationship between human beings and the world. Important the concept of resilience is reimagined not as individual recovery but rather as ethical continuity through relationship. This combines psychological understanding of existential crisis and ecofeminist suggestions of holistic restoration. Through the intersection, the framework examines how the fractures in the memory in Gokhale's mythic revisioning and Roy's realist narration embodied the ecofeminist praxis. This lens reveals how memory cannot be erased and the trauma absorption problem in *The Folded Earth*. It also suggests that the literary form is involved in survival, such that recognition of fragmentation itself becomes a form of resistance of patriarchal silencing. The study bridges trauma

studies, environmental humanities and feminist theory to reconsider the agency and repair response to gendered and ecological vulnerability.

Analysis

In ecofeminist resilience theory, memory is not a traditional passive remembrance but an essential relational process that maintains continuity, identity, and collective survival. According to Vandana Shiva, who states in *Staying Alive*, “the destruction of nature is also destruction of culture and memory” (41), which shows memory is inherent in ecological and social fabrics. Sustainability of memory becomes achievable when it is held down within a patriarchal mechanism; it shatters the continuity it is expected to maintain. This dynamic is affected in opposition ways in *Shakuntala: The Play of Memory* (2005) by Namita Gokhale and *The Folded Earth* (2011) by Anuradha Roy, where the work of memory is either suppressed or used as a relational practice.

In the reconstruction of Gokhale, there is a systematic weaponization of memory through patriarchal silencing. Critical studies argue that Gokhale does not depict her *Shakuntala* as a woman whose trauma dissociation is caused by the institutional refusal to acknowledge her testimony (Srivastava 72, Gokhale 43). Her memories are broken into disconnected fragments due to an absence of communal witness or ecological foundation. Since her childhood, the epistemic hunger *Shakuntala* has been repressed. “I have kept myself for they were neither asked nor valued ... as the scriptures were forbidden to women” (Gokhale 11). This suppression is not a question of literacy, but the right to tell one's experience.

Shakuntala is not allowed to express her suspicion, “I was not angry with Srijan—he was a man, men were allowed many women... But the hurt and betrayal, the prickling of thorns under the sheath of my skin—I had never known or anticipated these feelings” (Gokhale 58). Memory here is internalized, unprocessed, raw, disconnected from relational continuity. In the absence of a sanctioned space to express pain, resilience would not be an option. It is a heartbreaking commentary on the way in which patriarchal culture uses the silence of women (Akansha Srivastava 80). Still, within the novel's diegesis, this expression is constantly frustrated by structural constraints.

On the other hand, Roy's *Maya* is the embodiment of memory as an ecological practise. Grieving is not linear, not solved, but persistently involved. At Michael's vandalized grave, “one broken bottle on it and another empty bottle ... The day lilies I planted had been dug out thrown aside (Roy 90). Instead, “I began to gather lily bulbs from all around the grave to replant them.” (Roy 91) Her psychological process of remembering restores the dislocated life to the damaged ground. The recollection is triggered by the sensory landscape, which does not overwhelm her as while walking through a forest pathway, she recalls, “a forest near Hyderabad where I had once gone with Michael... Broad-leaved trees, stacked close and deep, blocked out the sun... I plucked a red wildflower and stuck it behind my ear. We laughed a lot. I felt beautiful” (Roy 103).” Memory does not turn out to be a false intrusion but as a gentle place-based reprisal. Importantly, the memory of *Maya* is maintained by relational exchange; the acquisition of *Charu* to read is an indirect processing of non-presence, the performance of the birdcall by Diwan Sahib keeps her in touch in the present, and even the gossip of *Ama* makes her past of community time. “I sifted through my mind for whatever I could retrieve of him, reconstructing our years together: the way I pretended sleep so that he would bring tea to our bed each morning, tugging a tuft of my hair to wake me (Roy 125) reflects her inner turmoil, allowing her pain to move beyond her body and into the environment. She has to rely on the present sensory landmark, “the smell of damp earth,” (Roy 102) “the barbet calls all day from its lonely perch high in a leafless tree. Its plaintive, monotonous cry is the distillation of solitude and sadness (Roy 235). This constant movement between the past and present, self and the surrounding turns memory into a bricolage into a scaffold.

The presence of grief acknowledgement of *Maya* enables memory to be secured as a strength, unlike that of *Shakuntala*, who was forced into an isolation condition. The Himalayan scenery does not require abandonment; it is painful, and at the same time, gives rebirth. Planting a lily in a disturbed grave is an ecological remembrance, not through the narrative art of the story, but in the sense of repairing connection with a harmed ecosystem. Memory becomes folded into earth, community, daily ritual, a living system that makes it possible to survive without erasure.

Shubhakarini et al.,

As Roy describes the wisdom of Diwan Sahib, “Corbett understood the jungle by looking, and he could tell you it’s story from the sounds he heard... He walked the forests barefoot when he was a boy. He understood the fall of every leaf and the meaning of a cloud (Roy 73). In the same way, Maya perceives in these forms the continuity of her own fragmented and persistent. Memory is not recoverable of the pre-traumatic wholeness, but adaptive reconstructive in fracture memory, as the Himalayan soil contains seeds for the next growth.

Fragementtion

In ecofeminist resilience theory, fragmentation is a signifier that does not imply complete breakdown but rather a set of three ruptures: loss of emotional continuity, internal disconnection, and the weakening of relational bonds. Fragmentation is not dangerous in its inevitability, as a social-ecological system is inherently disturbed, not in that the system does not accept a repair mechanism. The patriarchal capitalist regimes lead to an increase in fragmentation by destroying the same relationship threads that help to reintegrate. Gokhale and Roy use fragmentation at the formal and thematic levels to expose how memory suppression accelerates rupture and permits acknowledgement of how memory suppression delays collapse.

Fragmentation in *Shakuntala: The Play of Memory* is a process of self-deprecation under patriarchal silencing. Deprived of access since childhood, “the scriptures were for women” (Gokhale11), the consciousness of *Shakuntala* is broken down between the approved roles and the prohibited pleasure. Her first menstruation turns into a place of alienation of the body when her mother confines her in a cowhouse next to the dung and straw, declaring her “defiling the household fires when a holy man is visiting us! You are a woman now, you had better understand what that implies!” (Gokhale 31). The terrified young girl who thinks of drowning in blood is forced to break down the door and take into the forest a literal disintegration that reflects the psychological disintegration as her body turns into a foreign land to be patrolled by shame. This original break of filial continuity is argued by the betrayal of the relation when Srijan brings his cold eyes to challenge the sovereignty of *Shakuntala*. This disloyalty is sensorial, “the hurt and betrayal, the prickling of thorns sheath of my skin” (Gokhale 58). Most importantly, *Shakuntala* is unable to express this guilt; she runs away to the *Matrika* temple, where the silence is the only language she speaks. This fragmentation is relational; the marital bond is broken not by violence but by the approved erasure of her voice.

This break is not repaired by her flight with *Nerarchus*, but is increased. She throws away her silver anklets, “which weigh down your feet to keep you rooted in your home” (Gokhale, 103). It is not the liberation but the disintegration of selfhood, “The young woman called *Yaduri* had no history. She lived in the ceaseless present.” (Gokhale 129). Identity disintegrates in sensory immediacy served from the past or future. As *Kalidasa* is performing *Abhijaana Shakuntala*, she challenges her transgression in the reflection of myths. Through the heroine of *Kalidasa*, “even in disgrace ... of secret marriage,” she realized. “I had betrayed everything. I had renounced my name, I was no longer *Shakuntala*, only *Yaduri*, the unmentionable one. I had abandoned the husband whose true wife I was... the noble king *Dushyanta* had wives aplenty, and yet there was no slur in his love-making with *Shakuntala* ...only I stood condemned” (Gokhale 150). Fragmentation solidifies into an internalized judgment of the self, which splits into observer and observed.

This internal breakage leads to physical disintegration at *Kashi*, “a torn womb where my life and my daughter had been, now destroyed... the bull once again buried its horns in my stomach. The blood rushed out from my abdomen like a fountain, ... my feet” (Gokhale 188). In contrast to the absence of *Michael's* body in *Roy's* book, where memory remains present, *Shakuntala's* body is the visible fragment that marks the ultimate closure of a life broken into many pieces. More importantly, every rupture to isolation is irreparable; the broken door can never be repaired. Epistemic repression is maintained anklets are known away from mythic judgment, which is internalized and unrestrained. The patriarchal structure does not provide the relational scaffolding through which to reintegrate, and so such fragmentation here is closed without an existence.

Roy introduces fragmentation as something accepted and not concealed. Psychological fragmentation of *Maya* reflects the instability of the environment: “one broken bottle on it and another empty bottle propped against it.

Shubhakarini et al.,

Shattered glass lay all around the grave. The day lilies I had planted had been dug out and thrown aside, their long leaves wilted, their light-starved tubers helpless under the sun" (Roy 90), but more importantly, fragmentation is still visible and part of everyday practice. In the process of replanting the lilies on the grave of Michael, "I began to gather lily bulbs from all around the grave" (Roy 91). But these fragments become relational anchors. The process of teaching Charu to read the letters of the Kundan Singh is a way to make fragmented literacy a collective meaning-making. The disjoint papers of Diwan Sahib incinerated rejected drafts into a place of collaboration. "I sat up with his paper ... overcome by a sense of loss, if it had not been overpowering, would have struck me as absurd" (Roy 134). In contrast to the solitary torture of Shakuntala Maya, it is fragmented in the observed community.

When the deer Rani of Puran was killed by a bureaucrat's inhumane actions, the hill, the theatrics of Ama, the gossip of the clerk, and the silent sorrow of Charu, fragmentation in this case is not hidden behind propriety but is contained in the social network. According to Roy's description of the monsoon, "Roads were reclaimed by nature as landslides... telephones died cutting off our town (Roy 154). But in this disintegration of the ecological discontinuity, community exists, people endorsing generators together, Ama sending kheer after quarrels, fragmentation is no longer internal division.

This opposition is a fundamental ecofeminist argument with trauma and environmental destruction, but it is devastating only when structures do not allow for fixing. As Mies and Shiva suggest, the logic that divides women and their bodies and knowledge. (18) Gokhale reveals such reasoning with the silenced fragmentation of Shakuntala Roy in the recognition of Maya's relational acknowledgment. When Maya realizes that Veer's betrayal and discovers Michael's name on the trekking documents, she loses her world. "I flung away my mass of blankets and sprang out of bed... I pulled out the heavy, plastic-covered bundle inside it: Michael's rucksack (Roy 244)

Even this disintegration takes place in observed space, the preoccupation of Ama with the silent reliability of the hillside. Fragmentation does not lead to breakdown due to the availability of care. As Roy's narrator reflects, "The eagles feel the change in air and light... They are lifted higher and higher by air currents as they wheel and arc and sail" (Roy 257). Fragmentation, as in the flight of the eagles, is an element of a greater relational pattern, not a conclusion but a stage in continuity. Fragmentation in Gokhale's vision was enhanced by silenced memory until the breakdown of resilience, a scathing critique of the system that requires a person to endure, but does not support them. Memory is not a psychological property, but an ecological repository in lilies that are replanted on graves in the slope of the Himalayas in grief literacy classes under monsoon clouds. This reframing makes resilience in place, not human adaptability as it is, but as relational emergence in a damaged ecosystem. Recovery is not restoration of pre-traumatic wholeness, but the adaptive transformation of the fracture, carrying seeds of the next growing thing, like soil after fire.

Resilience

Process memory and fragmentation are mutually influential, but resilience is a response to their interplay. In ecofeminist theory, resilience is not about "bouncing back" but about transformative reorganizing relationships in the damaged system (Walker and Salt 45). It involves recognizing weaknesses in interconnected networks instead of proclaiming control over disruptions. Gokhale and Roy set resilience as the critical moment of disjuncture, where patriarchal refusal of memory and care produces an unsustainable collapse in relationship recognition, making it possible in the moment of fracture. Loyalty is disastrous in Shakuntala. Memory is abolished, fragmentation, and the denial of any relational care, social, and ecological. When Kamalini is introduced, Srijan is a patriarchal gas lighter: "Do not ask any questions. She has been brought here as your handmaiden, and that is all. See that you treat her well" (Gokhale 58). Shakuntala, to find a way of repairing herself by visiting a temple, tries to find comfort in the forest, but her efforts are presented as transgressive. She escaped with Nearchus, and in the beginning, it seems to be freeing her. "I took to my changed circumstances with ease. Only the river travelled with me, its murmur in my life-blood" (Gokhale 129). The brutality of Nearchus, "sometimes he was rough and coarse" (Gokhale 134), is a reflection of violence in society. The redemption after coming back to Kashi is no better than condemnation. "Shakuntala's wanderings on the streets of Kashi and finally her death reasserts the sanctity and inevitability of the codes that

Shubhakarini et al.,

define honour and morality for a woman" (1587126289.pdf 181). Hit by a bull, an image of uncontrolled patriarchal power, her broken physically and her mind was already torn apart socially. "Shakuntala may have been condemned by the society and culture in which she lived, but the new woman in her remained determined as ever to live life and die on her own terms" (Srivastava 188). But systematic denial of care cannot be overcome by this determination. The lack of resilience is not caused by personal weakness, and the social ecology is unable to provide a mechanism of repair, but instead provides a mechanism of punishment, which is transgression. This reflects what Shiva refers to as "maldevelopment." A system that requires endurance but rejects the resources of relational that would support adaptation (Shiva 52).

The Folded Earth, on the other hand, demonstrates resilience and shows non-linear emergences, which is low. Memories are painful; they remain fragmented, but grieving gives space in the relational network. The resilience of Maya does not show in the sense of moving on, but in proceeding with a scar. After replanting the lilies, she does not cure, though she incorporates it "I would talk things over with Michael as I sometimes did at his grave" (Roy 147). Her attention towards Charu's training her literacy, opposing the cruelty of Mr. Chauhan, becomes a resilience practice. When Puran dies of his deer, Rani Maya does not isolate herself but instead takes part in the group mourning. Even the sickness of Diwan Sahib turns into an object of relationship strengths. I sat up nights, placing ice-cold swabs on his forehead...object of I felt an unexpected, painful tenderness for him" (Roy 179). Crucially, resilience opposes neoliberal discourse of individual success. The continuity in Maya is supported by her factory job, her jam-making, and her newspaper meeting with Diwan Sahib; these pointless routines keep things going without needing recovery. As Roy writes of the monsoon, "Houses felt furry with fungus and damp ... The hills were a lush, brilliant green, and wild gladioli drooped everywhere in the rain. The forest was carpeted with pretty, mauve, orchid-like flowers. (Roy 154). But within ecological disintegration, there is a sense of resilience, neighbours who exchange the news, Ama can deliver food, and Charu maintains hope. Resilience does not mean restoration of pre-traumatic wholeness, but Roy describes it as a transformative adaptation within fracture.

This leads to a devastating but generative conclusion. Maya finds out that Veer has broken his vows and has left Michael at Roopkund, and her world shatters. However, her protests are of ecofeminist strength. She tears Diwan Sahib's will into "tinier and tinier pieces, until not an alphabet can be distinguished of the name" (Roy Ch. 21). This is not revenge but transformation through refusal. With the scattering of the fragments "like white butterflies dipping over the wild flowers in this garden gone to seed," she rejects patriarchal inheritance logic while affirming ecological continuity. Her last thought, "I have lost too much to care. I will find another and make it a home again" (Roy 257) express resilience not as rebuilding but as repetitive re-membling. In contrast to the fatal fragmentation of Shakuntala, the strength of Maya rises exactly in the nation of recognized damage. As the eagle's wheel overhead, "lifted higher and higher by air currents," Roy installs resilience as relational emerges in fragment yet generative ecologies.

CONCLUSION

Bringing Namita Gokhale and Anuradha Roy implies that fragmentation is not wound but rather the place of ecofeminist strength. By applying trauma theory through the logic of domination proposed by Karen Warren, the fractured narratives can seem not just a symptom of patriarchal ecological violence but as effective survival tactics. Gokhale's Shakuntala, for instance, the mythical silene is transformed into a subversive voice, reappropriating the power of agency by the act of broken remembering. The Maya of Roy, on the other hand, cannot be psychological healing as something that must be connected with the land. This perspective makes an individual psychological interpretation of the crisis of Maya, an internal phenomenon, complicated because resilience is externally relational. It connects human healing to the living world, disputing the idea of endurances as personal strength. Rather, resilience is a moral action that is maintained through connection. In this context, literary form does some repair work provide insights that connect trauma studies and environmental humanities. The study implies that it is not a restoration of wholeness, but an acknowledgement of the rupture, which will be navigated through gendered and ecological

Shubhakarini et al.,

vulnerability. Resilience is created through the denial of trauma, but forms within caring ecologies that witness fragmentation, suggesting a transformative paradigm of identity in contemporary Indian fiction

ABSTRACT

Cultural conceptions of childhood and identity have shaped children's literature, which holds an outstanding place in the literary canon. Hidden worlds, talking animals, magical landscapes, and amazing adventures are not merely ornamental components; rather, they represent the child's emotional and psychological struggles in reality. This paper examines the psychological effects of childhood abandonment in Frances Hodgson Burnett's *The Secret Garden* through the lens of Attachment theory and Object relations theory and themes such as dependency, fearfulness, and abandonment are explored as impacts of insecure attachment patterns that were created in reaction against emotional neglect and parental absence. From a psychoanalytic standpoint, the novel explores relationship dynamics to externalize the children's shattered inner worlds. The 'secret garden' turns out to be a healing space where suppressed emotional needs are recognized and progressively resolved by creating safe connections. This paper confirms that children's literature can be a powerful platform for examining psychological conflict and emotional integration by exposing the unconscious aspects of abandonment anxiety.

Keywords: childhood, fearfulness, abandonment, anxiety, dependency.

INTRODUCTION

Childhood is a crucial stage in human development during which emotional, psychological, and social identities are gradually formed. Literature has long served as a medium through which the complexities of childhood experiences are explored and interpreted. Many literary works portray childhood not merely as a period of innocence but as a phase marked by loneliness, imagination, fear, and self-discovery. Children's literature, in particular, often reveals the inner emotional landscapes of young characters and reflects how environmental and social influences shape their personalities. One of the most significant works that portrays the psychological and emotional dimensions of childhood is *The Secret Garden* written by Frances Hodgson Burnett. *The Secret Garden* narrates the story of Mary Lennox, a neglected child who is forced to move from colonial India to her uncle's estate in Yorkshire after the death of her parents. Initially depicted as ill-tempered, lonely, and emotionally withdrawn, Mary gradually undergoes a remarkable transformation through her interaction with nature and the friendships she forms. Alongside Mary, the character of Colin Craven, her cousin who lives in fear and isolation, also represents the fragile psychological world of childhood shaped by adult influence and personal imagination. Through the experiences of these characters, Burnett offers a profound exploration of the emotional struggles and developmental processes that define childhood. A central element of the novel is the hidden garden itself, which functions not only as a physical setting but also as a symbolic representation of the children's inner emotional world. As Mary, Colin, and their friend Dickon work to revive the neglected garden, they simultaneously experience emotional healing and psychological growth. The garden becomes a transformative space where fear, loneliness, and insecurity are gradually replaced by hope, confidence, and companionship. In this way, Burnett illustrates the therapeutic power of nature and friendship in shaping the emotional development of children. This study aims to explore the representation of the inner world of childhood in *The Secret Garden* by analyzing the psychological development of the central characters and the symbolic significance of nature within the narrative. By examining Mary Lennox and Colin Craven's emotional journeys, the paper seeks to demonstrate how the novel portrays childhood as a dynamic process of transformation influenced by environment, relationships, and imagination. Ultimately, Burnett's work highlights the resilience of children and emphasizes the importance of nurturing emotional care in fostering healthy psychological growth.

The Secret Garden by Frances Hodgson Burnett have often focused on the novel's exploration of childhood psychology, the healing influence of nature, and the transformative power of friendship. Critics generally agree that the novel portrays childhood as a complex developmental stage shaped by emotional experiences and environmental influences. Through the characters of Mary Lennox and Colin Craven, Burnett presents children who struggle with loneliness, fear, and emotional neglect, while also demonstrating their capacity for growth and renewal. Several scholars have interpreted the novel through the lens of childhood development and psychological theory. Theories of cognitive and emotional development proposed by Jean Piaget suggest that children actively construct their understanding of the world through interaction with their environment. In *The Secret Garden*, Mary's curiosity and exploration of the garden reflect this process of learning and development. Her gradual transformation from a self-centered child into a compassionate and empathetic individual illustrates the role of environment and experience in shaping a child's emotional maturity. Other critics have approached the novel from a psychoanalytic perspective

influenced by the ideas of Sigmund Freud, emphasizing the impact of childhood trauma and repression on personality formation. Colin Craven's fear of illness and death, for instance, can be interpreted as the result of psychological conditioning and the influence of adults who constantly reinforce his perceived weakness. His eventual recovery demonstrates how emotional encouragement and positive belief can reshape a child's psychological outlook.

Additionally, studies in children's literature frequently highlight the symbolic role of nature in the novel. Scholars argue that the secret garden functions as a metaphor for the children's inner emotional world. As the neglected garden is gradually restored to life, the characters also experience emotional healing and personal growth. This parallel transformation underscores Burnett's broader message that nurturing environments and supportive relationships play a vital role in childhood development. While existing scholarship has explored various thematic

**Shubamantha and Vanitha**

aspects of the novel, this study seeks to further examine how the inner psychological world of childhood is constructed through character development, symbolism, and the restorative power of nature.

This study applies Attachment Theory and Object Relations Theory to understand the emotional and psychological experiences of the child characters in *The Secret Garden* by Frances Hodgson Burnett. Both theoretical perspectives emphasize the significance of early relationships in shaping a child's emotional development, identity formation, and perception of the world. By focusing on the bonds between children and their caregivers, these theories provide a valuable framework for examining how early emotional experiences influence behavior, personality, and interpersonal relationships. Attachment Theory, developed by John Bowlby, highlights the fundamental role of early emotional bonds between a child and their primary caregiver. Bowlby argues that attachment

is an innate psychological system that motivates children to seek closeness and security from caregivers during times of vulnerability (Bowlby 26). A secure attachment relationship allows the child to feel protected and supported, encouraging confidence and healthy emotional development. In contrast, when caregivers are emotionally distant, inconsistent, or neglectful, children may develop insecure attachment patterns that lead to anxiety, mistrust, or social withdrawal. These early attachment experiences significantly shape how children understand relationships and regulate their emotions as they grow (Bowlby 58). Attachment theory therefore provides an important lens for examining childhood behavior and emotional needs in literary representations of young characters. Complementing this perspective is Object Relations Theory, associated with psychoanalytic thinkers such as Melanie Klein and Donald Winnicott. Object relations theory focuses on the internal psychological representations that children form based on their early interactions with caregivers. In this framework, the term "object" refers not to a physical object but to a significant person, usually a parent or caregiver, whose relationship with the child becomes internalized in the child's mind (Klein 90). These internalized relationships shape the child's emotional world, influencing their sense of security, self-worth, and ability to form connections with others. As children develop, these internal representations guide how they interpret and respond to social relationships and emotional experiences (Winnicott 34). Together, attachment theory and object relations theory provide a meaningful framework for analyzing childhood development by emphasizing the lasting impact of early relationships on a child's psychological and emotional life

Childhood isolation and emotional neglect form one of the most significant psychological foundations in *The Secret Garden* by Frances Hodgson Burnett. The novel presents a detailed portrayal of how the absence of consistent emotional care during childhood can influence the psychological development and behavior of young individuals. The characters of Mary Lennox and Colin Craven illustrate how children who grow up without stable parental affection often develop emotional insecurity, loneliness, and difficulties in forming meaningful relationships. Their early experiences reveal the profound impact that neglectful environments can have on a child's inner emotional world. Mary Lennox's childhood is marked by profound emotional neglect. Raised in a privileged household in colonial India, she grows up surrounded by servants rather than attentive parents. Her mother shows little interest in nurturing or emotionally supporting her, and the responsibility of raising Mary falls largely upon the household staff. As a result, Mary develops an isolated and self-centered personality. Without the presence of affectionate caregivers, she fails to learn empathy, cooperation, or emotional sensitivity. Her behavior reflects the consequences of growing up in an environment where material comfort replaces emotional connection. The lack of secure attachment in her early life contributes to her feelings of loneliness and alienation when she later moves to Misselthwaite Manor. Similarly, Colin Craven's childhood is characterized by psychological isolation. Following the death of his mother, Colin is confined within the manor and raised under constant supervision by adults who treat him as physically fragile. Instead of encouraging independence, the adults around him reinforce his fears and anxieties, leading him to internalize the belief that he is weak and incapable of living a normal life. This environment prevents Colin from developing emotional resilience or self-confidence. His isolation not only separates him from other children but also limits his understanding of the world beyond the confines of his room. From the perspective of attachment theory proposed by John Bowlby, the absence of consistent emotional bonds during childhood can lead to insecure attachment patterns and psychological distress (Bowlby 68). The experiences of Mary and Colin demonstrate how

**Shubamantha and Vanitha**

emotional neglect disrupts healthy childhood development, shaping their personalities and emotional responses. Through these characters, the novel highlights the critical importance of nurturing relationships in fostering emotional stability and psychological well-being during childhood

“If you look the right way, you can see that the whole world is a garden.” (Burnett)

This line reflects the novel’s central idea that perspective, hope, and emotional openness can transform how one experiences life, just as the children’s inner worlds change as they heal and grow. In *The Secret Garden* by Frances Hodgson Burnett, the character of Colin Craven represents a complex portrayal of the inner psychological world of a child shaped by fear, isolation, and emotional insecurity. Colin grows up in an environment dominated by grief and overprotection following the death of his mother. Instead of experiencing a supportive childhood, he is confined within the walls of Misselthwaite Manor and constantly treated as physically fragile by the adults around him. This environment significantly shapes his psychological state, causing him to internalize the belief that he is weak and incapable of leading a normal life. Colin’s psychological condition is deeply influenced by the attitudes and expectations of the adults who surround him. His caretakers reinforce the idea that he is sickly and unable to move freely, which gradually forms the basis of his self-perception. As a result, Colin develops intense anxiety and emotional instability. He becomes prone to anger, frustration, and despair, often expressing these emotions through sudden outbursts. His behavior reflects a child struggling to cope with loneliness and a lack of emotional reassurance. Instead of developing confidence and independence, Colin’s upbringing encourages dependency and fear. From the perspective of attachment theory proposed by John Bowlby, Colin’s psychological struggles can be understood as the consequence of disrupted attachment relationships. Bowlby argues that children require consistent emotional support from caregivers in order to develop a secure sense of self and emotional stability. In Colin’s case, the absence of nurturing parental presence, combined with the constant reinforcement of his perceived weakness, contributes to his feelings of helplessness and vulnerability. Additionally, object relations theory associated with Melanie Klein helps explain how Colin internalizes the attitudes of those around him. The adults’ fearful and protective behavior becomes part of his internal psychological world, shaping how he views his body and abilities. Consequently, Colin’s inner world is dominated by fear and self-doubt. Through Colin’s character, Burnett vividly illustrates how childhood environments and early relationships play a crucial role in shaping a child’s psychological identity. In *The Secret Garden* by Frances Hodgson Burnett, nature plays a crucial role in shaping the emotional and psychological transformation of Mary Lennox. At the beginning of the novel, Mary is portrayed as a lonely, irritable, and emotionally withdrawn child. Her early childhood is marked by neglect and the absence of meaningful parental affection. As a result, she develops a cold and self-centered personality. However, her arrival at Misselthwaite Manor introduces her to a natural environment that gradually influences her emotional development. The Yorkshire moors and the hidden garden provide Mary with a new space where she can explore, observe, and interact with the natural world. Through these experiences, nature becomes a powerful healing force that helps reshape her inner emotional state. Mary’s initial encounters with nature awaken a sense of curiosity and engagement that had been absent in her earlier life. The open landscape of the moors contrasts sharply with the confined and artificial environment in which she was raised. Spending time outdoors allows Mary to experience freedom, fresh air, and physical activity, all of which contribute to her gradual physical and

emotional improvement. As she begins to explore the grounds of the manor, she develops a growing fascination with plants, animals, and seasonal changes. This interaction with the natural environment encourages her to move beyond her isolation and develop a sense of responsibility and care. The secret garden itself becomes the central symbol of Mary’s emotional healing. When Mary begins to nurture the neglected garden, she simultaneously begins to nurture her own emotional growth. Gardening requires patience, attention, and dedication, qualities that Mary gradually learns through her involvement with the garden. As the plants begin to grow and flourish, Mary also experiences a transformation in her personality. She becomes more energetic, compassionate, and capable of forming friendships. Her growing connection with nature encourages a sense of belonging and emotional balance that she had never previously experienced. From a psychological perspective, the restorative influence of nature can also be connected to theories of emotional development. Generally, the natural environments provide children with opportunities for exploration, independence, and imaginative engagement, which contribute to healthy psychological growth. Mary’s

**Shubamantha and Vanitha**

experiences illustrate how nature can act as a therapeutic space where emotional wounds begin to heal. Through her interaction with the garden and the surrounding landscape, Mary develops confidence, empathy, and emotional resilience. Nature functions not merely as a backdrop but as an active agent of healing and transformation. Burnett demonstrates that contact with the natural world can nurture emotional well-being and encourage personal growth, ultimately helping Mary rediscover joy, curiosity, and human connection. In *The Secret Garden* by Frances Hodgson Burnett, nature functions as a powerful agent of healing, and the secret garden itself becomes a symbolic and transformative space where emotional restoration takes place. The garden, which had remained locked and neglected for many years after the death of Mrs. Craven, initially represents grief, loss, and emotional stagnation. Just as the garden has been abandoned and left to decay, the children in the novel particularly Mary Lennox and Colin Craven experience emotional emptiness and psychological isolation. When the garden is rediscovered, it gradually becomes a space where both the physical environment and the inner lives of the children begin to change and flourish. The process of restoring the garden mirrors the emotional healing experienced by the characters. When Mary first discovers the garden, it is overgrown and forgotten, yet it still contains the hidden potential for life and growth. As she begins to care for the plants and remove the weeds, she also begins to shed her own feelings of loneliness and bitterness. The act of gardening encourages patience, responsibility, and attentiveness, allowing Mary to develop qualities that had previously been absent in her personality. Through her daily interaction with the garden, she becomes physically healthier and emotionally more balanced.

The garden also becomes a place of transformation for Colin Craven. Having spent most of his childhood confined indoors and convinced of his own weakness, Colin initially lacks confidence and emotional stability. When he is finally brought into the garden, the natural surroundings offer him a sense of freedom and vitality that he has never experienced before. The fresh air, sunlight, and living plants create an atmosphere that encourages him to believe in his own strength and recovery. The garden thus functions as a therapeutic environment where fear and insecurity gradually give way to hope and self-belief. From a psychological perspective, the healing power of the garden can be understood through the lens of emotional development and human connection with nature. Natural spaces provide opportunities for exploration, reflection, and emotional renewal. Within the novel, the garden becomes a sanctuary where the children are free from the restrictive expectations of adults and are able to develop their identities in a supportive environment. As the garden begins to bloom with new life, it symbolically reflects the inner growth of the children themselves. Therefore, the garden in the novel operates not merely as a physical setting but as a living symbol of regeneration and healing. It demonstrates how nature can restore emotional well-being, nurture imagination, and guide children toward psychological growth and self-discovery.

The theme of transformation is closely connected to the psychological development of childhood. The novel illustrates how children's personalities and emotional states are not fixed but capable of change when they are exposed to nurturing relationships and supportive environments. Through the experiences of Mary Lennox and Colin Craven, Burnett portrays childhood as a stage of growth where emotional wounds can gradually heal and new patterns of thinking and behavior can emerge. Their transformations demonstrate the resilience of children and their ability to develop emotionally when they receive care, companionship, and encouragement. At the beginning Mary Lennox is depicted as an isolated and emotionally detached child. Her early life, marked by neglect and lack of parental attention, shapes her into a self-centered and unpleasant individual. However, as she begins to explore the grounds of Misselthwaite Manor and later discovers the hidden garden, her personality gradually changes. The process of caring for the garden introduces her to responsibility, patience, and empathy. Through her interactions with Dickon and Colin, Mary learns the value of friendship and emotional connection. Her transformation reflects an important aspect of childhood development, in which social relationships and environmental experiences contribute to the formation of emotional maturity. Colin Craven undergoes an equally significant psychological transformation. For most of his childhood, Colin lives under the constant belief that he is physically weak and destined to remain ill. The adults around him reinforce this perception, which leads him to develop anxiety and feelings of helplessness. His psychological condition illustrates how a child's self-image can be shaped by external influences and repeated

**Shubamantha and Vanitha**

messages from authority figures. However, once Colin begins spending time in the secret garden and forming friendships with Mary and Dickon, his perspective gradually changes. The supportive environment encourages him to believe in his own strength and capabilities, leading to both emotional and physical improvement. From the perspective of attachment theory developed by John Bowlby, these transformations can be understood as the result of new emotional bonds and supportive relationships. Bowlby suggests that secure attachments help children develop confidence and emotional stability (Bowlby 89). As Mary and Colin begin to form meaningful connections with one another and with their surroundings, they experience the sense of belonging that was absent in their earlier lives. Thus, the novel emphasizes that childhood development is a dynamic and transformative process. Burnett ultimately presents childhood not as a static condition but as a period of growth in which emotional healing and psychological maturity can be achieved through care, companionship, and positive experiences.

The Secret Garden by Frances Hodgson Burnett can be effectively interpreted through the frameworks of Attachment Theory and Object Relations Theory. Both theories emphasize the importance of early relationships in shaping the emotional world and psychological development of children. By applying these perspectives to the novel, it becomes possible to understand how the absence of nurturing bonds initially affects the characters and how new emotional connections later contribute to their transformation. Attachment Theory, developed by John Bowlby, highlights the significance of early emotional bonds between children and their caregivers. According to Bowlby, children develop a sense of security and emotional stability when they experience consistent affection and responsiveness from caregivers (Bowlby 40). When such attachments are absent or disrupted, children may develop feelings of insecurity, anxiety, and emotional withdrawal. This theoretical perspective is particularly relevant to the character of Mary Lennox. Mary grows up in an environment where her parents remain distant and emotionally unavailable. Instead of receiving warmth and affection, she is largely raised by servants who respond to her demands but do not provide genuine emotional care. As a result, Mary develops characteristics often associated with insecure attachment, including irritability, loneliness, and difficulty forming relationships with others. Similarly, Colin Craven's psychological condition reflects the consequences of disrupted attachment. After the death of his mother, Colin grows up without consistent parental support and becomes surrounded by adults who treat him with excessive caution and pity. This environment prevents him from developing confidence and independence. His fear of illness and death illustrates the emotional insecurity that can arise when a child lacks stable attachment figures. From Bowlby's perspective, both Mary and Colin demonstrate how the absence of secure emotional bonds can shape a child's behavior and self-perception. Object Relations Theory further deepens the understanding of these characters' psychological experiences. Developed by psychoanalytic thinkers such as Melanie Klein and later expanded by Donald Winnicott, object relations theory focuses on how children internalize their early relationships with caregivers. In this framework, "objects" refer to significant individuals, usually parents or caregivers, whose interactions with the child form internal psychological representations that influence later emotional life (Klein 92). These internalized relationships shape how individuals perceive themselves and relate to others.

In the novel, both Mary and Colin initially internalize negative relational experiences. Mary's emotional coldness reflects her early experience of neglect, while Colin internalizes the fearful attitudes of the adults who constantly remind him of his supposed weakness. However, as the narrative progresses, new relationships begin to reshape these internal patterns. Mary's friendship with Dickon and her growing bond with Colin introduce supportive emotional connections that challenge her earlier experiences of neglect. Similarly, Colin's interactions with Mary and the experience of freedom in the garden help him develop a more positive sense of self. Thus, the application of attachment theory and object relations theory reveals that the transformation of the characters in the novel is closely linked to the formation of new emotional bonds. Through these relationships, the children gradually reconstruct their inner psychological world, moving from insecurity and isolation toward emotional stability and confidence.

In The Secret Garden by Frances Hodgson Burnett, the secret garden functions as more than a physical location; it operates as a transformative and healing space that nurtures the emotional and psychological development of the children. The garden symbolizes renewal, growth, and restoration, reflecting the gradual healing of Mary Lennox and Colin Craven. Initially, both children suffer from emotional neglect, loneliness, and insecurity due to the absence

**Shubamantha and Vanitha**

of supportive familial relationships. Their early experiences demonstrate how a lack of attachment and emotional care can affect childhood development. However, the discovery of the garden marks the beginning of a significant shift in their psychological states. The garden offers an environment free from the restrictions and expectations imposed by adults. Within this space, the children are able to explore, interact with nature, and build meaningful relationships with one another.

The act of nurturing plants and witnessing their growth encourages patience, responsibility, and optimism. As Mary participates in the restoration of the garden, she gradually develops empathy and emotional awareness. Similarly, Colin's exposure to the garden challenges the negative beliefs that had been instilled in him since childhood. Surrounded by the vitality of nature, he begins to believe in his own physical and emotional strength. From the perspective of attachment theory proposed by John Bowlby, the garden can be viewed as a setting that facilitates the formation of new and healthier emotional bonds (Bowlby 90). The friendships formed within this space provide the children with the sense of security and belonging that had previously been absent in their lives. In addition, object relations theory associated with Melanie Klein suggests that positive relational experiences allow individuals to reshape their internal emotional world (Klein 95). Through their shared experiences in the garden, Mary and Colin begin to replace feelings of fear and isolation with confidence and trust. The exploration of childhood in *The Secret Garden* reveals that emotional neglect and isolation can profoundly affect the psychological development of children. Through the characters of Mary Lennox and Colin Craven, the novel illustrates how early experiences shape a child's inner emotional world. However, the narrative also emphasizes the possibility of transformation when children encounter nurturing environments and supportive relationships. By applying attachment theory and object relations theory, it becomes clear that the healing experienced by the characters is closely connected to the formation of new emotional bonds and positive experiences. Ultimately, the secret garden symbolizes the restorative power of nature, companionship, and emotional care, demonstrating that childhood development is a dynamic process capable of growth, resilience, and renewal.

ABSTRACT

This paper studies how personal life and national history are connected in *Persepolis*, a graphic memoir by Marjane Satrapi. The story is set during the Iranian Revolution and shows the social and political changes that followed. The black-and-white drawings are not just a style choice; they help show the strong conflicts between the individual and the government, and between freedom and control. This paper focuses on three main ideas: Memory, Nation, and Womanhood. First, it explains how memory becomes a form of resistance. By sharing her personal experiences, Satrapi challenges the official version of history given by the state. Second, it discusses the idea of the nation through the eyes of a young girl growing up. The narrator loves her country but questions the strict and oppressive rules imposed in the name of religion and politics. Third, the paper examines how womanhood is represented. The female body, especially through the symbol of the veil, becomes a space where political and religious control is enforced. Satrapi shows how women resist these controls and search for freedom. In conclusion, this paper argues that *Persepolis* goes beyond a simple life story. By using the graphic format, Satrapi makes her personal struggle meaningful for people everywhere. The memoir shows that remembering the past is a powerful act, and that women play a central role in the fight for freedom and identity.

Keywords: Graphic Memoir, Memory, Nation, Visual literacy, Feminism, Resistance, Womanhood.

INTRODUCTION

Graphic memoirs combine picture and personal story telling. They have become an important literary form in the recent years. Among the most influential works in this genre is Marjane Satrapi's *Persepolis*, first published in French in 2000. Set against the backdrop of the Iranian Revolution (1979) and the subsequent Iran-Iraq War, the memoir

**Yazhini**

offers account of growing up amid political instability. Unlike conventional historical narratives, Persepolis presents national history through the subjective lens of childhood memory, and make big political events easier to understand. The significance of Persepolis lies not only in its content but also in its form. Satrapi's use very strong contrast black-and-white imagery produces a visual language that the strong division in Iranian society after revolution. The memoir examines how personal memory, national identity, and gender politics intersect within everyday life. Through the experiences of young Marji, Satrapi reveals how strict government attempt to regulate both public behaviour and private identity. This paper argues that Persepolis functions as an act of cultural and political resistance. By showing memory, reimagining the nation through a child's perspective, and exposing the control imposed on women's bodies, Satrapi challenges dominant narratives about Iran, Islam, and female subjectivity. The following sections examine these themes in detail.

The Graphic Memoir as Political Form

Before analysing the core themes, it is important to understand why the graphic memoir format is particularly suited to Satrapi's project. Graphic narratives rely on the interaction between image and text, creating what scholars call "visual literacy." Readers must interpret meaning not only through words but also through visual cues such as framing, contrast, and spatial arrangement.

In Persepolis, the black-and-white palette performs several functions:

1. Moral and ideological contrast: The stark binary reflects the regime's attempt to divide society into rigid categories—faithful versus traitor, modest versus immoral.
2. Memory reconstruction: The simplified drawings mimic the fragmentary nature of childhood memory.
3. Universal accessibility: The minimalist style allows readers from diverse cultural backgrounds to engage with the narrative.

Satrapi herself has noted that black and white avoids exoticizing Iran. Instead of presenting an orientalist spectacle, the visual simplicity emphasizes emotional truth. Thus, the graphic form becomes inseparable from the memoir's political message.

Memory as Resistance**Personal Memory versus Official History**

One of the central concerns of Persepolis is the tension between personal memory and state-controlled history. Strict government often try to control history to protect their powers. In post-revolutionary Iran, school textbooks and public discourse promoted a singular ideological version of events.

Satrapi counters this by showing her own memories. Childhood scenes—family conversations, classroom experiences, street protest —collectively construct an alternative archive. These memory show that difference between what the government says and what the people actually experience. For example, while the state glorifies martyrdom during the Iran- Iraq War, Satrapi depicts the grief, fear, and confusion experienced by ordinary families. Memory thus becomes a political tool. By remembering differently, Satrapi refuses the erasure imposed by official discourse.

Fragmentation and the Child's Perspective

The memoir's episodic structure reflects the fragmented nature of memory. Rather than presenting a continuous historical timeline, Satrapi offers snapshots of experience. This fragmentation serves two purposes. First, it enhances authenticity. Childhood memory is rarely linear; it consists of vivid moments that stand out emotionally. Second, this broken structure makes the story feel more personal and less official. The child narrator openly admits confusion, curiosity, and contradiction. Young Marji frequently misunderstands political events, yet this very misunderstanding reveals the absurdity of ideological indoctrination. Her questions—about religion, class, and revolution—expose the inconsistencies within official rhetoric. In this way, the child's voice becomes subversive.

Family Memory and Intergenerational Resistance

Yazhini

Memory in Persepolis is not purely individual; it is deeply familial. Marji's parents and grandmother play crucial roles in shaping her political consciousness. Through stories of imprisonment, protest, and exile, the family preserves a counter-history that resists state authority. The grandmother, in particular, symbolizes moral continuity. Her advice about dignity and integrity anchors Marji during moments of identity crisis. These intergenerational memories demonstrate how resistance is transmitted within private spaces even when public dissent is suppressed.

Reimagining the Nation

Love and Critique

A notable feature of Persepolis is the way it presents nationalism in complex and thoughtfully manner. Satrapi neither romanticizes nor rejects Iran outright. Instead, she presents a complex emotional relationship with the nation. Young Marji expresses deep pride in Iran's history and culture. She learns about ancient Persian civilization and initially supports the revolution's promise of justice. However, as the government becomes more authoritarian, her patriotic excitement gradually turns into critical awareness.

This shows that Iran cannot be seen in a simple way as only an oppressive country. Satrapi distinguishes between the Iranian people and the ruling regime, thereby reclaiming the nation from political absolutism.

The Nation Through a Child's Eyes

Viewing national transformation through a child narrator produces a powerful, it makes readers see political events in a new view. Political slogans and ideological rituals appear strange when filtered through Marji's literal interpretations. For instance, compulsory veiling in schools confuses the young girls, who initially treat their veils as play objects. This scene reveals how state power attempts to naturalize control, while children instinctively resist rigid discipline. The child's perspective also highlights the intrusion of politics into everyday life. Bombings, food shortages, and moral policing become part of ordinary childhood experience. By situating national trauma within domestic spaces, Satrapi demonstrates that political violence is never abstract—it reshapes intimate life.

Womanhood and the Politics of the Body

The Veil as Political Symbol

Perhaps the most widely discussed theme in Persepolis is the politicization of the female body. After the revolution, the Iranian government imposed mandatory veiling, transforming women's clothing into a visible marker of ideological conformity. Satrapi treats the veil not as a simple religious garment but as a contested symbol. For the state, it represents moral purity and national identity. The memoir repeatedly shows how the veil becomes a site of negotiation. Women adjust it, loosen it, or combine it with Western fashion, subtly resisting rigid control. These small acts demonstrate that power is never absolute; it is continually contested in everyday practices.

Growing Up Female in Revolutionary Iran

Marji's coming-of-age is shaped by gendered expectations. As she enters her teenage years, the regime increases its restriction on female behaviour. Moral guardians patrol the streets, monitoring clothing, makeup, and public interaction between men and women. Satrapi portrays this surveillance with both humour and critique. Scenes where women are stopped for "improper veiling" show how far the state interfaces in women's personal freedom. At the same time, the memoir acknowledges the real fear underlying these encounters. Women's bodies become a place where government control and personal freedom clash.

Feminist Resistance and Solidarity

Despite oppressive conditions, Persepolis foregrounds women's agency. Marji's mother participates in demonstrations; her grandmother offers moral guidance; female friends experiment with identity and style. These characters collectively challenge stereotypes of passive Muslim women. Satrapi's feminism is grounded in lived experience rather than abstract theory.

Resistance appears in multiple forms:

1. speaking openly within the family

**Yazhini**

2. participating in protests
3. pursuing education abroad
4. Asserting personal dignity in daily interaction. By highlighting these actions, the memoir shows that Iranian women are active and strong, not silent.
5. Visual Literacy and the Power of Black and White Minimalism and Emotional Impact

The visual style of *Persepolis* deserves close attention. Satrapi's drawings are deliberately simple, avoiding excessive detail. Because of this minimal style readers can pay more attention to emotional expression and symbolism. Black often represents repression, fear, or ideological rigidity, while white spaces suggest possibility and reflection. The interplay between these tones mirrors the memoir's thematic concern with binaries—freedom versus control, childhood innocence versus political violence.

Universality Through Stylization

Because the characters are not hyper-realistic, readers from different cultural backgrounds can easily identify with them. The stylized figures function almost like visual archetypes, enabling the memoir to reach readers from different countries. This universality is crucial to Satrapi's project. She aims not only to tell her personal story but also to challenge Western misconceptions about Iran. The graphic format, combined with the black-and-white palette, creates an accessible yet politically sharp narrative Silence, Panels, and Narrative Rhythm.

Equally important is Satrapi's use of panel structure. Moments of silence—wordless frames showing bombed buildings or solitary figures—carry significant emotional weight. These visual pauses allow readers to process trauma in ways that pure text might not achieve. The rhythm created by panel sequencing mirrors the uneven pace of memory itself. Fast-moving sequences depict chaos and fear, while larger static panels emphasize reflection and loss. Through these techniques, the memoir highlights the unique special strength of graphic storytelling.

Global Reception and Cultural Significance

Persepolis has achieved international acclaim, partly because it bridges cultural divides. For Western readers, it offers an insider perspective that counters media stereotypes about Iran. For Iranian and diasporic readers, it preserves a nuanced memory of revolutionary experience.

The memoir also expanded the legitimacy of graphic narratives within academic discourse. Once dismissed as popular or juvenile, graphic memoirs are now recognized as serious literary forms capable of complex political commentary. Satrapi's work has influenced subsequent graphic autobiographies dealing with war, migration, and gender politics. Its continued presence in university curricula demonstrates its lasting relevance.

CONCLUSION

Persepolis is far more than a personal coming-of-age story. Through the innovative use of the graphic memoir form, Marjane Satrapi constructs a layered narrative that intertwines memory, national identity, and womanhood. The stark black-and-white imagery functions as a visual metaphor for ideological conflict while also making the story universally accessible. The memoir shows that memory can serve as a powerful form of resistance against authoritarian attempts to control history. By presenting the Iranian Revolution through the eyes of a questioning child, Satrapi rehumanizes political events often reduced to abstract headlines. Furthermore, her portrayal of women's everyday negotiations with power challenges simplistic assumptions about Muslim female passivity. In the end, *Persepolis* shows that personal stories can change how we understand history. Remembering the past becomes an act of political courage, and women's voices emerge as central to struggles over freedom, identity, and national belonging. Even today, the book remains important because it shows how graphic memoirs can tell powerful stories of resistance.
