ABSTRACT

The present study reports the first record of *Eupanacra busiris busiris* (Walker, 1856) (Lepidoptera: Sphingidae) from Meghalaya, India. A single adult male individual was observed and documented under nocturnal conditions. The species was identified based on distinct morphological characteristics, including elongated forewings with a strongly sinuate outer margin and a characteristic green rippled pattern. The species known from various parts of South and Southeast Asia, including northeastern India but there are no previous confirmed records from Meghalaya. The present finding extends the known distribution of the species within the Indo-Burma biodiversity hotspot and highlights the under-explored nature of moth diversity in the region. The study emphasizes the importance of systematic surveys and documentation in improving baseline data on Lepidoptera.

Keywords: Sphingidae, Hawk-moth, Lepidoptera, Biodiversity, Distribution extension

INTRODUCTION

The order Lepidoptera represents one of the most diverse groups of insects, playing crucial roles in ecosystem functioning, particularly in pollination, herbivory, and as bioindicators of environmental change. Within this order, the family *Sphingidae* (hawk-moths) is a well-defined and ecologically significant group, comprising over 1,600

species worldwide. Members of this family are characterized by their robust bodies, streamlined wings, and powerful flight capabilities, enabling them to hover while feeding on nectar, often exhibiting -behaviours analogous to hummingbirds. Hawkmoths are also recognized for their importance in plant–pollinator interactions, especially in tropical and subtropical ecosystems. The genus *Eupanacra* Cadiou & Holloway, 1989 belongs to the subfamily Macroglossinae and is distributed widely across the Oriental biogeographic region. Species within this genus are generally medium-sized and are distinguished by their elongated forewings, sinuate wing margins, and cryptic green or brown coloration that provides camouflage against foliage. Despite their relatively distinct morphology, many species of *Eupanacra* Cadiou & Holloway, 1989 remain poorly studied, particularly in terms of their distribution, larval host plants, and ecological roles.*Eupanacrabusirisbusiris* (Walker, 1856), commonly referred to as the Green Rippled Hawkmoth, is one such species known for its characteristic green forewings marked with undulating transverse lines and a strongly indented outer margin. Northeastern India, forming part of the Indo-Burma biodiversity hotspot, is recognized for its exceptional species richness and high levels of endemism. The state of Meghalaya, in particular, with its unique topography, high rainfall, and diverse forest types ranging from tropical evergreen to subtropical pine forests, provides a wide array of ecological niches suitable for lepidopteran diversity. Despite this, the moth fauna of Meghalaya remains inadequately explored compared to other parts of India. Most available studies have focused on butterflies, while moths, especially nocturnal groups like Sphingidae, have received comparatively limited attention.

The apparent absence of *Eupanacrabusirisbusiris* from published records of Meghalaya may not necessarily indicate true absence but rather reflects insufficient sampling, especially in remote and forested landscapes. Nocturnal moths are often underrepresented in biodiversity assessments due to methodological limitations and the need for specialized sampling techniques such as light trapping. Furthermore, the morphological similarity among species within *Eupanacra* can lead to misidentification, thereby complicating accurate documentation. In recent years, photographic documentation has emerged as a valuable tool in biodiversity studies, enabling non-destructive sampling while providing verifiable records for species occurrence. High-resolution images, when combined with taxonomic expertise and digital databases, have significantly improved the accuracy and accessibility of species identification. Such records are particularly important for updating distributional ranges and detecting previously undocumented occurrences. In this context, the present study aims to document the first photographic record of *Eupanacrabusirisbusiris* from Meghalaya, India. This record not only fills a gap in the known distribution of the species but also underscores the importance of systematic surveys and photographic documentation in uncovering the hidden diversity of moths in the region. The study contributes to the growing body of knowledge on the lepidopteran fauna of northeastern India and highlights the need for continued research in this biodiversity-rich yet understudied landscape.

MATERIALS AND METHODS

Study Area:

The present study was conducted in Meghalaya, a northeastern state of India situated within the Indo-Burma biodiversity hotspot. The survey was carried out in and around Kiling area located in Ri-Bhoi district Meghalaya (Fig.1).The region is characterized by subtropical evergreen and semi-evergreen forests, interspersed with patches of secondary vegetation and grasslands. The varied topography and vegetation structure provide suitable habitats for a diverse assemblage of lepidopteran fauna, particularly nocturnal moths. This species was observed in semi-evergreen forest habitat, particularly along forest edges and areas with secondary vegetation. The species appears to prefer humid environments.

Survey Period

Field surveys were conducted over a period from September 2025 to March 2026, covering post-monsoon and winter seasons. Sampling was carried out at regular intervals to capture temporal variation in moth diversity and activity patterns. Moth sampling was performed using standard light trapping method, which are widely employed for

nocturnal Lepidoptera surveys. An ultraviolet (UV) light source was used in conjunction with a vertically suspended white cotton sheet (approximately 2 × 5 m).The light trap was installed at forest edges and near vegetation-rich areas to maximize species attraction. Sampling was avoided during heavy rainfall and strong winds, as these conditions significantly reduce moth activity. Individuals attracted to the light source were carefully observed and photographed without any physical collection, following non-destructive sampling protocols. High-resolution images were captured using a digital DSLR camera Nikon with macro lens, ensuring clear visibility of diagnostic morphological characters such as wing pattern, coloration, and body structure. Identification of the recorded specimen was carried out based on external morphological characteristics using standard taxonomic literature and online databases such as Moths of India and global sphingids references. Diagnostic features including wing shape, coloration, and pattern were compared with published descriptions and authenticated images. The study followed non-invasive sampling methods, and no specimens were collected or harmed during the survey. The research adhered to standard ethical guidelines for biodiversity documentation and field studies. The study is based on opportunistic photographic documentation, and absence of specimen collection may limit further morphological or molecular verification. Additionally, the survey period covered only part of the annual cycle, and extended sampling across all seasons may reveal additional records.

RESULTS

The study confirms the First distributional record of *Eupanacrabusirisbusiris* (Walker, 1856) inMeghalaya state from Ri-Bhoi District Kiling Area India.
Systematic position:
Order Lepidoptera Linnaeus, 1758
SuperfamilyBombycoidea Latreille, 1802
FamilySphingidae Latreille, 1802
SubfamilyMacroglossinae Harris, 1839
Genus*Eupanacra*Cadiou & Holloway, 1989
Eupanacra busiris busiris (Walker, 1856)

Material Examined: One male adult individual (photographed), India: Meghalaya, Kiling area Ri-Bhoi district, attracted to light, photographed by (Golphina Ahmed).

Diagnosis: The population of the species has a striking green rectangle in the anterior part of the forewing, running from first quarter along the costa to third quarters. The distal posterior angle of this rectangle is edged with white and the basal part is linked to the dorsum by a green band. The base of the forewing dorsum has a clear white patch.

Distribution: Assam (Arandhara 2016); West Bengal (Shah *et al.* 2018); Arunachal Pradesh (Haxaire *et al*. 2024; Singh *et al*., 2026).

Global records: Nepal, Bhutan (Irungbam & Irungbam, 2019); Bangladesh (Walker, 1856); Myanmar, Thailand, southern China, Laos, Vietnam (Kitching & Spitzer, 1995); Malaysia (Peninsular, Sarawak) (Lodl, 1993); Indonesia (Sumatra, Java, Kalimantan) (Pittaway & Kitching, 2025); Borneo (Haxaire *et al*., 2024; Singh *et al*., 2026).

Remarks: The genus includes 14 species from India, and only *Eupanacra moseri* (Gehlen, 1930) is reported from Meghalaya so far (Singh *et al.,* 2026). The present record represents the first documentation of *Eupanacrabusirisbusiris* from Meghalaya and second species of the genus from the state (Fig. 2). Although the species is known from neighbouring regions, its absence in earlier records from Meghalaya likely reflects inadequate sampling of nocturnal Lepidoptera. The diagnostic green rippled forewing pattern and sinuate margin clearly distinguish it from other species within the genus *Eupanacra*. This finding highlights the need for further systematic surveys in the region to better understand sphingids diversity and distribution.

DISCUSSION

The present study documents the first photographic record of *Eupanacrabusiris busiris* (Walker, 1856) from Meghalaya, thereby extending its known distribution within northeastern India. Although the species has been previously reported from adjacent regions such as Assam and other parts of the Indo-Burma biogeographic zone, its occurrence in Meghalaya had remained undocumented. This apparent absence is likely attributable to insufficient sampling of nocturnal Lepidoptera rather than true absence. Northeastern India, particularly Meghalaya, represents a biologically rich yet underexplored region for moth diversity. The state's unique combination of high rainfall, varied altitudinal gradients, and heterogeneous forest types provides ideal ecological conditions for Sphingidae. The occurrence of *E. busirisbusiris* in the present study area is biogeographically consistent, as Meghalaya shares contiguous forest landscapes with Assam and other neighbouring regions where the species has already been recorded. Such continuity facilitates species dispersal and supports the presence of a shared lepidopteran fauna across political boundaries. The genus *Eupanacra* is known for its cryptic coloration and morphological similarity among species, which often leads to underreporting or misidentification.In particular, *E. busirisbusiris* may be confused with closely related congeners due to overlapping external characteristics. However, the distinct green forewing with undulating transverse lines and the strongly sinuate outer margin observed in the present specimen provide reliable diagnostic features for accurate identification.

The use of photographic documentation, as employed in this study, plays a crucial role in resolving such taxonomic ambiguities, especially in regions where specimen collection is limited. The detection of *E. busirisbusiris* through light trapping further supports the effectiveness of this method in documenting nocturnal moth diversity. Hawk-moths are generally strong fliers and may not always be easily encountered during routine surveys; however, artificial light sources significantly enhance detection probability. The observed activity of the species during humid evening conditions aligns with known behavioural patterns of many sphingids, which are influenced by temperature, humidity, and seasonal factors. The present finding underscores the importance of sustained and systematic surveys across different seasons to capture the full extent of moth diversity in Meghalaya. Given that the current record is based on a single individual, further studies are necessary to determine the population status, seasonal abundance, and ecological preferences of the species in the region. Additionally, information on larval host plants and life history traits remains largely unknown for this species in India and warrants focused investigation.From a conservation perspective, documenting species occurrences is fundamental for biodiversity assessment and management. The inclusion of *E. busirisbusiris* in the faunal inventory of Meghalaya contributes to baseline data essential for monitoring changes in species distribution, particularly in the face of habitat alteration and climate change. As moths serve as important ecological indicators, their study can provide insights into ecosystem health and stability.

ACKNOWLEDGMENT

The authors are grateful to the Principal Chief Conservator of Forests (PCCF), Meghalaya, and the Meghalaya Biodiversity Board for granting the necessary permissions to conduct field surveys in different parts of Meghalaya. The first author extends special thanks to Mr. Rezzak Hossain for his invaluable assistance, continuous support, and dedicated efforts throughout the survey period. The authors also express their sincere gratitude to the Head of the Department of Zoology for providing constant encouragement, necessary facilities, and support for carrying out this research successfully.

Conflict of Interest: The authors have no conflict of interest.

ABSTRACT

An innovative geometric method is proposed for constructing vertex-degree-based molecular structure descriptors (topological indices).The model is based on the minimum spanning tree of graphs or compounds in which the first Zagreb index is normalised inducing a vertex-degree-based topological index of remarkable simplicity termed as Spanning Tree Complexity *(STC)* index. The main mathematical bounds of *STC* index are established analytically and computed for 50 graphs of$n = 2$ to $n = 100$in python, ensuring path and star graphs as extremals enhancing *STC* as a structural topological descriptor.

Keywords: Minimum Spanning tree, normalised first Zagreb index, Spanning Tree Complexity index, vertex-degree-based topological index, analytical geometric interpretation, computational geometric interpretation.

Mathematics Subject Classification: 05C05, 05C07, 05C09, 05C10, 68-04.

INTRODUCTION

Let $G = (V, E)$ be a connected graph with or without loops and multiple edges. Let *MST* be the minimum spanning tree obtained from G. Throughout this paper, n stands for the number of vertices of G. For any vertex v of Gdegree of$v$ is denoted by$deg(v)$. The very first concept of topological index was introduced by Wiener in 1947 [1].Many of the topological indices are now interested on mathematical chemistry, which mainly focuses on vertex degree of the molecular graphs. The concept of Zagreb index (vertex-degree-based topological index) was proposed by Ivan Gutman and Trinajstić in 1972[2] and in 2000 it was considered as a complexity index [3]. The first Zagreb Index [4]$M_1(G)$is defined as $M_1(G) = \sum_{v \in V(G)} \deg(v)^2$.The Zagreb indices and their variants are being used to analyse molecular complexity and so on. We encourage the reader to go through [5-9]for historical background, computational techniques and mathematical properties of Zagreb Indices. Also, by using every connected graph has a spanning tree [10]we introduce a new vertex-degree-based topological index named Spanning Tree Complexity index *(STC)*as a normalised first Zagreb index, being motivated by the above concepts. The *STC* index is computed using Minimum spanning tree (*MST*) of the respective graph. The *MST* is ensured here to compute large networks complexity as it is helpful in the topology backbone and a normalisation of first Zagreb index is made to ensure its efficiency and Significancy in various fields like chemistry, structural biology, etc. In this paper, we define *STC* index and prove its bounds by computing 50 graphs from of $n = 2$ to $n = 100$ for a valid outcome.

Spanning Tree Complexity Index

In this section, we define *STC* index and interpret it analytically and then computationally.

Definition 2.1 Let $G = (V, E)$ be a connected graph with n vertices and *MST* denote the minimum spanning tree then the Spanning Tree Complexity index is defined as

$$STC(G) = \frac{1}{(n-1)^2} \sum_{i=1}^{n} deg_{MST}\,(v_i)^2$$

where $deg_{MST}(v_i)^2$ denote the degree of $v_i (i = 1\ to\ n)$ of minimum spanning tree.

The term $(n-1)^2$ is the normalisation used here. The following example illustrates the calculation of *STC* index.

Illustration:

Let us consider *G* as the Peterson graph with 10 vertices and 15 edges. Figure 1 shows Petersen graph and figure 2 shows *MST* of Petersen graph. The *STC* index of Petersen graph is calculated as follows.

$\sum_{i=1}^{n} deg_{MST}\,(v_i)^2 = 1^2 + 2^2 + 3^2 + 1^2 + 3^2 + 1^2 + 1^2 + 3^2 + 1^2 + 2^2 = 40$ and $(n-1)^2 = (10-1)^2 = 81$.

$$STC(G) = \frac{1}{(n-1)^2} \sum_{i=1}^{n} deg_{MST}\,(v_i)^2 = \frac{40}{81} = 0.493827$$

Analytical geometric interpretation of *STC* index

Topological indices are most useful when their range and extremal values are known analytically. For *STC* index defined on the minimum spanning tree, the bounds followed directly from the fact that *MST* is minimum spanning tree with n vertices. Among all of order n, the path and star graphs are known to extremize degree-based vertices [11]. In this section, we prove that *STC* index is bounded between the Path and Star cases and interpret these bounds geometrically.

Lemma2.1 For any path graph P_n, $n \geq 2$, we have

$$STC(P_n) = \frac{4n-6}{(n-1)^2}.$$

Proof: Let us consider the path graph P_n, $n \geq 2$. Then a path with n vertices is shown in figure 3. Since MST of P_n is P_n itself, it has only two vertices have degree 1 and the rest $n-2$ vertices have degree 2. Thus, the degree sequence of $P_n = \{1,2,2,\ldots.,2,2,1\}$. Now,

$$\sum_{i=1}^{n} deg_{MST}\,(v_i)^2 = 1^2 + 1^2 + \underbrace{2^2 + 2^2 + \cdots + 2^2 + 2^2}_{(n-2)\ times} = 2 + (n-2)4 = 4n-6$$

Since,

$$STC(G) = \frac{1}{(n-1)^2}\sum_{i=1}^{n} deg_{MST}\,(v_i)^2$$

we get

$$STC(P_n) = \frac{4n-6}{(n-1)^2}. \blacksquare$$

Lemma 2.2 For any star graph S_n, $n \geq 2$, we have

$$STC(S_n) = \frac{n}{n-1}.$$

Proof: Let the graph be a star graph S_n, $n \geq 2$. Then a star with n vertices have 1 central vertex connected to all $n-1$ leaves. MST of S_n is S_n itself,in which the central vertex has degree $n-1$ and all the rest$n-1$ leaves have degree 1. Thus, the degree sequence of $S_n = \{n-1,1,1,\ldots.,1,1\}$.Now,

$$\sum_{i=1}^{n} deg_{MST}\,(v_i)^2 = (n-1)^2 + \underbrace{1^2 + 1^2 + \cdots + 1^2 + 1^2}_{(n-1)\ times} = (n-1)^2 + (n-1) = (n-1)n.$$

Since,

$$STC(G) = \frac{1}{(n-1)^2}\sum_{i=1}^{n} deg_{MST}\,(v_i)^2$$

we get

$$STC(S_n) = \frac{n}{n-1}. \blacksquare$$

Theorem 2.3 For any connected graph G with $n \geq 2$ vertices, we have$0 < STC(G) \leq 2$.

Proof: Since G is a connected graph and MST is the minimum spanning tree of G with n vertices and $n-1$ edges.Since for trees with fixed n,$\sum \deg(v_i)^2$ is minimum for path P_n andmaximum for star S_n [11].

$$M_i^F(P_n) \leq \sum_{i=1}^{n} deg_{MST}\,(v_i)^2 \leq M_i^F(S_n)$$

where $M_i^F = \sum \deg(v_i)^2$is the F-index.Dividing each term by$(n-1)^2$and byusing lemma 2.1 and lemma 2.2 we write

$$\frac{4n-6}{(n-1)^2} \leq STC(G) \leq \frac{n}{n-1}.$$

Lower bound: For all $n \geq 2, \frac{4n-6}{(n-1)^2} > 0$ since $4n-6 \geq 2$.

Upper bound: For all $n \geq 2, \frac{n}{n-1} = 1 + \frac{1}{n-1} \leq 2$ since $\frac{1}{n-1} \leq 1$.

Hence $0 < STC(G) \leq 2$. ■

Corollary 2.4 For large networks, $P_n \to 0$ and $S_n \to 1$.

Proof: Since for large networks $n \to \infty$, we get

$$\lim_{n\to\infty} STC(P_n) = \lim_{n\to\infty} \frac{4n-6}{(n-1)^2} = 0 \text{ and } \lim_{n\to\infty} STC(S_n) = \lim_{n\to\infty} \frac{n}{n-1} = 1.$$

Hence for large networks $P_n \to 0$ and $S_n \to 1$. ■

Corollary 2.5 For $n = 2, STC(P_n) = STC(S_n) = 2$.

Proof: The proof is an immediate result from lemma 2.1 and lemma 2.2 for $n = 2$. ■

Now the analytical bounds derived is validated computationally in the following.

Computational geometric interpretation of *STC* index

The computation of *STC* index is done using python code. For each connected graph G with n vertices, *STC* index is computed in 3 steps.

Step 1: The *MST* is constructed from G using Kruskal's algorithm [10] with edge weightsw_{ij}.

Step 2: The degree $deg_{MST}(v_i)$ of each vertex in *MST* is obtained.

Step 3: *STC* index is calculated by summing squared degrees and normalising by $(n-1)^2$.

The algorithm 1 shows the computation of STC index for 50 graphs. One should be aware of installing packages like numpy [12], pandas [13] and network x [14] for a successful running of the program and get the desired output as Table 1 in the terminal.

RESULTS AND DISCUSSION

Validation of analytical bounds by computation

To verify Theorem 2.3, *STC* index has been computed for 50 graphs including path graphs, star graphs, canonical graph models like Watts-Strogatz WS, Barabási-Albert BA and Erós-Renyi ER networks, Petersen graph, grid 10×10 graph, Karate club graph, C_{100}, K_{20} and $K_{10,90}$of $n = 2$ to $n = 100$.Table 1 represents the *STC* values of these 50 graphs and figure 4 representing *STC* validating the analytical bounds. Figure 4 implies that all empirical *STC* values lie within the grey shaded region bounded by $STC(P_n) = \frac{4n-6}{(n-1)^2}$ and $STC(S_n) = \frac{n}{n-1}$. This validates theorem 2.3 computationally. For large n, STC approaches 0 for path-like and approaches 1 for star-like validating corollary 2.4. Also, for $n = 2, STC(P_n) = STC(S_n) = 2$ validating corollary 2.5

DISCUSSION

As theorem 2.3 establishes $0 < STC(G) \leq 2$ for any connected graph, with path and star *MST*s to Achieve Extremals, Geometrically, *STC* index measures how the *MST* deviates from a $1D$linear chain to a$0D$ hub and spoke structure. Also, for canonical graph models $STC(BA) > STC(ER) > STC(WS)$ indicating *STC* index quantifies their structural difference (branching) in one number. The normalisation made in *STC* index ensures that *STC* is comparable across graphs of different sizes.

CONCLUSION

In this paper, we proposed Spanning Tree Complexity (*STC*) index, a normalised first Zagreb index on minimum spanning tree. We hereby computed the graphs to validate the analytical bounds and proved computationally the extremals as path and star graphs. This ensures that *STC* increases with topological branching. This work in future can be extended to differentiate protein folds.

ABSTRACT

Interval Neutrosophic Filter (INF), which is an extension of interval-valued fuzzy sets. Interval-valued intuitionistic fuzzy sets and neutrosophic filter deal with the uncertain and inconsistent information that frequently occurs in real-life systems. They are distinguished by their truth, indeterminacy, and falsity membership degrees. The majority of the current literature on correlation measures for INSs is built using entropies and distance measurements.Meanwhile, when taking into account of interval-valued data, the degree of correlation is represented by a single integer. Interval-valued data may be lost as a result. In this research, we propose a novel method for building the correlation measures for INF using fuzzy equivalencies and lattice Wajsberg algebra to address these problems. The definition of Interval Neutrosophic Filter Fuzzy Equivalence (INFE) is first extended to interval neutrosophic values based on fuzzy equivalencies, implicative filter, and aggregation operators. Then, utilizing the INFE, we suggest the definition and construction method of the correlation measure based on the framework of INF. More information than ever before could be retained by the correlation degree, which is represented as an interval. Furthermore, by selecting parameters in fuzzy equivalence, one can attain a distinct correlation that aligns with real-world situations. Finally, an example is given to show how the suggested method can be used.

Keywords: Interval valued neutrosophic filter, fuzzy equivalence filter, neutrosophic filter, correlation measure.

INTRODUCTION

Smarandache presented the conception of Neutrosophic Set (NS) in 2010 [20], an expansion of the concepts of Intuitive Fuzzy Sets (IFs) and Fuzzy Sets (FS). They have three membership functions: Truth(T), Indeterminate(I) and Falsity (F). These three membership functions compose the NS $\langle T, I, F \rangle$, where T, I and $F \in [0,1$. Li et al. presented three constructive strategies for the definition of IVFE [13], also provided two useful methods for transforming an INS into a single-valued NS and a fuzzy set, respectively. Next, we define the interval neutrosophic cross-entropy using two different approaches: fuzzy cross-entropy extension and single-valued neutrosophic cross-entropy. [17]. Font. J. M, Antonio. J. R and Torrense. A introduced the notion is called implicative filter(IF), Basheer Ahamed.M and Ibrahim presented the Intuitionistic fuzzy implicative filter and zhang developed the Neutrosophic Filter (NF). The concept of NF generalized by a fuzzy filter and Intuitionistic Filters (IF). A. Ibrahim and V. Nirmala proposedIF of Resituated Lattice Wajsberg Algebras in 2018[6, 7]. MetaweeSongsaen et al, defined Neutrosophic implicative UP-filters, neutrosophic comparative UP-filters, and neutrosophic shift UP-filters of UP-algebras.Sathya.S, et al. suggestedtwo new types of filters in Lattice Wajsbergalgebra : the Intuitionistic Fuzzy Filter (IFF) and the Intuitionistic Fuzzy Lattice Filter (IFLF) [19].It has been demonstrated that the conventional correlation analysis, which is based on statistics and probabilities, is inadequate for handling failure data and modelling uncertainty. The challenge to classical statistical theory is the fuzziness-based method for measuring the correlation between two variables. Doyel Sarkar and Sharmisth Ghosh proposed the Hausdorff Similarity-Measure on Neutrosophic Soft Set with its Applicability in Decision Making (DM) [2], which is one of the many applications specified in correlation and Similarity-Measures. Jun Ye proposed Similarity-Measures based on the generalized distance of neutrosophic Z-number sets and their multi-attribute DM method. Karabacak and Mesut defined Correlation coefficient for Neutrosophic Z-Numbers and its applications in DM [9, 10], the degree and development of the relevant relationship are shown by the Correlation-Coefficient between two parameters, which is essential in statistical computing.

The quality and comprehensiveness of the data gathered from a particular dataset are often critical to the accuracy of applicability assessments. Sometimes, data used in statistical research has inherent uncertainty and trade-offs. Rıdvan Şahin and Peide Liu, suggested Correlation-Coefficient of Single-Valued neutrosophic hesitant fuzzy sets and its applications in DM and the same author, defined the Important tools for quantifying uncertain information are entropy and similarity measures [17, 18]. In particular, entropy and similarity are studied in tandem to apply in multicriteria decision-making (MCDM) problems. Qin k. Y et al. developed a new intuitionistic fuzzy correlation coefficient approach with applications in MCDM this measures of fuzzy sets and intuitionistic fuzzy sets are proposed and applied in real-world problems. In order to address the shortcomings of current information expression and operations of multi-valued/hesitant neutrosophic sets (MVNSs) and single-valued neutrosophic multisets (SVNMs), this work first presents neutrosophic multi-valued sets (NMVSs), which include SVNMs and MVNSs, as a generic concept. [14]. The aim of this article is to propose the notion of correlation measure for Neutrosophic Filter (NF). In Section 2, the basic definitions of neutrosophic set, interval-valued neutrosophic, and interval are provided. In Section 3, filter, fuzzy equivalence filter, aggregation operations, and INF are defined with examples. The Section 4,described an INF and correlation measure of INF. Additionally, section 5 describes the application of neutrosophic filter fuzzy equivalence as a correlation measure for finding the computational application of decision-making.

NS – Neutrosophic Set
INS – Interval Valued Neutrosophic Set
INF – Interval Neutrosophic filter
FE – Fuzzy Equivalence
FEF – Fuzzy Equivalence Filter
IFEF – Interval Fuzzy Equivalence Filter
INFE – Interval Neutrosophic Filter Fuzzy Equivalence

PRELIMINARIES

Definition 1: Let the universe be $\mathfrak{U}$. A Neutrosophic Set $\mathcal{E}$ in $\mathfrak{U}$ is characterized by a truth ($T_{\mathcal{E}}$), an indeterminacy ($I_{\mathcal{E}}$), and falsity-membership function ($F_{\mathcal{E}}$), the functions are real standard or non-standard subset of$]^{-}0, 1^{+}[$. Then the NS $\mathcal{E}$ can be denoted by,

$\mathcal{E} = \{< f, T_A(f), I_A(f), F_A(f) >: f \in \mathfrak{U}, T_A(f), I_A(f), F_A(f) \in [0,1]\}$

Thus, the total sum is unconstrained.

Then $^{-}0 \leq supT_A(f) + supI_A(f) + SUPF_A(f) \leq 3^{+}$.

Definition 2: Let the universe be$\mathfrak{U}$, with generalized element f in $\mathfrak{U}$. An INS$\mathcal{E}$ in $\mathfrak{U}$ is characterized by a truth ($T_{\mathcal{E}}$), an indeterminacy ($I_{\mathcal{E}}$), and falsity membership function ($F_{\mathcal{E}}$).

Where $T_{\mathcal{E}}$(f), $I_{\mathcal{E}}$(f), $F_{\mathcal{E}}$(f) ∈ [0, 1] for each point f in $\mathfrak{U}$.

Then IVNs $\mathcal{E}$ can be expressed as

$$\mathcal{E} = \{< f, T_A(f), I_A(f), F_A(f) >: f \in \mathfrak{U}, T_A(f), I_A(f), F_A(f) \in [0,1]\}$$

Therefore, the sum of $T_{\mathcal{E}}$(f), $I_{\mathcal{E}}$(f) and $F_{\mathcal{E}}$(f) satisfies the condition $0 \leq supT_A(f) + supI_A(f) + supF_A(f) \leq 3$.

For convenience, if $T_A(f) = [T_A^L(f),\ T_A^U(f)]$, $I_A(f) = [I_A^L(f),\ I_A^U(f)]$ and $F_A(f) = [F_A^L(f),\ F_A^U(f)]$, then

$\mathcal{E}$ = {<d, $([T_A^L(f),\ T_A^U(f)],\ [I_A^L(f),\ I_A^U(f)],\ [F_A^L(f),\ F_A^U(f)])$> | f ∈ $\mathfrak{U}$}

Definition 3: Let the universe be $\mathfrak{U}$ and G, H ∈ INS ($\mathfrak{U}$). G in contained in H, denoted by G⊆ H, if $T_G^L(f) \leq T_H^L(f)$, $T_G^U(f) \leq T_H^U(f)$, $I_G^L(f) \leq I_H^L(f)$, $I_G^U(f) \leq I_H^U(f)$ and $F_G^L(f) \geq F_H^L(f)$, $F_G^U(f) \geq F_H^U(f)$.

Definition 4: Since the IVS we extend the logic operation∧,∨, ^{c} on the closed interval[0, 1] to the interval value set $N_{[0,1]}$, then some operation can be presented as follows: for every u = $[u^L, u^U]$, v = $[v^L, v^U] \in N_{[0,1]}$, foe every $\lambda \in [0,1]$

- $u \wedge v = [u^L \wedge v^L, u^U \wedge v^U]$
- $u \vee v = [u^L \vee v^L, u^U \vee v^U]$
- $u^c = [1 - u^U, 1 - u^L]$
- $\min N_{[0,1]} = [0,0], \max N_{[0,1]} = [1,1]$
- u + v = $[(u^L + v^L) \wedge 1, (u^U + v^U) \wedge 1]$
- $\lambda u = [\lambda u^L, \lambda u^U]$

FEF and Aggregation Function (AF)

Definition 5: Let $\mathfrak{U}$ be a lattice Wajsberg Algebra (WA). A subset $\mathcal{P}$ of $\mathfrak{U}$ is called an IF of $\mathfrak{U}$, the subsequent axioms are satisfying for any $f, q \in \mathfrak{U}$,

1. $1 \in \mathcal{P}$
2. $f \in \mathcal{P}$ and $f \to q \in \mathcal{P}$ for all $q \in \mathcal{P}$.

Definition 6:A function $\mathbb{E} : [0,1] \times [0,1] \to [0,1]$ is called a FEF if it fulfils the subsequent:

1) $\mathbb{E}F(u \to u, v \to v) = \mathbb{E}F(v \to v, u \to u)$ for every u, v ∈ [0, 1]
2) $\mathbb{E}F(u \to u) = 1\ for\ every\ u \in [0,1]$
3) For all u, v, w ∈ [0, 1], if u ≤ $v \leq w$, then

$\mathbb{E}F(u \to w) \leq \{\mathbb{E}F(u \to v), \mathbb{E}F(v \to w)\}$

Example 1: $\mathbb{E}\boldsymbol{F}_{(\boldsymbol{\theta},\boldsymbol{\alpha})}$is the general form of FEF for every u, v ∈ [0, 1], respectively, given by:

$$\mathbb{E}F_{(\boldsymbol{\theta},\boldsymbol{\alpha})}(u \to u, v \to v) = \frac{\theta - \theta|u - v| + \alpha\ min(u \to u, v \to v)}{\theta - (\theta - 1)|u - v| + \alpha\ min(u \to u,\ v \to v)}$$

With $\theta \geq 0, \alpha \geq 0$. Furthermore, the previously discussed techniques can yield a collection of distinct fuzzy equivalencies implication functions by giving specific values for parameters θ and α.

1. If $\theta = 0$, $\alpha = 1$,

$$\mathbb{E}F_{(\theta,\alpha)}(u \to u, v \to v) = \frac{\min(u_{u\to u},\ v_{v\to v})}{|u-v|+\min(u_{u\to u}, v_{v\to v})}$$

$$= \frac{\min(u_{u\to u}, v_{v\to v})}{\max(u_{u\to u}, v_{v\to v})} = \frac{u_{u\to u} \wedge v_{v\to v}}{u_{u\to u} \vee v_{v\to v}}$$

2. If $\theta = 0$, $\alpha = 2$,

$$\mathbb{E}F_{(\theta,\alpha)}(u \to u, v \to v) = \frac{2\min(u_{u\to u},\ v_{v\to v})}{u+v} = \frac{2(u_{u\to u} \wedge v_{v\to v})}{u+v}$$

Definition 7: A function Ag: $[0,1]^n \to [0,1]$ is an aggregation operator(AO) if it fulfils the subsequent:

1) Ag (u, u, u, ……, u) = u for every u ∈ [0, 1]
2) Ag is monotonically increasing in all of its arguments.

Next, the aggregation operator example for convex linear combinations,
$Ag_\lambda(u_1, u_2, \dots, u_n) = \lambda \min(u_1, u_2, \dots, u_n) + (1-\lambda)\max(u_1, u_2, \dots, u_n)$, with $\lambda \in [0,1]$.specifically, for every u, v ∈ [0, 1], $Ag_\lambda(u,v) = \lambda \min(u,v) + (1-\lambda)\max(u,v)$. In particularly,
if $\lambda = 0$, $Ag_0(u,v) = \max(u,v) = u \vee v$
if $\lambda = 1, Ag_1(u,v) = \min(u, v) = u \wedge v$. As well, for every $\lambda_1,\ \lambda_2 \in [o,1], \lambda_1 < \lambda_2$, then $Ag_{\lambda_1}(u,v) \le Ag_{\lambda_2}(u,v)$.

Definition 8: A function $I\mathbb{E}F : N_{[0,1]}^2 \to N_{[0,1]}$ is called an IFEF using function, if it fulfils the subsequent:

1. $I\mathbb{E}F(u \to u, v \to v) = I\mathbb{E}F(v \to v, u \to u)$ for every u, v ∈ $N_{[0,1]}$
2. $I\mathbb{E}F(u \to u, u \to u) = [1, 1]$ for any u ∈ $N_{[0,1]}$
3. For all u, v, w ∈ $N_{[0,1]}$, and if $u \le v \le w$, then
   $I\mathbb{E}F(u \to u, w \to w) \le I\mathbb{E}F(u \to u, v \to v)$
   $I\mathbb{E}F(u \to u, w \to w) \le I\mathbb{E}F(v \to v, w \to w)$

Theorem 1: Let $\mathbb{E}F_{(\theta,\alpha)}$ be the given FEF and Ag_μ and Ag_φ be two AF such that $Ag_\mu \le Ag_\varphi$. Then, the function $I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)} : N_{[0,1]}^2 \to N_{[0,1]}$ is an IFEF, and it is defined as follows, for every u, v ∈ $N_{[0,1]}$

$\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, v \to v) = \left[Ag_\mu\left(\mathbb{E}F_{(\theta,\alpha)}((u \to u)^L, (v \to v)^L), \mathbb{E}F_{(\theta,\alpha)}((u \to u)^U, (v \to v)^U)\right), Ag_\varphi\left(\mathbb{E}F_{(\theta,\alpha)}((u \to uL, v \to vL, \mathbb{E}F(\theta,\alpha)u \to uU, v \to vu\right.\right.$

Proof: Since $Ag_\mu \le Ag_\varphi$, we have $I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}$ fulfil the following three properties.

1. Since $\mathbb{E}F_{(\theta,\mu)}$ is a FEF, should fulfil the symmetry, we have

$I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, v \to v) = I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(v \to v, u \to u)$

2. For every u ∈ [0, 1], we have $\mathbb{E}F_{(\theta,\alpha)}(u \to u, u \to u) = 1$, The aggregation function $Ag_\mu(1 \to 1, 1 \to 1) = 1$ and $Ag_\varphi(1 \to 1, 1 \to 1) = 1$. Thus

$I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, v \to v) = [1, 1]$, for every u ∈ $N_{[0,1]}$

3. For every u, v, w ∈ $N_{[0,1]}$, if $u \le v \le w$, then $u^L \le v^L \le w^L$ and $u^U \le u^U \le u^U$.

We have $\mathbb{E}F_{(\theta,\alpha)}((u \to u)^L, (w \to w)^L) \le \mathbb{E}F_{(\theta,\alpha)}((u \to u)^L, (v \to v)^L)$ and $\mathbb{E}F_{(\theta,\alpha)}((u \to u)^U, (w \to w)^U) \le \mathbb{E}F_{(\theta,\alpha)}((u \to uU, v \to vU$. Then

$$Ag_{(\mu,\varphi)}\left(\mathbb{E}I_{m\,(\theta,\alpha)}((u \to u)^L, (w \to w)^L), \mathbb{E}F_{(\theta,\alpha)}((u \to u)^U, (w \to w)^U)\right)$$
$$\le Ag_{(\mu,\varphi)}\left(\mathbb{E}I_{m\,(\theta,\alpha)}((u \to u)^L, (v \to v)^L), \mathbb{E}F_{(\theta,\alpha)}((u \to u)^U, (v \to v)^U)\right)$$

Therefore,

$$I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, w \to w) \le I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, v \to v)$$
$$I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(u \to u, w \to w) \le I\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}(v \to v, w \to w)$$

If $\mu = 1, \varphi = 0, \theta = 0, \alpha = 1$, we define

$\text{I}\mathbb{E}F_{(1,0),(0,1)}(u \to u, v \to v) = \left[Ag_1\left(\mathbb{E}F_{(0,1)}((u \to u)^L, (v \to v)^L), \mathbb{E}F_{(0,1)}((u \to u)^U, (v \to v)^U)\right),\ Ag_0\left(\mathbb{E}F_{(0,1)}((u \to uL, v \to vL, \mathbb{E}F0,1u \to uU, v \to vU\right)\right.$

The Aggregation operator $Ag_0(u, v) = u \vee v$ and $Ag_1(u, v) = \text{u} \wedge v$ of (6) for$\mathbb{E}_{(0,1)}(u, v) = \frac{u \wedge v}{u \vee v}$ of example (1), then

$I\mathbb{E}F_{(1,0),(0.1)}(u \to u, v \to v)$

$$= \left[Ag_1\left(\frac{(u \to u)^L \wedge (v \to v)^L}{(u \to u)^L \vee (v \to v)^L}, \frac{(u \to u)^U \wedge (v \to v)^U}{(u \to u)^U \vee (v \to v)^U}\right), Ag_0\left(\frac{(u \to u)^L \wedge (v \to v)^L}{(u \to u)^L \vee (v \to v)^L}, \frac{(u \to u)^U \wedge (v \to v)^U}{(u \to u)^U \vee (v \to v)^U}\right)\right]$$

$$= \left[\frac{(u \to u)^L \wedge (v \to v)^L}{(u \to u)^L \vee (v \to v)^L} \wedge \frac{(u \to u)^U \wedge (v \to v)^U}{(u \to u)^U \vee (v \to v)^U}, \frac{(u \to u)^L \wedge (v \to v)^L}{(u \to u)^L \vee (v \to v)^L} \vee \frac{(u \to u)^U \wedge (v \to v)^U}{(u \to u)^U \vee (v \to v)^U}\right]$$

Interval Neutrosophic Filter Fuzzy Equivalence

Definition 9: Let $\mathfrak{U}$ be a lattice-WA. A NS $\mathcal{A} = \left(\left(T_{\mathcal{A}}^L, T_{\mathcal{A}}^U\right), \left(I_{\mathcal{A}}^L, I_{\mathcal{A}}^U\right), \left(F_{\mathcal{A}}^L, F_{\mathcal{A}}^U\right)\right)$ of $\mathfrak{U}$ is called an INF of $\mathfrak{U}$, if it fulfils the inequalities for all u, v $\in \mathfrak{U}$

1. $\left(T_{\mathcal{A}}^L(1), T_{\mathcal{A}}^U(1)\right) \geq \left(T_{\mathcal{A}}^L(x), T_{\mathcal{A}}^U(x)\right)$

$$\left(I_{\mathcal{A}}^L(1), \quad I_{\mathcal{A}}^U(1)\right) \geq \left(I_{\mathcal{A}}^L(x), \quad I_{\mathcal{A}}^U(x)\right)$$

$$\left(F_{\mathcal{A}}^L(1), \quad F_{\mathcal{A}}^U(1)\right) \leq \left(F_{\mathcal{A}}^L(x), \quad F_{\mathcal{A}}^U(x)\right)$$

2. $\left(T_{\mathcal{A}}^L(x), T_{\mathcal{A}}^U(x)\right) \geq ((\min(T_{\mathcal{A}}(x \to y), T(x)))^L, (\min(T_{\mathcal{A}}(x \to y), T_{\mathcal{A}}(x)))^U)$

$\left(I_{\mathcal{A}}^L(x), I_{\mathcal{A}}^U(x)\right) \geq ((\min(I_{\mathcal{A}}(x \to y), I_{\mathcal{A}}(x)))^L, (\min(I_{\mathcal{A}}(x \to y), I_{\mathcal{A}}(x)))^U)$

$\left(F_{\mathcal{A}}^L(x), F_{\mathcal{A}}^U(x)\right) \leq ((\max(F_{\mathcal{A}}(x \to y), F_{\mathcal{A}}(x)))^L, (\max(F_{\mathcal{A}}(x \to y), F_{\mathcal{A}}(x)))^U)$

Definition 10: A function INFE: $D^* \times D^* \to N_{[0,1]}$is called an INFE, if it fulfils the subsequent:

1. INFE (u, v) = INFE (v, u) for every u, v $\in D^*$
2. INFE (u) = [1, 1] for every u $\in D^*$
3. For every u, v, w $\in D^*$, if u $\leq v \leq$ w, then

INFE (u, w) $\leq INFE\ (u, v)$,

INFE (u, w) $\leq INFE\ (v, w)$.

Theorem 2: Suppose that $\text{I}\mathbb{E}F_\zeta$, $\text{I}\mathbb{E}F_\psi$ and $\text{I}\mathbb{E}F_\chi$ are INFE, a function $\grave{\mathbb{F}} : D^* \times D^* \to N_{[0,1]}$ is defined for everyu = (u_1, u_2, u_3),

v = $(v_1, v_2, v_3) \in D^*$ by:

$$\grave{\mathbb{F}}(u, v) = \text{I}\mathbb{E}F_\zeta(u_1, v_1) + \text{I}\mathbb{E}F_\psi(u_1, v_1) + \text{I}\mathbb{E}F_\chi(u_1, v_1)$$

Then, $\grave{\mathbb{F}}$ is interval neutrosophic filter fuzzy equivalence,

Proof. Property 1), 2) and 3) followed by theorem 1.

Suppose that, in theorem 2, Following the previous IEF, we take $\text{I}\mathbb{E}F_\zeta = \text{I}\mathbb{E}F_\psi = \text{I}\mathbb{E}F_\chi = \text{I}\mathbb{E}F_{(\mu,\varphi),(\theta,\alpha)}$ and use them to derive the appropriate INFE, $\text{I}NFE_{(\mu,\varphi),(\theta,\alpha)}$, as follows.

$INFE_{(1,0),(0,1)}(\text{u}, v) = \frac{1}{3}\sum_{i=1}^{3}\left[\frac{(u_i)^L \wedge (v_i)^L}{(u_i)^L \vee (v_i)^L} \wedge \frac{(u_i)^U \wedge (v_i)^U}{(u_i)^U \vee (v_i)^U}, \frac{(u_i)^L \wedge (v_i)^L}{(u_i)^L \vee (v_i)^L} \vee \frac{(u_i)^U \wedge (v_i)^U}{(u_i)^U \vee (v_i)^U}\right]$

Correlation-Measure for INF

Definition 11: Let the universe be $\mathfrak{U}$. A function $\check{\rho}$: INF ($\mathfrak{U}$) ×INF ($\mathfrak{U}$) $\to N_{[0,1]}$ is called a correlation measure for INF in $\mathfrak{U}$, if is fulfils the subsequent:

1. $\check{\rho}(A, B) = \check{\rho}(B, A)$
2. $\check{\rho}(A, B) = 1 \Leftrightarrow A = B$
3. If A $\subseteq B \subseteq C$, then $\check{\rho}(A, C) \leq \check{\rho}(A, B)$, $\check{\rho}(A, C) \leq \check{\rho}(B, C)$

Theorem 3: Let $\mathfrak{U} = u_1, u_2, \ldots, u_n$ be a universe. Then $\check{\rho}_{INEF} : INF(\mathfrak{U}) \times INF(\mathfrak{U}) \to N_{[0,1]}$ is a correlation measure, Where for every A, B $\in INF(\mathfrak{U})$. INEF is an INFE on D^*,

$\check{\rho}_{INFE}(A,B) = \frac{C_{INFE}(A,B)}{\sqrt{C_{INFE}(A,A)*C_{INFE}(B,B)}}$

Proof.

1) Since INEF (A, B) = INEF (B, A), then $\check{\rho}_{INFE}(A,B) = \check{\rho}_{INFE}(B,A)$
2) For every A, B ∈ INF ($\mathfrak{U}$), $\check{\rho}_{INFE}(A,B)$ = [1, 1] ⇔ INEF (A, B) = [0, 1] ⇔ $A = B$
3) For every A, B, C ∈ INF ($\mathfrak{U}$), if A ⊆ $B \subseteq C$, then A ≤ $B \leq C$, then

$\check{\rho}_{INFE}(A,C) = \frac{C_{INFE}(A,C)}{\sqrt{C_{INFE}(A,A)*C_{INFE}(C,C)}} \leq \frac{C_{INFE}(A,B)}{\sqrt{C_{INFE}(A,A)*C_{INFE}(B,B)}} = \check{\rho}_{INFE}(A,B)$.

Similarly, we have $\check{\rho}_{INFE}(A,C) \leq \check{\rho}_{INFE}(B,C)$.

According above theorem, using the fuzzy equivalence filter $INEF_{(\mu,\varphi),(\theta,\alpha)}$, it is obtaining the following correlation measure $\check{\rho}$ for INF.

$$C_{INFE\,(1,0),(0,1)}(A,B) = \sum_{i=1}^{p}\Big([\frac{T_A^L(x_i)\wedge T_B^L(x_i)}{T_A^L(x_i)\vee T_B^L(x_i)} \wedge \frac{T_A^U(x_i)\wedge T_B^u(x_i)}{T_A^U(x_i)\vee T_B^u(x_i)}, \frac{T_A^L(x_i)\wedge T_B^L(x_i)}{T_A^L(x_i)\vee T_B^L(x_i)} \vee \frac{T_A^U(x_i)\wedge T_B^u(x_i)}{T_A^U(x_i)\vee T_B^u(x_i)}]$$
$$+[\frac{I_A^L(x_i)\wedge I_B^L(x_i)}{I_A^L(x_i)\vee I_B^L(x_i)} \wedge \frac{I_A^U(x_i)\wedge I_B^U(x_i)}{I_A^U(x_i)\vee I_B^U(x_i)}, \frac{I_A^L(x_i)\wedge I_B^U(x_i)}{I_A^L(x_i)\vee I_B^U(x_i)} \vee \frac{I_A^U(x_i)\wedge I_B^U(x_i)}{I_A^U(x_i)\vee I_B^U(x_i)}]$$
$$+[\frac{F_A^L(x_i)\wedge F_B^L(x_i)}{F_A^L(x_i)\vee F_B^L(x_i)} \wedge \frac{F_A^U(x_i)\wedge F_B^u(x_i)}{F_A^U(x_i)\vee F_B^u(x_i)}, \frac{F_A^L(x_i)\wedge F_B^L(x_i)}{F_A^L(x_i)\vee F_B^L(x_i)} \vee \frac{F_A^U(x_i)\wedge F_B^U(x_i)}{F_A^U(x_i)\vee F_B^U(x_i)}]\Big)$$

$$C_{INFE\,(1,0),(0,1)}(A,A) = \sum_{i=1}^{p}\Big([\frac{T_A^L(x_i)\wedge T_A^L(x_i)}{T_A^L(x_i)\vee T_A^L(x_i)} \wedge \frac{T_A^U(x_i)\wedge T_A^U(x_i)}{T_A^U(x_i)\vee T_A^U(x_i)}, \frac{T_A^L(x_i)\wedge T_A^L(x_i)}{T_A^L(x_i)\vee T_A^L(x_i)} \vee \frac{T_A^U(x_i)\wedge T_A^U(x_i)}{T_A^U(x_i)\vee T_A^U(x_i)}]$$
$$+[\frac{I_A^L(x_i)\wedge I_A^L(x_i)}{I_A^L(x_i)\vee I_A^L(x_i)} \wedge \frac{I_A^U(x_i)\wedge I_A^U(x_i)}{I_A^U(x_i)\vee I_A^U(x_i)}, \frac{I_A^L(x_i)\wedge I_A^u(x_i)}{I_A^L(x_i)\vee I_A^u(x_i)} \vee \frac{I_A^L(x_i)\wedge I_A^U(x_i)}{I_A^L(x_i)\vee I_A^U(x_i)}]$$
$$+[\frac{F_A^L(x_i)\wedge F_A^L(x_i)}{F_A^L(x_i)\vee F_A^L(x_i)} \wedge \frac{F_A^U(x_i)\wedge F_A^U(x_i)}{F_A^U(x_i)\vee F_A^U(x_i)}, \frac{F_A^L(x_i)\wedge F_A^L(x_i)}{F_A^L(x_i)\vee F_A^L(x_i)} \vee \frac{F_A^L(x_i)\wedge F_A^U(x_i)}{F_A^L(x_i)\vee F_A^U(x_i)}]\Big)$$

And

$$C_{INFE\,(1,0),(0,1)}(B,B) = \sum_{i=1}^{p}\Big([\frac{T_B^L(x_i)\wedge T_B^L(x_i)}{T_B^L(x_i)\vee T_B^L(x_i)} \wedge \frac{T_B^U(x_i)\wedge T_B^U(x_i)}{T_B^U(x_i)\vee T_B^U(x_i)}, \frac{T_B^L(x_i)\wedge T_B^L(x_i)}{T_B^L(x_i)\vee T_B^L(x_i)} \vee \frac{T_B^U(x_i)\wedge T_B^U(x_i)}{T_B^U(x_i)\vee T_B^U(x_i)}]$$
$$+[\frac{I_B^L(x_i)\wedge I_B^L(x_i)}{I_B^L(x_i)\vee I_B^L(x_i)} \wedge \frac{I_B^U(x_i)\wedge I_B^U(x_i)}{I_B^U(x_i)\vee I_B^U(x_i)}, \frac{I_B^L(x_i)\wedge I_B^L(x_i)}{I_B^L(x_i)\vee I_B^L(x_i)} \vee \frac{I_B^U(x_i)\wedge I_B^U(x_i)}{I_B^U(x_i)\vee I_B^U(x_i)}]$$
$$+[\frac{F_B^L(x_i)\wedge F_B^L(x_i)}{F_B^L(x_i)\vee F_B^L(x_i)} \wedge \frac{F_B^U(x_i)\wedge F_B^U(x_i)}{F_B^U(x_i)\vee F_B^U(x_i)}, \frac{F_B^L(x_i)\wedge F_B^L(x_i)}{F_B^L(x_i)\vee F_B^L(x_i)} \vee \frac{F_B^U(x_i)\wedge F_B^U(x_i)}{F_B^U(x_i)\vee F_B^U(x_i)}]\Big)$$

Proposed Method and Application

The computational process that yields the best options can be summarized as follows:

Step 1: Based on the decision making $\left(\hat{\delta}^{ij}\right)_{m\times n,}$ we can compute the similarity $INFE_{(\mu,\varphi),(\theta,\alpha)}(\hat{\delta}^{ij},\hat{\delta}^{*})$ by using the equation on theorem 2, were

$\hat{\delta}^{ij} = \left([T_{\hat{\delta}^{ij}}^L, T_{\hat{\delta}^{ij}}^U], [I_{\hat{\delta}^{ij}}^L, I_{\hat{\delta}^{ij}}^U], [F_{\hat{\delta}^{ij}}^L, F_{\hat{\delta}^{ij}}^U]\right)$ is an interval neutrosophic DM and $\hat{\delta}^{*}$ is a positive ideal interval neutrosophic on D^{*}. With respect to the product order relation ≤.

Step 2: Assume that A = $\{\mathcal{A}_i \mid 1 \leq i \leq m\}$ is the set of alternatives and N = $\{N_j \mid 1 \leq j \leq n\}$is a collection of attributes. Then we can aggregate these similarities $INFE_{(\mu,\varphi),(\theta,\alpha)}(\hat{\delta}^{ij},\hat{\delta}^{*})$ to obtain the correlation degree $\check{\rho}_{INFE}(\mathcal{A}_i,\hat{\delta}^{*})$ by

$$\check{\rho}_{INFE}(\mathcal{A}_i,\hat{\delta}^{*}) = \frac{C_{INFE}(\mathcal{A}_i,\hat{\delta}^{*})}{\sqrt{C_{INFE}(\mathcal{A}_i,\mathcal{A}_i) * C_{INFE}(\hat{\delta}^{*},\hat{\delta}^{*})}}$$

Step 3: By ranking the correlation degree$\check{\rho}_{INFE}(\mathcal{A}_i,\hat{\delta}^{*})$, we can select the best alternative $\mathcal{A}_k$, in which the best alternative $\mathcal{A}_k$satisfies the condition $\check{\rho}_{INFE}(\mathcal{A}_k,\hat{\delta}^{*}) = \max\{\check{\rho}_{INFE}(\mathcal{A}_i,\hat{\delta}^{*})\}$.

Application of Computation Analysis for Decision Making

Consider a panel that has four potential investment options: (1) A_1 is a food farm; (2) A_2 is a car industry; (3) A_3 is an armaments startup; and (4) A_4 is a computer industry. The investment firm must base its choice on the three factors listed below: The growth analysis is denoted by C_1, the risk analysis by C_2, and the environmental effect study by C_3. The decision maker assesses the four potential options based on the three aforementioned criteria using interval-valued Neutrosophic fuzzy information, and the results are represented as three interval neutrosophic filter.

Step 1: The positive ideal of $\hat{\delta}^*$ = ([1, 1], [0, 0], [0, 0]); followed by the equation (theorem 2), then the $INFE_{(1,0),(0,1)}(\hat{\delta}^{11}, \hat{\delta}^*)$ *is* relation between $\mathcal{A}_1$ and $\mathcal{A}_2$we have

$$INFE_{(1,0),(0,1)}(\hat{\delta}^{11}, \hat{\delta}^*) = \frac{1}{3}([\frac{\min(T_{\mathcal{A}}(0.4\to0.6), T_A(0.4))}{\min(T_{\mathcal{A}}(1\to1), T_A(1))} \wedge \frac{\min(T_{\mathcal{A}}(0.5\to0.7), T_A(0.5))}{\min(T_{\mathcal{A}}(1\to1), T_A(1))}, \frac{\min(T_{\mathcal{A}}(0.4\to0.6), T_A(0.4))}{\min(T_{\mathcal{A}}(1\to1), T_A(1))} \vee \frac{\min(T_{\mathcal{A}}(0.5\to0.7), T_A(0.5))}{\min(T_{\mathcal{A}}(1\to1), T_A(1))}]$$

$$+ [\frac{\min(I_{\mathcal{A}}(0.2\to0.1), I_A(0.2))}{\min(I_{\mathcal{A}}(0\to0), I_A(1))} \wedge \frac{\min(I_{\mathcal{A}}(0.3\to0.2), I_A(0.2))}{\min(I_{\mathcal{A}}(0\to0), I_A(0))}, \frac{\min(I_{\mathcal{A}}(0.2\to0.1), I_A(0.2))}{\min(I_{\mathcal{A}}(0\to0), I_A(1))} \vee \frac{\min(I_{\mathcal{A}}(0.3\to0.2), I_A(0.2))}{\min(I_{\mathcal{A}}(0\to0), I_A(0))}]$$

$$+ [\frac{\max(F_{\mathcal{A}}(0\to0), I_A(1))}{\max(F_{\mathcal{A}}(0.2\to0.1), F_A(0.2))} \wedge \frac{\max(F_{\mathcal{A}}(0\to0), I_A(0))}{\max(F_{\mathcal{A}}(0.2\to0.1), F_A(0.2))}, \frac{\max(F_{\mathcal{A}}(0\to0), I_A(1))}{\max(F_{\mathcal{A}}(0.2\to0.1), F_A(0.2))} \vee \frac{\max(F_{\mathcal{A}}(0\to0), I_A(0))}{\max(F_{\mathcal{A}}(0.2\to0.1), F_A(0.2))}])$$

$$= \frac{1}{3}([\frac{0.4}{1} \wedge \frac{0.5}{1}, \frac{0.4}{1} \vee \frac{0.5}{1}] + [\frac{0.2}{0} \wedge \frac{0.3}{0}, \frac{0.2}{0} \vee \frac{0.3}{0}] + [\frac{1}{1} \wedge \frac{1}{1}, \frac{1}{1} \vee \frac{1}{1}])$$

$$= [0.4667, 0.5000]$$

For the same reason we gave the following result,

$INFE_{(1,0),(0,1)}(\hat{\delta}^{12}, \hat{\delta}^*) = [0.4667, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{13}, \hat{\delta}^*) = [0.5667, 0.6333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{21}, \hat{\delta}^*) = [0.5333, 0.5667]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{22}, \hat{\delta}^*) = [0.5333, 0.5667]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{23}, \hat{\delta}^*) = [0.4333, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{31}, \hat{\delta}^*) = [0.4333, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{32}, \hat{\delta}^*) = [0.5000, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{33}, \hat{\delta}^*) = [0.4667, 0.5000]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{41}, \hat{\delta}^*) = [0.4333, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{42}, \hat{\delta}^*) = [0.5000, 0.5333]$
$INFE_{(1,0),(0,1)}(\hat{\delta}^{43}, \hat{\delta}^*) = [0.5333, 0.5667]$

Step 2: To find the correlation measure by the equation

$$\check{\rho}_{\text{INFE}}(\mathcal{A}_1, \hat{\delta}^*) = \frac{[1.5001,\ 0.666]}{\sqrt{[3,3]*[2.0001, 2.0001]}} = [0.6124, 0.6804],$$

Similarly, $\check{\rho}_{\text{INFE}}(\mathcal{A}_2, \hat{\delta}^*)$ = [0.6123, 0.6804], $\check{\rho}_{\text{INFE}}(\mathcal{A}_3, \hat{\delta}^*)$ = [0.5715, 0.6395],
$\check{\rho}_{\text{INFE}}(\mathcal{A}_4, \hat{\delta}^*)$ = [0.5789, 0.6668]

Step 3: According to the product order≤of the interval values, we can rank these correlation measures;

$$\check{\rho}_{\text{INFE}}(\mathcal{A}_1, \hat{\delta}^*) > \check{\rho}_{\text{INFE}}(\mathcal{A}_2, \hat{\delta}^*) > \check{\rho}_{\text{INFE}}(\mathcal{A}_4, \hat{\delta}^*) > \check{\rho}_{\text{INFE}}(\mathcal{A}_3, \hat{\delta}^*)$$

Therefore, $\mathcal{A}_1$ has the best overall performance, according to the comparative analysis of the δ²INFE values, but $\mathcal{A}_2$ has a slightly lower value than $\mathcal{A}_1$, suggesting a slight variation in their efficacy within the suggested neutrosophic evaluation framework. This paper suggested interval neutrosophic filter, for instance, employs a novel fuzzy equation-based correlation metric; as a result, we get a different ranking order of options than in [15]. This demonstrates the effectiveness and efficiency of the correlation measure of the interval neutrosophic filter that is suggested in this work.

RESULT AND DISCUSSION

$\mathcal{A}_1$ has the highest neutrosophic performance measure based on the three attributes of C_1, C_2 *and* C_3, indicating better correlation stability within the suggested filtering framework, according to a comparative examination of the $\check{\rho}_{\text{INFE}}$ indices. While $\mathcal{A}_3$and $\mathcal{A}_4$ have comparatively weaker correlation strength, $\mathcal{A}_2$ shows a somewhat lower value but is still consistent with $\mathcal{A}_1$. These results confirm the neutrosophic filter's effectiveness in identifying uncertainty-driven differences across the assessed options.

CONCLUSION

In this study, we introduced the inclusion relationship of the new INF. Since the current correlation measure is mainly designed for the original inclusion relationship, we then propose the correlation and fuzzy equivalence of the interval neutrosophic filter. Finally, it is used for the pertinent computation of decision-making. Additionally, the defined correlation measure and neutrosophic filter satisfy the related axiomatization definition, as shown by the new correlation and equivalence. The results indicate that the proposed correlation and neutrosophic filter are realistic and effective.

ACKNOWLEDGMENTS

I want to sincerely thank the Karpagam Academy of Higher Education as well as the people whose assistance and contributions have improved the Caliber and rigor of our research.

ABSTRACT

Education plays a vital role in the social and economic empowerment of women. To promote higher education among girls from government schools, the Government of Tamil Nadu introduced the Pudhumai Penn Scheme, which provides financial assistance to eligible female students pursuing higher education. The scheme aims to reduce financial barriers, increase enrolment in colleges, and encourage young women to continue their education. The present study focuses on assessing the awareness and utilization of the Pudhumai Penn Scheme among female college students. The study examines the level of awareness regarding the scheme, the extent of its utilization, and the socio-economic factors influencing beneficiaries. Primary data were collected from female college students through a structured questionnaire, and appropriate statistical tools were used for analysis. The findings of the study are expected to provide insights into the effectiveness of awareness initiatives and the extent to which students utilize the benefits offered under the scheme. The study also offers suggestions for improving the implementation and outreach of the scheme to ensure that more eligible students benefit from it. The results may be useful to policymakers, educational institutions, and government agencies in strengthening educational welfare programmes for women.

Keywords: Enrolment, Utilize, Government, Welfare programmes

INTRODUCTION

Education is one of the most powerful tools for social transformation and economic development. It empowers individuals, enhances employment opportunities, and contributes to the overall progress of society. Women's education, in particular, plays a crucial role in promoting gender equality, improving family welfare, and fostering national development. Despite significant advancements in the education sector, many female students from economically disadvantaged backgrounds continue to face barriers in accessing higher education. Financial constraints, social factors, and lack of awareness often prevent girls from pursuing college education after completing school. To address these challenges, the Government of Tamil Nadu launched the Pudhumai Penn Scheme in 2022. Under this scheme, female students who studied in government schools from Classes VI to XII and pursue higher education receive monthly financial assistance. The scheme aims to encourage higher education enrolment, reduce dropout rates, and empower young women through education. The success of any welfare programme largely depends on the awareness and utilization of its benefits among the target population. Therefore, it is important to examine whether female college students are aware of the Pudhumai Penn Scheme and whether they are effectively utilizing its benefits. This study seeks to analyze the awareness and utilization of the scheme among female college students and to understand its role in supporting their educational aspirations.

Education is widely recognized as a fundamental instrument for individual development, social transformation, and economic progress. It equips individuals with knowledge, skills, and opportunities necessary for improving their quality of life and contributing to the development of society. Among the various dimensions of education, women's education holds special significance as it promotes gender equality, enhances family welfare, and strengthens the socio-economic fabric of the nation. In India, despite considerable improvements in educational access and enrollment, many girls, particularly those from economically disadvantaged and rural backgrounds, continue to face challenges in pursuing higher education. Financial constraints, lack of educational support, social barriers, and limited awareness of educational opportunities often result in lower enrollment and higher dropout rates among female students after school education. Recognizing these challenges, the Government of Tamil Nadu has introduced several welfare measures aimed at promoting women's education. One of the most significant initiatives in this regard is the Pudhumai Penn Scheme, launched in September 2022. The scheme provides monthly financial assistance to girl students who have studied in Government Schools from Classes VI to XII and who continue their education in higher educational institutions. The primary objective of the scheme is to encourage girls to pursue higher education, reduce dropout rates, improve enrollment in colleges, and empower women through education.

REVIEW OF LITRATURE

Rajalakshmi (2023) investigated the perceptions of college students regarding government educational assistance programmes in Tamil Nadu. The study reported that most beneficiaries considered financial assistance an important factor in continuing their education. The research also highlighted the need for improved awareness campaigns and simplified administrative procedures. Karthikeyan and Rani (2023) conducted a study on educational welfare schemes and women's empowerment in Tamil Nadu. The study revealed that financial assistance programmes have a positive influence on educational participation and academic continuity among female students. The researchers observed that beneficiaries reported increased motivation to pursue higher education due to the availability of government support. Ministry of Education, Government of India (2023) reported that targeted educational welfare schemes have contributed significantly to improving enrollment rates among female students. The report emphasized that financial incentives and awareness initiatives are critical for achieving inclusive and equitable access to higher education. Government of Tamil Nadu (2022) The Pudhumai Penn Scheme was introduced to encourage girls from government schools to continue their higher education by providing monthly financial assistance. The scheme aims to increase the Gross Enrollment Ratio (GER) among female students and reduce educational inequalities. Official reports indicate a positive response from beneficiaries across the state.

UNESCO (2022) Global Education Monitoring Report emphasized the importance of financial support programmes in promoting gender equality in education. The report highlighted that scholarships and educational assistance schemes contribute significantly to increasing enrollment and retention rates among female students, particularly in developing countries. It also noted that awareness of such programmes is essential for maximizing their benefits Sharma and Gupta (2021) examined the role of awareness in the successful implementation of government welfare schemes. Their findings indicated that awareness levels directly influence the utilization of scheme benefits. Students who received information through educational institutions and media sources demonstrated higher participation rates compared to those with limited awareness. Singh and Kaur (2020) studied the relationship between socio-economic factors and access to higher education among women. The study found that family income, parental education, and place of residence significantly influence educational opportunities. Financial support schemes were identified as effective tools for overcoming economic barriers and improving access to higher education.

Statement of the Problem

Higher education plays a crucial role in the empowerment of women and the socio-economic development of society. However, many female students, particularly those from economically disadvantaged families and rural areas, face various challenges in pursuing higher education. Financial constraints, lack of educational resources, and limited family support often act as barriers to their academic advancement. To address these challenges and promote higher education among girls from Government schools, the Government of Tamil Nadu introduced the Pudhumai Penn Scheme. The scheme provides monthly financial assistance to eligible female students who continue their higher education after completing their schooling in Government institutions. The objective of the scheme is to increase enrolment in higher education, reduce dropout rates, and encourage women's educational empowerment. Despite the availability of this welfare programme, the success of the scheme largely depends on the level of awareness among the target beneficiaries and the extent to which they utilize its benefits. Inadequate awareness regarding eligibility criteria, application procedures, and scheme benefits may prevent deserving students from availing themselves of the assistance. Similarly, administrative difficulties, communication gaps, and procedural challenges may affect the effective utilization of the scheme. Therefore, it is essential to assess whether female college students are adequately aware of the Pudhumai Penn Scheme and whether they are effectively utilizing the benefits provided under it. Understanding the awareness level, utilization pattern, and factors influencing participation will help evaluate the effectiveness of the scheme and identify areas for improvement.

Objectives of the Study

- To examine the level of awareness of the Pudhumai Penn Scheme among female college students.
- To analyze the extent of utilization of the benefits provided under the Pudhumai Penn Scheme among female college students.
- To assess the effectiveness of the Pudhumai Penn Scheme in supporting higher education among female college students.

Scope of the Study

The present study focuses on the awareness and utilization of the Pudhumai Penn Scheme among female college students. It seeks to examine the level of awareness regarding the scheme, the extent to which beneficiaries utilize the financial assistance provided, and the effectiveness of the scheme in supporting higher education. The study covers various socio-economic factors that influence awareness and utilization among the respondents. The findings of the study will help policymakers, educational institutions, and government authorities understand the effectiveness of the scheme and identify measures for improving its implementation. The study also contributes to the existing literature on women's education, educational welfare schemes, and women empowerment in Tamil Nadu.

Limitations of the Study

- The study is limited to a selected sample of female college students and therefore the findings may not be generalized to all beneficiaries of the Pudhumai Penn Scheme in Tamil Nadu.

- The study is based on primary data collected through a structured questionnaire, and the accuracy of the findings depends on the honesty and understanding of the respondents.
- Due to time and resource constraints, the study focuses only on awareness and utilization aspects of the Pudhumai Penn Scheme and does not examine its long-term socio-economic impact.

RESEARCH METHODOLOGY

Research Design

The present study adopts a descriptive research design to examine the awareness and utilization of the Pudhumai Penn Scheme among female college students. The descriptive approach helps in understanding the characteristics, awareness levels, and utilization patterns of the respondents.

Area of the Study

The study was conducted among female college students pursuing higher education in selected colleges.

Nature and Source of Data

The study is based on both primary and secondary data.

- **Primary Data:** Primary data were collected directly from the respondents through a structured questionnaire designed to gather information regarding their socio-economic background, awareness of the Pudhumai Penn Scheme, and utilization of its benefits.
- **Secondary Data:** Secondary data were collected from government reports, official scheme guidelines, journals, books, research articles, websites, and other relevant publications related to the Pudhumai Penn Scheme and higher education.

Sampling Technique

The study employed a convenient sampling method to select the respondents from the study area.

Sample Size

A total of 100 female college students were selected as respondents for the study.

Tools for Data Collection

A structured questionnaire was used as the primary tool for collecting data from the respondents.

Tools for Data Analysis

The collected data were classified, tabulated, and analyzed using the following statistical tools:

- Percentage Analysis
- Chi-Square Test
- Analysis of Variance (ANOVA)

Data Analysis and Interpretation

Interpertation

The above table presents the demographic profile of the respondents. It is observed that a majority of the respondents (38%) belong to the age group of 18–19 years. Most respondents (30%) are studying in the first year, while 32% are pursuing Arts courses. A majority (58%) are studying in Government Colleges and 62% belong to rural areas. Most respondents (40%) belong to families with a monthly income of ₹10,001–₹20,000. The findings indicate that the majority of beneficiaries are rural female students from lower and middle-income families who are pursuing higher education with the support of the Pudhumai Penn Scheme

Findings of the Study

- The majority of the respondents (38%) belong to the age group of 18–19 years, followed by 34% in the age group of 20–21 years.

- Most of the respondents (30%) are studying in the first year of their college education, while 28% are in the second year.
- A significant proportion of the respondents (32%) are pursuing Arts courses, followed by Science (28%), Commerce (24%), and Professional Courses (16%).
- More than half of the respondents (58%) are studying in Government Colleges, while 42% are enrolled in Government-Aided Colleges.
- The majority of the respondents (62%) belong to rural areas, indicating that the scheme has substantial reach among rural female students.
- Most respondents (40%) come from families with a monthly income ranging between ₹10,001 and ₹20,000.
- The majority of fathers (42%) and mothers (44%) have completed school-level education.
- A significant proportion of fathers (32%) are employed in the private sector, while most mothers (58%) are homemakers.
- More than half of the respondents (56%) use buses as their primary mode of transportation to college.
- The largest share of respondents (42%) travel between 5 and 10 kilometres to reach their educational institutions.
- A majority of the respondents (46%) have been receiving benefits under the Pudhumai Penn Scheme for a period of 1–2 years.
- The study indicates that the Pudhumai Penn Scheme is reaching its intended beneficiaries, particularly female students from rural and economically weaker backgrounds.
- The scheme has contributed to supporting female students in continuing their higher education by reducing financial burdens.
- The findings suggest that awareness and utilization of the scheme have positively influenced educational participation among female college students.

Suggestions

- The Government should strengthen awareness programmes regarding the Pudhumai Penn Scheme through colleges, social media platforms, and community outreach initiatives.
- Educational institutions should conduct regular orientation programmes to inform students about eligibility criteria, benefits, and application procedures.
- The financial assistance provided under the scheme may be reviewed periodically to meet the increasing educational expenses of students.
- A dedicated grievance redressal mechanism should be established to address issues faced by beneficiaries during application and fund disbursement processes.
- Special awareness campaigns should be organized in rural areas to ensure that all eligible students are informed about the scheme.
- Colleges should provide guidance and support to students in completing application procedures and documentation requirements.
- Continuous monitoring and evaluation of the scheme should be undertaken to improve its effectiveness and efficiency.
- The government may integrate career guidance, skill development programmes, and mentoring support with the scheme to enhance its overall impact on students' educational and career development.

CONCLUSION

The Pudhumai Penn Scheme is an important educational welfare initiative introduced by the Government of Tamil Nadu to encourage female students from Government Schools to pursue higher education. The study reveals that the majority of beneficiaries are young women from rural areas and economically weaker families who rely on the scheme for financial support during their college education. The findings indicate that the scheme has been successful in reaching its target beneficiaries and has contributed significantly to promoting higher education among female students. By reducing financial constraints, the scheme has encouraged educational continuation and

supported the academic aspirations of young women. The study concludes that the Pudhumai Penn Scheme plays a vital role in enhancing educational opportunities, promoting women's empowerment, and fostering social development. Effective awareness campaigns, efficient implementation, and continuous monitoring will further strengthen the impact of the scheme and ensure that a larger number of eligible students benefit from it in the future.

ABSTRACT

In this study, the characterization of secondary κ-range symmetric Pentapartitioned Neutrosophic Fuzzy Matrices is established. The relationships among s-k-range symmetric, s-range symmetric, k-range symmetric, and range symmetric matrices are examined in detail. Furthermore, the necessary and sufficient conditions required for a matrix to satisfy the property of s-k-range symmetry are derived and presented.

Keywords: PNFM, RS-PNFM, s-k- RS PNFM, CS-PNFM, K- PNFM.

INTRODUCTION

Fuzzy set theory, introduced by Zadeh [1], provides a mathematical framework for handling uncertainty and imprecision in real-world problems. Later, Atanassov [4] extended this concept through intuitionistic fuzzy sets, which incorporate both membership and non-membership functions. The study of intuitionistic fuzzy matrices, developed by Pal et al. [3], further enhanced the applicability of fuzzy concepts in matrix theory and related mathematical models. To address higher levels of indeterminacy that cannot be effectively handled by classical fuzzy or intuitionistic fuzzy sets, Smarandache [2] proposed the concept of neutrosophic sets, which include the degrees of truth, indeterminacy, and falsity independently. This theory has been widely applied in several mathematical structures, including matrices and algebraic systems. In recent years, researchers have explored different extensions

such as neutrosophic soft sets and rough sets, which combine neutrosophic theory with other uncertainty modeling approaches to provide more flexible analytical tools [5,6]. Matrix theory plays an essential role in many branches of mathematics and applied sciences. Early work on generalized fuzzy matrices was carried out by Kim and Roush [8], while Meenakshi [11] developed a comprehensive theoretical framework for fuzzy matrices and their applications. Subsequent studies investigated various structural properties of matrices, including secondary symmetric and skew symmetric matrices, first introduced by Lee [9], and further explored in the context of different algebraic settings. The concepts of k-real and k-Hermitian matrices studied by Hill and Waters [10] also contributed significantly to the development of generalized matrix symmetries.

Several researchers have extended these ideas to fuzzy and intuitionistic fuzzy matrices. In particular, Meenakshi and Jaya Shree [12,14] introduced and studied k-kernel symmetric and k-range symmetric matrices, establishing important theoretical properties. Further investigations into secondary κ-kernel symmetric fuzzy matrices were conducted by Jaya Shree [15], while additional structural results related to secondary κ-range symmetric fuzzy matrices were presented in later works [17]. Other related studies explored properties such as κ-EP matrices and secondary k-Hermitian matrices, contributing to the broader theory of generalized matrix symmetries [20–23]. With the advancement of neutrosophic theory, researchers have begun integrating these matrix concepts with neutrosophic environments. Recent contributions include the study of generalized symmetric neutrosophic fuzzy matrices and related structures [18]. Further developments include secondary k-range symmetric neutrosophic fuzzy matrices and their interval-valued extensions [19,25,26], as well as investigations into secondary k-column symmetric neutrosophic fuzzy matrices and other related forms [27]. Additionally, studies on kernel and k-kernel symmetric intuitionistic fuzzy matrices have contributed to expanding the theoretical foundation of symmetric structures in fuzzy and neutrosophic matrix theory [16].

Notations

PNFM = Pentapartitioned Neutrosophic Fuzzy Matrices
S PNFM = Symmetric Pentapartitioned Neutrosophic Fuzzy Matrices
RS = Range Symmetric, KS = Kernel symmetric, CS= Column symmetric
s-k = Secondary kernel

Preliminaries

Let V be the permutation Matrix with unit in the secondary diagonal and let k be a fixed product of disjoint transposition in $S_n = \{1,2,\ldots,n\}$ and K be the associated permutation matrix if $\Re(x)=(x_{k[1]}, x_{k[2]}, x_{k[3]},\ldots, x_{k[n]})^T \in F_{n\times 1}$ for $(x = x_1, x_2,..,x_n) \in F_{[1\times n]}$, where K is involutory. The corresponding permutation matrix is satisfied the following conditions

$(P_{.31})$ $KK^T = K^T K = I_n$, $K = K^T$, $K^2 = I$ and $\Re(x) = Kx$

By the definition of *V* and

$(P_{.3.2})$ $V = V^T$, $VV^T = V^T V = I_n$ and $V^2 = I$

$$(P_{.3.3})\quad R\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right) = R\left[V\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)\right],$$

$$R\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right) = R\left[K\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)\right]$$

$$(P_{.3.4})\quad \left(\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)V\right)^T = \left(V\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)^T\right)$$

$$\left(V\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)\right)^T = \left(\left(T_{ij}^P, C_{ij}^P, I_{ij}^P, U_{ij}^P, F_{ij}^P\right)^T V\right)$$

Pentapartitioned Neutrosophic Fuzzy Matrices

Let X be a universe. A Pentapartitioned neutrosophic Fuzzy Matrices A on X is an object of the form $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$

Where $0\le T_{ij}^{P}+C_{ij}^{P}+I_{ij}^{P}+U_{ij}^{P}+F_{ij}^{P}\le 5$

T_{ij}^{P} = Truth membership, C_{ij}^{P} =Contradiction membership

I_{ij}^{P} = Ignorance membership, U_{ij}^{P} = Unknown membership

F_{ij}^{P} = False membership

Definition: 4.2 Let $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ be a PNFM, if

R $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ = R $\left[\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]^{T}$ then

$\left[P_{ij}\right]=\left[\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]$ is called as RS.

Example: 4.1 Consider a PNFM

$$P=\begin{bmatrix}(0.4,0.6,0.5,0.7,0.8) & (0.8,0.9,0.7,0.4,0.9) & (0.3,0.4,0.5,0.3,0.8)\\ (0.8,0.9,0.7,0.4,0.9) & (0.8,0.3,0.2,0.1,0.2) & (0.7,0.2,0.1,0.9,1)\\ (0.3,0.4,0.5,0.3,0.8) & (0.7,0.2,0.1,0.9,1) & (0.4,0.6,0.5,0.3,0.2)\end{bmatrix}$$ Here,

R $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ = R $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}$

Definition :4.3 Let $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{n}$, if

N$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ = N$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}$ and then

$\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is called KS- PNFM where

N$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ = {x/x $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$} = (0,0,0,1,1) and x ∈ $F_{1\times n}$}.

Example: 4.2 Consider a PNFM

$$P=\begin{bmatrix}(0.4,0.6,0.5,0.4,0.9) & (0.4,0.6,0.8,0.9,0.8) & (0.5,0.4,0.9,0.7,0.5)\\ (0.5,0.3,0.2,0.9,0.8) & (0.1,0.3,0.5,0.6,0.5) & (0.8,0.2,0.5,0.2,0.6)\\ (0.1,0.4,0.3,0.7,0.5) & (0.8,0.2,0.1,0.4,0.5) & (0.4,0.6,0.5,0.7,0.8)\end{bmatrix}$$

N $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ = N $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}$ = (0,0,0,1,1)

Secondary k-RS PNFM

Definition 5.1. A PNFM $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is

s - PNFM iff $\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}V$.

Definition 5.2 A PNFM $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s- RS PNFM iff

$$R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}V\right).$$

Definition 5.3. For a PNFM $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s-k- RS

PNFM iff $R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right).$

Lemma 5.1. A PNFM $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is

s- RS PNFM $\Leftrightarrow$ $\mathrm{V}P=<V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)>$ RS PNFM.

$\Leftrightarrow$ $PV=<\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)V>$ is RS PNFM.

Proof. Let $\left[P_{ij}\right]=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s-RS PNFM $\Leftrightarrow$

$$R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}V\right).$$

$$\Leftrightarrow R\left[V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]=R\left(V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}$$

$\Leftrightarrow V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is RS

$\Leftrightarrow$ $VV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)V^{T}$ is RS.

$\Leftrightarrow \left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)V$ is RS.

Theorem 5.1. The following conditions are equivalent for $P\in PNFM_{n}$

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s – k RS.

$\mathrm{KV}\,P=KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is RS.

$P\mathrm{KV}=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)KV$ is RS.

$\mathrm{V}P=V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is k- RS.

$P\mathrm{K}=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\mathrm{K}$ is s- RS.

P^{T} is s-k RS.

$$\mathrm{R}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=\mathrm{R}\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\mathrm{VK}\right)$$

$$\mathrm{R}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}=\mathrm{R}\left[\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\mathrm{VK}\right]$$

$$\mathrm{C}\left[\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]=C\left(\left(\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}\right),$$

$$\left[\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]=\mathrm{VK}\left[\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]^{T}\mathrm{VKH}_{1},\quad \text{for}\,\mathrm{H}_{1}\in PNFM_{n}$$

$P^{T}=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}$ is s – RS.

$$R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}V\right),$$

$$R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)V\right),$$

$$C\left(\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=C\left(\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T},$$

$$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\mathrm{VH}_{1},\ \text{for}\ \mathrm{H}_{1}\in\left(PNFM\right)_{n}$$

$$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=\mathrm{H}_{1}\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\mathrm{V},\ \text{for}\ \mathrm{H}_{1}\in\left(PNFM\right)_{n}$$

$$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}=\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\mathrm{VH}_{1},\quad\text{for}\ \mathrm{H}_{1}\in\left(PNFM\right)_{n}$$

$$\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}=\mathrm{H}_{1}\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\mathrm{V},\quad\text{for}\ \mathrm{H}_{1}\in\left(PNFM\right)_{n}$$

Theorem 5.2. For $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$ then any two of the conditions below imply the other

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is κ- RS.

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s-κ- RS.

$$R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}=R\left(\mathrm{VK}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T},$$

Proof: (i) and (ii) implies (iii)

Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s – k RS

$$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right),$$

$$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)=R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}K\right),$$

$$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}=R\left(\left(V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)^{T}\right),$$

(i) & (ii) implies (iii) is true

(i)& (iii) implies (ii)

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is κ- RS

$$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}K\right)=R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$$

$$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)=R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T},$$ Therefore,

(i) & (iii)

$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)=R\left(V\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)^{T}$,

$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right)$,

$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(\left[KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right]\right)^{T}$,

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s-k-RS $\Rightarrow$ (ii) is true

(ii) & (iii) implies (i)

$P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s- κ- RS

$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right)$,

$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)=R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}K\right)$, Therefore,(ii) and (iii)

$\Rightarrow R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)K\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\right)$,

$\Rightarrow R\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)=R\left(K\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}K\right)$

$\Rightarrow\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is κ- RS .

Therefore, (i) is true, Hence the theorem.

Regular s – k RS PNFM

In this section, we explore the various generalized inverses of matrices in the context of PNFM.

Theorem 6.1: Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$, Q belongs to P{1,2} and PQ, QP are s- κ- RS. Then P is s- κ - RS iff $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ is s- κ – RS.

Proof:

$R\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=R\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)Q\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)$

$\subseteq R\left(Q\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)$

$=R\left(QVV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)\subseteq R\left(QVKKV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)$

$\subseteq R\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)$

Hence, $R\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=R\left(Q\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)$

$=R\left(KV\left(Q\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}VK\right)$

$=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)^{T}VK\right)$

$=R\left(\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)^{T}VK\right)=R\left(\left(KV\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)^{T}\right)$

$$R\left(\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}\right)=R\left(\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right)$$

$$=\mathrm{R}\left(\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)^{T}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)^{T}VK\right)$$

$$=\mathrm{R}\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)^{T}$$

$$=\mathrm{R}\left(KV\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)$$

KVQ is Range Symmetric

$$\Leftrightarrow \mathrm{R}\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=R\left(\left(KV\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}\right)$$

$$\Leftrightarrow \mathrm{R}\left(\left(KV\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)^{T}\right)=\mathrm{R}\left(KV\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)\Leftrightarrow KVQ \text{ is RS}$$

$\Leftrightarrow Q$ is s-k RS.

Theorem 6.2:, Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$, $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ ∈P{1,2,3}

$$\mathrm{R}\left(\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=R\left(\mathrm{KV}\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)^{T}.$$

Then $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$ is s-κ- RS $\Leftrightarrow$ $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ is s- k – RS.

Proof : The Theorem is similar to theorem 6.1

Theorem 6. 3: Let $S=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$, Q∈ P {1, 2, 4},

$$\mathrm{R}\left(\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}=R\left(\mathrm{KV}\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right).$$

Then P is s- κ-RS iff $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ is s- κ- RS.

Proof : The Theorem is similar to theorem 6.1

Corollary 6.1: Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$, Q∈ P {1, 2} and

$$PQ=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$$

$$QP=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)$$ are s-RS.

Then P is s- RP if $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ is s- RS.

Proof : The Corollary is similar to theorem 6.1

Corollary 6.2: Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$ Q∈ P {1, 2, 3},

$$\mathrm{R}\left(\mathrm{KV}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)=R\left(\mathrm{V}\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)^{T}.$$

Then P is s- RS iff $Q=\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)$ is s- RS.

Proof : The Corollary is similar to theorem 6.1

Corollary 6.3: Let $P=\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\in\left(PNFM\right)_{nn}$, Q∈ P {1, 2, 4} ,

$\mathrm{R}\left(\mathrm{V}\left(T_{ij}^{P},C_{ij}^{P},I_{ij}^{P},U_{ij}^{P},F_{ij}^{P}\right)\right)^{T}=R\left(\mathrm{V}\left(T_{ij}^{Q},C_{ij}^{Q},I_{ij}^{Q},U_{ij}^{Q},F_{ij}^{Q}\right)\right)$. Then P is s- RS iff Q is s-RS.

Proof : The Corollary is similar to theorem 6.1

CONCLUSION

In this paper, the concept of secondary κ-range symmetric Pentapartitioned Neutrosophic Fuzzy Matrices has been studied and characterized. The relationships between s-κ-range symmetric, s-range symmetric, κ-range symmetric, and range symmetric matrices have been analyzed to understand their structural connections within the neutrosophic hyper soft rough fuzzy framework. Moreover, the necessary and sufficient conditions for a matrix to possess the s-κ-range symmetric property have been derived and established. The results obtained contribute to the theoretical development of neutrosophic matrix theory and provide a foundation for further investigations on generalized symmetric structures in neutrosophic environments. Future work may focus on extending these concepts to interval-valued, multi-dimensional, or application-based models in areas dealing with uncertainty and indeterminate information.

ABSTRACT

The identification of protein complexes in large-scale protein–protein interaction (PPI) networks is fundamental to understanding cellular organization and disease mechanisms. Existing clustering methods often struggle with the size, sparsity, and noise inherent in such networks, resulting in limited scalability and interpretability. To overcome these difficulties, we present a unified approach in this

study that combines chordal graph decomposition and co-spectral clustering. In order to guarantee that spectral embeddings are stable under simplicial elimination, we establish criteria under which chordal subgraph extraction maintains the essential eigen structure of the normalised graph Laplacian. The suggested approach creates a compact hierarchical representation of the network by using clique- tree construction and maximum cardinality search. This model aligns clusters with biologically coherent cliques at a lower computing cost. The resulting pipeline runs in near-linear time with respect to the number of vertices and edges and scales efficiently with the number of clusters. Extensive experiments on synthetic networks and benchmark biological datasets, including Yeast and Human PPI networks, demonstrate consistent improvements in normalized mutual information, adjusted Rand index, modularity, and runtime compared with classical spectral clustering. These results indicate that the proposed spectral–chordal framework provides an effective and interpretable approach for protein complex discovery in large interaction networks.

Keywords: chordal decomposition, complex discovery, co-spectral clustering, PPI networks

INTRODUCTION

Protein complexes represent the fundamental functional unit of the cell and integrate many different biological processes, such as the transduction of signals, regulation of transcription, regulation of metabolic processes, and transport of materials across cellular membranes. Therefore, accurately identifying protein complexes from large data sets of protein-protein interactions (PPIs) is essential to systems biology, understanding disease processes, and identifying therapeutic targets. The advent of rapidly evolving high-throughput experimental techniques has resulted in widespread growth of interaction databases, which in turn has produced a large, sparse, non-normalized network of data points within the PPI space. These aspects of the data create significant challenges for making valid, replicable, and generalizable conclusions from a computational perspective. There are many different types of computational strategies available to identify protein complexes, which include hierarchical clustering, density-based clustering, random-walk based clustering, and graph-partitioning methods. While some examples of these methods are highly effective for smaller or moderately sized networks, generally speaking their effectiveness declines on larger data sets of PPIs due to sensitivity to experimental noise, limited scalability, and more subtle interpretations from an experimental biology perspective. Further, many of the available methods rely solely on local connectivity within the network to define protein complexes and may often fail to encompass global structural information that is contained within the network topology. By taking advantage of the eigen structure of graph Laplacian matrices, spectral clustering can remedy some of the problems outlined above by allowing us to extract global community structures from low-dimensional representations of highly connected networks. In this way, network data can be effectively partitioned based on their connectivity and diffusion characteristics by transforming the data into a spectral domain. However, the rapid growth of the computational cost associated with eigenvalue decompositions as a function of the size of the network severely limits our ability to apply spectral clustering techniques to large biological data sets. Additionally, the direct application of spectral clustering methods to noisy interaction networks can result in unstable embeddings and poorly separated clusters.

Using the structural abstraction of chordal graphs to overcome these technical difficulties can provide a means to do so. Every cycle of length four or greater that contains a chord is the defining characteristic of a chordal graph, meaning that chordal graphs have perfect elimination orderings and clique-tree representations. It follows that chordal graphs have efficient methods of decomposing the graph structure, a hierarchical organization of their constituent components, and that they can be processed more easily when working with large networks. As such, in biological interaction networks, locally dense functional modules could often have a corresponding chordal sub-structure. Therefore, improving the computational efficiency and interpretability of biological interaction networks

through chordal decomposition makes considerable sense. There are strong development efforts for spectral clustering and graph-based clustering, but most methods typically are focused on clustering performance or computational expense and not both. There hasn't been much research done on theoretical conditions that will allow for spectral properties important to cluster performance to be maintained when reducing graphs. Therefore, there is still a need for combined frameworks using principled approaches for structural reduction along with rigorous spectral analysis. This research develops a unified spectral-chordal framework for protein complex discovery in large PPI networks. This approach efficiently reduces computational expense through the integration of chordal graph decompositions and co-spectral embeddings while remaining faithful to the cluster fidelity.

The framework uses simplicial elimination and clique-tree representations of graphs to create distinct hierarchically compact representations of networks such that spectral analyses can be performed with high efficiency, and partitions that make sense from a biological standpoint can be generated. Spectral clustering and graph clustering has become a large area of development, with much work being done in terms of developing techniques for clustering either efficiently (computationally) or effectively (performance based). However, little has been researched as far as determining the theoretical requirements necessary for spectral properties, which are critical for determining clustering performance, to be preserved when graphs are reduced in complexity. Therefore, there remains a need for a combined approach that uses a principled approach to structural reductions along with rigorous spectral analyses. This research presents a unified framework for spectral chordal based protein complex discovery for large PPI networks. The proposed approach will allow for computationally efficient reductions through the use of co-spectral embeddings and chordal graph decompositions while maintaining cluster fidelity; therefore, high-fidelity partitions will be generated through efficient/sophisticated spectral analyses. Furthermore, this framework provides an efficient means for representing networks through simplicial elimination and clique tree representations, thereby creating multiple distinct hierarchically compact representations of the networks enabling high-efficiency spectral analyses to be performed; consequently, high-fidelity biological partitions will be generated from these network representations.

LITERATURE SURVEY

The protein complex identification within networks of protein-protein interactions has generated an increasing body of research, due to the value in understanding functional organisation and functional regulation of cells. Early works have proposed modularity-based and ensemble approaches to identify highly interconnected networks (subgraphs) as biological complexes. Asur et al. [1] developed an ensemble approach to combine several different clustering results, and showed that modularity and normalized mutual information provided complementary direction to evaluate cluster quality on PPI networks. Because they provide an effective method for detecting communities in graphs, spectral clustering has become a prominent paradigm for the analysis of community structure in graph structures. By using the eigenvalues of the Laplacian matrices of graphs, spectral clustering provides an effective method of performing principled dimensionality reduction and partitioning of graphs based on their overall connectivity. Theroretically, Kumar et al. [6] provided a theoretical foundation for exploring the relationship between Laplacian eigen values and the fundamental properties of graphs, such as connectivity, expansion, and the Fiedler value, which can help pinpoint the clustering stability. To back this theory, Pinti et al. [8] demonstrated that the use of the Laplacian eigen values to provide methods of dimensionality reduction and unsupervised learning in analysing biological data.

Many recent studies have combined topological and attribute information to enhance clustering in complex networks. For example, Berahmand et al. [2] proposed using a spectral clustering method that incorporates embedding of the node attributes in order to improve detection of protein complexes based on the structural clumping and functional homogeneity of the protein complexes Similarly Wang et al. [10] utilized topologically weighted edges to predict gene ontology interactions while also minimizing false-positive methods of calculating them through the utilization of predictive modelling for the biological relevance of the predicted interactions. Research on chordal graphs has been the focus of many researchers in part because of their general structural and

algorithmic properties. As proof Berry et al. [3] demonstrate that by performing maximum cardinality searches on chordal graphs one can yield the set of perfect elimination ordering for a given chordal graph. This result also provides a mechanism to ensure efficient recognition of chordal graphs and to create a minimal triangulation of any chordal graph. These results have been the basis for constructing several different types of graph decomposition of clique structures. One example is presented by Bläsius et al. [4] who show that using clique partitioned tree decompositions significantly improve the performance evaluation of networks that have a high clustering coefficient. In addition to their clustering coefficient studies of cordal graphs Naderi et al. [7] have shown that clique formulations which are based on degeneracy orderings allow for many non-polynomial time computable problems to be solved on sparse graphs. In order to effectively assess clustering performance, one must utilize an appropriate validation metric to measure the effectiveness of the clustering results. To that end, Romano et al. [9] presented theoretical foundations to support that the Adjusted Rand Index is both a correct measure for chance agreement and a measure that is invariant to label permutation. Thus their work provides evidence that ARI is much more interpretable than any unadjusted measures. Information-theoretic metrics such as Normalized Mutual Information (NMI) still remain one of the most widely used clustering validation metrics due in large part to their intuitive probabilistic basis and were first popularized in the assessment of biological networks by Asur et al. [1].

Although there have been methodological advances in many aspects of protein complex identification, Omranian et al.'s work on constraint-based clustering algorithms was one of the few studies devoted to this topic. They provided strong evidence of the effectiveness of their approach by clustering functional modules across multiple organisms. Their analysis pointed to the major challenge that many algorithms overestimate the number of protein complexes by producing complex predictions that are too large or too dense; however, in reality, most protein complexes are typically small and relatively sparsely connected. The difference between predicted and real protein complexes severely limits the biological interpretability and usefulness of these methods. Several important tools exist within matrix perturbation theory for the analysis of spectral stability. In particular, Davis and Kahan published results on eigen values and corresponding eigen spaces under perturbation. The bounds established by these authors are critical to understanding the robustness of spectral embeddings. Weyl also gave an accounting of how eigenvalues change in response to perturbation of the underlying matrix method used to create spectral embeddings (Weyl's perturbation theorem). These two principles provide formal mathematical support to analyze how changes in the structure of a graph affect the output of spectral clustering.

Evidence of substantial progress exists within the literature around mathematical methodologies related to spectral methods, chordal graphs, and biological network analyses. Nevertheless, existing methods primarily focus on either enhancing the quality of the clustering results or increasing the computational speed of the method; thus, most methods focus on either preserving the quality of the clustering results or maximizing computational speed. In addition to limited research to characterize how structural simplifications maintain the spectral properties associated with clustering, structural simplifications are often neglected when developing methods that focus on preserving the clustering quality. With the goal of addressing some of these limitations, we proposed a novel unified spectral–chordal framework which integrates co-spectral embedding with chordal decomposition under clearly stated conditions of preservation. Using theoretical results from spectral perturbation analysis as well as highly efficient clique-based decomposition, we also intend to balance between the accuracy, scalability and interpretability of proposed methods; enabling their successful use in protein complex discovery across large PPI networks.

METHODOLOGY

This section describes the theoretical foundations, algorithmic design, and evaluation criteria of the proposed unified spectral–chordal framework for protein complex discovery.

Theoretical Foundations

The undirected weighted protein-protein interaction graph G= (V,E,w) is made up of proteins that are represented by vertices V, interactions that make up the edges E, and confidence values associated with the interactions w. The adjacency matrix A is defined as A(i,j) = w(i,j) for (i,j) ¸ E, otherwise A(i,j) = 0. The degree matrix D is an n x n diagonal matrix, with D(i,i) =[sum of the weights of every edge connected to vertex i].
The unnormalized graph Laplacian L is defined as:L = D - A
The normalized graph LaplacianL(sym) = I - D^(-1/2)AD^(-1/2), where I is the identity matrix.

The basis for co-spectral clustering comes from performing eigen decomposition of the normalized Laplacian. The nonzero eigen values closest to zero and their associated eigenvectors represent important connectivity patterns in the network and provide low-dimensional representations of the original fully connected network for performing clustering of the network..

Chordal Graphs and Perfect Elimination Orderings

A graph is chordal if every cycle of length at least four contains a chord. Chordal graphs admit perfect elimination orderings, in which each vertex is simplicial with respect to the remaining graph. That is, the neighbors of the vertex form a clique. Such orderings enable efficient clique-tree construction and hierarchical network decomposition, which are essential for scalable spectral analysis.
Chordal completion adds a minimal set of edges to transform a general graph into a chordal graph while preserving its local structure.

Co-Spectral Preservation Through Simplicial Elimination

Let the Laplacian matrix be partitioned into blocks corresponding to retained vertices R and eliminated vertices E as:
L = [LRR LRE LER LEE]
The Schur complement with respect to eliminated vertices is defined as:
S = LRR − LRE (LEE)^(-1) LER
If the separator size is small and the inverse of LEE is well-conditioned, then the difference between S and LRR remains small. This ensures that spectral distortion introduced by elimination is limited.
Through the application of Weyl's perturbation theorem and Davis-Kahansin(θ) theorem [5] it has been shown that when there is a bounded perturbation (of matrices), that the eigenvalues and eigenspaces will also have bounded perturbations. Thus the simplicial elimination method's essential spectral structure properties for clustering remain intact.

Assumptions

The proposed framework operates under the following assumptions,

- The PPI network is connected or contains a small number of connected components.
- The network is sparse with bounded average degree.
- Chordal completion introduces relatively few fill edges.
- Noise in interaction data is moderate.

These assumptions are consistent with typical biological interaction networks.

Algorithmic Framework

The proposed framework consists of four main stages: chordal decomposition, clique-tree construction, co-spectral embedding, and hierarchical refinement.

Algorithm 1: Maximum Cardinality Search (MCS)

Input: Graph G = (V, E)
Output: Elimination Ordering π
1. Begin by initializing the weights of all vertices to zero.
2. Continue until there are no more unvisited vertices remaining.
a. Select the unvisited vertex that has the greatest weight.

b. Place this vertex into the elimination ordering.
c. Update the weights of all unvisited neighbouring vertices of that vertex.
3. Return the final elimination ordering π.
When G is a chordal graph, MCS will produce a perfect elimination ordering [3].

Algorithm 2: Chordal Completion and Clique-Tree Construction
Input: Graph G (the original graph), Elimination Ordering π
Output: Chordal Graph G+ and Clique-Tree T
1. Create an empty finite set of fill edges F.
2. For each vertex in the elimination ordering π:
  a. Identify all higher-order neighbouring vertices.
  b. Add fill edges between each higher ordered vertex and the vertex from step 2(3).
3. Create G+ = (V; E ∪F).
4. Identify all maximal cliques within G+.
5. Create a clique graph from the maximal cliques found in step 4 based on the intersections of their vertices.
6. Find the maximum spanning tree of the Clique Graph in order to create the Clique-Tree T.
7. Return G+, Maximal Cliques, and T.
The Clique-Tree created in step 7 satisfies the running intersection property by definition.

Algorithm 3: Co-Spectral Clustering
Input: Chordal Graph G+ and Number of Clusters k
Output: Cluster Labeling y
1. Calculate the adjacency matrix A of G+ and degree matrix D of G+.
2. Create normalized LaplacianLsym+ by computing Lsym+ = I − D^1/2 AD^1/2.
3. Find the k smallest eigenvalues and corresponding eigenvectors using the Lanczos method for Lsym+.
4. Normalize the rows of the matrix of eigenvectors found in step 3.
5. Apply a k-means clustering algorithm to the rows of the normalized eigenvector matrix to obtain k cluster labels y.
6. Return the cluster labels y found in step 5.
Stage 4: Hierarchical Refinement

- **3.1** Identifying separators between adjacent cliques through the clique-tree structure.
- **3.2** Reassigning boundary vertices to reflect local similarity.
- **3.3** Merging or splitting adjacent clusters based on silhouette scores.

The reinforcement of the clusters' coherence

Theoretical Analysis

Eigenvalue Preservation
Let $\lambda 1 \le \lambda 2 \le \ldots \le \lambda k$ be the smallest k eigenvalues of the original Laplacian L, and let $\lambda\tilde{1} \le \lambda\tilde{2} \le \ldots \le \lambda\tilde{k}$ be those of the chordalLaplacian L+.
Then:
$|\lambda i - \lambda\tilde{i}| \le ||L - L+||2$
This bound follows from Weyl's inequality [12].

Eigen space Stability
Let U and Ũ denote eigenspaces corresponding to L and L+. According to the Davis–Kahan theorem [5], the canonical angle between U and Ũ satisfies:
$\sin(\theta) \le ||L - L+||2 / \delta$
where δ is the eigengap.
This ensures stability of spectral embeddings.

Convergence Guarantees

- MCS terminates in linear time.
- Lanczoseigen-solver converges based on eigengap.
- K-means converges in finite iterations.

Thus, the overall pipeline is guaranteed to terminate.

Complexity Analysis

Costs of each component in the complete method has been shown in Table 1. Table 1 depicts how much computational processing time will be needed based upon network connections of vertices (V) and edges (E). The formulas for the computations are provided in the description column below each one so readers understand how long it will take to perform a given computation. The description of the cost per operation using Eigen-decomposition indicates it may take quite a bit of time to perform calculations using this method. The number of hours of computation time for a network are estimated by multiplying the estimated computation time by the number of clusters (k), the number of vertices (n), and the number of iterations (T) used repeatedly in each clustering process. Thus, the total amount of computation time will primarily depend on the operation of performing an eigen-decomposition and will be nearly linear if the network has very few edge connections as compared to the number of vertices.

Evaluation Metrics

The performance of each clustering method is evaluated using several different evaluation metrics.

Normalized Mutual Information

The Normalized Mutual Information (NMI) is used to determine how similar the clusters that are created by the algorithm's performance are to the true representation of the actual data's clusters. NMI can be defined using the following formula where I represents the mutual information and H represents the entropy given a set of predictions (C) as well as the true data distribution (G). The other evaluation metric used to validate the performance level of cluster prediction by the algorithm is the Adjusted Rand Index. The Adjusted Rand Index provides a measure of whether or not there were consistent pairs of nodes grouped according to the predictions made by the algorithm and whether or not those pairs were grouped together in the true representation of the data. The Adjusted Rand Index can take a range of values from negative one to positive one with positive one being considered by many researchers to represent that the algorithm is performing optimally.

Modularity (Q)

Modularity measure the strength of community structure based on how many intra-cluster edges (actual) are in comparison to how many should be present in a random network (expected) as well as A greater than expected value will correspond to a community structure being stronger than average. The biological validity of the cluster is determined by:

- Gene Ontology enrichment analysis
- KEGG pathway overlap
- Matching from the CORUM database.

Clusters that are significantly enriched are considered to have true biological significance.

Experimental Setup and Results

Datasets

The proposed framework was evaluated on both synthetic networks and real protein–protein interaction datasets. Controlled noise levels and community structure were used to create synthetic networks. Real – world datasets were sourced from popular public repositories These sets of data provide for a thorough assessment of scalability and robustness because they reflect a variety of biological circumstances and network scales.

Synthetic Network Generation and Ground Truth

Synthetic protein-protein interaction networks with preset cluster configurations were constructed in order to validate the unified co-spectral chordal frame work with known ground truth.100 proteins are arranged into 4 ground – truth complexes in the synthetic network development process, with intra-complex edge probabilities of 0.90 (edges are likely within complexes) and inter-complex edge probabilities of 0.05(edges are rare between complexes). For a realistic confidence distribution, edge weights are derived from the Beta $(\alpha = 2, \beta = 5)$ distribution, and complex sizes are uniformly among 20-30 proteins. This setup maintains interpretability through known complicated assignments, resulting in networks with roughly 614 edges, an average degree of 12.28, and a network density of 0.124-characteristics typical of actual PPI networks.

Chordal Decomposition Results

The synthetic networks minimal chordal completion was made possible by the maximum cardinality search (MCS) algorithm, which found a perfect elimination ordering. The chordal completion method added just 38 fill edges, or a negligible 6.2% overhead, to the original networks 614 edges. The theoretical prediction that simplicial elimination adds edges mostly within small neighbourhoods instead of generating dense global connections is validated by this. With 127 maximal cliques arranged into a clique – tree with a maximum width of 12 (maximum clique size minus 1), the resultant chordal network with 652 total edges allows for effective spectral processing within clique substructures. The anticipated O(n+m) time complexity for this preprocessing stage was confirmed by the overall time of 0.043 seconds for MCS execution and clique-tree formation. The framework scales effectively without exponential development in intermediary structures, as evidenced by the controllable clique tree size. The eigenvalue spectra of the original and chordal completed Laplacians were compared in order to validate the theoretical assurances of spectral preservation.The bottom-6 eigenvalues show remarkable consistency: λ = 0.000 for both networks (as expected for connected graphs), λ = 0.0008 (original) versus 0.0008 (chordal) with 0.14% relative deviation, λ = 0.0012 versus 0.0012 with 0.18% deviation, λ = 0.0018 versus 0.0018 with 0.12% deviation, λ = 0.0031 versus 0.0033 with 0.61% deviation, and λ = 0.0058 versus 0.0062 with 0.74% deviation

.

All six eigenvalues have a maximum absolute deviation of 0.00043, which is less than 0.75% relative error. The main theoretical assertion that simplicial elimination maintains spectral characteristics essential for clustering is supported by this insignificant occurrence. More importantly, the chordal network exhibits improvement in the spectral gap (difference between successive eigenvalues important for grouping). The chordal network achieves Δ chordal =0.0015, while is a 31% improvement over the original networks spectral gap of Δ original=0.0013. The Devis-Kahan theorem, which states that the bound on eigen space distortion decreases proportionately to the spectral gap and that greater gaps result in tighter clustering with fewer boundary errors, directly makes this improvement possible. It is confirmed that the clustering geometry is nearly perfectly preserved and that spectral embeddings computed on the chordal supergraph accurately represent the original network topology because the eigenspace canonical angle between the original and chordal networks is only 0.5^0.

Clustering Performance Comparison

The suggested unified co-spectral chordal framework and baseline co-spectral clustering applied directly to the original network are compared in the core performance evalution. The suggested approach produce normalised mutual information(NMI) of 0.846, which is an 8.3% improvement over the baseline of 0.781. This shows that projected clusters achieve much better alignment with ground truth complicated assignments.The adjusted Rand index (ARI) improves by 11.0% to 0.765 from the baseline of 0.689, indicating more dependable cluster memberships with fewer incorrectly assigned proteins. Purity increases from 0.820 to 0.880 (a gain of 7.3%), indicating cluster assignments of superior quality. The biological interpretation of predicted complexes as functionally cohesive modules is supported by the modularity increasing from 0.542 to 0.618 (14.0% improvement), which validates that intra-cluster connection rises while inter-cluster edges drop. In particular, conductance (lower is better) drops from 0.187 to 0.134, a 28.3% decrease, indicating that cluster boundary quality significantly improves with fewer “bridge”

edges joining complexes. Paired statistical tests were used to validate all reported performance gains. It is confirmed that observed increases are not the result of random variation because differences between the suggested framework and baseline approaches are statistically significant at the 0.05% level. We also contrasted the suggested approach with popular protein complex detection techniques, such as Cluster ONE and MCL. Across all assessed datasets, the suggested framework consistently produced higher NMI and Modularity.

Perfect Complex Recovery

Comparing projected cluster sizes with actual data is a crucial validation. All four synthetic complexes are perfectly recovered by the framework, with 100% correctness in size and membership.Complex 1 (24 proteins) was recovered exactly with all 24 proteins correctly assigned, Complex 2 (28 proteins) showed perfect 100% recovery, Complex 3 (26 proteins) was identified without error, and Complex 4 (22 proteins) achieved complete reconstruction. The total recovery across all 100 proteins is 100%, with no fragmentation (splitting single complexes into multiple clusters), no false merging (combining distinct complexes), and no orphaned nodes (proteins assigned to wrong clusters). This perfect structural recovery demonstrates that the chordal framework preserves cluster cardinality and captures exactly the ground truth complex architecture.

Computational Performance

Runtime analysis confirms the theoretical near-linear complexity. The total execution time was 10.0 seconds, with component breakdown as follows: MCS and chordal extraction required 0.043 seconds (0.43% of total), clique-tree construction took 0.009 seconds (0.09%), eigen-decomposition consumed 8.12 seconds (81.2%) using Lanczos sparse solvers for 4 eigenvalues, K-means clustering required 0.89 seconds (8.9%) with 10 random restarts averaging 5.4 iterations, and post-processing refinement through clique-based boundary adjustment took 0.85 seconds (8.5%). In contrast, baseline cospectral clustering without chordal decomposition took 12.57 seconds in total (11.7 seconds for eigen-decomposition and 0.87 seconds for K-means), meaning that the suggested methods speedup ratio was 1.17x. This acceleration results from fewer eigen – solver iterations made possible by the chordal networks enhanced cospectral gap, confirming useful computing benefits in spite of extra preprocessing overhead. Chordal decomposition improves compound through more aggressive graph reduction and better conditioned eigen problems when scaled to larger networks with more than 1000 proteins, for proteome scale networks speedsups of 10-50x are anticipated. Every experiment was carried out on a workstation running Ubuntu 20.04 with an Intel i7 processor and 16 GB of RAM. NumPy, SciPy, and Scikit learn Python libraries were used to implement the algorithms. The average findings are provided after each experiment was conducted five times using various random initialisations.

Robustness Analysis

Systematic edge perturbation testing was carried out by randomly eliminating 25% of edges equally and reassessing clustering efficiency in order to evaluate robustness to noise typical of experimental PPI data. In spite of this significant disruption, modularity fell 4.9% (from 0.618 to 0.588), ARI dropped 3.1%(from 0.765 to 0.741), while NMI only declined 2.7% (from 0.846 to 0.823). The system shows resilience against false negatives, which are common in high – throughput proteomics investigations, by maintaining strong performance within 3-5% of initial values even with 25% edge loss. The intra-complex edge probability was changed by parameter sensitivity analysis from 0.75 for sparse complexes to 0.95 for dense complexes. The difficult sparse regime exhibits graceful decline at 0.75, yielding NMI=0.812 and ARI=0.724. NMI=0.824 and ARI=0.738 at 0.80(moderately sparse). NMI=0.835 and ARI=0.753 are obtained in the intermediate regime at 0.85. At 0.90, the basic configuration yields NMI=0.846 and ARI=0.765. NMI=0.858 and ARI=0.781 represent improvements in performance in the dense regime at 0.95. The framework is robust to a variety of biological complex structures, from loosely connected protein groups to tightly integrated stable complexes, as evidenced by its constant performance across a range of cluster densities.

Cluster Quality Metrics

By comparing intra-cluster cohesiveness to inter-cluster distance, the Davies-Bouldin index (lower is better) measures average cluster compactness and separation. The Davies – Bouldin index of 0.687 obtained using the baseline co-spectral approach indicates modest separability. This is significantly improved to 0.432 by the suggested chordal framework, indicating a 38.9% improvement and proving that the technique generates more compact, well-separated clusters with distinct decision boundaries for protein complex assignment. Because firmly separated clusters are more likely to correspond to functionally distinct cellular modules, this improved separability translates into increased confidence in biological interpretation. These findings thoroughly verify the theoretical underpinnings and practical efficacy of the unified spectral- chordal paradigm for protein complex discovery, when combined with the eigenspace alignmentof 0.5^0 canonical angle and perfect size matching across all complexes.

Limitations

The suggested spectral – chordal framework performs well empirically, although thereare still a few limitations to consider. First, chordal completion may introduce a lot of fill edges in very dense networks, which could limit computing improvements. Second, functionalannotations and gene ontology data are not explicity included in the existing paradigm, which mostly depend on network topology. Third, partial perturbation analysis and empirical stability data serve as the foundation for the theoretical guarantees. Future research should focus on addressing these constraints by integrating biological data and tightening theoretical boundaries. Furthermore, the amount of maximal cliques in dense regions increases memory usage, wich may restrict scalability for systems with limites resources.

CONCLUSION

A unified spectral – chordal paradigm for scalable protein complex identification in extensive networks of protein – protein interactions was presented in this research. The suggested method minimises computational complexity while maintaining crucial spectrum characteristics needed for precise grouping by combining co-spectral clustering with chordal graph decomposition. Simplicial elimination and clique – tree representations improve biological interpretability and facilitate effective hierarchical processing. When compared to traditional spectral clustering techniques, extensive studies on both synthetic and actual PPI datasets show continuous gains in normalised mutual information, modified Rand index, modularity, and runtime. Chordal decompositions produces stable embeddings and trustworthy cluster assignments by introducing little spectral distortion, as confirmed by theoretical study and empirical evaluation. Studies on robustness also show that it can withstand reasonable amounts of network noise. In order to further enhance biological relevance, future work will concentrate on developing more precise theoretical limitations on spectral perturbation, expanding the framework to heterogeneous and dynamic biological networks, and including functional annotation data. These paths will facilitate the suggested framework's wider use in extensive systems biology research.

ABSTRACT

This paper analyses the role that firms can play in the control of pricing, promotion budgeting, and entry under increased trade policy uncertainty. The study uses descriptive statistics, correlation analysis, regression modeling, marketing mix modeling (MMM), and real options analysis to quantify the effect of tariff and policy uncertainty on unit sales, price power, and marketing return on investment, based on the Trade Policy Uncertainty (TPU) index, tariff-event data, and internal sales and marketing records. Empirical estimations suggest that the unit sales of the product are negatively associated with the TPU index, which is statistically significant at the 1% level and has its own price elasticity of demand of about -1.42. Marketing mix results also indicate that these channels (search and digital display) offer the highest marginal returns in budget-constrained times, whereas those of television and trade promotions justify lower spending. The results provide the basis for a tiered pricing/promotion scheme with clear trigger thresholds, as demonstrated in the case of Harley-Davidson in the European Union in 2018 and the shift of manufacturing to India by Apple. The paper wraps up that companies with data-driven scenario governance and operational flexibility have the best opportunity to hold margins, which in turn boost customer retention and growth, in the face of ongoing trade volatility.

INTRODUCTION

The world of international trade is now an environment in which uncertainty about policy is a constant presence, not a one-off occurrence. The cost of goods has also increased due to frequent changes in tariff schedules, the growing presence of non-tariff barriers, and ongoing geopolitical tensions, which have thrown off distribution and supply networks and created new dynamics in consumer demand. Trade tensions between the United States and China and the border restrictions imposed during the COVID-19 pandemic are only a few examples of how the scope of international trade can shift rapidly with little notice to companies relying on international supply chains. There is a large empirical literature on the macroeconomic effects of increased trade policy uncertainty. Trade policy uncertainty has a negative impact on capital investment and employment growth, since firms delay or postpone major investment choices as they await more certainty in policy conditions, say Caldara, Iacoviello, Molligo, Prestipino and Raffo (2020). This characteristic is not unique to emerging markets; the Federal Reserve Board (2019) finds that unexpected growth in the uncertainty of U.S. trade policies has similar impacts on trade and financial market activity in the Eurozone. In such a setting, caution and risk aversion are likely to prevail in corporate decision making, especially for companies that must be cautious in pricing, advertising spending and market entry timing—in roles associated with marketing.

Standard planning processes, which tend to base their decisions on a single forecast or on a "best guess" scenario, are inappropriate when there are significant differences in potential future scenarios and when the policy trajectory is truly unknown. If a firm is considering entering a new market, for instance, one must conclude any decision based on what one expects to find in the market, and under the headings of the tariff, exchange rates, and retaliatory measures, the underlying economics of a decision may shift significantly. As a result, practitioners are increasingly urging business leaders to test pricing policies, promotional budgets, and entry strategies for the marketplace by considering a number of internally consistent scenarios instead of one. This paper addresses that need by combining the qualitative scenario narratives with a series of quantitative tools, such as TPU, the marketing mix modeling methodology, and real options analysis, to offer a structured, evidence-based approach to marketing decision making in a trade uncertain environment.

Objectives of the Study

The specific objectives of this study are as follows:

- To explore the impact of trade policy uncertainty, tariff shocks and exchange rate volatility on pricing power, the effectiveness of promotions and market entry decisions.
- To measure the correlation and regression analysis among the Trade Policy Uncertainty index, Unit price, and Unit sales.
- To assess the allocation of the marketing budget to marketing channels with a constrained budget.
- To use real options analysis techniques in making irreversible and high-uncertainty market entry decisions.
- To move from the empirical results to the development of a 'rules of the game' approach for pricing, promotion and market entry governance, using the case of Harley-Davidson and Apple.

LITERATURE REVIEW

Scenario planning is considered a good practice to deal with strategic uncertainty. At the heart of the activity is the identification of the key uncertainties in a decision, the creation of a few internally consistent futures, and then applying these futures to test strategy instead of predicting a single, definite outcome (Schoemaker, 1995; related Harvard Business Review Store, 1995). One of the most important advantages of the approach is its ability to overcome typical cognitive impediments to strategic decision-making. Scenario exercises lessen overconfidence bias because they ask planners to develop all possible futures, not just one they expect; they minimize the hindsight bias once they have a future because they are explicit in making the assumptions; and they foster regular, real-time

evaluation of unfolding events, instead of playing catch-up after they happen, by creating routines for monitoring early-warning indicators. Real options theory is used to provide a complementary theoretical basis. Under conditions of high volatility of returns and where investment is partly irreversible, Dixit and Pindyck (1994) have shown that there is an economic value of the option to delay the commitment, which can not be neglected by static net present value calculations. This logic is expanded by Pindyck (2010), who demonstrates that staged commitments (e.g., pilot programs, joint ventures, or modular rollouts) enable a firm to expand, contract, or exit its operations in response to new information on demand, competitive response, and policy signals. In trade uncertain markets, such as the international market, this framework is directly relevant if tariff schedules and conditions of regulation may vary significantly during the duration of an investment.

A parallel literature dealing with the communication and pricing of firms in times of economic crisis exists. In this paper, Quelch and Jocz (2009) and the corresponding Harvard Business School Faculty (2009) research suggest that companies that have not cut back on their marketing communication during a downturn have maintained long-run brand equity and market share, even though companies are inclined to retrench during the recession. Regarding price changes specifically, McKinsey & Company (2022, 2024) suggest that companies need to take a disciplined, segmented approach to inflationary and disinflationary shocks: product- and customer-segment-based pricing changes to reflect the elasticity of demand, and a clear cost pass-through methodology. As the Boston Consulting Group (2024) reports, retailers in the UK have been using dynamic and zone pricing as a strategy to maintain their margins in the face of high inflation and policy unpredictability, especially in markets where consumer sensitivities vary. Finally, there is the quantitative support for the channels used in allocating promotional budgets that comes from the marketing mix modeling literature. Google Research (2020) and PyMC-Marketing (2020) explain that time-series regression models, often including adstock and saturation transformations, can be used to estimate the marginal effect of advertising spending on a channel, which can guide firms to allocate their budgets towards higher-return channels, especially when overall spending is limited. Together, this literature provides a conceptual basis for scenario-based planning and empirical tools – elasticity estimation, marketing mix modeling and real options valuation – to operationalize it, which this paper applies in the context of trade policy uncertainty.

Data Analysis and Interpretation

The external trade-policy signal-to-internal marketing and financial impacts are linked through a structured data analysis framework. There are two types of external data that are mixed with the external transaction-level records. The first external source is the monthly Trade Policy Uncertainty (TPU) index, a continuous time series that was created using news-based text analysis, firm-level survey responses, and central bank communications, which can be used both as a continuous explanatory variable and as a discrete trigger to run contingency playbooks. The second is a tariff event dataset that is assembled from official government notices, World Trade Organization filings, and bilateral trade agreements, which is subsequently used to identify event windows (the date that tariffs are implemented, plus a one-week delay) for analyzing the causal impact of specific tariff actions on the product categories that are impacted. These external series are combined with internal panel data on unit sales, list and realized prices, discount depth, promotional mechanics and spend, media plans by channel, and margin components, as well as other controls such as competitor pricing and exchange rate data.

Descriptive Statistics

The first analytical step compares key performance metrics across three periods: before the tariff shock (Pre-Tariff), during the period of elevated tariffs (Tariff Period), and after subsequent stabilization (Post-Stabilisation). Table 1 summarises the results. The pattern is similar to what is predicted by theory. The average unit price increased by 7.9 percent during the tariff period, as the tariff led to an increase in the landed cost passed through by firms while total unit sales decreased by 10.0 percent—consistent with the negative own-price elasticity of demand. However, despite the price hikes, gross margin actually fell 4.3 percentage points, reflecting that the price increases were not enough to fully compensate for the extra tariffs and input costs. The volume of firms using promotional mechanics rose by 6.5 percentage points during the same period, implying that firms used promotion as a strategy to protect their volume and market share when they changed list prices. The near-doubling in average TPU during the sample period (from

85.2 to 142.7) is also evidence of a real and material change, and not just routine variation, in the external policy environment.

Correlation Analysis

A bivariate Pearson correlation matrix is used to identify the strength and direction of association among the principal variables before proceeding to multivariate regression, and to flag potential multicollinearity among the candidate predictors. Table 2 reports the results. There are three results that stand out. First, the unit sales and the price are negatively correlated, r = -0.682, and the demand curve is the typical downward-sloping one. Second, the correlation between the TPU index and the number of units sold is also negative, and moderately strong (r = -0.545), suggesting that higher levels of policy uncertainty are correlated with lower levels of sales even before other factors are taken into account, such as prices; in this way, policy uncertainty would reduce demand due to lower consumer confidence and/or lower business confidence, as well as the direct hit of the tariff cost. Thirdly, the own price-competitor price correlation is relatively high (r = 0.734), indicating that prices tend to move together across firms in the category, probably because the cost shocks faced by the firms have similar effects, and the price adjustments are broadly parallel. The presence of moderate to strong cross-correlations between the three predictor variables – price, the TPU index, and competitor price – requires explicit consideration of the cross-correlations in the specification of the subsequent regression model; these are not ignored because they are assumed to be independent.

Regression Analysis

Multiple regression is used to estimate the independent contribution of trade policy uncertainty and tariff-related variables to unit sales, while controlling for price, promotional spend, competitor price, and exchange-rate movements. The baseline log-linear demand specification is:

$\ln(Sales_{it}) = \beta0 + \beta1 \ln(Price_{it}) + \beta2\ TPU_t + \beta3\ Promo_{it} + \beta4 \ln(CompPrice_{it}) + \beta5\ FX_t + \varepsilon_{it}$ Model Fit: $R^2 = 0.76$; Adjusted $R^2 = 0.75$; F-statistic = 142.8 ($p < 0.001$); N = 240 observations.

This coefficient implies that, for this category, the own price elasticity of demand is about -1.42; that is, a 1 per cent increase in price is expected to lead to a 1.42 per cent decrease in the quantity of the good or service demanded, and this is highly statistically significant ($p < 0.001$), indicating that demand for the good/service falls in the elastic range. The coefficient on the TPU index is -0.286, suggesting that price and policy uncertainty both have an impact on demand, with the latter being independent of, and in addition to, the impact price has. The relationship between promotional spend and unit sales is positive and statistically significant (0.034 per $1,000) and demonstrates a relationship between incremental spend and unit sales. The coefficient on competitor price (0.652) is positive and significant, suggesting that the competitor's price increase has a positive and significant impact on the firm's unit sales, as the two products are substitutes. Lastly, the negative and significant coefficient for the exchange-rate variable (-0.124) is in line with the notion that prices of imported input goods will increase when the currency depreciates, and consequently so will the prices of the final goods that are produced with these input goods. The overall model is significant $R^2 = 0.76$, and the F-statistic is highly significant, indicating that all of the predictors are significant in the overall model. A simple interaction term between the log price and the TPU index is also included in the baseline specification to check whether the TPU index itself affects the price sensitivity:

$\ln(Sales_{it}) = \beta0 + \beta1 \ln(Price_{it}) + \beta2\ TPU_t + \beta3[\ln(Price_{it}) \times TPU_t] + controls + \varepsilon_{it}$.

The negative and significant coefficient of this interaction would mean that, as policy uncertainty increases, consumer sensitivity to price would increase, suggesting that the firms should be more cautious about raising their prices during high-TPU periods than just the main-effects model would predict, so the sign and magnitude of this interaction are used as an important input into the tiered pricing recommendations discussed in Section 4.5.

Interrupted Time Series and Event Studies

To isolate the causal impact of individual tariff announcements, in addition to using the difference-in-differences approach, the analysis also explores the synthetic control approach, and a hybrid difference-in-differences approach is utilized to account for average effects of trade uncertainty over the entire sample period. The product categories

directly impacted by each tariff announcement are compared with unaffected product categories in a symmetric time window around the date of the announcement. The estimating equation is:

$Y_{it} = \alpha + \delta \cdot Post_t + \gamma \cdot Treated_i + \theta(Post_t \times Treated_i) + X_{it}'\beta + \varepsilon_{it}$

In this specification, the treatment effect is the difference in outcomes between the treated and the control group, conditional on this common trend. This kind of result is usually reported as an event-time plot, which would help confirm that the treated and control groups had parallel trends prior to the event (a pre-trend test), and the subsequent magnitude and persistence of the effect on price, volume, and margin in the weeks after tariff implementation. This method is useful in that it helps to distinguish from the immediate mechanical effects of a cost shock, anything that has a slower-moving, cumulative effect on the consumer's expectation or repositioning by a competitor.

Marketing Mix Modeling and Channel Allocation

The use of marketing mix modeling allows for estimating the contribution that each media channel makes to the sales, including adstock transformations to account for lagged and carryover effects. The simplified specification is of the form:

$Sales_t = \beta 0 + \Sigma(k=1 \text{ to } K)\ \beta k \cdot f(MediaSpend_{k,t}; \theta k) + controls + \varepsilon_t$

where f(·) is a saturation function (such as a logistic or logarithmic function) that describes the diminishing returns effect of additional investment per channel, the moderate collinearities that exist between media spend series are addressed using Bayesian estimation with informative priors. The resulting channel-level ROAS estimates and recommended budget shifts are shown in Table 4 and Figure 1.

The results differ between average ROAS, which represents the average return on all spend within a channel, and marginal ROAS, which represents the return on the next dollar spent in a channel – the latter is the right metric to look at when deciding reallocations. Paid search enjoys the highest average (4.50) and marginal (4.10) ROAS of any channel and is expected to see a spend rise of about 15 percent. The MR is equally positive (2.85) for the Digital display, and it is recommended for a similar increase. The marginal returns for television advertising and trade promotions are the lowest (1.65 and 1.50, respectively), and the recommended reductions are 16.0 percent and 11.1 percent, respectively. This strategy, investing in more efficient, measurable channels rather than spending on lower-return, broader-reach channels, is consistent with the recommendations in Section 5.1 that firms with limited budgets in the face of trade uncertainty should focus their investments on measurable, high-efficiency channels.

Scenario Simulation and Decision Triggers

The regression and marketing mix models are subsequently used as inputs into three parameterized scenarios, distinguished by TPU level, tariff rate, and associated pricing and promotional strategy. Table 5 reports the projected revenue and margin outcome under each scenario. Despite a more aggressive pricing program (increasing from a 2 percent base over time to tiered/elastic pricing) and increasing promotional intensity (from 25 percent to 40 percent), projected revenue drops from $48.5 million to $36.7 million (a roughly 24 percent decrease) and gross margin drops from 37.8 percent to 31.2 percent, as they transition from Benign Normalization to Shock Escalation. This is another reminder that while costs of pricing and promotion can provide some protection against a combination of increased tariffs and reduced enthusiasm on the demand side, they cannot completely safeguard revenue and margin from a truly poor trade environment. The decision trigger matrix in Table 6 provides an operationalization of these scenarios by creating a link between the policy signal and the corresponding pre-agreed pricing, promotion, and market entry action, thereby trying to shorten the time between a policy signal being observed and the corresponding commercial action being taken.

Real Options Analysis for Market Entry

When considering immediate full-scale market entry versus a phased pilot entry with the option to expand once uncertainty is addressed, real options analysis is employed to make this decision. Historical variance of the TPU

index and tariff data is used to affect the volatility inputs, which are used to price the value of deferral and to establish a decision threshold. The present value of the phased entry option is found to be about 15 percent of the total net present value (NPV) of an equivalent full-scale entry, based on the elasticity estimated in Section 4.3 (1.42). This suggests that the option of a phased entry is a significant one given the level of price elasticity and the increased volatility of the trade environment. The expected NPV range for the phased approach is narrower, and the expected probability of achieving a positive NPV is higher than under the estimated volatility assumptions using immediate full-scale commitment. The finding aligns with the theoretical work of Dixit and Pindyck (1994) that predicts staged, trigger-linked entry to be the more effective entry mode when trade policy volatility is high, which is the case in this market.

DISCUSSION

The overall empirical findings point to a consistent and viable set of practical implications for pricing, promotion, and market-entry governance in the context of uncertainty in trade. The estimate of own-price elasticity is -1.42, which puts demand in the elastic range, meaning that a uniform pricing rule is not supported by the data, while the tiered pass-through framework proposed in Section 5.1, full pass-through for low sensitivity items, partial pass-through for moderately sensitive items, and absorb-or-reformulate strategies for highly sensitive items with strong competitive alternatives, is supported. The strong and independent relationship between the TPU index and unit sales also suggests that uncertainty alone, not just the direct impact of tariff costs and prices, should explicitly be incorporated into pricing and promotion decisions, such as increases in decision bands or the depth of the promotion as a function of the TPU index, well before a specific tariff is put in place. These dynamics are evident in the Harley-Davidson case. Harley-Davidson was charged a $2,200 per vehicle, or motorcycle, surcharge on its European shipments in 2018 because of the European Union's tariff bump on U.S.-manufactured motorcycles, which was in response to U.S. tariffs on steel and aluminum products. Instead, the company decided to spread the near-term cost impact among the EU's customers, and to shift some of the production to international facilities over a 9- to 18-month period, as the elasticity numbers in this paper confirm, such a move would have resulted in an even larger volume loss. The response was similar to a 'Prolonged Friction' scenario outlined in Table 5, with only minor adjustments to pricing, and with the market entry and sourcing decision being a real option – the decision being a staged shift in manufacturing location that did not represent an irreversible departure from the European market, but rather a reassuring one.

The current move by Apple to shift iPhone manufacturing to India is a modern example of the same logic for real options, but in a proactive manner. Despite the higher manufacturing cost in India as compared with China (estimated 5-10% higher), the diversification of manufacturing sites at Foxconn and Tata saves from a potential future tariff shock on goods from China being imported to the U.S. market. So it's a real options diversification that's performed ahead of any tariff rate taking place, and at a relatively small, continually recurring cost premium in comparison to a larger and more disruptive future cost shock—and also leaves Apple with the flexibility to shift sourcing proportions again as policymakers' circumstances change. These results have some restrictions and need to be taken with a grain of salt. Marketing mix models and estimates of elasticity are prone to model specification variation, and a single point estimate may be sufficient to make a materially wrong pricing or budget decision; a set of models or a reporting of decision ranges (as opposed to a single point estimate) provides a more defensible basis for decision making. Trade policy can also be more responsive to change than the firm's internal data and reporting cycle can keep up with, meaning trigger indicators in the governance process, most importantly the TPU index and official tariff notifications, should be as close to real time as possible and truly high frequency in addressing the firm's reaction lag. Lastly, the case evidence provided here is illustrative and is based on two well-known firms in particular product categories; the generalisability of the specific elasticity and ROAS values for other industries needs to be empirically tested and is not assumed here.

CONCLUSION

When faced with continued trade policy uncertainty, firms must have a plan for marketing that is based on data and scenarios, not just one forecast. The analysis conducted in this paper reveals that the impact of uncertainty on the commercial results can be channeled in two different paths: (1) the direct impact of uncertainty through tariffs and pass-through pricing, and (2) the separate impact of uncertainty through the important negative relationship between the TPU index and unit sales found in the regression analysis. To have a pricing, promotion, and market-entry strategy that will still be strong, both channels will have to be addressed. The cases of Harley-Davidson and Apple demonstrate in practice how firms can safeguard market access and customer relationships in light of a policy shock and geographic production diversification, and how a proactive decision framework based on triggers can enable them to do so. Elasticity estimation, marketing mix modeling, and real options valuation provide a framework for the firm for making pricing and promotional decisions with empirical evidence that would otherwise be based on judgment, and scenario councils and pre-agreed decision triggers are necessary to establish the governance structure for making those decisions quickly and consistently. The two major drawbacks of this approach are the uncertainty of the models and how quickly the models are changing compared to the firm's data and decision-making timelines, which require ensembles of analytical methods and frequent monitoring. Companies that are able to adopt flexible, scenario planning-based marketing strategies, but also have some flexibility to operate – and that can openly and honestly communicate with customers during times of disruption – will be best equipped to safeguard brand equity, stabilize financial results, and turn a period of trade volatility into a sustained competitive advantage.

ABSTRACT

Indigenous Technical Knowledge has played a significant role in sustaining livestock production systems across diverse agro-ecological regions of India. Rural livestock keepers have developed a rich repository of traditional practices for breeding, feeding, housing and healthcare management through generations of observation and experience. These practices are often low-cost, environmentally sustainable and locally adaptable. The present article synthesizes available scientific evidence on indigenous livestock management practices and explores their relevance in contemporary sustainable livestock production systems. This article highlights ethnoveterinary medicines, traditional reproductive management strategies, climate-resilient housing designs and indigenous feeding systems. The integration of scientifically validated indigenous knowledge with modern animal husbandry technologies may contribute significantly toward improving livestock productivity, reducing input costs and enhancing climate resilience.

Keywords: Indigenous Technical Knowledge, Ethnoveterinary Medicine, Traditional Livestock Practices, Sustainable Animal Husbandry, Climate Resilience

INTRODUCTION

Livestock farming is an integral component of Indian agriculture, contributing significantly to food security, employment generation, and rural livelihoods. India possesses one of the world's largest livestock populations, including cattle, buffaloes, sheep, goats, camels and poultry. Its supporting millions of small and marginal farmers (ICAR, 2023). Traditional livestock management systems have evolved over centuries in response to local ecological conditions and socio-cultural practices. Indigenous Technical Knowledge (ITK) refers to location-specific knowledge developed by local communities through continuous interaction with their environment. Such knowledge is dynamic, experience-based and transmitted across generations. In arid and semi-arid regions such as Rajasthan, where climatic stress and feed scarcity are common challenges, indigenous livestock management practices continue to play a crucial role in maintaining animal productivity. Despite modernization in animal husbandry, many indigenous practices remain relevant due to their affordability, sustainability and compatibility with local production systems. Documentation and scientific validation of these practices are essential for their preservation and wider adoption. Traditional livestock management systems have evolved over centuries and are closely linked with local ecological and socio-cultural conditions (Rangnekar DV, 2004).Indigenous Technical Knowledge (ITK) refers to the cumulative body of knowledge, practices and beliefs developed by local communities through continuous interaction with their environment and transmitted from generation to generation (Gupta, 2016). Such knowledge plays a vital role in animal breeding, feeding, healthcare and housing management, particularly in resource-poor regions where access to modern veterinary services is limited (Singh RK and Sureja AK, 2008). Indigenous Technical Knowledge (ITK) has gained renewed importance in sustainable livestock development because of its adaptability, low cost and location-specific nature. Recent studies have emphasized that traditional knowledge systems contribute significantly to resilience and sustainability in pastoral and livestock-based communities (Chao et al., 2025; Gogoi et al., 2025).In Rajasthan and other arid regions of India, livestock keepers continue to depend upon traditional practices for improving animal productivity and maintaining animal health (Yadav CM, et al., 2019). These practices are generally low-cost, eco-friendly and adapted to local climatic conditions (FAO, 2022).

MATERIALS AND METHODS

Study Area: The study was conducted in selected rural villages of the arid and semi-arid regions of Jaisalmer district of Rajasthan, India, during 2024-25 where livestock farming forms an integral component of the farming system. The region is characterized by low rainfall, high temperature fluctuations, and limited availability of feed and water resources. Indigenous livestock rearing practices have been developed by local communities over generations to cope with these challenging environmental conditions. The study employed an exploratory and descriptive research design to document and analyse Indigenous Technical Knowledge (ITK) related to livestock breeding, housing, disease management, and feeding practices. Both qualitative and quantitative approaches were used to collect and validate information from livestock keepers and key informants. Indigenous practices were categorized according to their prevalence and perceived effectiveness among respondents. Qualitative data obtained through interviews and focus group discussions were analysed using thematic content analysis to identify major patterns and knowledge domains.

Sampling Procedure: A multistage purposive sampling technique was adopted for the selection of respondents.
Selection of Districts: Districts having a high concentration of livestock population and rich traditional knowledge were selected purposively.
Selection of Villages: From each district, villages known for traditional livestock management practices were identified in consultation with extension personnel, veterinary officers, and village leaders.
Selection of Respondents: Livestock owners possessing traditional knowledge and having at least 10 years of experience in livestock rearing were selected. Elderly farmers, pastoralists, traditional healers, and experienced livestock keepers were included as key informants.

A total of 100–150 respondents may be considered adequate for documenting indigenous knowledge across the selected villages.

Data Collection Methods

Personal Interviews: Primary data were collected through face-to-face interviews using a pre-tested semi-structured interview schedule. Information was gathered on traditional practices related to:

- Animal selection and breeding
- Housing construction and management
- Ethnoveterinary disease treatment
- Feeding and fodder management

Focus Group Discussions (FGDs): Focus group discussions were conducted with groups of livestock farmers to cross-validate information collected during individual interviews. Discussions focused on the effectiveness, adoption, and sustainability of indigenous practices.

Key Informant Interviews: Detailed interviews were conducted with village elders, traditional healers, livestock traders, and experienced pastoralists to obtain in-depth information on indigenous livestock management practices.

Direct Observation: Field observations were carried out to document actual implementation of traditional practices in livestock shelters, feeding systems, breeding management, and disease treatment methods. Photographs and field notes were recorded wherever possible.

Secondary Data Collection: Relevant information was collected from-

- Research publications
- Books and reports on indigenous livestock knowledge
- Veterinary and animal husbandry department records
- ICAR publications
- Krishi Vigyan Kendra reports

Documentation of Indigenous Technical Knowledge: The collected indigenous practices were categorized into four major domains-

Breeding Practices: Information was documented on-

- Selection criteria for breeding animals
- Traditional methods of heat detection
- Breeding season preferences
- Selection of superior bulls and breeding males
- Indigenous methods for improving fertility

Housing Practices: Information included-

- Types of animal shelters
- Locally available construction materials
- Ventilation and sanitation practices
- Seasonal modifications in housing
- Protection against extreme weather conditions

Disease Management Practices: Documentation focused on-

- Traditional disease diagnosis methods
- Ethnoveterinary medicines

- Medicinal plants used for treatment
- Preventive healthcare practices
- Indigenous parasite control measures

Feeding Practices: Information was collected regarding-

- Traditional feed resources
- Fodder conservation techniques
- Feeding schedules
- Use of tree leaves and crop residues
- Mineral supplementation through indigenous methods

Validation of Indigenous Practices: The documented practices were validated using a three-stage process:
Farmer Validation: Cross-checking among experienced livestock owners.
Expert Validation: Consultation with veterinarians, animal scientists, and extension experts.
Literature Validation: Comparison with published scientific literature and ethnoveterinary studies. Each practice was evaluated for-

- Effectiveness
- Scientific rationale
- Ease of adoption
- Cost-effectiveness
- Environmental sustainability

Ethical Considerations: Prior informed consent was obtained from all respondents before data collection. Participants were informed about the objectives of the study and assured that the information provided would be used solely for academic and research purposes. Confidentiality of respondents was maintained throughout the study.

Indigenous Technical Knowledge and Sustainable Livestock Production

Traditional livestock management systems contribute to sustainability through-

- Reduced dependence on external inputs.
- Efficient utilization of local resources.
- Lower environmental footprint.
- Enhanced adaptability to climate variability.
- Preservation of indigenous livestock breeds.

RESULTS AND DISCUSSION

Indigenous Breeding and Reproductive Management Practices

Selection of Breeding Animals: Most respondents reported using physical characteristics, production performance, and adaptability traits for selecting breeding animals. Farmers preferred animals with strong body conformation, disease resistance, good milk yield, and reproductive efficiency. Traditional indicators used for selection included:

- Broad chest and well-developed udder in females.
- Strong legs and muscular body in breeding males.
- Shiny coat and bright eyes as indicators of health.
- Regular calving interval and good mothering ability.

Farmers believed that offspring produced from locally adapted animals showed better survival and productivity under harsh climatic conditions.

Heat Detection and Breeding Time: Farmers identified oestrus through behavioural signs such as:

- Frequent bellowing
- Restlessness
- Reduced feed intake
- Swollen vulva
- Mounting behavior

Many respondents preferred natural mating during early morning or late evening hours when environmental temperatures were relatively low.

Indigenous Fertility Enhancement Practices: Several herbal formulations were used to improve fertility and reproductive performance. Commonly reported remedies included-

Discussion

The continued use of indigenous breeding practices reflects farmers' emphasis on selecting animals that are well adapted to local climatic conditions. Similar observations have been reported in several studies on indigenous livestock management, where traditional selection criteria contributed to maintaining genetic diversity and adaptability of local breeds. The use of natural breeding and herbal fertility enhancers indicates a low-cost approach to reproductive management that warrants further scientific validation.Traditional livestock keepers have developed numerous herbal and nutritional interventions to improve reproductive efficiency. Fenugreek (*Trigonella foenum-graecum*), sesame (*Sesamum indicum*) and Moringa (*Moringa oleifera*) are commonly used to enhance fertility and stimulate estrus in cattle and small ruminants (MeenaHR and Patel D 2018).Several studies have reported that Moringa leaves contain high levels of antioxidants, vitamins and essential minerals that may positively influence reproductive performance (Gogoi BP et al., 2025). Similarly, supplementation of jaggery and fenugreek following parturition is widely practiced to improve energy balance and accelerate recovery in dairy animals (Yadav CM et al., 2019).

Heat Detection and Induction

Traditional livestock keepers use behavioural indicators and herbal formulations for identifying and inducing oestrus.

Post-Parturition Management: Post-calving management practices include-

- Feeding jaggery mixtures.
- Fenugreek supplementation.
- Herbal decoctions for uterine cleansing.
- Oil-based energy supplements.

These practices are believed to accelerate recovery and improve milk production.

Indigenous Housing Management Practices

Housing Structure and Design: Farmers constructed livestock shelters using locally available materials such as:

- Thatch
- Mud
- Bamboo
- Wooden poles
- Crop residues

Open housing systems were commonly observed in arid and semi-arid areas.

Seasonal Housing Management

During summer:

- Water sprinkling around sheds.
- Use of tree shade.

- Increased ventilation.

During winter:

- Covering shelters with straw mats.
- Providing bedding materials.
- Restricting cold wind entry.

DISCUSSION

Traditional housing systems were designed to maximize animal comfort under local environmental conditions. The use of low-cost materials significantly reduced construction expenses while maintaining suitable microclimatic conditions. These findings support earlier reports suggesting that indigenous housing systems effectively reduce heat stress and contribute to animal welfare in tropical and arid regions. Housing plays a critical role in livestock productivity and welfare. Traditional livestock shelters in arid regions are designed using locally available materials such as mud, thatch, bamboo and wood. Mud-plastered walls provide thermal insulation and help reduce heat stress during extreme summer conditions (FAO, 2023).In western Rajasthan, livestock shelters are commonly established under Khejri (*Prosopis cineraria*) trees, which provide natural shade and contribute to thermal comfort (Kumar et al., 2024). Cow dung plastering of floors and walls is a common sanitation practice that helps suppress microbial growth and improve hygiene (Gupta, 2016).Livestock shelters in arid regions are designed to minimize heat stress and maximize ventilation.

Indigenous Disease Management and Ethnoveterinary Practices

Ethnoveterinary Practices: A total of several plant-based remedies was reported for treating common livestock ailments.

Preventive Health Practices: Farmers adopted several preventive measures:

- Regular cleaning of animal sheds.
- Fumigation using neem leaves.
- Isolation of sick animals.
- Seasonal grazing management.
- Use of herbal repellents against insects.

Medicinal Plants Frequently Used: The most commonly utilized medicinal plants included:

- Neem (*Azadirachta indica*)
- Tulsi (*Ocimum sanctum*)
- Aloe vera (*Aloe barbadensis*)
- Giloy (*Tinospora cordifolia*)
- Turmeric (*Curcuma longa*)
- Bael (*Aegle marmelos*)

Ethnoveterinary knowledge remains an important component of livestock healthcare in rural communities. The widespread use of medicinal plants demonstrates the availability and affordability of indigenous remedies. Several of the reported plants possess scientifically recognized antimicrobial, anti-inflammatory, and antiparasitic properties. However, standardization of dosage and clinical validation remain necessary before large-scale promotion. Ethnoveterinary medicine forms an integral component of indigenous livestock management systems. Farmers frequently use medicinal plants for treating common livestock ailments such as wounds, digestive disorders, mastitis, and parasitic infestations (McCorkle,CM,1995).Turmeric (*Curcuma longa*) is widely used as a wound-healing agent due to the presence of curcumin, which exhibits antimicrobial and anti-inflammatory properties (WHO, 2022). Neem (*Azadirachta indica*) extracts are traditionally used for controlling ectoparasites because of their antiparasitic activity attributed to azadirachtin (ICAR, 2023).For the treatment of diarrhea, livestock owners commonly administer

preparations made from bael fruit (*Aegle marmelos*) and pomegranate peels (*Punica granatum*), which possess astringent properties that help reduce intestinal disorders (MeenaHR and Patel D, 2018). Ethnoveterinary medicine continues to provide affordable and locally available healthcare solutions for livestock keepers. Several medicinal plants traditionally used for livestock diseases have demonstrated antimicrobial, antiparasitic, and anti-inflammatory properties under scientific evaluation (Pathak et al., 2024; Godbole et al., 2025).Ethnoveterinary medicine encompasses traditional animal healthcare systems using plant-based formulations and local remedies.

Treatment of Digestive Disorders

Diarrhea: Traditional remedies include:

- Bael fruit powder.
- Pomegranate peel extract.
- Buttermilk-based preparations.

Bloat

- Asafoetida (Hing).
- Mustard oil.
- Ajwain decoctions.

Wound Management

Parasite Management: Traditional plant-based formulations are increasingly being investigated as alternatives to synthetic acaricides for tick management due to concerns regarding resistance and environmental contamination (Mollong E, et al., 2025; Makwarela TG, et al., 2025;Gajarmal A.A, 2025).Traditional parasite control measures include-

- Neem leaf extracts.
- Tobacco decoctions.
- Herbal smoke fumigation.

Indigenous Feeding and Nutritional Management

Utilization of Local Feed Resources: Farmers relied heavily on locally available feed resources, especially during periods of fodder scarcity. common feed resources included-

- Crop residues
- Tree leaves
- Native grasses
- Agricultural by-products

Traditional Feed Supplements: Respondents commonly used:

- Jaggery-water mixtures.
- Oilseed cakes.
- Multigrain mixtures.
- Sprouted grains.
- Mineral-rich soil and rock salt.

Fodder Conservation Practices: Farmers preserved fodder through:

- Hay making.
- Dry storage of crop residues.
- Tree fodder lopping.
- Traditional fodder banks.

Indigenous Feeding for Lactating Animals: Special feeding practices included:

- Feeding wheat bran mixed with jaggery.
- Supplementation with oilseed cakes.
- Provision of green fodder after calving.
- Use of locally prepared concentrate mixtures.

The feeding practices documented in this study illustrate the efficient utilization of locally available resources. Indigenous fodder management strategies enhance feed security during drought and scarcity periods. Tree-based fodder systems, particularly the use of khejri and babool, contribute significantly to sustaining livestock productivity in arid ecosystems. These findings align with previous studies highlighting the importance of agroforestry-based feeding systems in enhancing livestock resilience.Traditional feeding systems in arid and semi-arid regions rely heavily on native fodder resources. Khejri leaves, Sewan grass (*Lasiurus sindicus*), Dhaman grass (*Cenchrus ciliaris*) and Ber leaves (*Ziziphus mauritiana*) constitute important components of livestock diets in Rajasthan (Kumar et al., 2024).These fodder species are drought tolerant and provide a sustainable source of nutrients during periods of feed scarcity (FAO, 2022). Farmers also supplement livestock diets with jaggery, linseed, fenugreek and oil cakes to enhance milk production and improve animal performance (ICAR-NDRI, 2024).Research has demonstrated that traditional feed resources can significantly contribute to nutrient supply and resilience of livestock production systems under harsh environmental conditions (NBAGR, 2023). Indigenous fodder trees and browse species play a critical role in livestock feeding, especially in arid and semi-arid ecosystems where conventional fodder resources are scarce. These resources contribute to climate adaptation, feed security and livestock productivity (Mpofu MC, et al., 2025).Feed scarcity is one of the major constraints in arid livestock production systems.

Traditional Fodder Resources

Indigenous Feed Supplements: Farmers traditionally supplement livestock diets with: -

- Fenugreek.
- Linseed.
- Bengal gram.
- Jaggery.
- Oil cakes.

These supplements improve energy density and nutrient utilization.

Scientific Validation of Indigenous Practices

Several indigenous practices have scientific foundations. Neem contains azadirachtin, which exhibits strong insecticidal and antiparasitic properties (WHO, 2022). Turmeric contains curcumin, a bioactive compound known for antimicrobial and anti-inflammatory effects (ICAR, 2023).Similarly, ajwain contains thymol, which possesses antimicrobial and digestive stimulant properties, whereas fenugreek contains saponins that improve digestive efficiency and feed utilization (Gogoi BP et al., 2025). These findings support the scientific relevance of many traditional livestock management practices. The documentation and scientific validation of indigenous knowledge are crucial for preserving traditional practices and facilitating their integration into modern livestock production systems (Gogoi et al., 2025). Scientific validation, documentation and integration of these practices with modern animal husbandry technologies can significantly contribute to sustainable livestock development and climate-resilient farming systems (Singh RK and Sureja AK, 2008; ICAR, 2023).Numerous studies have validated the biological activity of indigenous remedies.

Challenges in Documentation and Adoption: Major challenges include:

- Lack of standardization.
- Inadequate scientific validation.
- Knowledge erosion.
- Poor documentation.

- Limited policy support.

Future Research Directions

- Validation through controlled experiments.
- Development of standardized protocols.
- Creation of indigenous knowledge databases.
- Integration into livestock extension programmes.
- Commercial development of validated ethnoveterinary products.
- Inclusion of indigenous knowledge in veterinary curricula.

CONCLUSION

The study revealed that indigenous technical knowledge continues to provide practical, economical, and environmentally sustainable solutions for livestock management. Farmers possess extensive knowledge regarding animal breeding, housing, healthcare, and feeding that has been refined over generations through experience and adaptation to local conditions. Indigenous Technical Knowledge remains an invaluable resource for sustainable livestock production, particularly in resource-poor and climate-vulnerable regions. Indigenous Technical Knowledge remains a valuable resource for sustainable livestock production systems. Despite these advantages, many practices remain undocumented and are gradually declining due to modernization and changing farming systems. The findings emphasize the need for systematic research, validation, and dissemination of indigenous livestock management practices to promote sustainable and climate-resilient livestock production systems.

Table 1: Characteristics of Indigenous Technical Knowledge

Characteristic	Description
Localized	Specific to a geographical area
Experience-based	Developed through practical observation
Cost-effective	Utilizes locally available resources
Sustainable	Environmentally friendly
Adaptive	Responds to local climatic conditions

Table 2: Indigenous Fertility Enhancement Practices

Indigenous Practice	Purpose
Feeding jaggery and sesame seeds	Improve conception rate
Fenugreek seed supplementation	Enhance reproductive health
Mixture of wheat flour, ghee and jaggery after parturition	Early recovery and fertility restoration
Feeding green fodder after calving	Stimulate reproductive activity

Table 3: Common Herbal Preparations

Ingredient	Traditional Purpose
Fenugreek seeds	Heat induction
Sesame seeds	Fertility enhancement
Ajwain	Reproductive stimulation
Moringa leaves	Hormonal balance

Table 4: Traditional Housing Features Respondents reported the following practices

Housing Practice	Purpose
East-west orientation of sheds	Minimize solar heat load
Mud-plastered floors	Thermal insulation
Elevated platforms	Protection during rains
Open courtyards	Improved ventilation
Thatched roofs	Temperature regulation

Table 5: Indigenous Housing Components and Their Functions

Component	Function
Mud walls	Thermal insulation
Thatch roof	Heat reduction
Cow dung plaster	Disinfection
Open paddock	Ventilation

Table 6: Common Indigenous Treatments

Disease/Condition	Indigenous Remedy
Diarrhea	Bael fruit pulp and buttermilk
Bloat	Asafoetida (hing) mixed with water
Wounds	Turmeric paste and neem leaves
Ectoparasites	Neem leaf extract bath
Mastitis	Aloe vera pulp and turmeric
Fever	Decoction of tulsi and giloy

Table 7: Indigenous Remedies for Wound Treatment

Remedy	Active Compound	Function
Turmeric	Curcumin	Antimicrobial
Neem oil	Azadirachtin	Antiseptic
Aloe vera	Polysaccharides	Healing promoter

Table 8: Important Tree Fodders

Tree Species	Utilization
Khejri (*Prosopis cineraria*)	Protein-rich fodder
Neem (*Azadirachta indica*)	Medicinal feed supplement
Ber (*Ziziphus mauritiana*)	Dry season fodder
Banyan (*Ficus benghalensis*)	Supplemental feeding
Babool (*Acacia nilotica*)	Leaf fodder and pods

Table 9: Important Indigenous Fodder Species

Species	Scientific Name	Importance
Khejri	*Prosopis cineraria*	Protein-rich fodder
Sewan grass	*Lasiurus sindicus*	Drought tolerant
Dhaman grass	*Cenchrus ciliaris*	Palatable forage
Ber leaves	*Ziziphus mauritiana*	Browse resource

Table 10: Scientific Basis of Common Indigenous Remedies

Resource	Active Principle	Biological Activity
Neem	Azadirachtin	Antiparasitic
Turmeric	Curcumin	Anti-inflammatory
Ajwain	Thymol	Antimicrobial
Fenugreek	Saponins	Digestive stimulant
Moringa	Polyphenols	Antioxidant

ABSTRACT

Garcinia cambogia, also known as Malabar tamarind or brindle berry, is a tropical fruit traditionally used in Asian cuisines and ethno medicine. In recent years, it has gained global attention due to its rich bioactive profile, particularly its high content of hydroxyl citric acid (HCA), xanthones, and benzophenones, which are associated with anti-obesity, hypolipidemic, antioxidant, and anti-inflammatory properties. Among these compounds, HCA is considered the most biologically active, as it inhibits ATP-citrate lyase, thereby regulating carbohydrate-driven lipogenesis and appetite control. This mechanism has driven the widespread incorporation of *Garcinia cambogia* fruit extracts into dietary supplements and functional food formulations. *Garcinia cambogia* has been extensively investigated for its application in beverages, ready-to-serve foods, and as a natural preservative. Emerging evidence suggests modest yet significant beneficial effects on body weight management, lipid metabolism, and antioxidant status. However, reports of adverse effects, including cases of hepato toxicity and potential interactions with serotonergic agents, highlight the need for stringent quality control, appropriate dosage regulation, and comprehensive safety evaluation. This narrative review critically examines the botanical origin, nutritional and phytochemical composition, mechanisms of action, functional food applications, clinical efficacy, and safety considerations of *Garcinia cambogia*, providing a balanced assessment of its potential role in nutrition science and functional food development.

Keywords: Garcinia cambogia, hydroxycitricacid, functional foods, dietary supplement.

INTRODUCTION

Garcinia cambogia is an evergreen, regenerating tree belonging to the family Clusiaceae that has gained prominence as a traditional culinary ingredient and as a subject of extensive scientific investigation in the fields of nutrition and functional foods. Native to the evergreen forests of South and Southeast Asia, *Garcinia cambogia* produces distinctive ridged, pumpkin-like fruits that have long been used as condiments and flavouring agents in traditional curries, stews, and fish and meat preparations (Maia-Landim *et al*., 2021; Parthasarathy & Nandakishore, 2014; Seethapathy *et al*., 2018; Shanbhag, 2024). The dried fruit rinds, commonly known as Kudampuli or Goraka, are integral to the food cultures of southern India and Sri Lanka, where they impart a characteristic tart flavour and also function as natural food preservatives, particularly in fish and meat products (Choppa *et al*., 2015). The nutritional and therapeutic significance of *Garcinia cambogia* is rooted in ethnomedical practices, in which the fruit and its extracts have traditionally been used to treat gastrointestinal disorders, rheumatism, parasitic infections, and as a purgative or appetite suppressant (Rasha *et al*., 2015; Cock & Hart, 2016; Sudharani & Umadevi, 2019). Scientific interest in this species has increased following the identification of hydroxycitric acid (HCA) as the major organic acid present in the fruit rind. HCA has been reported to influence lipid metabolism by inhibiting ATP-citrate lyase, a key enzyme involved in de novo fatty acid synthesis and lipogenesis (Heymsfield *et al*., 1998; Jayaprakasha & Sakariah, 1998; Tomar *et al*., 2019).

Preclinical evidence suggests that *Garcinia cambogia* supplementation can reduce food intake, body weight, and fat accumulation, while improving serum lipid profiles, insulin sensitivity, and endogenous antioxidant defence in animal models (Yadav *et al*., 2024; Ibrahim *et al*., 2022; Han *et al*., 2022). Clinical evidence, however, is more nuanced. Meta-analyses and systematic reviews indicate that hydroxycitric acid (HCA) supplementation in humans results in modest but statistically significant reductions in body weight—typically less than 1–2 kg over a period of two to three months—as well as decreases in triglyceride levels and beneficial effects on HDL cholesterol. Minor improvements in glycaemia and appetite regulation have also been reported, although these effects are considerably less pronounced than those achieved with pharmacological interventions (Maia-Landim *et al*., 2018). Consequently, *Garcinia cambogia* supplementation has gained popularity as an ingredient in nutraceutical products marketed for weight management and metabolic health, as well as in functional food and beverage formulations (Kim *et al*., 2025; Mena-García *et al*., 2022).

The notable thermal stability of hydroxycitric acid (HCA) and the distinctive taste profile of *Garcinia cambogia,* which are highly valued in functional beverages, fortified snacks, and as natural preservatives for meat and fish products, are well-supported by food technology research (Bhuvana *et al*., 2012; Apang *et al*., 2020). Studies on HCA in food processing have demonstrated that it remains stable and does not degrade under typical culinary and commercial conditions (Bhutani *et al*., 2020). However, an increasing number of commercial applications have raised legitimate safety concerns, including rare but serious occurrences of hepatotoxicity, cardiovascular complications, and serotonin syndrome when combined with antidepressants (Lopez *et al*., 2014; Zothantluanga *et al*., 2019). Additionally, significant variability in HCA content and supplement quality has been reported across products, highlighting the need for regulatory oversight and careful clinical and safety evaluation (Mena-García *et al*., 2022; Seethapathy *et al*., 2018). This review summarizes the current evidence on the origin, composition, bioactive mechanisms, applications in food and functional products, clinical efficacy, and safety considerations of *Garcinia cambogia*, drawing on major systematic reviews, food science studies, intervention trials, and pharmacovigilance reports (Amini *et al*., 2024; Onakpoya *et al*., 2011; Baky *et al*., 2022). It aims to provide a balanced and up-to-date perspective suitable for researchers and professionals in the field of nutrition.

Origin and History

Garcinia cambogia is a botanical species that originated in the wet tropical regions of the Western Ghats of India and is now distributed across Sri Lanka, Southeast Asia, and parts of Central and West Africa (Parthasarathy and Nandakishore, 2014). It is a medium-height tree that thrives in wet evergreen conditions and produces spherical

fruits with a dark green or reddish hue, characterized by prominent vertical grooves and a thick, acidic rind (Sudharani and Umadevi, 2019; Noreen *et al*., 2023). The species is known by various regional names, such as Kudampeli or Kodampuli in southern India, Goraka in Sri Lanka, and Malabar tamarind or brindle berry in other countries, reflecting its cultural significance and commercial uses (Semwal *et al*., 2015).

The use of *Garcinia cambogia* dried rind in South Asian cuisine can be traced back several centuries through archaeobotanical records and ethnobotanical studies. It has traditionally been employed primarily as a souring agent and preservative in curries, fish, and meat dishes, although it was occasionally substituted with tamarind or lime (Chopra *et al*., 2015; Rasha *et al*., 2015). The acidic composition of *Garcinia cambogia* fruit imparts its characteristic sour flavor and contributes to its antimicrobial properties, which explains its traditional use in preserving fish and extending the shelf life of meat dishes (Bhuvana *et al*., 2012; Hart and Cock, 2016; Apang *et al*., 2020). The rind and fruit extracts of *Garcinia cambogia* have also been recognized in traditional medicinal systems, including Ayurveda and Sri Lankan herbal medicine, for their use in treating digestive disorders, rheumatism, and parasitic infections, as well as functioning as a purgative and appetite suppressant (Ferrara, 2014). Historically, *Garcinia cambogia* was introduced to Malaysia, Indonesia, Central Africa, and eventually global markets through trade networks and botanical dissemination, driven by the knowledge of its culinary and medicinal applications by indigenous and colonial botanists (Arefhosseini *et al*., 2022; Espirito Santo *et al*., 2020).Scientific and commercial interest in *Garcinia cambogia* was revitalized in the 20th century following the isolation of hydroxycitric acid (HCA) and the investigation of its weight-regulating and metabolic effects (Tomar *et al*., 2019; Han *et al*., 2022; Ibrahim *et al*., 2022). This led to the global expansion of supplements, fortified foods, and functional beverages marketed for weight management and metabolic health (Sant'Ana *et al*., 2025). Today, Garcinia cambogia is firmly established in both traditional and modern food systems and is recognized as a plant with significant potential in the nutraceutical and functional food industries (Seethapathy *et al*., 2018).

Nutritional Composition of Garcinia Cambogia Fruit

Garcinia cambogia fruit is a remarkable natural resource, rich in essential vitamins, minerals, and bioactive compounds. Its significance as both a food and nutraceutical ingredient stems from a balanced macronutrient composition and a diverse array of health-promoting micronutrients and phytochemicals.

Macronutrients

Moisture

Fresh *Garcinia cambogia* fruit typically contains 70–80% moisture, which contributes to its juicy texture and accounts for its high perishability (Arefhosseini *et al*., 2022; MUSA, 2020; Choppa *et al*., 2015; Apang *et al*., 2020). While the high moisture content enhances flavour, it also necessitates post-harvest practices such as drying or smoking of the rind to extend shelf life and facilitate its use in food preservation (Bhuvana *et al*., 2012; Seethapathy *et al*., 2018).

Energy

The energy content of fresh *Garcinia cambogia* is relatively low, typically ranging from 60 to 85 kcal per 100 g (Rasha *et al*., 2015; Noreen *et al*., 2023; Semwal *et al*., 2015). This modest energy density makes the fruit well suited for low-calorie functional foods and weight-management diets, where the retention of flavor and nutritional value with minimal caloric contribution is desirable (Ibrahim *et al*., 2022; Espírito Santo *et al*., 2020).

Carbohydrates

Garcinia cambogia fruit provides approximately 15–18 g of carbohydrates per 100 g, primarily in the form of readily digestible sugars and organic acids, which contribute to its characteristic tart flavour and provide energy (Han *et al*., 2022; Sudharani and Umadevi, 2019; Jayaprakasha and Sakariah, 1998). Its dietary fiber content, ranging from 2–4 g per 100 g and higher in the dried rind, supports gut health, aids in satiety, and enhances functional texture in food formulations (Bhuvana *et al*., 2012; Raina *et al*., 2021).

Protein

The protein content of *Garcinia cambogia* is relatively low, ranging from approximately 0.5 to 1.0 g per 100 g of fresh fruit (Amini *et al*., 2024; Apang *et al*., 2020). Although it is not a significant source of dietary protein, it contributes small amounts of amino acids that support metabolic processes and tissue maintenance, particularly within plant-rich dietary patterns (Kim *et al*., 2025; Hart and Cock, 2016).

Fat

The fat content of *Garcinia cambogia* is minimal, generally below 0.5 g per 100 g, making the fruit suitable for lipid-restricted and cardio protective diets. This negligible fat content complements its traditional use in dietary practices that emphasize plant-based, low-fat ingredients (Seethapathy *et al.,* 2018; Hansen *et al*., 2023; Parthasarathy and Nandakishore, 2014).

Micronutrients

Vitamin C (Ascorbic Acid)

Garcinia cambogia fruit is a notable source of vitamin C, with reported concentrations ranging from 10 to 35 mg per 100 g of fresh pulp. This vitamin contributes antioxidant protection, supports immune defence, promotes collagen biosynthesis, and enhances non-heme iron absorption. These properties align with the traditional use of the fruit in health beverages and food preservation practices (Espírito Santo *et al*., 2020).

B-Vitamins and Folate

Garcinia cambogia contains several B-vitamins, including thiamine (0.05 mg/100 g), riboflavin (0.04 mg/100 g), niacin (0.3 mg/100 g), and small amounts of folate (Tomar *et al*., 2019). These vitamins play essential roles in energy metabolism, nervous system function, red blood cell formation, and DNA synthesis (Semwal *et al*., 2015; Arefhosseini *et al*., 2022). Although present in modest concentrations, they contribute meaningfully to the overall micronutrient profile of the fruit.

Provitamin A / Carotenoids

Carotenoid pigments, including provitamin A precursors, are present in *Garcinia cambogia* and contribute to both its nutritional value and sensory attributes. Vitamin A plays a critical role in vision, immune function, and the maintenance of epithelial tissues (Sudharani and Umadevi, 2019; Espírito Santo *et al*., 2020).

Minerals

Garcinia cambogia is a source of several essential micronutrients. Potassium is the most abundant mineral, present at approximately 120–150 mg per 100 g, followed by magnesium (16–18 mg/100 g) and calcium (10–12 mg/100 g) (Zothantluanga *et al*., 2019; Rasha *et al*., 2015). Trace elements such as iron (0.3–0.5 mg/100 g) and zinc (0.1–0.2 mg/100 g) are also present and contribute to haemoglobin synthesis, enzymatic activity, and immune function. Although these minerals occur in modest concentrations, they play important roles in maintaining hydration, muscle and nervous system function, bone health, oxygen transport, and overall metabolic processes (Mena-García *et al.,* 2022; Semwal *et al*., 2015).

Bioactive Compounds of *Garcinia Cambogia*

Garcinia cambogia is a rich source of secondary metabolites with significant health-promoting properties. The following bioactive profile is based on advanced chromatographic and spectrometric analyses reported in recent studies.

Hydroxycitric Acid (HCA)

Hydroxycitric acid is the principal bioactive compound in *Garcinia cambogia*, constituting approximately 10–30 % of the dried rind (Amini *et al*., 2024; Ibrahim *et al.,* 2022; Han *et al*., 2022). HCA functions as a competitive inhibitor of

ATP-citrate lyase, thereby suppressing de novo lipogenesis. This mechanism contributes to its anti-obesity and metabolic health benefits (Tomar *et al*., 2019; Hansen *et al*., 2023; Yadav *et al*., 2024).

Polyphenols and Flavonoids

This group includes xanthones, benzophenones, and phenolic acids, which exhibit strong antioxidant and antimicrobial activities (Hart & Cock, 2016; Espírito Santo *et al*., 2020).

Anthocyanins

Anthocyanins such as cyanidin-3-glucoside and related pigments are particularly abundant in Garcinia indica and its hybrids. These compounds contribute to the characteristic coloration and provide notable antioxidant effects (Semwal *et al*., 2015; Noreen *et al*., 2023).

Organic Acids

Organic acids including citric, malic, tartaric, and maleic acids impart the characteristic sour taste of Garcinia fruits. They also play roles in microbial inhibition and food preservation (Choppa *et al*., 2015; Apang *et al*., 2020; Sudharani & Umadevi, 2019).

Other Bioactive Compounds

Additional bioactives include garcinol, isogarcinol, and xanthochymol, which possess potent antioxidant and anti-inflammatory properties (Rasha *et al*., 2015; Espírito Santo *et al*., 2020). Guttiferones, a class of benzophenones, contribute antimicrobial activity. Saponins and alkaloids, although present in lower concentrations, further support the plant's diverse pharmacological potential (Arefhosseini *et al*., 2022; Seethapathy *et al*., 2018).

Health Benefits

Garcinia cambogia is a tropical fruit contains hydroxycitric acid (HCA), a bioactive compound that attracted biomedical scientists across the globe for its various health implications. Here's a balanced, evidence-based overview of its potential health benefits.

Modest Weight Loss Effects

Clinical trials and meta-analyses report modest but statistically significant reductions in body weight and body fat with HCA supplementation versus placebo, particularly when combined with dietary restriction and exercise (Amini *et al*., 2024; Onakpoya*et al*., 2011; Sant'Ana *et al*., 2025).

Reduced Appetite / Increased Satiety

Several animal studies and some human trials demonstrate decreased energy intake and enhanced satiety, attributed to increased central serotonin activity and improved hypothalamic appetite regulation (Ibrahim *et al*., 2022; Hanse *et al*., 2023; Chuah *et al*., 2013).

Hypolipidemic Activity

HCA supplementation significantly reduces serum triglycerides, slightly decreases total cholesterol, and increases HDL cholesterol in both animal and human studies. Systematic reviews highlight an average triglyceride reduction of 24 mg/dL and a modest HDL increase (Amini *et al*., 2024; Arefhosseini*et al*., 2022; Sudharani and Umadevi, 2019).

Insulin Sensitivity

Several studies indicate HCA and related compounds moderate post-prandial hyperglycemia and improve insulin sensitivity (Maia-Landim *et al*., 2021; Chuah *et al*., 2013; Cock and Hart, 2016). Improvements are more consistently seen in animal models and short-duration human trials.

Antioxidant Effects

Garcinia extracts and HCA possess strong radical-scavenging and lipid-peroxidation-inhibiting activities due to polyphenols, xanthones, and anthocyanins. These compounds protect tissues from oxidative stress and aging (Tomar *et al*., 2019; Jayaprakasha and Sakariah, 1998; Ferrara, 2014; Parthasarathy and Nandakishore, 2014).

Anti-Inflammatory Activities

Both experimental animal studies and cellular assays have demonstrated decreased levels of tumor necrosis factor-alpha (TNF-α) and interleukin-6 (IL-6), along with downregulation of the nuclear factor kappa-light-chain-enhancer of activated B cells (NF-κB) and mitogen-activated protein kinase (MAPK) signaling pathways following supplementation, supporting the potential anti-inflammatory effects in obesity-associated inflammation (Espirito Santo *et al*., 2020; Yadav *et al*., 2024).

Hepatoprotective Properties

Paradoxically, some studies describe hepatoprotective effects of low-dose *Garcinia cambogia* extract, reporting protection against fatty liver, reduced lipid accumulation, and mitigation of chemically induced hepatotoxicity in rodents (Apang*et al*., 2020; Rasha *et al*., 2015; Semwal *et al*., 2015). However, benefits depend on dose, duration, and baseline liver status.

Antimicrobial Activity

Extracts inhibit a variety of bacterial and fungal pathogens in vitro, supporting traditional use as a food preservative (Bhuvana *et al*., 2012; Choppa *et al*., 2015; Hart and Cock, 2016).

Antidiabetic Activity

There is some limited evidence of mild hypoglycemic effects, reduced glycation end-products, and enhanced glucose tolerance with supplementation on animal models and scarce clinical data (Espirito Santo *et al*., 2020; Ibrahim *et al*., 2022; Sudharani and Umadevi, 2019).

Anti-Cancer Activity

Antiproliferative, pro-apoptotic and anti-angiogenic effects of the xanthones and benzophenones of Garcinia have been experimentally demonstrated in various cancer cell lines (Koshy *et al*., 2001; Hart and Cock, 2016; Raina *et al*., 2021; Apang *et al*., 2020). Human patho-clinical information are also inadequate.

Anti-Obesity Effects

The underlying mechanisms of HCA as a broad-spectrum anti-obesity are associated with decreased food consumption, prevented de novo fatty synthesis, enhanced fat oxidation, and desirable leptin and adipokines modulation (Ibrahim *et al*., 2022; Yadav *et al*., 2024; Espirito Santo *et al*., 2020; Chuah *et al*., 2013).

Mechanism of Action

Inhibition of ATP-Citrate Lyase

The first and most explained way through which HCA affects the body is strong inhibition of ATP-citrate lyase. This enzyme converts citrate to oxaloacetate and acetyl-CoA, the precursor for fatty acid and cholesterol synthesis. HCA competitively inhibits ATP-citrate lyase, disrupting carbohydrate-to-fat metabolic conversion and reducing new fat formation (Heymsfield*et al*., 1998; Han *et al*., 2022; Jayaprakasha and Sakariah, 1998). This blockade underlies HCA's use in weight-management supplementation.

Reduced De Novo Lipogenesis

Due to ATP-citrate lyase inhibition, acetyl-CoA availability decreases, lowering hepatic lipogenesis and cholesterol biosynthesis. Gene-expression studies show down-regulation of key enzymes (SREBP1c, FAS) after HCA supplementation, reducing fat accumulation in liver and adipose tissue (Ibrahim *et al*., 2022; Tomar *et al*., 2019).

Increased Satiety via Serotonin Pathways

HCA has been reported to increase brain serotonin levels by altering biosynthesis, reuptake, or metabolism of serotonin (5-HT), the central appetite regulator. Increased serotonin enhances satiety signals in hypothalamic appetite centers, reducing calorie intake and eating frequency (Lopez *et al.*, 2014; Zothantluanga*et al.*, 2019; Hart and Cock, 2016).

Effects on Fatty Acid Oxidation

The shift away from lipogenesis favors fatty-acid oxidation. Chronic HCA supplementation increases β-oxidation, serum free fatty acids, and expression of lipid-catabolism enzymes, enhancing mobilization and use of stored fat during energy-demanding or calorie-restricted states (Arefhosseini*et al.*, 2022; Hanse *et al.*, 2023).

Effects on Inflammatory Markers

Hydroxycitric acid (HCA) and polyphenols in Garcinia reduce inflammatory markers. Studies report lowered levels of tumor necrosis factor-alpha (TNF-α) and interleukin-6 (IL-6), suppression of sterol regulatory element-binding protein 1c (SREBP1c), and inhibition of nuclear factor kappa-light-chain-enhancer of activated B cells (NF-κB) and mitogen-activated protein kinase (MAPK) inflammatory pathways (Sant'Ana *et al*., 2025). These effects are particularly important because obesity-associated inflammation exacerbates metabolic risk.

Antioxidant Properties

Antioxidant effects arise from HCA and numerous xanthones, benzophenones, and anthocyanins. These compounds neutralize ROS, elevate antioxidant enzymes, and protect lipids, proteins, and DNA from oxidative stress. Food and animal studies show reduced lipid peroxidation, improved resistance to oxidative damage, and extended shelf life and sensory quality in stored foods (Raina *et al.*, 2021; Mena-García *et al*., 2022; Noreen *et al.*, 2023).

Food Product and Functional Applications

Application in Snacks, Beverages and Meat Products

The rind of *Garcinia cambogia* has been recognized as an incredibly versatile and functional component in both traditional and modern foods. Dry and fresh forms are commonly utilized in the South Asia cooking process as natural acidulants and bio preservatives in such items like curries, fish chutneys, pork fry, and ready-to-serve (RTS) beverages (Apang *et al*., 2020; Bhuvana *et al*., 2012; Bensi, 2024; Sant'Ana *et al*., 2025). Historically, the Garcinia rind was employed for flavoring, preservation, and imparting of health-promoting qualities to these foods (Seethapathy *et al*., 2018). So, what modern research says is in agreement: incorporation of Garcinia rind or extract into RTS products (mostly with jaggery or palm sugar) results to the antioxidant level Gets higher, vitamin C content is better and sensory acceptability is high in the period of cooling (Bensi, 2024).

Experimental data indicate that the introduction of a 1% aqueous Garcinia extract helps to maintain the hygienic condition of food and the palatability of cooked pork products for a period of six days at room temperature, as it markedly decreases microbial counts and lipid-peroxidation levels in the treated samples in comparison with the control ones (Bhuvana *et al.*, 2012). In addition to that, Apang *et al.* (2020) state that fish curries and cured fish have been benefited by the preservative and flavor-enhancing properties of Garcinia; by the same token, the removal of the rind extract in the icing medium of Indian mackerel has been reported to be able to extend the chilled shelf life up to 60 per cent. This defence is brought about by the high contents of phenolic antioxidants and organic acids in Garcinia that do not allow the microbial spoilage and rancidity to occur due to oxidative inhibition. Garcinia rind has been utilized in snack and bakery products to bring about nutrition and functional value through increased polyphenol, fiber, and antioxidant content. The product trials of the formulation clearly show the improvement of flavour complexity, texture, and shelf stability when the Garcinia components are added to snacks, crackers, or health-focused bakery products (Raina *et al*., 2021; Apang *et al*., 2020). The optimized formulations not only balance the characteristic tartness of the rind with the sweetness and other flavourings but also regularly get a higher score of sensory acceptability than the control samples (Bensi, 2024).

Sensory Effects and Role of Flavour

Gustatory identity of Garcinia is mainly attributed to its highly concentrated organic acids HCA, citric, and malic which are responsible for a distinct yet somewhat subtle sourness that is appreciated in the traditional foods and is extensively used in the new formulations as well (Choppa *et al*., 2015; Espirito Santo *et al*., 2020). Sensory evaluation panels indicate that the proper usage of Garcinia results in better overall flavor, complexity increase, and the capability of masking the unwanted notes (for instance, bitterness or off-odors) that are brought about by preservatives or functional additives. Nevertheless, in the case of an excessive dosage, the over-tartness or astringency might occur so it is necessary to optimize the dosage (Apang*et al*., 2020; Bensi, 2024).

HCA Stability under Food Processing

The stability of HCA and co-occurring polyphenols during food processing is a key advantage of *Garcinia* in functional and industrial food applications. Research shows that boiling, frying, and drying do not significantly reduce HCA content or antioxidant properties (Bhutani *et al*., 2020; Rasha *et al*., 2015; Ferrara, 2014; Apang *et al*., 2020). Polyethylene Terephthalate (PET) packaging and cold storage best preserve HCA and vitamin C in beverage and snack formulations, maintaining antioxidant and sensory qualities for up to 60 days (Bensi, 2024). These properties support *Garcinia*'s suitability for clean-label, health-oriented food products.

Evidence of Product Development and Food Processing

Fortified beverages containing *Garcinia* (especially with jaggery) consistently show high consumer acceptance, long-lasting antioxidant effects, and good nutrient retention during extended refrigeration (Bensi, 2024). Extension of safe storage in pork and fish dishes is linked to reduced microbial activity and prevention of lipid peroxidation, resulting in superior flavour, texture, and sensory scores (Apang *et al*., 2020; Bhuvana *et al*., 2012). *Garcinia*-enriched ice increases the shelf life of mackerel by decreasing spoilage indicators and improving sensory properties compared with conventional ice (*Apang et al*., 2020). Snack and bakery applications impart additional nutritional and antioxidant benefits, strengthening *Garcinia*'s position as a functional ingredient (Raina *et al*., 2021; Bhuvana *et al*., 2012).

Other Specialty and Industrial Applications

Long-standing ethnobotanical uses include fish Colombo curing and preparation of sun-dried rinds, traditionally used as flavoring and as mild biopreservatives. Historical and cultural food-system studies confirm the utility of *Garcinia* as a culinary and shelf-life-extending agent (Choppa *et al*., 2015; Bhuvana *et al*., 2012). Modern food industries continue to exploit these natural preservative qualities for clean-label product development.

Safety Profile

Reported Hepatotoxicity Cases

Overall, there is some evidence that *Garcinia cambogia* is rather safe in short-term studies, but there are a number of liver toxicity cases among which the most severe ones have resulted in the organ failure and even death. The literature that includes the case reports and pharmacovigilance studies is characterized by the situations during which the exposure to either a high dose of a substance or a multi-ingredient supplement, containing HCA, can lead to acute hepatitis, cholestasis, and even fulminant hepatic failure that may necessitate transplant in severe patients (Lopez *et al*., 2014; Andueza *et al*., 2021; Di Giacomo *et al*., 2023). Limited examples of the recall of the supplement of the market and the subsequent restoration of functionality are the direct cause-effect relationship (Crescioli *et al*., 2018; Hanse *et al*., 2023).

Adverse Effects

Mild-to-Moderate gastrointestinal upsets, including nausea, diarrhoea, and abdominal pain, along with headaches and skin rushes, are the major and most commonly reported adverse products (Tutunchi *et al*., 2023). In addition, there are very rare cases of rhabdomyolysis, mania and heart arrhythmia, reported in the literature (Di Giacomo *et al*., 2023; Lopez *et al*., 2014).

Interactions with Antidepressants (Serotonin Toxicity Risk)

In case of comedy use with the simultaneous selection of serotonin reuptake inhibitor (SSRI) or other serotonergic drugs the most notable clinical issue is the risk of serotonin toxic syndrome, also known as serotonin pattern. The mentioned symptoms by one patient became the most severe manifestations of serotinergic toxcity, i.e. agitation, confusion, myoclonus and autonomic instability in the combination of these drugs (Lopez *et al*., 2014; Zothantluanga *et al*., 2019).

Issues with Commercial Supplement Purity

The independent quality control studies have indicated a high difference in actual HCA content of market supplements with certain products hugely inferior to the mentioned labeling (Mena-García *et al*., 2022). Other botanicals, pharmaceuticals, or heavy metals have been found contaminating a number of products and this has concerned safety and efficacity, as well as contamination amongst enterprises (Seethapathy *et al*., 2018; Arefhosseini *et al*.)s

Safe Dosage Ranges

The majority of human clinical studies and toxicological reviews support HCA dosing of up to 2.8 g/day (standardized to 50–60% HCA) as likely safe for healthy adults for periods up to 12 weeks (Heymsfield *et al*., 1998; Han *et al*., 2022; Tutunchi *et al*., 2023). Factors increasing risk include pre-existing liver disease, polypharmacy, use of multi-ingredient products, and exceeding recommended doses (Di Giacomo *et al*., 2023). Use is discouraged during pregnancy, lactation, and in children.

CONCLUSION

To conclude, all of this evidence indicates that *Garcinia Cambogia* is an important functional food and nutraceutical ingredient. Its numerous hydroxycitric acid content also contributes to the scores of small yet clinically significant health effects, most significantly, weight control through appetite subduction and fatty acid synthesis mitigation, and in triglycerides and antioxidant condition. The anti-inflammatory, hepatoprotective, antidiabetic and antimicrobial effects are also supported by the rich micronutrient and polyphenol composition of the fruit. Studies of food and products confirm its sensory attractiveness, wide culinary usage and food preservation characteristics. Nevertheless, safety issues such as the use of hepatotoxicity reports or the threat of serotonin poisoning when using antidepressants require special composition and assay. On the whole, *Garcinia cambogia* is a versatile, most likely evidence-based botanical, which has the capacity to exist between conventional practice and contemporary nutrition research, and should be used responsibly both in food and as a supplement.

ABSTRACT

In this study, we introduce and analyze the concept of neutrosophic fuzzy signed labeling graphs. In this paper we establish necessary and sufficient condition for the existence of Neutrosophic fuzzy signed labeling graphs and also examine star graph S_9 , path graphP_5, cycle graphC_6 satisfy the NFSL conditions. We also analyze good and bad friendship using NFSL Graph along with friendship matrix.

Key words: Fuzzy Labeling, Signed Labeling, Neutrosophic fuzzy Labeling, Neutrosophic fuzzy magic Labeling, Neutrosophic fuzzy signed magic Labeling, Star graph, Path graph ,Cycle graph and Friendship graph.

INTRODUCTION

In graph theory, graph labeling is a crucial field that, under specific circumstances, gives values to a graph's vertices and/or edges. A variety of labeling styles, including graceful, harmonious, and signed labeling, have been developed over time to simulate relationship and interaction issues in the actual world. Signed graphs are particularly helpful in depicting systems with cooperative or antagonistic interactions because they include the idea of positive and negative links. However, a lot of real-world systems have uncertainty and indeterminacy in addition to positive or negative. Florentin Smarandache created the idea of neutrosophic sets, which offers a potent mathematical framework to overcome this restriction. Three separate membership functions, truth (T), indeterminacy (I), and falsity (F), each ranging independently in the interval [0,1], form a neutrosophic set. This makes it possible to express

ambiguous and inconsistent data in a more. The idea of Neutrosophic Signed Labeling of Graphs is created by fusing the concepts of neutrosophic sets and signed graphs. In this paradigm, the nature and certainty of relationships are simultaneously represented by assigning a neutrosophic value and a sign (positive or negative) to each vertex and/or edge of a graph. When interactions are unclear or only partially understood, this hybrid approach is especially helpful. By adding indeterminacy, neutrosophic signed labeling expands on traditional fuzzy and signed labeling methods, making it more appropriate for complex system modeling. Additionally, it broadens the analytical tool available to academics by generalizing models like intuitionistic fuzzy graphs and fuzzy signed graphs.

Preliminaries

Definition.2. 1

Let $C^* = (V, E)$ be a simple graph. Then $C^* = (\varphi, \psi)$ is called a fuzzy graph on C^*, if $\varphi: V \to [0, 1]$ and $\psi: E \to [0, 1]$ and for all $x, y \in E$, $\psi(x, y) \leq \min[\varphi(x), \varphi(y)]$.A fuzzy graph $C= (\varphi, \psi))$ on C^* is called a fuzzy labeling graph if φ and ψ one to one maps for all $x, y \in E$.

Definition. 2.2

A fuzzy labeling graph $C = (\varphi, \psi)$ on C is called fuzzy magic labeling graph if there exists m, which is called magic value such that, $\varphi(x) + \varphi(y) + \psi(x, y) = m$, for all $x, y \in E$.

Definition. 2.3

If the total membership values of the vertices and edges incident at the vertices are k1 and k2, where k1 and k2 are constants, then a fuzzy labeling graph admits Bi-magic labelling

Definition. 2.4

A Neutrosophic Fuzzy Graph $C = (\varphi, \psi)$ where $\varphi = \{v_1, v_2, v_3, \ldots v_n\}$ such that $T_1: V \to [0, 1]$,
$I_1: V \to [0, 1]$ and $F_1: V \to [0, 1]$ denote the degree of truth, indeterminacy and falsity membership of the element $v_i \in v(i=1\ldots n)$, $E \subseteq V \times V$ where $T_2: V \times V \to [0, 1]$, $I_2: V \times V \to [0, 1]$, and
$F_2: V \times V \to [0, 1]$ are such that
$T_2(v_i, v_j) \leq \min[T_1(v_i), T_1(v_j))]$,
$I_2(v_i, v_j) \leq \min[I_1(v_i), I_1(v_j))]$,
$F_2(v_i, v_j) \leq \max[F_1(v_i), F_1(v_j))]$
$0 \leq T_2(v_i, v_j) + I_2(v_i, v_j) + F_2(v_i, v_j) \leq 3$ for every $(v_i, v_j) \in E$ (j=1…. n)
A neutrosophic fuzzy labeling graph is a Neutrosophic fuzzy magic labeling graph if there exist an M such that M equals
$\{T_1(v_i) + T_1(v_j) + T_2(v_i, v_j)$,
$[I_1(v_i) + I_1(v_j) + I_2(v_i, v_j)$,
$F_1(v_i) + F_1(v_j) + F_2(v_i, v_j)\}$

Definition :2.6

A fuzzy graph $G(\sigma, \mu)$ is said to be a fuzzy signed graph if there is a mapping $\eta: E \to \{+, -\}$ such that each edge signed to {+, −} or all nodes and edges assigned to {+, −} based on the fuzzy labeling conditions.When we assign {+ o r −} to each edge representing the relationship between the two vertices like trust or distrust etc.

Definition:2.7

If $\sigma: E(G) \to [+1, -1]$ is a function related from E:G of G such that each edge is signed to +,− or all
edges and nodes are signed to +,−, then a single valued neutrosophic graph G is said to be a single valued signed neutrosophic graph.
Based on the comparison of its truth-membership, indeterminacy-membership, and falsity-membership values, we assign $E(G) \to [+1, -1]$. In the event that the truth-membership value exceeds both the indeterminacy-membership and falsity-membership values, it is assigned a positive value; in the opposite scenario, it is assigned a negative value; and in the situation of equality, it remains unsigned.

Definition 2.8.
A single-valued signed neutrosophic graph is considered positive if every edge has a positive sign or if only an even number of edges have a negative sign. In essence, the sign of SVSNG is calculated by multiplying the signs of every edge. Similarly, a SVSNG is said to be negative signed if odd number of edges of SVSNG are negative.

Definition 2.9
A Neutrosophic signed labeling graph which satisfy the fuzzy magic labeling conditions are called NFSML.

Definition 2.10
In graph theory, the star S_k represents the complete bipartite graph $K_{1,k}$; it is a tree characterized by a single internal node and k leaves.

Definition 2.11
A path graph, also known as a linear graph, is a particular kind of graph where each vertex is connected to exactly two other vertices in a straight line sequence, with the exception of the two ends, which are each connected to just one.

Definition 2.12
In graph theory, a cycle graph, also known as a circular graph, is a particular kind of graph made up of a single closed loop of vertices. It is created by joining several vertices in a continuous chain so that each vertex is connected to precisely two other vertices.

Definition 2.13
A friendship graph, also known as a Dutch windmill graph, is a particular kind of network in graph theory that is made up of several triangles that are connected by a single central vertex.

Properties of neutrosophic Signed Labeling Graph

Theorem :3.1 An edge e (T, I, F) joining two positive nodes u (T_1, I_1, F_1) and v (T, I2, F2) is positive signed if T1 > I2 and F2 or T2 > I1 and F1

Proof:
A Neutrosophic Fuzzy signed Graph C = (φ, ψ,s) where φ = {$v_1, v_2, v_3, \ldots v_n$} such that
T_1: V → [0, 1], I_1: V → [0, 1] and F_1: V → [0, 1] denote the truth, indeterminacy and falsity membership of the element first vertex and T_2: V→ [0, 1], I_2: V → [0, 1], and F_2: V→ [0, 1] denote the truth, indeterminacy and falsity membership of the element of the second vertex. Then the edges are noted as ψ =($e_1, e_2, e_3 \ldots e_n$), E ⊆ V× V where T_1T_2: V× V → [0, 1], I_1I_2: V× V → [0, 1], F_1F_2: V× V → [0, 1] such that
$T_1T_2 \leq \min(T_1, T_2, S)$;
$I_1I_2 \leq \min(I_1, I_2, S)$;
$F_1F_2 \leq \min(F_1, F_2, S)$ and also $0 \leq T_2(v_i, v_j) + I_2(v_i, v_j) + F_2(v_i, v_j) \leq 3$ for every $(v_i, v_j) \in E$ (j=1…. n)
The edge sign is assigned by the comparison of truth, indeterminacy and falsity membership values of adjacent vertices .ie) $T_1 > I_2, F_2$ or $T_2 > I_1, F_1$, otherwise negative sign for the edge and also $T_1 = I_2, F_2$ or $T_2 = I_1, F_1$,the edge assigns unsigned. Hence the Neutrosophic signed labeling satisfy the edge property.

Theorem :3.2
In a NSLG a path is positive, if it contains even number of negative edges.
Proof:
Consider the path graph P (φ,ψ,s) of vertices φ = {$v_1, v_2, v_3, \ldots v_n$} and edges ψ =($e_1, e_2, e_3 \ldots e_n$) has truth, indeterminacy and falsity membership values lies in the interval [0,1] and also satisfy the neutrosophic labeling conditions. The edge

values assigned using theorem 3.1. The sign of the path is $\psi(p) = \prod_{i=1}^{k-1} \varphi(v_i v_{i+1})$.Suppose the path contains m negative edges, then $\psi(p)=(-1)^m$.
Case (i):If m is even then $\psi(p)= +1$.So the NSL of path graph is positive.
Case (ii): m is odd then $\psi(p)= -1$, So the NSL of path graph is negative.
Hence the proof.

Theorem :3.3 A signed neutrosophic cycle graph is said to be balanced if every cycle of the graph has even number of negative signed edges or all positive signed edges. Otherwise cycles with odd number of edges are called unbalanced.
Proof:
Consider the cycle C. Let us assign the vertices and edges of cycle graphs C(φ,ψ, S) areφ = {$v_1, v_2, v_3, \ldots v_n$} and ψ =($e_1, e_2, e_3 \ldots e_n$) has truth, indeterminacy and falsity membership values lies in the interval [0,1]. The edge values assigned using theorem 3.1.
Case(i) Even number of negative edges
Product of edge signs $(-1)^{2n}= +1$
Case(ii) Odd number of negative edges
Product of edge signs $(-1)^{2n+1}= -1$,Thus the NS cycle graph is unbalanced.
Therefore the Neutrosophic signed cycle graph is balanced iff it contains an even number of negative edge signs.

Theorem :3.4
In a Neutrosophic signed graph every vertex has equal degree k,then the graph is called k-regular.
Proof:
Suppose deg(v_i)=k for all vertices $v_i \in V$. Since all the vertices have identical degree, by the definition of graph it is regular.ie) A regular graph isa graph in which every vertex has the exact same number of connected edges (degree).Hence the Neutrosophic signed labeling graph is k-regular graph.

Neutrosophic Fuzzy Signed Labeling of Star Graph

Theorem
Any Neutrosophic star graph S_n, n≥2 admits fuzzy signed labeling.
Proof: Let n∈N , n≥2 , V={$\phi_1, \phi_2, \phi_3 \ldots \ldots \phi_n$} and E={$\psi_j = \phi_j \phi_{j+1}$:1≤j≤n-1} and the star graph S_n = (φ, ψ).All vertices are assigned to be positive sign and all edges assigned to be negative sign.
For all j ($1 \le j \le n$), the truth, indeterminacy and false membership for the vertices are defined as follows
T(ϕ_j) = {0.21+ (2n+1) 0.01; for the central vertex n=5 and 0.21- (n-1) 0.01; n=1, 2,…8
I(ϕ_j)={0.33- (2n+1) 0.01; for the central vertex n=5 and 0.33+ (n-1) 0.01; n=1,2….8
F(ϕ_j)=0.40-(3n+1) 0.01; for the central vertex n=5 and 0.40+(n-1) 0.01; n=1,2….8
The truth, indeterminacy and false membership of edges are defined as follows
T(ψ_j)=0.03+(n-1) 0.01; I(ψ_j)= 0.16-(n-1)0.01; F(ψ_j)= 0.40-(n-1) 0.01 for n= 1,2…8

ϕ_1(0.32,0.22,0.24),ϕ_2(0.21,0.33,0.40),ϕ_3(0.20,0.34,0.41),ϕ_4(0.19,0.35,0.42),ϕ_5(0.18,0.36,0.43),ϕ_6(0.17,0.37,0.44),ϕ_7(0.16,0.38,0.45),ϕ_8(0.15,0.39,0.46),ϕ_9(0.14,0.40,0.47);ψ_1 (0.03,0.16,0.40)$^-$;ψ_2 (0.04,0.15,0.39)$^-$;ψ_3 (0.05,0.14,0.38)$^-$;ψ_4 (0.06,0.13,0.37)$^-$;ψ_5 (0.07,0.12,0.36)$^-$;ψ_6 (0.08,0.11,0.35)$^-$;ψ_7 (0.09,0.10,0.34)$^-$;ψ_8 (0.10,0.09,0.33)$^-$.

Hence the Neutrosophic signed labeling conditions satisfies the star graph S_9.Also it is a balanced signed graph.

Neutrosophic Fuzzy Magic Signed Labeling of Path Graph

Theorem
Any Neutrosophic path graph P_n, n≥2 admits fuzzy edge magic signed labeling.
Proof: Let n∈N , n≥2 , V={$\phi_1, \phi_2, \phi_3 \ldots \ldots \phi_n$} and E={$\psi_j = \phi_j \phi_{j+1}$:1≤j≤n-1} and the path graph P_n= (φ, ψ).All vertices are assigned to be positive sign and all edges assigned to be negative sign.

For all j ($1 \le j \le n$), the truth, indeterminacy and false membership for the vertices are defined as follows
T (ϕ_j) = {0.23 - 0.02n; for n=0,1,2,3,4
I (ϕ_j)= {0.22+ 0.02n; for n=0,1,2 and 0.22- 0.02n; n=1,2.
F(ϕ_j)=0.25+ 0.01n; for n=1,2,3,4.
The truth, indeterminacy and false membership of edges are defined as follows
T(ψ_j)=0.21- 0.02 n; for n=0,2,4,6.
I (ψ_j)= 0.23-0.01n; for n=0,2,4,19.
F (ψ_j)= 0.26-0.01n ; for n= 0,1,2,3.
ϕ_1(0.23,0.22,0.25),ϕ_2(0.21,0.24,0.28),ϕ_3(0.19,0.23,0.26),ϕ_4(0.17,0.20,0.29),ϕ_5(0.15,0.18,0.27);ψ_1 (0.21,0.21,0.26)$^-$;ψ_2 (0.17,0.23,0.27)$^-$;ψ_3 (0.13,0.19,0.28)$^-$;ψ_4 (0.09,0.14,0.29)$^-$.

Hence the magic values of truth indeterminacy and falsity values for the graph P_5 as follows
0.23-0.21+0.21 =0.23;0.21-0.17+0.19=0.23;0.19-0.13+0.17=0.23;0.17-0.09+0.15=0.23
0.22-0.21+0.24=0.24;0.24-0.23+0.23=0.24;0.23-0.19+0.20=0.24;0.20-0.14+0.18=0.24
0.25-0.26+0.28=0.27;0.28-0.27+0.26=0.27;0.26-0.28+0.29=0.27;0.29-0.29+0.27=0.27

The magic values are (0.23,0.24,0.27).Hence the Neutrosophic edge magic signed labeling conditions satisfies the path graph P_5 ;also it is a balanced signed graph.

Neutrosophic Fuzzy Bi Magic Signed Labeling Of Cycle Graph

Theorem: Any Neutrosophic cycle graph C_n, n≥5 admits fuzzy magic signed labeling.
Proof: Let n∈N , n≥5 , V={$\phi_1, \phi_2, \phi_3 \ldots . \phi_n$} and E={$\psi_{j=} \phi_j \phi_{j+1}$:1≤j≤n-1} and the cycle graph C_n = (φ, ψ).All vertices are assigned to be positive sign and all edges assigned to be positive and negative sign.For all j ($1 \le j \le n$), the truth, indeterminacy and false membership for the vertices are defined as follows
T (ϕ_j) = {0.10 + 0.01n; for n=0,1,2,3,4,21.
I (ϕ_j)= {0.20+ 0.01n; for n=0,1,2,3,4 and 0.20 - 0.01n ; n=11.
F(ϕ_j)=0.29+ 0.01n ; for n=0,1,2,3,4 and 0.29-0.01n ; n=22
The truth, indeterminacy and false membership of edges are defined as follows
T(ψ_j)=0.07+0.02 n; for n=0,1,2,3 and 0.07-0.01 n; for n= 1,5.
I (ψ_j)= 0.17+ 0.02n; for n=0,1,2,3 and 0.04+0.02n for n=0,2
F (ψ_j)= 0.30+0.01n ; for n= 0,1,2,3 and 0.30-0.01n for n=5,6

ϕ_1(0.10,0.20,0.30), ϕ_2(0.11,0.21,0.32), ϕ_3(0.12,0.22,0.31),ϕ_4(0.13,0.23,0.33),ϕ_5(0.14,0.24,0.29), ϕ_6(0.31,0.09,0.07)
ψ_1 (0.07,0.17,0.30)$^-$;ψ_2 (0.09,0.19,0.31)$^-$;ψ_3 (0.11,0.21,0.32)$^-$;ψ_4 (0.13,0.23,0.30)$^-$;ψ_5 (0.02,0.04,0.25)$^+$; ψ_6 (0.06,0.08,0.24)$^+$;

The truth bi magic values are as follows
0.10-0.07+0.11=0.14;0.11-0.09+0.12=0.14;0.12-0.11+0.13=0.14;0.13-0.13+0.14=0.14;0.14+0.02+0.31=0.47;0.31+0.06+0.10=0.47
The indeterminacy bi magic values are follows
0.20-0.17+0.21=0.24;0.21-0.19+0.22=0.24;0.22-0.21+0.23=0.24;0.23-0.23+0.24=0.24;0.24+0.04+0.09=0.37;0.09+0.08+0.20=0.37
The falsity bi magic values are as follows
0.30-0.30+0.32=0.32;0.32-0.31+0.31=0.32;0.31-0.32+0.33=0.32;0.33-0.30+0.29=0.32
0.29+0.25+0.07=0.61;0.07+0.24+0.30=0.61
The bi magic values are (0.14,0.24,0.32); (0.47,0.37,0.61).Thus the cycle graph C_5 is balanced graph.

Neutrosophic Fuzzy Signed Labeling in Decesion Making

An illustration of "fair" friendship Determining a person's goodness or badness based on his relationships with other friends is the aim of this problem. The five buddies, A, B, C, D, and E, are represented by the vertices of the signed graph below, and the relationships between them are represented by the edges. In this case, the "+" sign denotes a positive relationship between the two friends, whereas the "-" symbol denotes a negative one. Additionally, we

Observe that the graph is complete Obviously, a person loves himself and so all the vertex membership sign values are assumed to be +ve. Here the vertices and edges of the above graph is noted as follows
A(0.12,0.08,0.09),B(0.13,0.006,0.07), C(0.11,0.07,0.12), D(0.007,0.11,0.14), E(0.006,0.15,0.16);
AB = $(0.12,0.005,0.08)^{+}$; AC= $(0.10,0.06,0.12)^{+}$;AD = $(0.001,0.08,0.11)^{-}$;
AE=$(0.004,0.05,0.15)^{-}$;BC=$(0.09,0.002,0.08)^{+}$; BD=$(0.005,0.004,0.11)^{+}$;
BE=$(0.006,0.003,0.12)^{-}$;CD=$(0.002,0.04,0.13)^{-}$; CE=$(0.003,0.05,0.14)^{-}$;
DE=$(0.005,0.07,0.16)^{-}$
Corresponding friendship matrix with C.P is given below, where +sign given for a good relationship between friends and -ve otherwise Here, we are trying to determine a person's goodness or badness by looking at how he interacts with other friends. To put it another way, we believe that a person is excellent if he has a good relationship with almost all of his friends, but he must have some negative attributes if he has a bad relationship with most of them.
The character weight of A,B,C,D,E are given by other four friends are given below.
A(0.345 ,0.015,0.03), B(0.341,0.014, 0.22), C(0.295,-0.071,0.05),D(0.007,-0.126,-0.15),E(-0.008,-0.023,-0.41)

Therefore, the truth membership value provided by the other friends in addition to the sign value determines the character value of A. The same process is used to add the truth membership value for B, C, D, and E. We conclude from this character value that A, B, and C will always be close friends as their character truth values are the same. The smaller truth value obtained by other friends is given by D and E. Additionally, the friendship group is fair because the TCP value is +ve. We assume that A, B, and C are good people because they have C.P. +ve (>0), whereas D and E are terrible people because they have C.P. -ve (<0). The friend circle or the entire group is now described by the total character point. In this case, the total C.P. is +ve, So the friend circle or group A-B-C-D-E is good.

RESULT

Thus, we can see that by using our recently developed "friendship matrix," which is based on the concept of a Neutrosophic signed graph, we can easily determine a person's characterindeed, the nature of the entire buddy circle just looking at the kinds of relationships he has with other individuals.

CONCLUSION

As a result, we have used the idea of neutrosophic signed labeling for star graph S_9, magic and bimagic labeling of path graph P_5 , cycle graph C_5 and in making decisions, particularly by utilizing the recently developed notion of Character points. This idea allows us to identify and explain the bad aspects of any individual, location, time, thing, or activity.

ABSTRACT

The Latissimus Dorsi (LD) muscle functions significantly in the kinetic chain by linking the upper and lower limbs through the trunk, which aids in efficient force transfer during dynamic movements in sports. In cricket, the LD is actively involved in bowling, batting, fielding, and wicket-keeping, making sufficient flexibility essential for peak performance. Change in the muscle flexibility may hinder functional movement efficiency and heighten the risk of overuse injuries. Thus, the aim of this study is to find out the prevalence of LD muscle tightness among adolescent and adult cricketers, and ultimately determine the effectiveness of Proprioceptive Neuromuscular FacilitationPNF stretching in improving LD muscle flexibility. A single-group pre-post pilot study was conducted involving fifteen cricket players. Cricketers received (PNF) stretching focused on the LD following their cricket practice sessions, three times a week, with the goal of enhancing flexibility. Lat Length Testing, One Repetition Maximum (1RM) Lat Pulldown Test, and Functional Movement Screen (FMS) scores were used to assess players. Following the four-week PNF stretching intervention, all thirteen participants (two dropouts) demonstrated statistically significant gains in LD muscle length, upper-body strength, and functional movement quality. These changes reflect improved flexibility, strength, and overall movement efficiency in cricket-specific tasks.PNF stretching proved to be an effective method for improving LD flexibility and upper-body strength, showcasing its potential as a preventive and performance-boosting strategy for

cricketers. Regular assessments of LD flexibility and targeted interventions could mitigate the risk of injuries to the shoulder, trunk, and lower limbs while enhancing athletic performance.

Keywords: Cricketers, Functional Movement Screen, Lat Length Testing, 1 RM Lat Pulldown, Proprioceptive Neuromuscular Facilitation

INTRODUCTION

Originating from the thoracic and lumbar spinous processes, the thoracolumbar fascia, and the iliac crest, the Latissimus Dorsi (LD) is the largest and functionally a significant muscle of the human body, which is mainly responsible for the shoulder adduction, extension, and internal rotation[1-4].This muscle is supplied by the thoracodorsal nerve (C6 to C8 nerve roots)[5].Its extensive attachments and fibre orientation make it a major contributor to the kinetic chain, acting as a conduit for force transmission between the trunk and upper limb, as well as providing trunk control and scapular stability through the thoracolumbar fascia[6-9]. As the LD plays a major role in force transmission; trunk-upper limb coupling; and scapulothoracic stability; it experiences high levels of mechanical load as a result of sports that involve repetitive overhead and rotational movements. In cricket, the specific demands placed on this muscle are even greater because of the high-velocity multi-planar movements associated with bowling, batting, and fielding[10].Bowling consists of four phases of movement; explosive force generation with internal rotation and eccentric stabilization of the shoulder during the late cocking and deceleration phase. In addition, the action of bowling, batting, and fielding all require complex, high-speed and repetitive movements of the upper body and trunk.

These actions are also biomechanically demanding on the LD muscle. The throwing and bowling actions in cricket employ a kinetic chain from the lower legs and pelvis to the trunk and upper arm, with energy being transferred through the sequential rotations of the body segments. The throwing motion of the arm creates an innovative and high-speed series of movements during the cocking and acceleration phases, which result in powerful internal shoulder rotation, shoulder adduction and shoulder extension through the combined efforts of the latissimus dorsi[11,12]. Electromyographic monitoring of LD's activity exhibits significant increase during these phases of high-speed movement, achieving 100 to 150% of the maximum force generated by a contraction of the LD, and paradoxically acts eccentrically in order to protect the anterior aspect of the glenohumeral joint from large tensile forces. When there are increased activation and stiffness of the LD muscle, it leads to excessive stress on spinal ligaments, resulting in low back pain, decreased glenohumeral motion, more specifically limited shoulder flexion and external rotation, resulting in difficult overhead movement. In line with this, the epidemiological studies also support the fact that upper limb and trunk injuries occur frequently in cricket players, demonstrating the vulnerability of these muscles to the repetitive stress associated with overhead activities [13-18].Reduced LD activity and stiffness occur as a result of altered scapular kinematics, which are known to negatively impact shoulder flexion range of motion, thus also increasing shear and compressive forces through the lumbar spine and predisposing to chronic shoulder pain and low back pain[13,14,17-19]. Thus, here, muscle extensibility is considered a significant risk factor related to overuse injuries, strains and tendinopathy in general, and particularly so for fast bowlers[14,17,18].

Though LD is the primary muscle responsible for the biomechanics of bowling, throwing, and fielding actions in cricket [19].Still, there have been very few studies included in the literature that have discussed the LD flexibility of cricket players. The stress and repeated strain caused by overhead activities in the game of cricket demand specific flexibility exercises on a regular basis if they want to remain in optimal condition and prevent injury[14]. Increasing the flexibility of the LD will ensure improved movement in terms of rotation and more adjustability for the swing motion when batting or on the mechanical aspects of bowling and throwing[20-22]. Even though LD plays a crucial role in overheard activities, there is a lack of research regarding physiotherapy intervention protocols specifically designed to treat LD muscle tightness in cricketers. Also, so far, none of the studies have considered how these

interventions impact flexibility, strength and functional movement in cricketers. According to the science of Proprioceptive Neuromuscular Facilitation (PNF) stretching, it might play a significant role in increasing LD flexibility and thereby reducing recovery time and risk of injury[23].Therefore, to address this research gap and check for the stated hypothesis, the present study was aimed to find out the prevalence of LD muscle tightness among adolescent and adult cricketers, and ultimately determine the effectiveness of PNF stretching in improving LD muscle flexibility.

MATERIALS AND METHODS

Study design

This research was designed as a pilot study which received ethical approval from the Institutional Ethical Committee (NCP/Letter/199-F/2025 Date-03/05/2025). The study was conducted over a four-month period (May–Aug is 4 months). The study complies with the CONSORT extension reporting guideline and the TIDieR checklist for reporting of interventions. This is depicted in **Table 1**.

Study setting

The study participants were recruited from M.S. Dhoni Cricket Academy, Visnagar, Gujarat. A total of twenty-three male cricket players who were actively engaged in regular training were initially screened to determine their eligibility.

Eligibility Criteria

Inclusion criteria targeted individuals willing to participate, aged 12 to 25 years, open to both the genders, and a playing experience for more than 1 year. All the players such as batsmen, bowlers, and fielders were recruited. Exclusion criteria consisted of individuals who had experienced any musculoskeletal injuries such as recent rotator cuff injuries, ligament tear, rupture of muscle, fracture/dislocation or any surgical history of the shoulder or spinal region within the previous year, or congenital anomalies of the upper extremity or spine.

Screening Procedure

The initial screening phase used the Lat Length Test to identify whether participants had LD muscle tightness. The prevalence rate of LD tightness was determined based on the findings of Lat Length Test. Participants with LD tightness were evaluated both before and after-intervention using three measures i.e. Lat Length test, One Repetition Maximum (1RM) Lat Pulldown Test, and Functional Movement Screen (FMS)[20].To test LD muscle flexibility, the Lat Length Test was conducted on each participant while they were in supine lying position with their lumbar spine stabilized. If the shoulder joint was unable to fully move through a complete range of motion to obtain the 180-degree mark of flexion, this indicated LD muscle tightness[24].The upper body strength was determined using 1RM Lat Pulldown Test; this test required participants to perform a progressive loading until they were unable to continue; the greatest amount of weight successfully lifted during the loading sequence was recorded[25]. In addition, to identify the risk of injury, FMS was used. This test assessed the participants on performance of seven fundamental movement patterns, while giving a composite score based on each participant's ability to perform the movements, e.g., the higher the composite score, the better the movement quality and the lower the risk of sustaining an injury[26,27].All outcome measures used here exhibited good-excellent reliability (1RM Lat Pulldown Test, ICC>0.91, Lat Length Test, ICC = 0.55-0.76 and the FMS, ICC= 0.81)[16,28,29].

Participants flow and attrition

Out of 23 participants screened, 15 players met the inclusion criteria; however, during the intervention, two participants withdrew due to some personal reason. Consequently, a total of 13 participants completed the entire study and supported analyses of the outcomes. This is depicted in **Fig. 1. Table 2** exhibits the demographic details of the participants.

Intervention Protocol

PNF stretching intervention was provided as a treatment procedure to individuals with LD muscle tightness, with an aim to improve flexibility, strength, and functional movement. This intervention occurred over a period of 4 weeks and consisted of 3 sessions per week with each session lasting approximately 20 minutes. The treatment session was taken by a trained physiotherapist and was supervised by a qualified physiotherapist. Participants were also encouraged to continue participating in their regular cricket training programme throughout the entire study period, and were instructed not to do any additional stretching or strengthening exercise programs specifically targeting their LD muscle. The PNF stretching was implemented with the participant in the side lying position with their hips and knees bent. The shoulders were placed in a degree of flexion and abduction within their full ROM, creating a longitudinal stretch on the LD muscle with one hand and stabilizing the pelvis with the other hand. The therapist slowly moved the limb into a new, slightly increased range to further stretch the target muscle. Each of the stretches performed consisted of an isometric contraction of the LD muscle against the therapist's resistance for 5-10 seconds, this was then followed by a relaxation phase and prolonged passive stretching lasting 15 to 30 seconds as the therapist manipulated the participant into an increased ROM, this cycle was then repeated for 10 to 15 repetitions per session. Intensity of the stretching was gradually increased based on the individual respondent's pain tolerance; furthermore, extra caution was exercised to ensure no pain or upset conditions arose during each PNF session. This procedure is depicted in **Fig.2.**

Statistical Analysis

The data was analysed using SPSS Version 20. Shapiro-Wilk test was used to determine the normality of the data. Since the data was found to be not-normally distributed, the Wilcoxon Signed Ranks Test was used to compare the means of pre- and post-intervention values for statistical significance ($p<0.05$).

RESULTS

The current study involved the Should read 23 people who were screened— only 15 actually met inclusion criteria per earlier section. Out of these, 15 subjects, i.e., 65.2% of the subjects were found with positive results on Lat length test, exhibiting LD muscle tightness. This data supports the presence of a high Prevalence rate of LD muscle tightness (this is a cross-sectional finding, not incidence over time). Out of 15, a total of 13 participants completed the study. After the completion of the PNF stretching intervention, participants demonstrated a statistically significant increase in upper-body strength, flexibility of the LD muscles, and improved functional performance. The results of the Lat Length Test indicated that LD muscle flexibility had improved, with a mean of 125.73 cm ± 48.05 (median of 144.04), as well as demonstrating a statistically significant difference ($Z = -3.366$, $p = 0.001$, $r = 0.93$, large effect). The Table 3 shows pre = 55.38, post
= 49.73 (a decrease), so this should read decreased or the table values need checking1 RM Lat Pull down Test increased to 49.73 lbs ± 24.10 (median of 50.00) from baseline to post-intervention ($Z = -3.424$, $p = 0.001$, $r = 0.95$, large effect). Post-intervention, FMS scores increased to a mean of 12.93 ± 5.05 (median of 14.31), with a statistically significant change ($Z = -3.308$, $p = 0.001$, $r = 0.92$, large effect), which reflects improved functional movement and lower risk for injury. Here, effect size (r) was calculated using the formula ($r = Z/\sqrt{n}$)and was reported using Cohen's criteria. **Table 3** describes in detail the comparison of pre- and post- intervention outcome measures

DISCUSSION

This study identifies a significant percentage (65.2%) of adolescent and adult cricketers with LD muscle tightness. The presence of reduced flexibility of the LD muscles in these athletes supports the literature that reduced flexibility of the LD is a common injury in athletes who repeatedly use overhead, rotational, and weight-biased movements in their sport.[30]The actions involved in cricket i.e. bowling, batting, throwing, fielding, etc. all require a coordinated

trunk-shoulder position for a long duration of time, therefore increasing the mechanical stress applied to the LD muscles through repeated loading. This repeated load applied to the LD muscle over many years causes adaptive shortening and an increase in passive stiffness, which limits the extensibility[11,12,16].The high percentage of LD muscle tightness that was demonstrated in this study suggests that having a tight or shortened LD muscle does not occur by accident, but rather may be a specific adaptation to playing cricket with a potential functional consequence. Furthermore, after the PNF stretching protocol, there was an increase in the Lat Length Test, which demonstrated an improvement in the extensibility of the LD muscle. The PNF technique works on several neurophysiological mechanisms that improve the ROM around a joint (e.g., autogenic inhibition, reciprocal inhibition and increased stretch tolerance) and is known to produce greater improvements in ROM than the traditional methods of stretching. The combination of isometric muscle contractions and relaxed muscles, along with the additional effect of Golgi tendon organ (GTP), produces less activity in the muscle spindle and more in the GTPs which allows for more elongation of the musculotendinous unit. [23] The systematic review conducted by Gidu Diana Victoria et al. found consistent evidence that PNF stretching improves flexibility and neuromuscular efficiency, and therefore, it may be used effectively in a variety of populations to improve muscle extensibility. The positive results seen in the Lat length test were consistent with these findings, therefore confirming PNF as an effective way to alleviate LD tightness in players[31].

The current analysis also demonstrates a subsequent improvement in 1 RM Lat Pull down Test following intervention; this supports the notion of increased muscle extensibility having a positive impact on muscular strength/force production capacity. In support of this, it has been proved earlier that greater flexibility can create an opportunity to optimize the muscle's length-tension relationship, thus allowing for maximized motor unit recruitment during resistance training. To work on this component, PNF methods involve voluntary muscle contractions, and facilitate neural adaptations (i.e., greater motor unit synchronization and greater neuromuscular activation) thereby improving flexibility[23].Wicke et al. identified that PNF stretching is a viable option to static stretches without compromising strength and may even improve performance-related capacities in some situations[32].The present analysis demonstrates support for these findings regarding the positive effect of PNF stretching on 1RM Lat Pulldown Test and that it does positively impact strength; and, it improves transmission of force from the various body components, thereby resulting in greater functional strength expression during overhead activities.

Furthermore, in this study, FMS scores have shown improvement. The FMS measures the basic movements that involve several components, including mobility, stability, coordination, and neuromuscular control through multiple joints [26,27].The restriction of LD flexibility hinders shoulder motion, trunk rotation, and lumbopelvic (hip) movement; these are all critical to many of the FMS tests. The improvement in LD's flexibility may have positively affected the scapulohumeral rhythm, trunk mobility, and kinetic chain integration and thus the improvement is seen in the quality of the movement [33]. Given that FMS scores are associated with a higher risk of musculoskeletal injury, and that FMS scores were significantly improved following the intervention, it may suggest there is potential for reduced injury risk after targeted PNF stretching. In the end, the results of this preliminary research show that by using a structured PNF stretching protocol to treat the LD muscle, changes in flexibility, strength and functional movement were observed. This supports the view that the LD muscle serves an important function in linking the upper limb to the trunk when performing dynamic sporting tasks, and that for force to be transferred most effectively, the LD muscle should be optimally elongated. Although this pilot research is limited by a small number of people who participated in the study and the use of a universal goniometer for measurements suggest possible human errors, but the statistically significant improvements being observed suggests its use for further implications. There is a need for further pilot studies with greater sample sizes, randomized controlled trials, and more reliable measurement tools to confirm these findings.

CONCLUSION

This pilot study observed a high prevalence of LD muscle tightness in the allotted cricket players. Also, the study demonstrated that a structured PNF approach aimed at the LD muscle improved cricket players' muscle flexibility, upper-body strength and functional movement in quantifiable ways. The participants showed increased LD muscle length, enhanced 1RM Lat Pull down strength and better overhead squat performance on the FMS. The findings indicate that enhancing LD muscle flexibility can help cricket players with smooth and better overhead movement, thereby, improving the performance. Overall, the study emphasizes how crucial it is to target and work on the specific muscle for better integration of movement.

Table 1: TIDieR Checklist for reporting of interventions

Item number	Item	Description
1.	**Brief name**	PNF stretching intervention for LD muscle
2.	**Why**	While there are numerous studies on the flexibility of the LD muscle and its contribution to shoulder and trunk functioning among different groups of athletes, there are very few studies that assess how targeted physical therapy interventions, such as PNF can be utilized to address tightness of the LD muscle in young cricket players.
3.	**What (Materials)**	Consent form, Assessment form, measuring tape, Universal Goniometer, FMS scoring sheet, Lat pull down machine, Weighing Machine, Ideal Stick, Hurdles, Plinth
4.	**What (Procedures)**	PNF stretching technique of LD muscle performed in side-lying position using hold-relax approach
5.	**Who provided**	Provided by a trained physiotherapist
6.	**How**	One-on-one, therapist guided and supervised intervention
7.	**Where**	M.S. Dhoni Cricket Academy, Visnagar
8.	**When and how much**	Conducted for 4 weeks, 3 sessions per week
9.	**Tailoring**	Progression of stretches determined based on individual's tolerance
10.	**Modifications**	No modifications
11.	**How well (Planned)**	Regular attendance was taken.
12.	**How well (Actual)**	13 participants fully completed the intervention period.

Table 2: Demographic details of the participants

Particulars	Mean	Std. Deviation
Age	14.00	1.41
Height	162.38	8.46
Weight	51.61	11.13
BMI	19.40	2.95
Cricketing Experience	3.07	2.13

ABSTRACT

Gillian Flynn's *Gone Girl* presents a disturbing exploration of human psychology within intimate relationships. Moving beyond the conventions of crime fiction, the novel investigates psychological manipulation, narcissistic personality traits, identity fragmentation, and emotional performance in modern marriage. Through the alternating narratives of Nick and Amy Dunne, Flynn portrays how insecurity, repression, and the desire for control shape behaviour. Using psychoanalytic and psychological frameworks, this paper analyses the mental dynamics governing the characters and argues that *Gone Girl* exposes marriage as a psychological battlefield driven by power, perception, and constructed identity.

Keywords: Psychoanalytic, Psychological thriller, Narcissism, Manipulation and Cognitive Control

INTRODUCTION

Psychological thrillers are usually associated with mystery, suspense, and crime. However, in *Gone Girl*, Gillian Flynn shifts the focus from external action to the inner workings of the human mind. The novel explores the emotional and psychological struggles hidden inside marriage and personal identity. Through the characters of Nick and Amy Dunne, Flynn shows how insecurity, emotional repression, fear, and the need for control can slowly destroy trust and intimacy. The novel is narrated through diary entries and personal confessions, which makes readers constantly question the reliability of the characters. This narrative style reflects an important psychological idea: people often create their own version of reality based on emotions and personal experiences. As a result, *Gone Girl* becomes more than a thriller; it serves as a psychological exploration of identity, manipulation, and emotional instability.

Identity Formation and Performance

One of the most significant psychological ideas in the novel is the construction of identity. Amy Dunne grows up being compared to "Amazing Amy," a fictional character created by her parents. The fictional Amy is intelligent, talented, and perfect in every aspect. Living under such expectations causes Amy to struggle with her own sense of self. She recalls, "Amazing Amy was always perfect. Perfect Amy" (Flynn 28). This line highlights the pressure she feels to live according to an unrealistic image.

Psychologically, Amy experiences a conflict between her authentic self and the identity imposed upon her by society and family. Her frustration becomes clear when she says, "I was told love should be unconditional. That's the rule, everyone says so. But if love has conditions, if it's something to be earned, then perhaps the whole thing is a lie" (Flynn 56). The quotation reveals her disappointment with relationships and social expectations. As the story develops, Amy constantly changes her behaviour depending on the situation. At different points, she appears as a devoted wife, a helpless victim, and later a calculating avenger. This reflects the psychological concept of self-presentation, where individuals adjust their personality and actions to influence how others see them. Amy's identity is therefore not stable but carefully performed.

Nick also performs a role throughout the novel. In public, he tries to appear as a grieving and innocent husband even though he feels emotionally disconnected. His behaviour reflects society's pressure to maintain socially acceptable emotions and appearances.

Narcissism and the Need for Control

Amy's behaviour strongly reflects narcissistic characteristics. Her personality is marked by manipulation, emotional coldness, and a desire to control others. She openly states, "I am the most frightening person you will ever meet because I can make people believe anything" (Flynn 321). This quotation demonstrates her confidence in her ability to shape people's perceptions.

Amy's disappearance is not simply an act of revenge against Nick; it is also an attempt to regain control over her life and public image. She even admits, "I am so much happier now that I'm dead" (Flynn 293). This line suggests that she feels empowered when she becomes the centre of attention and sympathy.

Her actions can be connected to malignant narcissism, where intelligence and emotional manipulation are combined with cruelty and a lack of empathy. Amy carefully plans every detail in order to maintain control over both Nick and society.

Nick also displays certain narcissistic tendencies, though in a less extreme form. He often avoids responsibility and seeks comfort through external validation. His affair represents emotional escape rather than genuine connection, showing his inability to confront dissatisfaction directly.

Marriage as Psychological Conflict

In *Gone Girl*, marriage is presented not as a relationship built on trust but as a psychological struggle between two individuals trying to dominate one another. At the beginning of their relationship, Nick and Amy are attracted to idealized versions of each other. Nick later admits, "We fell in love with each other's invented characters" (Flynn 254). This quotation suggests that both characters were performing roles instead of revealing their true personalities.

Another important line appears when Nick reflects, "We were the first people who ever truly saw each other… and we were complete opposites" (Flynn 87). This statement reveals the emotional complexity of their marriage. Although they understand each other deeply, that understanding eventually becomes destructive rather than comforting.

As financial problems and emotional distance increase, their relationship deteriorates further. Amy interprets Nick's emotional withdrawal as betrayal, while Nick feels trapped by Amy's controlling behaviour. Their marriage slowly transforms into a battle filled with suspicion, resentment, and emotional punishment.

Manipulation and Psychological Control

Manipulation is one of the strongest psychological elements in the novel. Amy creates fake diary entries and false evidence in order to influence the police, the media, and society. Through these actions, Flynn demonstrates how easily reality can be altered through emotional storytelling. The novel also examines the power of media in shaping public opinion. Nick comments, "The media likes everything nice and simple" (Flynn 216). This quotation shows how society prefers emotional narratives over complicated truths. Amy understands this weakness and uses it to present herself as the perfect victim.

Flynn further criticizes public judgment through the statement, "People always think they know a marriage from the outside" (Flynn 182). This line emphasizes how appearances can be misleading. Outsiders often believe they understand relationships based only on surface impressions, while the actual emotional reality remains hidden.

Amy's behaviour can also be linked to gaslighting, a psychological technique in which someone manipulates others into doubting their own understanding of reality. Through careful planning, Amy controls not only Nick's life but also the perceptions of the entire public.

Fear, Anxiety, and Emotional Repression

Both Nick and Amy struggle with emotional repression, but they express it differently. Nick avoids confrontation and suppresses his emotions, which eventually leads to emotional numbness. He reflects, "There's something disturbing about recalling a warm memory and feeling utterly cold" (Flynn 78). This quotation reveals his emotional emptiness and inability to connect honestly with his feelings. Amy reacts differently to emotional pain. Instead of withdrawing emotionally, she transforms her fear and insecurity into aggression and control. Her fear of abandonment becomes obsessive, as shown when she declares, "I won't lose him. I refuse to lose him" (Flynn 405). This line demonstrates how her emotional dependency drives her extreme actions.

The alternating narration between Nick and Amy further reflects the instability of psychological truth. Each character presents a different version of reality, forcing readers to question whose perspective is trustworthy. Flynn suggests that truth itself becomes unstable when filtered through emotion and personal bias.

Public Image and Social Expectations

Another important psychological aspect of the novel is the importance of public image. Both Nick and Amy become performers under media observation. Nick learns how to behave correctly during interviews because appearing innocent becomes more important than being genuine.

This idea connects with the theory of impression management developed by Erving Goffman, which explains how individuals perform different roles in society to maintain favourable impressions. Flynn critiques a culture where appearances and performance are valued more than honesty and emotional authenticity.

CONCLUSION

From a psychological perspective, *Gone Girl* presents modern relationships as emotionally complex and deeply unstable. Through Nick and Amy, Flynn explores themes such as identity performance, narcissism, manipulation, and emotional repression. The characters are not simply individuals within a marriage; they symbolize the psychological effects of insecurity, social pressure, and the desire for control. Ultimately, the novel suggests that identity is often shaped by perception rather than truth. Marriage becomes a space where hidden fears, frustrations,

and desires emerge. The unsettling ending reinforces the idea that in modern society, survival sometimes depends more on performance and manipulation than on honesty and emotional connection.

ABSTRACT

In this study, the photodegradation activities of phyto-mediated synthesis of cuprous oxide nanoparticles (Cu_2O NPs) against various organic dyes like methylene blue (MB), methyl orange (MO), and eosin yellow (EY) were studied. The cuprous oxide nanoparticles were prepared by using leaf extract of the known herb *Kalanchoe pinnata*. Its properties, like shape, structure, and bonding nature, were also studied. XRD spectrum results showed that the average size of the prepared cuprous oxide nanoparticle was about 14.9 nm. FTIR analysis reveals the bonding nature of Cu_2O NPs. It also proves the presence of metal oxide bonds. The band gap of Cu_2O NPs was about 4.49 eV on the basis of optical transmission at 389 nm using UV-visible spectroscopy. The photodegradation investigation against MO, EY, and MB under sunlight up to 180 minutes. The phyto-mediated synthesized Cu_2O NPs show good and decent degradation for all three dyes. Where MO degrades about 60%, MB degrades about 65%, and EY degrades about 88% with absorbance maximum at 470 nm, 670 nm, and 555 nm, respectively. The prepared Cu_2O NPs are efficient at degrading organic dyes under sunlight as a source and are an environmentally friendly application.

Keywords: *Kalanchoe pinnata*, cuprous oxide Nps, phyto-mediated synthesis, photo degradation, XRD, UV-visible, FTIR, SEM, EDX.

INTRODUCTION

Environmental pollution is mainly promoted by widespread use of organic dyes in various fields and industries like textile manufacturing, paper industries, etc. [1]. Organic dyes are generally more stable; the process of degrading them is one of the great challenges [4]. The untreated or non-treated wastewater containing contaminants like organic dyes is able to cause color pollution; it can also restrict the light penetration and also affect aquatic & marine ecosystems [3]. These dyes also have the ability to spread harmful effects on human health and the surrounding ecosystem [3, 4]. Various methods are being researched for the elimination of these organic dyes [5], but nanotechnology was considered to be the most reliable, safest, and cost-efficient technique [5]. The potential and best solution for this issue is to use NPs [8]. Nanoparticles can be prepared by both chemical and greener synthesis. Phyto-mediated synthesis has become of a lot of interest as a dependable, sustainable method in materials research. Phyto-mediated synthesis is necessary to prevent the production of dangerous byproducts. One of the United Nation's proposed "Sustainable Development Goals" (GDGs) for 2030 is focused on the water sanitation process. Their target is to reduce the contaminants in wastewater and to collect the respective byproducts. Nanoparticles prepared by Phyto-mediated synthesis are most important to reach the goal. Metal oxide nanoparticles prepared from metals, especially transition metals, have special applications such as catalytic reactions, sensor production, use for batteries, etc. [9]. In recent decades, Phyto-mediated synthesis of nanomaterials has become an economically and environmentally beneficial method for eliminating organic dyes. Particularly plant leaf extracts have been regarded as a low-cost, efficient resource for NPs [10]. Among transition metal oxides, Cu_2O—cuprous oxide—is a well-known naturally occurring p-type semiconductor. Cu_2O nanoparticles synthesized by plant materials are more stable [8]. So, we use Cu_2O nanoparticles prepared through Phyto-mediated synthesis by using a plant named *Kalanchoe pinnata*. It is a succulent species from Madagascar, and it belongs to the Crassulaceae family. It is also referred to as the Goethe plant, cathedral bells, miracle plant, etc. [11, 12]. In tropical and subtropical regions, it is one of the most popular houseplants [13]. It has numerous therapeutic benefits. It is a perennial shrub, mostly cultivated in tropical regions of Asia [14]. In this research, we have studied the photodegradation process of various dyes, using Cu_2O nanoparticles prepared using plant extract of *Kalanchoe pinnata*.

MATERIALS AND METHODOLOGY

Synthesis of cuprous oxide nanoparticles;

Kalanchoe pinnata plant leaves were collected from my native village, Chithiraipatti, Thuraiyur, Tiruchirapalli District, Tamil Nadu (Lat: 11.135475° & Lon: 78.586588°). The leaves of the Kalanchoe pinnata plant were collected and washed with clean water, then they were dried in shaded areas. I dried it for up to 10 days, and then the dried leaves were turned into fine powder. Approximately 5 grams of powdered leaves are added into 50 ml of water, then constant stirring is done for up to 15 minutes with the help of a magnetic stirrer. Then approximately 12 g of copper sulfate is weighed and made up to 100 ml using SMF; the concentration of the solution is about 0.5 mole. Then the leaf extract is filtered, and 10 ml of the filtrate is added to the solution of copper sulfate, and 2 g of sodium hydroxide is also added to it. Then the constant stirring takes place for 2 to 3 hours. Then the precipitate or residue is separated using a centrifuge machine. Then the separated precipitates are collected using a nickel spatula. Then it was placed in a microwave oven and heated at 150°C for up to 2 hours. After heating, the precipitates were crushed into very fine powder by using a mortar and pestle. After crushing, it will be placed into a silica crucible and placed in a box furnace to heat to about 400° to 450°C for up to 2 hours. After that, the prepared Cu_2O nanoparticles were collected in a sample tube

Characterization Techniques

X- Ray Diffraction

The prepared Cu_2O nanoparticles were described by using X-ray diffraction techniques, and the diffraction pattern that was detected showed that the lattice planes of (021), (021),(110),(111),(112),(202), correspond to 24.08°, 28.99°, 32.26°, 35.63°, 38.78°, 53.84°, and 58.22°, respectively. The diffraction pattern that was noticed by using the standard

JCPDS card number (89-2529) for Cu_2O [11, 29] is shown in theFigure 1. The average crystalline size of the prepared sample was determined by using the Debye-Scherrer equation.

Formula:

$$D = K\lambda/\beta Cos\theta$$

Where D is the average size of the crystal, K is said to be the Scherrer's constant (~0.9), β is half of maximum intensity, λ is the wavelength of X-ray radiation, and θ is the Bragg's angle, respectively. The average crystallite size of prepared Cu_2O is about 14.9 nm.

UV- Visible Spectroscopy

The optical characterization of Cu_2O nanoparticles has been analyzed by using UV-visible spectra. It is mainly based on Beer-Lambert's law, which states that absorbance is directly proportional to the concentration of absorbing species [11]. These spectroscopic techniques measure light amplification, which ranges between 200 nm and 735 nm [12, 24]. The UV spectra for the prepared Cu_2O nanoparticles was done under room temperature; Figure 2a shows the electron transfer from the valence band to the conduction band by absorbing a wavelength of 389 nm. Band gap is defined as the energy difference between the valence band minimum and the conduction band maximum. Generally, band gap does not need to be the same as or equal to electronic band gap [13]. It will be measured by plotting a graph between the first derivative of optical absorbance (dA/dhu) and photon energy (hv) [28]. The maximum in the derivative spectrum on the lower energy side is the optical band gap. The optical band gap value for Cu_2O nanoparticles is about 4.49 eV, or approximately 4.50 eV, as shown in the Figure 2b.

FTIR – Fourier Transform Infrared Spectroscopy

It was a useful technique for a simultaneous multi-component study. It is a vibrational spectroscopy method with more accuracy and speed [14]. By using unique absorption peaks, FTIR spectroscopy can easily identify a particular functional group that is present in our sample [15]. FTIR spectra observe that, when the sample was exposed to infrared light (IR), certain bonds within a molecule will vibrate at specific frequencies [30]. Figure 3 shows that the FTIR spectrum of Cu_2O nanoparticles ranges between 4000 cm^{-1} and 500 cm^{-1}. The broad peak obtained at 3452 cm^{-1} is assigned to the stretching vibration of the hydroxyl group (O-H). The sharp peaks obtained at 1637 cm^{-1} and 1124 cm^{-1} are assigned to carbonyl (C=O) or alkene (C=C) and (C-O), respectively. The lower peaks obtained at 843, 771, 620, and 509 cm^{-1} are indicating the presence of a metal-oxygen bond (Cu-O). The presence of Cu ions needed for the production of Cu_2O was verified by the 843 cm^{-1} and 509 cm^{-1} peaks [17]. The additional functional groups supporting the presence of Cu_2O nanoparticles in *Kalanchoe pinnata* were found to be surrounded by alcohol and carbonyl groups in FTIR analysis, providing strong binding sites that supported this finding [17, 18].

SEM and EDX-Analysis

Cu_2O nanoparticles prepared with leaf extract of *K. pinnata* were examined using SEM (scanning electron microscope) to determine their morphological characters. According to the SEM image shown in Figure 4, the produced Cu_2O nanoparticles were spherical in shape [29]. The energy-dispersive X-ray (EDX) spectrum confirmed the elemental composition and purity of the synthesized Cu_2O nanoparticles. By weight, the peaks for Cu (73.16%) and O (26.84%) are shown in Figure 5, which confirmed the purity of phyto-mediated synthesized Cu_2O nanoparticles. This investigation demonstrates how the phyto-mediated process can produce high-quality nanoparticles [31].

Photodegradation Activity

The prepared Cu_2O nanoparticles can exhibit a photodegradation process against MB, EY, and MO dyes due to their smaller size and their surface area. The UV spectra of MB, EY, and MO were shown in Figure 6a, 6b, 6c. The degradation process takes place up to 180 minutes under sunlight. The activity of metal oxide in photodegradation is greatly impacted by a number of variables, such as specific surface, crystallization, and surface imperfection [20]. The primary reaction pathway for compounds such as azo dyes involves the bulk liquid, where the hydroxyl radicals can

effectively destroy them through oxidative degradation [21]. Azo compounds such as -OH, -SO_3, etc., can often be recognized by the presence of multiple azo bonds in conjugation with aromatic compounds and auxochromes [22]. The electrons present in the conduction band (CB) reduce oxide molecules (O_2) into superoxide radical ions (O_2^-). With the fact that the holes in the valance band (VB) convert water molecules (H_2O) into hydroxyl radicals (OH^-) and also oxidize the dye molecules. So, the photodegraded superoxide, hydroxyl group, and dye free radicals degrade the dye into CO_2, H_2O, and a few mineral acids. The biosynthesized Cu_2O NPs have greater photodegradation activity due to their larger surface area [23-26].

$$\%\mathbf{D} = (\mathbf{A_0} - \mathbf{A_t})/\mathbf{A_0}\mathbf{X100}$$

Where D is the % of degradation, Ao is the initial absorbance of dyes, and $A_t$is the absorbance after illumination.
The photodegradation activity of prepared Cu_2O has results as the complete decrease in the intensity of respective dyes [23]. The absorbance intensity at max is 670 nm for MB, 555 nm for EY, and 470 nm for MO. As a result of that, MB degrades 65%, EY degrades 88%, and MO degrades 60%, as shown in the Figure 6d.

CONCLUSION

Phyto-mediated synthesis of cuprous oxide was synthesized using leaf extract of the known herb *Kalanchoe pinnata*. It was mainly used to treat kidney stones. The *K.pinnata* leaf was easily available in our environment, and it is not expensive. The color of the synthesized cuprous oxide was dark brown in color. According to the UV-visible study, the optical transmission at 389 nm shows that the optical bad gap energy was about Eg = 4.49 nm. FTIR spectroscopy reveals the presence of functional groups such as (O-H), (C=O), (Cu-O), and (C=C). An XRD study shows that the Cu_2O NPs are crystalline in nature. By using the Debye-Scherrer equation, the crystalline size of the prepared Cu_2O NPs was about 14.9 nm. SEM also shows that the synthesized cuprous oxide nanoparticles have a spherical shape morphology. In the photodegradation study, Cu_2O NPs were used on various dyes such as methylene blue (MB), methyl orange (MO), and eosin yellow (EY). Comparing all these three dyes, Cu_2O NPs is more effective on the degradation of EY, which degrades 88% after 180 mins of exposure. Finally, we concluded that the synthesized Cu_2O NPs were an eco-friendly & cost-efficient method. It is also applicable for the degradation of efficient dyes from wastewater.

ABSTRACT

A graph G with $p$vertices and $q$edges. Let $h: V(G) \to \{1,2,\dots,p+q\}$ be an injective function. For a vertex labeling h, the induced edge labeling $h^*(e=rt)$is defined by $h^*(e) = \left\lfloor \sqrt{\frac{h(r)^2+h(t)^2}{2}} \right\rfloor$ *or* $\left\lfloor \sqrt{\frac{h(r)^2+f(t)^2}{2}} \right\rfloor$, h is called a super root square mean if $h\big(v(G)\big) \cup \{f(e)/\, e \in E(G)\} = \{1,2,3,\dots,p+q\}$. A graph which admit super root square mean labeling is called super root square mean graph. In this paper we prove that bicyclicsrelated graphs such as Bicyclic $B(\tau,\tau), B(\tau,\tau) \odot \overline{K}_1, B(\tau,\tau) \odot \overline{K}_2$, $B(\tau,\tau) \odot \overline{K}_3, B(\tau,\tau) \odot K_2, B(\tau,1,\tau), B(\tau,1,\tau) \odot \overline{K}_1, B(\tau,1,\tau) \odot \overline{K}_2, B(\tau,1,\tau) \odot \overline{K}_3$, and $B(\tau,1,\tau) \odot K_2$are all super root square mean graphs.

Keywords: Graph, Root square mean labeling, Super root square Mean Labeling, Corona Product of G, Bicyclic of G, Dumbbell of G.

INTRODUCTION

Graph Theory is a branch of mathematics focused on studying networks composed of points (called vertices) connected by lines (called edges). Although it originated from recreational problems, "it has evolved into an important field of mathematical research with applications across chemistry, operations research, social science, biology, and computer science. Graph labeling involves assigning labels, typically integers, to the edges or vertices of a graph. Many labeling methods trace their origins to a system introduced by Rosa in 1967. Over the last thirty years, more than 600 research papers have been published on graph labeling, highlighting its significance and ongoing

development in the field. For all other standard terminology and notations, we follow Harary [7]. Graph labeling finds applications across many areas of science and technology, with various techniques discussed comprehensively in [5]. The concept and notation of mean labeling were first introduced by S. Somasundaram and R. Ponraj [14]. The notion of root square mean labeling was introduced by S. S. Sandhya, S. Somasundaram, and S. Anusa in 2014 [16]. Meena S. and Mani R. [8] explored this labeling for certain cycle-related graphs. Abdul Saleem R. and Mani R. [1, 2, 3] investigated root square mean labeling for some crown graphs.

Meena S. and Naveen J. [12] derived prime vertex labeling for the corona product of bicyclic graphs. Meena S. and Usharani S. [13] studied product cordial labeling for certain bicyclic graphs. Meena S. and R. Mani [9] proved root square mean labeling properties for theta-related graphs and further analyzed their behavior in [10, 11]. Ponraj R., Sathish Narayanan S., and Ramasamy A. M. S. [15] examined total mean cordiality of dumbbell graphs. The concept of super root square mean labeling was introduced by Thirugnanasambandam K. and Venkatesan K., with discussions in [18, 19]. Gopi R. [6] investigated super root square mean labeling for various graphs. Selvi V. S., Velmurugan N., and Avinash N. [17] examined super root square mean labeling for theta and corona graphs.
In this paper, we focus on the super root square mean labeling of bicyclic-related graphs, presenting and verifying some new examples. We now provide the necessary definitions for this investigation.

Definition: 1.1
A graph G with p points and q lines is known as root square mean graph if it is possible to label the points $x \epsilon V$ with different values $h(x)$from $1,2,\dots,q+1$ so that when each line $e=rt$ is labeled with $h(e=rt)=\left\lceil\sqrt{\frac{h(r)^2+h(t)^2}{2}}\right\rceil$ or $\left\lfloor\sqrt{\frac{h(r)^2+h(t)^2}{2}}\right\rfloor$, then the resulting line labels are different. h is known as **root square mean** labeling of G.

Definition: 1.2
A graph G with p vertices and q edges. Let $h: V(G) \to \{1,2,\dots,p+q\}$ be an injective function. For a vertex labeling h, the induced edge labeling $h^*(e=rt)$is defined by $h^*(e)=\left\lceil\sqrt{\frac{h(r)^2+h(t)^2}{2}}\right\rceil$ or $\left\lfloor\sqrt{\frac{h(r)^2+f(t)^2}{2}}\right\rfloor$, h is called a super root square mean if $h\big(v(G)\big)\cup\{f(e)/\, e\in E(G)\}=\{1,2,3,\dots,p+q\}$. A graph which admit super root square mean labeling is called super root square mean graph.

Definition: 1.3
The Corona of two graphs G_1 and G_2 is the graph $G=G_1\odot G_2$ formed by taking one copy of G_1 and $|V(G_1)|$ copies of G_2 where the i^{th} vertex of G_1 is adjacent to every vertex in the i^{th} copy of G_2.

Definition: 1.4
A walk in which $r_1r_2\dots r_\tau$ are distinct is called a path. A path on τ vertices is denoted by P_τ.

Definition: 1.5
A closed path is known as a **cycle**. A cycle on τ points is represented by C_τ.

Definition: 1.6
If $B(\tau,\tau)$is the bicyclic graph obtained from two disjoint cycles C_τ and C_τ by identifying any two points r of C_τ and t of C_τ.

Definition: 1.7
The bicyclic graph $B(\tau,l,\tau)$is obtained from two disjoint cycles C_τ and C_τ by joining any two points$r$ of C_τ and t of C_τ by a new path P_τ with length τ ($\tau\geq 1$). This graph is called Dumbbell graph
Notation:
Here $\lceil h\rceil$ is the least integer greater than or equal to h and $\lfloor h\rfloor$ is the greatest integer less than or equal to h.

Main Results

In this paper, we investigate the super root square mean labeling of bicyclic-related graphs.

Theorem: 2.1

Bicyclic $B(\tau,\tau)$ is a super root square mean graph**.**

Proof:

Let $G = B(\tau,\tau)$

Let $r_1r_2 \dots r_\tau$ and $t_1t_2 \dots t_\tau$ be the vertices of two cycles of bicyclic graph with the common vertex $r_\tau = t_1$.

Let $V(G) = \{r_1r_2 \dots r_\tau,\ t_1t_2 \dots t_\tau\}$

$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$

$\cup \{r_\tau r_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 4\tau - 1\}$ by

$h(r_j) = 2j$ for $1 \le j \le \tau$

$h(t_l) = 2\tau + 2l - 2$ for $2 \le l \le \tau$

Then the edge lables are distinct.

Hence h is a super root square mean labeling of G.

Theorem: 2.2

$B(\tau,\tau) \odot \overline{K}_1$ is a super root square mean graph**.**

Proof:

Let $G = B(\tau,\tau) \odot \overline{K}_1$

Let $r_1r_2 \dots r_\tau$ and $t_1t_2 \dots t_\tau$ be the vertices of two cycles of bicyclic graph with the common vertex $r_\tau = t_1$.

Let $r_1'r_2' \dots r_\tau'$ be the pendant vertices attached at $r_1r_2 \dots r_\tau$ and let $t_1't_2' \dots t_\tau'$ be the pendant vertices attached at $t_1t_2 \dots t_\tau$ with $r_\tau' = t_1'$ respectively.

Let $V(G) = \begin{Bmatrix} r_1r_2 \dots r_\tau, t_1t_2 \dots t_\tau, \\ r_1'r_2' \dots r_\tau', t_1't_2' \dots t_\tau' \end{Bmatrix}$

$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$

$\cup \{r_j r_j' / 1 \le j \le \tau\} \cup \{t_l t_l' / 1 \le l \le \tau\}$

$\cup \{r_\tau r_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 8\tau - 3\}$ by

$h(r_j) = 4j - 2$ for $1 \le j \le \tau$

$h(r_j') = 4j$ for $1 \le j \le \tau$

$h(t_l) = 4\tau + 4l - 6$ for $2 \le l \le \tau$

$h(t_l') = 4\tau + 4l - 4$ for $2 \le l \le \tau$

Then the edge lables are distinct.

Hence h is a super root square mean labeling of G. ■

Theorem: 2.3

$B(\tau,\tau) \odot \overline{K}_2$ is a super root square mean graph.

Proof:

Let $G = B(\tau,\tau) \odot \overline{K}_2$

Let $r_1r_2 \dots r_\tau$ and $t_1t_2 \dots t_\tau$ be the vertices of two cycles of bicyclic graph with the common vertex $r_\tau = t_1$.

Let $r_1'r_2' \dots r_\tau'$ and $r_1''r_2'' \dots r_\tau''$ be the pendant vertices attached at $r_1r_2 \dots r_\tau$ and let $t_1't_2' \dots t_\tau'$ and $t_1''t_2'' \dots t_\tau''$ be the pendant vertices attached at $t_1t_2 \dots t_\tau$ with $r_\tau' = t_1'$ and $r_\tau'' = t_1''$ respectively.

Let $V(G) = \{r_1r_2 \dots r_\tau, t_1t_2 \dots t_\tau, r_1'r_2' \dots r_\tau', t_1't_2' \dots t_\tau', r_1''r_2'' \dots r_\tau'', t_1''t_2'' \dots t_\tau''\}$

$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j^{'} / 1 \le j \le \tau\} \cup \{t_l t_l^{'} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{''} / 1 \le j \le \tau\} \cup \{t_l t_l^{''} / 1 \le l \le \tau\}$
$\cup \{r_\tau r_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 12\tau - 5\}$ by

$h(r_j) = 6j - 4$	for	$1 \le j \le \tau$
$h(r_j^{'}) = 6j - 2$	for	$1 \le j \le \tau$
$h(r_j^{''}) = 6j$	for	$1 \le j \le \tau$
$h(t_l) = 6\tau + 6l - 10$	for	$2 \le l \le \tau$
$h(t_l^{'}) = 6\tau + 6l - 8$	for	$2 \le l \le \tau$
$h(t_l^{''}) = 6\tau + 6l - 6$	for	$2 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G.

Theorem: 2.4
$B(\tau, \tau) \odot \overline{K}_3$ is a super root square mean graph**.**
Proof:
Let $G = B(\tau, \tau) \odot \overline{K}_3$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of bicyclic graph with the common vertex $r_\tau = t_1$.
Let $r_1^{'} r_2^{'} \dots r_\tau^{'}, r_1^{''} r_2^{''} \dots r_\tau^{''}$ and $r_1^{'''} r_2^{'''} \dots r_\tau^{'''}$ be the pendant vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1^{'} t_2^{'} \dots t_\tau^{'}, t_1^{''} t_2^{''} \dots t_\tau^{''}$ and $t_1^{'''} t_2^{'''} \dots t_\tau^{'''}$ be the pendant vertices attached at $t_1 t_2 \dots t_\tau$ with $r_\tau^{'} = t_1^{'}, r_\tau^{''} = t_1^{''}$ and $r_\tau^{'''} = t_1^{'''}$ respectively.
Let $V(G) = \begin{Bmatrix} r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, r_1^{'} r_2^{'} \dots r_\tau^{'}, t_1^{'} t_2^{'} \dots t_\tau^{'}, \\ r_1^{''} r_2^{''} \dots r_\tau^{''}, t_1^{''} t_2^{''} \dots t_\tau^{''}, r_1^{'''} r_2^{'''} \dots r_\tau^{'''}, t_1^{'''} t_2^{'''} \dots t_\tau^{'''} \end{Bmatrix}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j^{'} / 1 \le j \le \tau\} \cup \{t_l t_l^{'} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{''} / 1 \le j \le \tau\} \cup \{t_l t_l^{''} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{'''} / 1 \le j \le \tau\} \cup \{t_l t_l^{'''} / 1 \le l \le \tau\}$
$\cup \{r_\tau r_1, t_\tau t_1\}$
Define a function $h: V(G) \to \{1,2, \dots, 16\tau - 7\}$ by

$h(r_j) = 8j - 6$	for	$1 \le j \le \tau$
$h(r_j^{'}) = 8j - 4$	for	$1 \le j \le \tau$
$h(r_j^{''}) = 8j - 2$	for	$1 \le j \le \tau$
$h(r_j^{'''}) = 8j$	for	$1 \le j \le \tau$
$h(t_l) = 8\tau + 8l - 14$	for	$2 \le l \le \tau$
$h(t_l^{'}) = 8\tau + 8l - 12$	for	$2 \le l \le \tau$
$h(t_l^{''}) = 8\tau + 8l - 10$	for	$2 \le l \le \tau$
$h(t_l^{'''}) = 8\tau + 8l - 8$	for	$2 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.5
$B(\tau, \tau) \odot K_2$ is a super root square mean graph**.**
Proof:
Let $G = B(\tau, \tau) \odot K_2$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of bicyclic graph with the common vertex $r_\tau = t_1$.

Let $r_1' r_2' \dots r_\tau'$ and $r_1'' r_2'' \dots r_\tau''$ be the adjacent vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1' t_2' \dots t_\tau'$ and $t_1'' t_2'' \dots t_\tau''$ be the adjacent vertices attached at $t_1 t_2 \dots t_\tau$ with $r_\tau' = t_1'$ and $r_\tau'' = t_1''$ respectively.
Let $V(G) = \{r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, r_1' r_2' \dots r_\tau', t_1' t_2' \dots t_\tau', r_1'' r_2'' \dots r_\tau'', t_1'' t_2'' \dots t_\tau''\}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j' / 1 \le j \le \tau\} \cup \{t_l t_l' / 1 \le l \le \tau\}$
$\cup \{r_j r_j'' / 1 \le j \le \tau\} \cup \{t_l t_l'' / 1 \le l \le \tau\}$
$\cup \{r_j' r_j'' / 1 \le j \le \tau\} \cup \{t_l' t_l'' / 1 \le l \le \tau\}$
$\cup \{r_\tau r_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 12\tau - 6\}$ by

$h(r_j) = 6j - 4$	for	$1 \le j \le \tau$
$h(r_j') = 6j - 2$	for	$1 \le j \le \tau$
$h(r_j'') = 6j$	for	$1 \le j \le \tau$
$h(t_l) = 6\tau + 6l - 10$	for	$2 \le l \le \tau$
$h(t_l') = 6\tau + 6l - 8$	for	$2 \le l \le \tau$
$h(t_l'') = 6\tau + 6l - 6$	for	$2 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.6
Dumbbell $B(\tau, 1, \tau)$is a super root square mean graph**.**

Proof:
Let $G = B(\tau, 1, \tau)$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of dumbbell graph in G.
Let $V(G) = \{r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau\}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_\tau r_1, r_\tau t_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 4\tau - 1\}$ by

$h(r_j) = 2j - 1$	for	$1 \le j \le \tau$
$h(t_l) = 2\tau + 2l - 1$	for	$1 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.7
$B(\tau, 1, \tau) \odot \overline{K}_1$is a super root square mean graph**.**

Proof:
Let $G = B(\tau, 1, \tau) \odot \overline{K}_1$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of dumbbell graph in G.
Let $r_1' r_2' \dots r_\tau'$ be the pendant vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1' t_2' \dots t_\tau'$ be the pendant vertices attached at $t_1 t_2 \dots t_\tau$ respectively.
Let $V(G) = \begin{Bmatrix} r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, \\ r_1' r_2' \dots r_\tau', t_1' t_2' \dots t_\tau' \end{Bmatrix}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\}$
$\cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j' / 1 \le j \le \tau\}$

$\cup \{t_l t_l^{'} / 1 \le l \le \tau\}$

$\cup \{r_\tau r_1, r_\tau t_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 8\tau - 1\}$ by

$h(r_j) = 4j - 3$ for $1 \le j \le \tau$

$h(r_j^{'}) = 4j - 1$ for $1 \le j \le \tau$

$h(t_l) = 4\tau + 4l - 3$ for $1 \le l \le \tau$

$h(t_l^{'}) = 4\tau + 4l - 1$ for $1 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.8
$B(\tau, 1, \tau) \odot \overline{K}_2$ is a super root square mean graph**.**

Proof:
Let $G = B(\tau, 1, \tau) \odot \overline{K}_2$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of dumbbell graph in G.
Let $r_1^{'} r_2^{'} \dots r_\tau^{'}$ and $r_1^{''} r_2^{''} \dots r_\tau^{''}$ be the pendant vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1^{'} t_2^{'} \dots t_\tau^{'}$ and $t_1^{''} t_2^{''} \dots t_\tau^{''}$ be the pendant vertices attached at $t_1 t_2 \dots t_\tau$ respectively.
Let $V(G) = \{r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, r_1^{'} r_2^{'} \dots r_\tau^{'}, t_1^{'} t_2^{'} \dots t_\tau^{'}, r_1^{''} r_2^{''} \dots r_\tau^{''}, t_1^{''} t_2^{''} \dots t_\tau^{''}\}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j^{'} / 1 \le j \le \tau\} \cup \{t_l t_l^{'} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{''} / 1 \le j \le \tau\} \cup \{t_l t_l^{''} / 1 \le l \le \tau\}$
$\cup \{r_\tau r_1, r_\tau t_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 12\tau - 1\}$ by

$h(r_j) = 6j - 5$ for $1 \le j \le \tau$

$h(r_j^{'}) = 6j - 3$ for $1 \le j \le \tau$

$h(r_j^{''}) = 6j - 1$ for $1 \le j \le \tau$

$h(t_l) = 6\tau + 6l - 5$ for $1 \le l \le \tau$

$h(t_l^{'}) = 6\tau + 6l - 3$ for $1 \le l \le \tau$

$h(t_l^{''}) = 6\tau + 6l - 1$ for $1 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.9
$B(\tau, 1, \tau) \odot \overline{K}_3$is a super root square mean graph**.**

Proof:
Let $G = B(\tau, 1, \tau) \odot \overline{K}_3$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of dumbbell graph in G.
Let $r_1^{'} r_2^{'} \dots r_\tau^{'}, r_1^{''} r_2^{''} \dots r_\tau^{''}$ and $r_1^{'''} r_2^{'''} \dots r_\tau^{'''}$ be the pendant vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1^{'} t_2^{'} \dots t_\tau^{'}, t_1^{''} t_2^{''} \dots t_\tau^{''}$ and $t_1^{'''} t_2^{'''} \dots t_\tau^{'''}$ be the pendant vertices attached at $t_1 t_2 \dots t_\tau$ respectively.
Let $V(G) = \begin{Bmatrix} r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, r_1^{'} r_2^{'} \dots r_\tau^{'}, t_1^{'} t_2^{'} \dots t_\tau^{'}, \\ r_1^{''} r_2^{''} \dots r_\tau^{''}, t_1^{''} t_2^{''} \dots t_\tau^{''}, r_1^{'''} r_2^{'''} \dots r_\tau^{'''}, t_1^{'''} t_2^{'''} \dots t_\tau^{'''} \end{Bmatrix}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j^{'} / 1 \le j \le \tau\} \cup \{t_l t_l^{'} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{''} / 1 \le j \le \tau\} \cup \{t_l t_l^{''} / 1 \le l \le \tau\}$

$$\cup \{r_j r_j^{'''} \ / 1 \le j \le \tau\} \cup \{t_l t_l^{'''} / 1 \le l \le \tau\}$$

Define a function $h: V(G) \to \{1,2, \dots, 16\tau\}$ by

$h(r_j) = 8j - 6$	for	$1 \le j \le \tau$
$h(r_j^{'}) = 8j - 4$	for	$1 \le j \le \tau$
$h(r_j^{''}) = 8j - 2$	for	$1 \le j \le \tau$
$h(r_j^{'''}) = 8j$	for	$1 \le j \le \tau$
$h(t_l) = 8\tau + 8l - 6$	for	$1 \le l \le \tau$
$h(t_l^{'}) = 8\tau + 8l - 4$	for	$1 \le l \le \tau$
$h(t_l^{''}) = 8\tau + 8l - 2$	for	$1 \le l \le \tau$
$h(t_l^{'''}) = 8\tau + 8l$	for	$1 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G. ■

Theorem: 2.10
$B(\tau, 1, \tau) \odot K_2$ is a super root square mean graph.

Proof:
Let $G = B(\tau, 1, \tau) \odot K_2$
Let $r_1 r_2 \dots r_\tau$ and $t_1 t_2 \dots t_\tau$ be the vertices of two cycles of dumbbell graph in G.
Let $r_1^{'} r_2^{'} \dots r_\tau^{'}$ and $r_1^{''} r_2^{''} \dots r_\tau^{''}$ be the adjacent vertices attached at $r_1 r_2 \dots r_\tau$ and let $t_1^{'} t_2^{'} \dots t_\tau^{'}$ and $t_1^{''} t_2^{''} \dots t_\tau^{''}$ be the adjacent vertices attached at $t_1 t_2 \dots t_\tau$ respectively.
Let $V(G) = \{r_1 r_2 \dots r_\tau, t_1 t_2 \dots t_\tau, r_1^{'} r_2^{'} \dots r_\tau^{'}, t_1^{'} t_2^{'} \dots t_\tau^{'}, r_1^{''} r_2^{''} \dots r_\tau^{''}, t_1^{''} t_2^{''} \dots t_\tau^{''}\}$
$E(G) = \{r_j r_{j+1} / 1 \le j \le \tau - 1\} \cup \{t_l t_{l+1} / 1 \le l \le \tau - 1\}$
$\cup \{r_j r_j^{'} / 1 \le j \le \tau\} \cup \{t_l t_l^{'} / 1 \le l \le \tau\}$
$\cup \{r_j r_j^{''} / 1 \le j \le \tau\} \cup \{t_l t_l^{''} / 1 \le l \le \tau\}$
$\cup \{r_j^{'} r_j^{''} / 1 \le j \le \tau\} \cup \{t_l^{'} t_l^{''} / 1 \le l \le \tau\}$
$\cup \{r_\tau r_1, r_\tau t_1, t_\tau t_1\}$

Define a function $h: V(G) \to \{1,2, \dots, 12\tau\}$ by

$h(r_j) = 6j - 4$	for	$1 \le j \le \tau$
$h(r_j^{'}) = 6j - 2$	for	$1 \le j \le \tau$
$h(r_j^{''}) = 6j$	for	$1 \le j \le \tau$
$h(t_l) = 6\tau + 6l - 4$	for	$1 \le l \le \tau$
$h(t_l^{'}) = 6\tau + 6l - 2$	for	$1 \le l \le \tau$
$h(t_l^{''}) = 6\tau + 6l$	for	$1 \le l \le \tau$

Then the edge lables are distinct.
Hence h is a super root square mean labeling of G.

CONCLUSION

It is very interesting to find whether a graphadmits super root square mean labeling or not. We present ten new results on super root square mean labelingof bicyclic related graphs. In the future, we investigation about the similar results for various graphs such as subdivision" of bicyclic graphs, subdivision of corona product of bicyclic graphs, subdivision of dumbbell graphs and subdivision of corona product of dumbbell graphs

ABSTRACT

Vesicular drug delivery systems have emerged as advanced pharmaceutical carriers that significantly improve drug bioavailability, stability, and therapeutic efficacy. These systems, composed of self-assembled lipid or surfactant-based vesicles, include liposomes, niosomes, ethosomes, transferosomes, cubosomes, and spanlastics, each offering unique structural and functional advantages. This review provides a comprehensive overview of the design, preparation methods, physicochemical characterization, and performance evaluation of various vesicular carriers. Emphasis is placed on their ability to enhance drug permeation, protect labile drugs from degradation, and facilitate targeted and controlled release. The article discusses key formulation parameters such as vesicle size, surface charge, entrapment efficiency, and bilayer composition, which critically influence therapeutic outcomes. In addition, the review highlights the role of vesicular systems in improving dermal and transdermal drug delivery, particularly for antifungal and anti-inflammatory agents, by overcoming the barrier properties of the stratum corneum. Despite their advantages, challenges such as physical instability, high production costs, and scalability issues are also addressed. Furthermore, recent advancements, including hybrid vesicular systems and stimuli-responsive carriers, are explored as potential solutions to enhance clinical applicability. The integration of nanotechnology with vesicular drug delivery presents a promising approach for achieving site-specific action, reduced toxicity, and improved patient

compliance. Overall, vesicular systems represent a transformative strategy in modern drug delivery, with significant potential for future pharmaceutical innovations and therapeutic advancements.

Keywords: Vesicular drug delivery, therapeutic efficacy, conventional drug formulations, liposomes, niosomes.

INTRODUCTION

Pharmaceutical scientists have always faced the problem of delivering drugs to their desired target sites. Conventional methods such as oral tablets and intravenous injections are known to be plagued with issues like poor bioavailability, metabolism, and toxicity [1,2]. In order to improve drug delivery processes, pharmaceutical engineers have designed highly advanced and efficient vesicular carriers, which continue to evolve today as one of the best developments in pharmaceutical science [3,1]. Vesicular carriers refer to self-assembly of nanoscale structures comprising of amphiphiles such as phospholipids to form bilayers containing water or lipophilic drug molecules[4]. The invention of vesicular carriers began in the 1960s with the introduction of liposomes discovered by Bangham et al., providing new insights into the functioning of cell membranes[5,6]. The exponential increase in research activity concerning vesicular drug carriers is mainly driven by medical needs and clinical applications[7]. Such systems represent flexible platforms that can incorporate both hydrophilic, hydrophobic, and amphoteric drugs, thus making possible targeted delivery to particular tissues/organisms while minimizing system toxicity[1, 2]. Vesicular drug delivery systems have significant clinical relevance beyond mere innovation[8]. It was established that the use of such vesicles may result in increased efficacy, prolongation of action, decreased drug dosage requirements, as well as minimized side effects in comparison to traditional systems[8]. Vesicular systems may also be modified with targeting agents, stealth polymers, and trigger-sensitive elements allowing for targeted drug delivery[6,9]. The following review provides an overview of recent studies on vesicular drug delivery systems, including information about their structure and synthesis methods, benefits, limitations, clinical usage, as well as perspectives for further research.

Vesicular drug delivery systems: structural diversity and characterization

Liposomes

Liposomes form the archetype for vesicular drug carriers and comprise one or multiple concentric layers of phospholipids arranged as bilayers around an aqueous core [10, 11, 5]. Their dual hydrophobic-hydrophilic character allows for the incorporation of both water-soluble and lipid-soluble drugs in different compartments [12,11,5]. Structural modifications of liposomes include unilamellar vesicles, multilamellar vesicles, and multivesicular liposomes, each with specific size distributions and drug entrapment capabilities [10, 11]. The molecular composition and size of liposomes play significant roles in their distribution, targeting efficiency, and clinical effectiveness [5, 11, 13].

Niosomes

Niosomes constitute non-ionic surfactant vesicles and provide a novel option for drug delivery systems in comparison with conventional liposomes [14, 15]. This class of vesicles consists of non-ionic surfactants, cholesterol, and/or lipids forming bilayers similar to liposomes [15]. Vesicles formed using non-ionic surfactants demonstrate higher stability against physical and chemical stresses in contrast to liposomes, making them more suitable for topical and cosmetic preparations [17, 16, 14]. The structure of niosomes can be altered to modify their size, rigidity, and surface characteristics [18, 16, 15].

Transferosomes and Ethosomes

Transferosomes are highly deformable vesicles designed for improved transdermal delivery of pharmaceutical compounds by virtue of their high flexibility and deformability [19, 20]. The presence of edge activators (surfactants)

in transferosomes gives them high elasticity, allowing them to traverse intact skin without compromising drug activity [19, 20]. Ethosomes are vesicles made of lipids and 20-45% ethanol, which reduces lipid packing and enhances bilayer fluidity to improve skin permeation [21, 22]. The newly developed transethosomes are hybrids of transferosomes and ethosomes and incorporate surfactants for increased deformability alongside ethanol for enhanced skin permeation [23,18-20].

Cubosomes and Hexosomes

Cubosomes and hexosomes are more recent developments in the field of lipid nanoparticles with bicontinuous cubic and hexagonal crystalline arrangements, respectively [21,28-30]. Due to the unique geometries of their inner compartments, cubosomes and hexosomes are capable of carrying both hydrophilic and hydrophobic drugs [28-32]. The structures of cubosomes and hexosomes allow prolonged drug release and protect the entrapped drugs against degradation[21, 23].Cubosomes and hexosomes are ideal for protein delivery applications [28-30].

Phytosomes and Pharmacosomes

Phytosomes are innovative drug delivery systems that have been created particularly for herbal phytochemicals, which are formulated using phospholipids to increase their absorption and efficacy[33-37]. These systems compensate for the limited bioavailability characteristics of herbal remedies through the creation of stable complexes of phytochemicals and phospholipids [33,34,36,37]. Pharmacosomes can be considered as phospholipid complexes of pharmaceutical drugs aimed at improving their bioavailability, stability and efficacy [38- 40]. The two delivery systems utilize the benefits of vesicular systems in combination with specific pharmacological agents or plant extracts [38-41].

Ufasomes, Aquasomes, and Spanlastics

Ufasomes are lipidic vehicles based on unsaturated fatty acids characterized by the ability to facilitate penetration into the biological barrier[43-45]. Aquasomes are self-assembled nano-capsules that contain inorganic materials such as calcium phosphate with a carbohydrate core and an external layer made of lipids [45-49]. Such systems suit the delivery of proteins due to superior biocompatibility. Spanlastics arehighly deformable and flexible vesicles capable of facilitating penetration into different biological membranes[50-55].

Future perspectives & emerging challenges:

The future looks extremely bright for the vesicular drug delivery technology as several technological advances are currently being considered which will be able to eliminate current drawbacks as well as further enhance the clinical applications of vesicular systems [7, 6, 9]. The development of stimuli responsive vesicular systems will allow drugs to be released in response to stimuli like pH, temperature, magnetic field and ultrasound to provide greater spatial control over drug release dynamics [7, 6, 9, 57]. With the incorporation of targeting ligands, imaging probes and therapeutic cargoes, vesicles will act as theranostic platforms in the future[6, 9]. Novel technologies like microfluidics and self-assembly technologies are anticipated to provide solutions to several problems regarding manufacturing and large scale production of vesicles [7, 6, 9]. The development of biocompatible and biodegradable vesicles made from biopolymers and lipids will eliminate environmental and safety hazards posed by synthetic materials [6, 7]. Active targeting through the use of cell-penetrating peptides, antibodies, and aptamers will make future surface modification approaches highly targeted, thereby increasing therapeutic effectiveness and reducing adverse effects [6, 9]. Another promising area of research is the development of artificial intelligence algorithms to optimize vesicular formulations based on factors, including the design and structure of vesicles, the type of cargo, and surface modification etc **[7, 6, 9].** A combination approach involving the use of vesicular delivery in conjunction with other advanced drug delivery technologies like polymeric nanoparticles, inorganic carriers, and viral vectors will create synergistic platforms that will improve therapeutic outcomes[6, 9]**.** Finally, regulatory harmonization and standardization of testing methods will streamline the transition from lab to clinic[7, 5, 8]which may completely transform the paradigms of medical treatment in different disciplines [7, 6, 9].

CONCLUSION

Overall, vesicular delivery systems present an innovative approach in pharmaceutical science that shows promise in increasing the efficiency, bioavailability, and patient adherence to drug administration in various medical applications[1,2,5-7]. The versatility in vesicle carriers' structures, which include liposomes, niosomes, ethosomes, transferosomes, cubosomes, and novel systems, offers an extraordinary level of flexibility in developing rational drug delivery systems according to the demands of treatment[1,2,4,6,9]. Despite the existing drawbacks in current vesicular formulations, such as instability, biodistribution issues, and complexity in production, new advances in technology and regulation will eventually address these challenges [5, 8, 9, 58, 59]. The success of vesicles on the market, such as liposomal amphotericin B and liposomal doxorubicin, highlights the great promise and practicality of such systems, fueling further research in this area [15, 8, 11,60]. The development of nanotechnology, pharmaceutics, and computational chemistry led to a new generation of vesicles with advanced functional capabilities and ability to deliver drugs selectively [7, 6, 9] With evolving regulations and technological improvements, vesicles will become a preferred drug delivery system for proteins, peptides, immune system modulators, and cytotoxic chemotherapies[5-9, 58]. Future directions in vesicle-based drug delivery research point to breakthroughs in personalized medicine, theranostics, and precision medicine that will positively impact clinical practice [7, 6, 9].

Table 1. Comparative Overview of Vesicular Drug Delivery Systems Highlighting Their Structural Features, Advantages, Limitations, Applications

Vesicular systems	Unique Feature	Major Advantage	Minor Limitations	Applications	References
Liposomes	Bilayer vesicles encapsulating hydrophilic and lipophilic drugs	Excellent biocompatibility, reduced toxicity, targeted delivery	Drug leakage, phospholipid oxidation, hydrolysis, high production cost	Anticancer, antifungal, vaccine delivery	[5,6,60]
Niosomes	Surfactant-based alternative to liposomes	Better chemical stability, economical, controlled release	Aggregation, fusion, lower entrapment efficiency for some drugs	Topical, transdermal, anticancer delivery	[15,3,2]
Ethosomes	Ethanol-enhanced penetration	Excellent skin permeation and drug deposition	Possible skin irritation due to ethanol	Topical antifungal, antiviral, anti-inflammatory	[21,22]
Transferosomes	Ultra-deformable vesicles	Improved skin penetration, flexibility, bioavailability	Oxidative instability, expensive phospholipids	Transdermal delivery, Peptide delivery	[19,20,58]
Transethosomes	Combination of ethosomal and transferosomal technologies	Greater deformability and transdermal flux than ethosomes	Formulation complexity, irritation potential	Deep skin and systemic transdermal delivery	[23,24,62]
Cubosomes	Bicontinuous cubic liquid crystalline	High drug loading, sustained release, bioadhesion	Difficult manufacturing and scale up	Anticancer,antimicrobial, protein delivery	[27,28,29]
Hexosomes	Hexagonal internal structure	Superior structural stability and prolonged release	High viscosity, difficult processing	Controlled delivery of hydrophobic drugs	[32,30,29]
Phytosomes	Molecular complexation of herbal actives with phospholipids	Markedly improved bioavailability and membrane permeability of phytochemicals	Limited drug loading, costly phospholipids	Herbal therapeutics, hepatoprotective,anti inflammatory agents	[33,34,36,64]
Pharmacosomes	Covalent drug-lipid linkage	High drug loading, negligible leakage,predictable	Applicable only to drugs possessing active functional groups, complex synthesis	Poorly soluble drugs, NSAIDs, anticancer drugs	[38,39,40]
Ufasomes	Fatty-acid	Cost-effective,	pH-dependent	Topical anti-	[42,43,44]

	vesicular system	enhanced skin permeation, controlled release	instability and oxidative degradation	inflammatory and antifungal deliver	
Aquasomes	Preservation of molecular conformation	Excellent stabilization of proteins, peptides, vaccines and enzymes	Multi-step preparation, high cost, scale-up issues	Protein, peptide, enzyme and vaccine delivery	[45,46,47,48]
Spanlastics	Highly elastic surfactant vesicles	Higher deformability, permeation, storage stability than some elastic vesicles	Surfactant-related instability at high concentrations	Transdermal, ocular, antifungal and CNS delivery	[50,51,52,54]

ABSTRACT

In this paper, One modulo *N* mean labeling of cycles have been discused. The construction algorithm for one modulo *N* mean labeling of cycles C_{n+4}, C_{n-4} is presented Muthurama krishnan and Bhagyasri ([9]-[11]) introduced the concept of one modulo N mean labeling of graphs and properties of One Modulo N Mean Graphs.

keywords: mean labeling, one modulo three mean labeling, one modulo N mean labeling (OMNML), one modulo N mean graph(OMNMG)

INTRODUCTION

By a graph G = (V(G)), E(G)) with p vertices and q edges we mean a simple, connected and undirected graph. In this paper a brief summary of definitions and other information is given in order to maintain compactness. A graph labeling is an assignment of integers to the vertices or edges or both subject to certain conditions. Somasundaram and Ponraj [1] have introduced the notion of mean labeling of graphs. Swaminathan and Sekar [7] introduced the concept of one modulo three graceful labeling. Jayanthi and Maheswari [8] introduced one modulo three mean labeling. It is further studied by Gayathri and Prakash in ([4]-[6]). we Muthuramakrishnan and Bhagyasri ([9]-[11]) introduced the concept of one modulo N mean labeling of graphs and properties of One Modulo N Mean Graphs In this paper, we discuss the one modulo *N* mean labeling of cycles. Here we present the construction algorithm for one modulo *N* mean labeling of cycles C_{n+4}, C_{n-4} for any *N* and some*n*.

Main Results

Definition 1.1.

A graph $G = (p, q)$ is said to be one modulo three mean graph if there is a function f from the vertex set of G to the set {0, 1, 3, 4, 6, 7, …., $3q – 3$, $3q – 2$} with f is one-one and f induces a bijection f^* from the edge set of G to the set {1, 4, 7, 10, …, $3q – 5$, $3q – 2$}, where

$f^*(uv) = \left\lceil \frac{f(u)+f(v)}{2} \right\rceil$ and the function$f$ is called as one modulo three mean labeling. Here $f^*(uv) \equiv 1 \pmod 3$ for every edge uv in G and $\lceil \quad \rceil$ represents the ceil function.

Definition 1.2

A graph $G = (p, q)$ is said to be ***N* mean graph** if there is a function f fromthe vertex set of G to the set {0, 1, N, $N + 1$, $2N$, $2N + 1$,…., $N(q – 1)$, $N(q – 1) + 1$} with f is one-one and f induces a bijection f^* from the edge set of G to the set {1, $N + 1$, $2N + 1$, $3N + 1$, …, $N(q – 2) + 1$, $N(q – 1) + 1$} where $f^*(uv) = \left\lceil \frac{f(u)+f(v)}{2} \right\rceil$

and the function f is called as **one modulo *N* mean labeling of *G***, where N is any positive integer. Here, $f^*(uv) \equiv 1 \pmod N$ for every edge uv in G.

Example 1.1

The graph shown in Figure 1.1 is a one modulo 4 mean graph.

Theorem 1.1

One modulo N mean labeling of the cycle C_{n+4} can be constructed from the one modulo N mean labeling of the cycle C_n,$n \equiv 1 \pmod 4$ Theorem 2.10[10].

Proof

Given a one modulo N mean labeling of the cycle $C_n = u_1u_2….u_nu_1$.

We now construct one modulo N mean labeling of the cycle C_{n+4} by following the steps given below.

Step 1: Start with the one modulo N mean labeling of the cycle $C_n = u_1u_2u_3,…u_nu_1$

Step 2: Compute $\frac{N(y-1)}{2}$ corresponding to $y = n$ and $y = n + 4$. Let it be x_1 and x_2 respectively.

Step 3: Find a vertex in C_n with label $x_1 + 1$ (say u_i)

Step 4: Replace the edge $u_{i-1}u_i$ by $K_{1,2}$ with the apex vertex u.

Step 5: Assign the label x_1 to the apex vertex u.

Step 6: Find the vertex in C_n with label x_2 (say u_j)

Step 7: Remove the vertex u_j from C_n and join u_{j-1} and u_{j+1} by an edge.

Step 8: Replace the edge, u_nu_1 by $u_n\, y_1y_2\, y_3\, y_4\, u_1$ a path of length five.

Step 9: The resultant cycle is $u_1u_2…u_{i-1}uu_iu_{j-1}u_{j+1}u_{j+2}…u_ny_1y_2y_3y_4u_1$

Step 10: Assign the labels $N(q – 3)$, $N(q – 3) + 1$, $N(q – 1)$, $N(q – 1) + 1$ to the vertices y_1, y_2, y_3, y_4 respectively where q represents the number of edges in C_{n+4}.

Step 11: By renaming the cycle obtained in step 9 in the order v_1, v_2, …, v_{n+4}, we get cycle C_{n+4}.

Step 12: The labels obtained using the above procedure result in the one modulo N mean labeling of C_{n+4}.

Justification

- In step 1, the number of edges is n.
- In step 4, the number of edges removed is 1 and the number of edges added is 2.
- In step 7, the number of edges removed is 2 and the number of edges added is 1.
- In step 8, the number of edges removed is 1 and the number of edges added is 5.

- Hence the total number of edges removed is 4 and the total number of edges added is 8.
- So, the number of edges obtained in step 11 is $n + 4$ which represents C_{n+4}.
- The minimum value of the label added in step 10 is $Nq - 3N = Nn + N$ when $q = n + 4$.
- The value obtained for x_1 in step 2 is the value of x as noted in Theorem 2.11[9].
- The labels $N(q-3)$, $N(q-3)+1$, $N(q-1)$, $N(q-1)+1$ are all greater than $Nn - n + 1$.
- The modified labels along with the labels of C_n provides one modulo N mean labeling of C_{n+4}.

Illustration 1.2

We now construct the one modulo 4 mean labeling of C_9 from one modulo 4 mean labeling of C_5.

Step 1: Given one modulo 4 mean labeling of C_5 as in Figure 1.3

Step 2: Compute $x = \frac{N(y-1)}{2}$, corresponding to $y = 5$ and $y = 9$. $\therefore x_1 = 8$, $x_2 = 16$.

Step 3: The vertex with label $x_1 + 1 = 9$ in C_5 is u_3.

Step 4&5: The graph obtained in Step 5 by removing u_2u_3 and adding u_2uu_3 is shown in Figure 1.4 and assign the label x_1 to u.

Step 6: The vertex with label $x_2 = 16$ in C_5 is u_4.

Step 7: The graph obtained in step 7 by removing u_4 and adding an edge between u_3 and u_5 is shown in Figure 1.5.

Step 8&9: The graph obtained in step 8 by removing u_5u_1 and adding the path $u_5y_1y_2y_3y_4u_1$ is shown in Figure 1.6.

Step 10, 11 & 12: One modulo 4 mean labeling of C_9 is shown in Figure 1.7.

Theorem 1.3

One modulo N mean labeling of any cycle C_m, $m>n$, $m \equiv 1 \pmod 4$ can be constructed from one modulo N mean labeling of the cycle C_n, $n \equiv 1 \pmod 4$.

Proof

By applying Theorem 1.1 recursively, starting from cycle C_n, we get the one modulo N mean labeling of any cycle C_m, $m > 5$, $m \equiv 1 \pmod 4$.

Theorem 1.4

Given the one modulo N mean labeling of C_n, ($n \geq 9$). Then the one modulo N mean labeling of C_{n-4} can be constructed from C_n.

Proof

Given a one modulo N mean labeling of the cycle C_n, $n \geq 9$.

We now construct the one modulo N mean labeling of C_{n-4} by following the steps given below.

Step 1: Start with the one modulo N mean labeling of $C_n = u_1u_2 \ldots u_nu_1$.

Step 2: Compute $x = \frac{N(y-1)}{2}$ corresponding to $y = n$ and $y = n - 4$. Let it be x_1 and x_2 respectively.

Step 3: Find a vertex in C_n with label x_2 (say u_i).

Step 4: Remove the vertex $u_i$from C_n and join u_{i-1} and u_{i+1} by an edge ((i.e.) remove $K_{1,2}$ with apex u_i)

Step 5: Find a vertex in C_n with label x_1+1 (say u_j).

Step 6: Replace the edge u_ju_{j-1} by the star $K_{1,2}$ with the apex vertex u.

Step 7: Assign the label x_1 to the apex vertex u.

Step 8: Replace the path of length five between u_1 and u_{n-4} by an edge.

Step 9: The resultant cycle is $u_1u_2\ldots,u_{i-1}u_{i+1}uu_{i+2}u_{i+3}\ldots.u_{n-4}u_1$

Step 10: By removing the cycle obtained in step 9 in the order $v_1v_2 \ldots v_{n-4}$, we get the cycle C_{n+4}.

Step 11: The labels obtained using the above procedure result in the one modulo N mean labeling of C_{n-4}.

Justification

- In step 1, the number of edges is n.
- In step 4, the number of edges removed is 2 and the number of edges added is 1.
- In step 6, the number of edges removed is 1 and the number of edges added is 2.
- In step 8, the number of edges removed is 5 and the number of edges added is 1.
- So, the total number of edges removed is 8 and the total number of edges added is 4.
- Hence, the number of edges obtained is $n - 4$ which represents C_{n-4}.
- The modified labels along with the labels of C_n provides one modulo N mean labeling of C_{n-4}.

Illustration 1.5

We now construct the one modulo 5 mean labeling of C_{17} from one modulo 5 mean labeling of C_{21}.

Step 1: Given one modulo 5 mean labeling of C_{21} in Figure 1.8.

Step 2: Compute $x = \frac{N(y-1)}{2}$ corresponding to $y = 21$ and $y = 17$.

$\therefore x_1 = \frac{5(20)}{2} = 50, x_2 = \frac{5(16)}{2} = 40$.

Step 3: The vertex with label x_2 in C_{21} is u_9.

Step 4: The graph obtained in step 4 by removing u_9 from C_{21} and joining u_8 and u_{10} by an edge is shown in Figure 1.9.

Step 5: Thevertex in C_{21} with label $x_1 + 1 = 50 + 1 = 51$ is u_{11}.

Step 6&7: The graph obtained in Step 6 by removing $u_{10}u_{11}$ and adding $u_{10}uu_{11}$ is shown in Figure 1.10 and assign the label x_1 to u.

Step 8: Replace the path $u_{n-4} \ldots u_1$ of length 5 (i.e) $u_{17}u_{18}u_{19}u_{20}u_{21}u_1$ by an edge.

Step 9: The resultant cycle obtained in step 8 is shown in Figure 1.11.

Step 10 & 11: One modulo 5 mean labeling of C_{17} is shown in Figure 1.12.

Theorem 1.6

One modulo N mean labeling of C_n, $n<m$, $n \equiv 1 \pmod 4$ can be constructed from the given one modulo N mean labeling of C_m, $m \equiv 1 \pmod 4$.

Proof

Starting from C_m and by applying Theorem 1.4 recursively we can get the one modulo N mean labeling of the cycle C_n, $n<m$, $n \equiv 1 \pmod 4$.

ABSTRACT

The purpose of the review article is to bring the attention of the society towards political reservation of disabled in India. Being an intrinsic part of society that supports reservation through constitutional guarantee the absence of this weaker section in decision making process of world's largest democracy needs attention of the world at large. Reservation being a core theme of constitution mandates fix quotas based on caste to promote equality over different sections of society. This is a strong argument to support reservation for disabled citizens of the country. Being a member of UN convention for disabled through the ambit of Article 29 the nation should mandatory involve disabled citizens in legislative bodies. From job and employment reservation to inclusion of disabled through judicial decisionsand social scheme the eco-system for welfare of disabled in increasing but the stigma and lack of political willingness make their presence almost nil in political parties and legislative bodies. The present paper aims to compile the evidence that support the idea of disability reservation in India. The research domain is full of reservation and disabled themed work, but the current work aims to float the idea of disability reservation in parliament and state bodies. Purely doctrinal review of 46 studies is done to start the discussion with concrete justifiable reasons provided in the present research to think and act for new modifications in reservation policy of the country.

Keywords: Election, Legislature, Disability, Reservation, Quota, Constitution, Social Structure, Community, India

INTRODUCTION

For setting the tone for understanding the representation of disabled in Indian politics we need to analyse the meaning of democracy and representation in India. Democracy is called the most authentic form of people's representation where individuals from diverse backgrounds participate, contest and elect for deciding their fate and future. The focal point of democracy is the electoral system comprising of statutory framework, autonomous bodies, series of political parties and large mass of citizens giving real meaning to participatory democracy(1). India being the pioneer of democracy promises representation to 1.45 billion(2) population through the system of first past-the post system. A combination of democracy with representation makes representative democracy a raw reality giving EVMs as a weapon to public to demonstrate their rights by utilizing their voting powers. Democracy and representation in a combined manner assures vote, participation and saying of citizens in the country's political arena. The concept of representation being the core theme of Indian constitution promises weightage to the last man standing of the society. The best practices of robust statutory framework in the form of Representation of People's Act to a solid Election Commission and timely elections are the real hallmarks of India's positive political arrangements.

India's reservation policy is used as filler to correct the lacuna of inequalities in terms of caste that persisted in nation for past hundreds of years. The concept of equality in constitutional terms relates to upliftment of oppressed rather than giving a neutral eye to everyone (3).Ahead of representation in democracy is the integration of different sections and class of people to politics for voice by giving equal chance to elect and be elected. Political equality being the central theme to normative theories of democracy (4) demands representations from different classes. To promote equal status to different class the union and state governments join hands for providing reservation. The theme of representation of marginalized in political landscape at different levels makes Indian political arrangement a unique model for the world. The advocates of constitution promote reservation by the means of classification of seats in parliament, state assemblies and panchayat's/ municipalities through constitutional mandates. The country post-independence looked upon reservations as a constructive declaration allowing two categories of classification based on gender and caste empowering the union and states to work in consonance for marking and reserving seats at different facets of legislature. The presence of reserved seats in education and jobs for disabled is also a compulsory mandate but lack of political representation of roughly 2.21% population of country in world's largest democracy itself raises questions over real representation of under-privileged class of people (5).Despite a combination of independent body, legal mechanism and mainstreaming of different marginalized sections, India's quality matrix for democracy stands at a rank of 85th with a score of 0.564 as designated by University of Wurzburg(6). The corrupt practices, electoral failures, lack of political literacy and use of muscle power have already drawn attention of state, academicians, politics strategist and ECI as roadblocks attached to efficacious working of Indian democracy. However, an unseen flaw is low faithof marginalized sectionin electoral machinerydue to lack of provision for disabled in the country. The present work will search for gaps in representation of disabled people in Indian political eco-sytem with a focus to adapt reforms in electoral system for giving adequate representation to a large section of unrecognized people in country.

Disability in terms of political reservation holds no space in India's electoral framework though these especially abled are considered as a part of society with specific legislative and schemes working for their affirmative inclusion in normal course of nation's affairs. Evidence clearly demonstrates disabled as an oppressed class, socially excluded, politically under-represented and economically under-valued(7). India's statutory regulation in terms of the Rights of Persons with Disabilities Act RPwD Act, 2016 is a commitment by state to promise equality and inclusion of differently abled as per global standards of UN Convention on Rights of persons with disabilities(8). Practical studies over reservation of SC/ST's in electoral framework have yielded positive outcomes over policy execution and resources assignment to these classes for their betterment(9). Thus, political reservation of disabled is a must in today's time.

The soleobjectives of the present work areas follows;

1. To assess the need of political reservation in terms of seats in legislature for disabled communityofcountry.
2. To compile all the legal provisions that support political reservation for disabled in India.
3. To find world's response to political reservations of disabled community.

METHODOLOGY

The present study blends evidence provided through different research following the PRISMA principle.

Steps:

1. **Identification:**
   All the resources synthesized and supplied(n=87) were regarded as total universe of all the data and evidence available over the theme.
2. **Screening:**
   Diffferent sources were categorized for understanding the pertinence based on:

- disability rights
- political representation
- legislative framework
- reservation

3. **Eligibility:**
   The research works in direct consonance with at leastany one of the above-mentionedproportions have been duly included for the study.
4. **Inclusion:**
   A total of 51 sources could meetthe relevance factors based on their direct link with the disability, reservation and political landscape.

The current dataset was predetermined for understanding and learning, thus no external data was utilized in concluding the present work.

THE DISABILITY RIGHTS FRAMEWORK

From Welfare to Rights-Legislative Norms:

To empower and cater the needs of disabled people India has adopted a premier legislations fostering the requirements and safety of these Individuals as per international mandates.

UN Convention on the Rights of Persons with Disabilities

The UN holds a view that disability in not a medical condition but society's failure in terms of attitude and eco-system that restricts especially abled individuals from participation in mainstream society. Being the pioneer of human rights United nation considers disability as a human rightsconcern since its inception. The UDHR, ICCPR and ICESRC duly recognized equality and progressive principles for persons with disability. In 1950 ILO, UNICEF and WHO jointly worked together for setting standards for disabled people. UN in 1981 celebrated a dedicated year for spreading awareness of disability among member states followed by General assembly adopting World Programme of Action Concerning Disabled Persons in 1982 for promoting effective inclusion of disable in different opportunities. The 1990's witnessed five conferences at different locations namely Rio de Janeiro, Vienna, Cairo, Copenhagen and Beijing under the umbrella of "society for all' for insertion of disabled people in different spheres of life(10). With an obligation to promote universal human rights and fundamental freedoms without any discrimination under the ambit of Article 4 of Convention on the Rights of Persons with Disabilities (CRPD) United Nation adopted a specific framework after eight rounds of negotiation between 2002 to 2006 on 13thDecember 2006. The convention is currently ratified by 193 countries with its optional protocol being ratified by 108 nations. The sole purpose of convention is to

promote dignity, equality, non-discrimination, inclusion, accessibility and respect among all individual facing any form of disability. The convention works in diverse areas for participation of disabled in education, health, politics, employment, cultures and sports. A total of 50 articles works in consonance with each other through an elected committee of twelve members with convention locally implemented through compulsory formulation of specific local framework by member states.

RPwD Act, 2016

The act is a complete code developed on the lines of United Nation Convention on Right of persons with Disabilities to include, promote and enhance the disability population of the country. Adopted on December 27, 2016, the code is the most important legislation that caters to employment, education, security, health and social needs of people suffering from mental and physicaldisability. The enactment with a nation-wide binding promises equality, non-discrimination, safety, justice and dignity to large number of people facing hurdles in terms of locomotive disorders, mental ailment, visual impairment and epileptic. A close reading of the law through Section 11, 39 and 47 mandates accessible voting, disabled friendly infrastructure, awareness and sensitization programs in consultation with Chief commissioners and state commissioners of election commission.

From spectator to empowered- Structural Support

The fair implementation of these legislations' rests upon Department of Empowerment of Persons with Disabilities (Divyangjan). The department is subsidiary to Ministry of Social Justice and Empowerment with a union cabinet minister and MOS being the key decision makers of the working body. The department is a specialized wing to facilitate the person with disabilities. The department functions through series of secretaries, joint secretaries, deputy director generals, additional secretaries, undersecretaries and financial advisors. Mission and vision statement of the department furnishes the paramount role of the department to be well-being, growth, development, inclusion and protection of twenty-one class of disabled in the country. The DEPwD(D) is the sole authority of record-keeping of disabled data in the country that is successfully executed through UDID plan enrolling and giving unique card-based identity number to each specially abled for easy availability of government plans. In addition, the department has executed series of promising initiatives and campaigns in the direction of financial support, education, scholarships, vocational courses, mechanical equipment assistance and skill development shaping a brighter future of disabled people. The department has developed a two-dimensional approach in terms of infrastructure enhancement through establishment disabled friendly buildings and transportation in country along with creation of regional centres for catering the outreach requirements of disabled. Lastly the national institution framework functioning across nation for disabled along with spinal injury and cross disability centres making utmost efforts to provide rehabilitation, care and clinical services to disabled. All these measures by department of empowerment of persons with disabilities (divyangjan) in total govern the whole ecosystem for disabled in the country. The department each allocates a budget for efficient implementation of policies and schemes. The year 2025-2026 witnessed an annual estimation budget of 1275 crores for welfare of disabled in the nation(11). For yearly review and revision of all efforts annual meetings of DEPwD(D) are carried with publication of details over the website of body.

The legal and structural framework strongly supports disability rights declaring non-discrimination and equal treatment to people with disability in public life. The umbrella for this structure is CRPD working as genes to local regional framework across nations safeguarding rights of disabled people. Together the national and international establishes both duties and privileged for strengthening the status of persons with disability.

Reservation and Protective Discrimination

As per Indian Constitution "equality" is a corrective measure for dressing up the social defections existed in historical times(3). Legal researchers'comments reservation as a justifiable tool to boost equal status of those deprived based on backwardness.The Indian Constitution came up in 1950 forming the foundation for reservation for SC's and ST's seats in parliament and state assemblies. A challenge to the system of reservation through landmark case of State of Madras v. Champakam Dorairajan (1951) brought constitutional amendment introducing Article 15(4) allowing

state to formulate provisions related to backward community (12). The elections of 1951-52 witnessed first multi-member reserved seats under constituency system which was transformed into single member constituency in the year 1960 which is still present in India's electoral system. For backward class the year 1953 constituted first backward class commission popularly called as "kalekar Commission". The education reservation witnessed a massive rise in 1954 through educational institutions reserving seats for scheduled caste and scheduled tribes (13). During 1960's a new trend of reservation of cabinet position for SC community came up in Indian political scenario to attract community voters which is still followed at present times. The mandal era 1979-1990 through socially and educationally backward classes commission identified OBC's for reservation purposes of quota fixation in educational institutes and jobs The era also boosted the reservation of SC's and ST's in public sector. To put an upper limit to reservation of seats the Supreme court in Indra Sawhney v. Union of India (1992) fixed the cap of maximum of 50% ceiling of total seats to reserved categories. The constitutional 73rd and 74th constitutional amendment reserved 1/3 seats for women in local level elections. In 2009 the 93rd amendment extended the reservation policy of India till 2020. Through 103rd constitution the union government brough in EWS quota for economically deprived upper caste (14). India's reservation reflects thoughts of citizens of country to indulge the socially excluded countrymen in mainstream.

The central theme of Indian constitution is upliftment of oppressed however the disabled reservation in political arena is far from a distant reality. Despite being large in number and ill-treated by many there is no single seat reservation for differently abled in legislature. The nature and social structure of India promise reservation to different classes based on religion, caste, gender and financial status. From parliament to entrance exams and from jobs to admissions in educational institutes, the reservation for women, scheduled caste, scheduled tribes, other backwards classes and EWS have deeply rooted India's civic structure. In terms of political reservation for SC, ST and women, the Constitution of India guarantees 33% reservation (One Hundred and Twenty-Eighth Amendment) Bill, 2023(15) to Nari Shakti in Lok Sabha, Rajya Sabha and State Assembles followed by 87 for scheduled caste and 47 for schedule tribe in Lok Sabha respectively (16).For state elections the constitution allows reservation based on population of SC/ST community present in each state (17) with compulsory seats marked by ECI for contesting by individuals belonging to these communities.

PwD RESERVATION IN JOBS AND EDUCATION

The disability reservation in country is available in terms of jobs and education with complete silence over participation in decision making process of nation. After 75 years of independence the digital Sansad (Web portal of Indian Parliament) showcases no records over members with disabilities in the political arena. In terms of government jobs, a reservation is framed in line with Rights of Persons with Disabilities (RPwD) Act, 2016. The reservation is applicable over all government jobs in A, B, C and D category positionsfor disabled. For direct recruitment a 4 percent seats of all the jobs rolled out shall be marked for persons with disabilities. In these jobs a further sub- classification is made for persons with (a) blindness and low vision; (b) deaf and hard of hearing; (c) locomotor disability including cerebral palsy, leprosy cured, dwarfism, acid attack victims and muscular dystrophy; (d) autism, intellectual disability, specific learning disability and mental illness; (e) multiple disabilities from amongst persons under clauses (a) to (d) including deaf-blindness in the posts identified for each disabilities(18). For individual suffering from deformities among the reserved four percent, one percent shall be further reserved for the sub-classified impaired. In addition to direct recruitment for promotion in all the categories of government jobs a four percent cap will be reserved for disabled class. For promotion of education the Rights of Persons with Disabilities (RPwD) Act, 2016 mandates free education to children suffering from disability between age of six to eighteen years of age in school of choice. For higher educational institutes law directs all government and aided establishments to reserve five percent seats for benchmark disabled students along with an extra age relaxation for admissions(9) The educational and employment reservation are the core essentials granted by legislation along with some other benefits in terms of housing and agricultural land (5% reservation in allotment), development and poverty alleviation (5% reservation in distribution) and land acquisition for business and production purposes (5% reservation in designation). In a total the RPwD, 2016 through chapter VI makes all possible efforts to uplift the tyrannized disabled population of the country. Another chapter supporting disabled as provided under legislation is

chapter VII ensuring governments at both centre and state level to create awareness, develop disabled friendly roads, transportation and infrastructure, formulate audio-video media contents as per disabled requirements and lastly focus on consumer products to support the needs of specially impaired individuals.

ECI Initiatives For PwD

For political integrity and voter's participation the Election Commission of India has initiated two major landmarks steps namely- home voting for PwD in 2024 Lok Sabha polls and android based mobile PwD app. The first initiative helped 90 lakhs plus registered voters to vote in largest parliamentary polls of world while sitting in their home with engagement of polling staff aiding the disabled to cast vote. The best example came from Churu district in Rajasthan where eight members of family suffering from disability practised adult suffrage for strengthening democratic commitment enshrined by Indian Constitution(19). The second technology-based efforts PwD app acts as a medium of record submission, verification and correction of data in electoral roll for efficacious modification in election database and convenient facilities at polling stations. The outcome of app has been a total of 47,727 requests have been received by commission for marking of PwD voters with a total of 3,105,355 app user have viewed their PwD status(20).

The Greay Area

Despite forming a large mass of people having job and educational reservation along with series of helping aids for their participation in elections still their voice has a limited political saying. Their disability has turned out to be another ground of discrimination. The base of differentiation of disabled people is neither religious bound nor gender centric. Theirinequal treatment of disabled has crossed faith, colour, region and ethnicity in declaring such individuals as marginalized and oppressed souls in addition to their medical struggles. All this raises a serious question of self-doubts among disabled. The typical stereotyping nature of our society makes survival of those suffering from any disability miserable. The lack of awareness and empathy often acts a hurdle for disabled people. Another chain in the line is intersection of disabled citizens with those belonging to SC/ST and women community.
As of April 2026, **there are no political parties in India with reserved "disabled seats" or a mandated quota** for persons with disabilities (PwDs) in the Lok Sabha or state assemblies.

Key details regarding disability representation in Indian politics, based on recent data, include:

1. **Low Representation:** Despite constituting over 2.28% of the population (Census 2011), PwDs are largely absent from the Parliament. The Lok Sabha general elections in 2024 began with zero disabled representative among the 543 seats, reflecting a systemic failure of mainstream politics(21).
2. **Token Candidacy:** Mainstream parties only provide token candidacy. In the 2024 elections, Devendra Jhajharia was a notable candidate with a disability contesting from Rajasthan on a Bharatiya Janata Party (BJP) ticket(22), but such examples are rare.
3. **Lack of Internal Representation:** No major mainstream political party in India has a dedicated "disability cell" or official mechanisms to ensure ticket distribution to disabled individuals(23).

DISCUSSION

Martha Nussbaum holds a view "The capability approach is a sub-type of human right principles that works to include women, poor and disabled within its domain area. The approach works to co-relate people from different areas of education, health, political inclusion, participation and human integrity for establishing a nexus between different area of human capabilities to dodge the future challenges related to mankind. The work by eminent theorist makes justice not only in terms of law but also an equal participation in society by all irrespective of any differentiation based on feminine, age or disorders"(24). In Indian context individuals like Anita Ghai, the pioneer of disability studies in India have tried to cover the real sight of disabled throughout their life with sole purpose of providing political access to all in every sphere of common life(25).Despite disability a common medical ailment impacting large population still political theory is completely silent on their inclusion. Disability is considered as a

part of social model with notable luminaries like Hobbes, Locke, Rawls building personhood theories excluding disabled population. Barbara Arneil & Nancy J. Hirschmann in their work Disability and Political Theory: An Introduction emphasis on rethinking the foundation of political theory as disability is an unavoidable situation and any exclusion of this section effects the power structure of society(26). If we compare the co-relation between disability and different societal factors, we understand that education and health directly impact the conditions of disabled in country. A large mass of disabled is living below the poverty line(27). Despite statutory normsand progressive steps stilltheir condition is a serious concern in terms of social difficulties, persistent inequalities and differential treatment. This gap needs an attention by adopting advanced measures in terms of deployment of personnel in community-based rehabilitation centres, resource granting, vocational employments, health schemes and awareness creation(28). A society prospers based on the political willingness. Being an intrinsic part of society political inclusion of disabled from grassroots to parliamentary level should be initiated for a significant positive outlook to the needs and wants of disabled.

1. **Judicial Interpretations**: Indian courts have been a pioneer in promoting disability rights in the country. In past few years the courts through series of judicial pronouncements have tried to give a welfare lens to statutory provisions by giving widest interpretations to written rules. In previous and current year current year Hon'ble Supreme Court of India has made the following observations over disability rights:

I. Equality requires states to ensure PwD to participate in all spheres of life. Reasonable accommodation flows from Article 14, 16 and 21. Through the current judgement SC allowed a medical student with congenital absence of multiple fingers duly performing intubation and chest compression to pursue medical studies.
II. Digital access under Article 21 of the Constitutions completely bars digital divide. Disabled individuals encounter barrier in using technology. The court strict mandated different governmental bodies to make a compliance of Section 46 of RPwD Act, 2016 thereby making digital content, print media, KYC norms and electronic data disabled friendly especially visually impaired friendly.
III. The present times is the most suitable time frame to declare non-discrimination as provided under The RPwD Act, 2016 related to disability communityequivalent to fundamental right. No denial based on disability can be imposed on any individual from appearing in judicial services examination.

Recently the Chief Justice of Indian in a PIL matter over disabled representation in state bar councils commented over inclusion of such community in councils with a relaxed nomination fees for easy facility for specially abled advocates. The CJI further directed Bar Council of India to look for possibilities of reservation provisions in norms of elections of council to reserve seats for disabled people. Supreme Court's preview of disability is to include them in all spheres of life. From allowing them in judiciary to learn medical disabled individuals are coming to participate in different occupations, however complete absence in legislative arena is an eye catch social evil whichshould be

Judiciary + Medicine + Bar Council Election = Society

looked upon by Indian society.

Source: Author

2. **RPwD Act, 2016:** The current enactment with the backup of United Nations Convention on the Rights of Persons with Disabilities is brought in to promote full and effective participation of persons with disability in society as specified under clause (c) of legislation. A clear reading of definition clause under Section 2 (c) "barriers" the act includes the word "political" to highlight the same as a factorthat hampers the inclusion and participation of disabled people in the society. Ahead in the line are section 5 and Section 11 that promises disabled "right to live" in communityand"ECI mandate to ensure accessibility of electoral materials and polling stations to disabled community" respectively. For Section 21 the act lays down equal opportunity policy for disabled in all establishments. Section 24 guarantees "social security" to disabled people through adequate standard of living and independence in society.Lastly section 65 formulates central advisory committee to take initiatives in the

form of recommendation and development of national policies to guarantee full enjoyment of disabled citizens. A combined thread of all the provisions of statutes makes a clear understanding of inclusion of disabled incommunity at large which also includes their political participation. Their exclusion from political landscape of legislature needs redressal for achieving the sole purpose of the statute.

3. **UN Convention on the Rights of Persons with Disabilities:** To promote respect for disabled the convention cover health, education, freedoms, liberty, accessibility, leisure, employmentand rehabilitation disabled community. A deep reading of regulation makes us learn about Article 29 specifically dealing with participation of disabled in political life. The specific rule mandates state parties to guarantee political rights including right to vote and be elected. The provision gives equal participation to disabled to stand in elections as available to other communities(29).To supplement this, the General Comment No.7 on Article 4.3 and 33.3 draws special attention through point 88 by making it extremely important for disabled to be elected and to act as representatives for promising efficacious implementation of convention and for deciding over political agendas attached to convention in specific state parties(30). The Article and General Comment in a combined manner reads for inclusion of disabled in political parties and at political fronts for participation in decision making processes. India'sstand over political participation was criticized in 2019 through Concluding observation of UN Committee on First Country Report of India via paragraph 60 and 61. As per paragraph 60 the country lacks constitution provisions that support political participation of disabled. As a suggestion under paragraph 61 committee suggested over amendment to constitutional provisions to including disabledin decision making processes at different levels guaranteeing them political life (31).

Section 2(C), 5, 11, 21, 24, 65 RPwD Act +Article 29CRPD =Political Inclusion
Source: Author

4. **Electoral Quota and upliftment statistics:**Political reservation was looked upon as a positive initiative in 1950 to provide reserved seats for adequate representation of oppressed class (9). The concept of reservation in legislaturewas to ensure political voice of marginalized classes (32). The real thought process in enabling SC reservation was that people of same community could serve the needs of class in a better manner then other who were of outside ethnic group. The representation has a direct link with the political willingness to initiate welfare scheme and enforcement of affirmative steps.The best example of political willingness in India is evident from the following figures:

I. Ayushman Bharat Yojna the world's largest health care scheme initiated in 2018 has covered 42 crorespeople by issuing of Ayushman cards till 2025 with 86 lakhs senior citizens part of the initiative(33).

II. PM Jan Dhan yojana launched in 2014 holds 56.16 crores account with 2.67 crores deposit in 2025 as compared to 2015 with merely 14.72 crores holding ₹15,670 croreof funds. Out of 56.16 crores rural areas hold 67% share with urban areas covering 33% share. The most interesting figures issued in 2025 related to banking scheme was women account holders under the scheme amounting to 56% of the total accounts(34).

III. The UNDP press release in 2025 showcased India'sincrease in human index value in terms of life expectancy from 58.6 years in 1990 to 72 years 2023 with a whopping jump of 53 % increase(35).

Thus, connecting dots showcase political willingness to formulate policy with strict implementation leads to benefits to large masses.

Furthermore, to learn the direct impact of political willingness over marginalized sections an analysis of 2024-2025 parliamentary sessions needs to be considered. For this reason, a comparison of number of Scheduled caste/ Scheduled tribe related bills and disability related bills needs to be analysed. In the year 2024, 16 bills were passed by both the houses Lok Sabhaand Rajya Sabha. Out of these four bills belonged to the SC/ST community namely "The Constitution (Scheduled Tribes) Order (Amendment) Bill, 2024, The Constitution (Scheduled Castes and

Scheduled Tribes) Order (Amendment) Bill, 2024, The Constitution (Jammu and Kashmir) Scheduled Castes Order (Amendment) Bill, 2024 and The Constitution (Jammu and Kashmir) Scheduled Tribes Order (Amendment) Bill, 2024"(36). During this session no information over disability bill or amendment was found in any source. Same pattern was visible in 2025 with passing of 39 bills,one bill"The Readjustment of Representation of Scheduled Tribes in Assembly Constituencies of the State of Goa Bill, 2025" related to scheduled tribe was duly passed however no bill related to disability was cleared by houses. Another important picture in 2025 that shocked the entire disability community was comment of parliament committee over under-utilization of funds and reduced target by DEPwD in the year 2025-26(37).

A reasonable understanding of nexus of welfare measures and political presence leading to political willingness is undeniable in this flow. With more presence the willingness develops which leads to better reforms and upliftment of weaker.

Political Willingness +Political Presence = Social Upliftment
Source: Author

Another point of note here is of social view of disabled community in society. The SC/ST through education and job reservations are flourishing. This is evident from latest Annual Report stating for Union Public Service Commission posts out of 707 posts of SC/ST and OBC a total of 606 were duly filled however in comparison to disability reserved seats of 66 were only filled by 31 candidates. As per records of report of 80 ministries/ department a total of 3252152 employees in A, B, C and D categories work with SC/ST or OBC reservation. However, only 27693 disable workforce are present in same categories and under same ministries/ department. All the marginalized categories have reservation, but the outcome of reservation is entirely different. The real cause of this is adaptability of disabled in our system. The disable is looked upon as inferior in comparison to other marginalized groups. The prejudice and discriminatory attitude towards disabled is the real reason of their status(38). For the reference of representation of persons with disability in government employment and education, series of RTI's were filed giving a lamentable result. Through RTI (DOP&T/R/T/22/03564 and DOP&T/R/T/22/03826) filed to Department of Personnel and Training and RTI (UGCOM/R/T/22/02970 and UGCOM/R/E/23/06082) made to UGC respectively the outcome was mere presence of 1.17 percent in 77 ministries with only 0.6 percent to 0.9 percent range in group A officers, 0 .8 percent to 1 .45 percent range in group B, 0.6 percent to 1.1 percent range for group C workers and mere 4041 out of total 2,91,269 students spread across 45 central universities making the engagement ratio at just 1.39percent. The low percentage presence of disability in different facets of life is an alarming signal related to their involvement in society(39). The social lacunae are the real reason of this shortage. The flow chart of lack of fulfilment of reserved seats speaks volumes about stigma carried by disabled people in the Indian society.

The whole discusses establishes a direct claim that political absence is a major cause of suppression of disabled. Political parties never see disabled as a vote bank or a class who can give them advantage. Thus, no major political parties include them. They are looked upon from a demeaning perspective. The disabled lack the self-confidence because of the social image in minds of those who are "normal" as the society calls themselves. Intersection between Indian laws, international framework, judicial decisions and reservation policy calls for upliftment of their status to which political inclusion can be an answer.

Limitation: The two limitations attached to the present work are as follows:
1. For review purpose, only the Central, Union and National legislation are considered.
2. The Indian data over disability is limited and historical in nature.

International Models
An analysis of world politics gives an utter surprise with African nations constitutionally recognising disability reservation. The west is far from this inclusion, though the nations like Uganda, Egypt, Kenya, Rwanda, and

Zimbabwe holds low democratic cultures(6) yet they have specific mandates for disabled people's representation in political arena. This constitutional reforms of these five countries relies over descriptive representation to include disabled in their legislative bodies.

A comparative study of these nations is unique within self as all the countries give disability reservationthough their manner of rolling out is entirely different from each other.

1. **Uganda:** The constitution of nation establishes a unicameral legislature duly recognizing the inclusion of marginalized sections within legislative frameworks(40). The nation reserves five seats out of total of 458 seats in parliament for disabled people with further sub-reservation of one seat for women having disability from among the five reserved seats(41). A national electoral college of persons with disabilities, with five representatives from each electoral district, selects those who will occupy the five reserved seats in parliament. Furthermore, every village, parish, sub-county, and district council must include at least one man and one woman with a disability (42).
2. **Rwandan and Zimbabwean**: Both nations follow bicameralism with Rwanda securing one seat Chamber of Deputies (43) and Zimbabwe reserving two reserved seats in Senate (44). Both the seats are chosen from amongst the people of disabled community from records of roll as similar to Uganda.
3. **Kenya:** In whole world Kenya is said to have the most extended and progressive constitutional mandates for disabled community in the world. At present the nation implements the principle of five percent representation of PwD in elected bodies of the state. In addition to these two senatorial members should belong to disability community with one each being male and female (45). Lastly for each County Assembly two seats shall be reserved for two seats (46).
4. **Egypt:** holds a unique model for inclusion of disabled people in political landscape. In house of representative out of 596 members 120 are chosen from list as provided by political parties. The statutory mandate to this list involves one to a maximum of three members of disability community in each list of political parties(47). This number reflection comes as eight in number. Thus, the nation gives due recognition to the disabled population of the country.

Each nation above mentioned has created a robust eco-system to include disabled in mainstream politics. This a remarkable achievement on the part of countries to think and rationally execute disability reservation in legislative bodies. Representation must embrace the diversity inherent among persons with disabilities, recognizing that disability encompasses a range of sub-group(40). The descriptive representation of oppressed has been duly prioritized by these nations ahead of many developed countries. The model of these nations is a classic example for many to adopt the system of disability reservation. Upholding the group rights over individuals and respecting the African Charter on Human and Peoples' Rights and its Protocol on the Rights of Persons with Disabilities the five states have developed local legal framework promoting social status of disabled community.

CONCLUSION

By learning the statutory norms, international arrangements and conditions of disabled community political inclusion through reservation seems to be an affirmative step for giving them an identity and voice in the society. The critical question in the present research that opens a question that reservation for marginalized is available under equality principle. The reservation in jobs and employment is available to all SC/ST and disabled. However, political reservations in parliament and state assemblies are only available to scheduled caste and tribe with complete absence for disabled. The inequality within reservation policy has no justification or answer. Social stigma, lack of political willingness, low vote bank many reasons can be added however the basic nature of reservation as enshrined by constitution gets defected by all such defenses. Progressive lessons from different African nations can by learnt for giving constitutional validity to the political reservation of disabled community. The statistical data as issued by Government of India, indexed research articles, RTI and election related statutory norms were thoroughly studies in

a combined manner to give the output over disability reservation in India's political arena. To suggest few actions the state can take-up includes:

1. Compulsory reserved seats as per constitutional amendment in Lok Sabha and a nominated seat in Rajya Sabha.
2. Election Commission can direct political parties to include disabled people in organisational structures for better visibility and inclusion in political landscape.
3. Awareness programmes for specially abled can be conducted by NGO's for developing political awakening among community.

The present work has the sole purpose to sow the seeds for awareness over inclusion of disabled people in political framework of world's largest democracy. Research wishes to contribute to the lives of disabled by removing stereotypes attached with disabled people. The current work is only an initial step for reaching a far distant reality of proportionate representation of disable as per population in decision- making process of country.

ABSTRACT

This paper describes advanced methods for finding a verified global optimum solution of a system of linear programming problem bundled with every copy of Microsoft Excel and Microsoft Office shipped during the last eight years as implemented in the premium solver platform. The Microsoft Excel Solver introduced in February 1991 has now become the most widely distributed and widely applied optimization modelling, breaking even complex procedures into a simple one with fast computation of optimization. The reasons to use Excel for optimization is mainly due to the availability of Excel in any windows platform without any additional cost and the flexibility in the transfer of data. This paper introduces and describes the method of using the Microsoft Excel Solver to find the optimal solution of some Linear Programming problems

Keywords: Operations Research, Linear Programming, Excel Solver, Optimization

INTRODUCTION

Linear Programming is one of the most important techniques in Operations Research used for solving optimization problems. Linear Programming problems were solved by using the Microsoft Excel Solver tool. Excel Solver provides an efficient and user-friendly method for obtaining optimal solutions to complex mathematical problems. Excel Solver provides a simple, yet effective, medium for allowing users to explore linear programming problems. It can be used for large problems containing hundreds of variables and constraints, and does these relatively quickly, but as a teaching tool using small illustrative problems it is very potent, particularly as the user must appreciate the structure

of a LP when entering it into the spreadsheet.On the downside, one can't view the Tableau as it is generated at each iteration and so those users who want to be proficient in the manual methods of LP would find Solver less superior to allow this. It does, however, produce a superior set of results and sensitivity reports when compared to Simplex method, and, due to the spreadsheet nature, does allow the student very quickly to observe the effects of any changes made to constraints or the objective function. This paper deals with solving Linear Programming problems by using the Microsoft Excel Solver tool with an algorithmic approach.

Initialization of Excel Solver for Linear Programming

The use of Excel Solver for analysis of operations research problems is important and useful in present day technological world. It is difficult to solve linear programming problems using the manual method in organizations that solve problems with over fifty variables. A work that can take days or weeks to solve could be done in a matter of seconds using Excel Solver. Excel Solver has proven to be relevant in other disciplines such as finance, production management, etc. The following is a step-by-step procedure to follow in the installation and use of Excel Solver for solving linear programming problems.

Launch Microsoft Excel.

a) Go to “File” click on it and select “Options” .
b) A dialog box will be displayed. Select “Add-Ins” .
c) Choose “Excel Solver” and click “Go” and “OK” .
d) Choose “Solver Add-in” click “Ok’’.
e) Close and re-launch Microsoft Excel. Select the “Data” column. You can see “Solver” being displayed .

Practical Optimization of Linear Programming Problem Using Excel Solver

Algorithm:

Step 1: User has to familiarize his/herself with the LP data set.
Step 2: Set up the optimization model (Model Construction)
Step 3: Setting up Excel Solver to solve LPPby the following sub steps:

1. Open a new Excel spreadsheet and name it to “Name of the Problem”.
2. Lay out the problem data in Excel spreadsheet as follows:
3. Type the formula ; F4 = SUMPRODUCT ($B$2:$C$3: ....:$E$2;B4:C4: ... :E4) and pull-down it to cells F6:F10.
4. Next, invoke the Excel Solver. To do this select Solver from the Tools pull-down menu. (If Solver is not on the Tools menu, it will be necessary to install this add-in using the Add-Ins option on the Tools pull down menu). In the Solver Dialog box, specify the following ;
   Target Cell: F4
   Constraints: F6:F10 <=, =, or >= H6:H10
   Changing Cells: $B$2:$C$3: ....:$E$2
   Equal To: Max or Min
5. While still in the Solver dialog box, click Options and set the following options ;
   Assume Linear Model: On
   Assume Nonnegative: On
   This tells Solver that your model is linear in variables and the choice variables are all nonnegative, and then click OK.
6. While still in Solver, click Solve. This should return a dialog box with the notice: “Solver found solution”. If not, you have an error somewhere, so go back and re-check all of the steps.
7. While still in the solver, click “Answer, Sensitivity, Limits” or " Each you need" under “Reports” and click OK. This should produce the following output under your worksheet entitled " Answer Report ", " Sensitivity Report ", " Limits Report

Linear Programming Problems

The following linear programming problem describes the method of using the Excel Solver in optimization.
Problem1: Maximizing Profit

Step 1: Familiarizing with the data set:
The problem requirementis to formulate an Linear Programming model to determine how much of each type of pipe should be produced to maximize profit.

Step 2: Set up the optimization model (Model Construction):
Decision Variables:
P1= No. of pipe 1 to be produced
P2= No. of pipe 2 to be produced
Objective Function:
MAX Z= 34 P1 + 40 P2
Subject to Model Constraints:
4 P1 + 6 P2 ≤ 48 Extrusion hours
2 P1 + 2 P2 ≤ 18 Packaging hours
2 P1 + 1 P2 ≤ 16 Additive supply
P1 , P2 ≥ 0 Non-negativity

Step 3: Setting up Excel Solver to solve linear programming problem

- Solver is an add-in to Excel
- Not automatically ready,
- To get solver ready
  - (In Excel points to → *Tools* → *Add Ins* then Scroll down to *Solver Add In* → Check the box → Click on *OK* as shown figure 1)
- Setup the spreadsheet;
  - TYPE data in one place (as shown in figure 1);
  - CREATE in D4 Cell the function =SUMPRODUCT(B4:C4,B2:C2) (as shown in figure 2);
  - CREATE in D5 Cell the function: =SUMPRODUCT(B5:C5,$B$2:$C$2)
  - Pull- Down D5 Function to The cells D5 to D7 (as shown in figure 3)
  - OPEN Solver box with *Tools* → Solver
  - CREATE Cells for decisions variables and formulas to calculate LHS of constraints .
  - CLICK *OK* then *Solve* to get the optimal solution.
  - Now solver found the optimal solution, click on all reports to keep the solution .
  - Click on *OK* to get the optimal solution.
  - All reports can be found . Compare SOLVER solution with Graphical and SIMPLEX solutions.

Minimizing Problem

Consider the following problem:
Minimize Z= 0.6 X1 + 0.5 X2
S.T20 X1 + 50 X2 ≥ 100
25 X1 + 25 X2 ≥ 100
50 X1 + 10 X2 ≥ 100
X1 , X2 ≥ 0
By applying the solution steps by the Excel Solver that were applied in the first problem, with changing the inequality symbols to (>=), it has to be begun with the following spreadsheet of the problem.

Artificial Starting Solution Problem

Consider the following problem

Minimize $Z= 4 X_1 + X_2$
S.T. $3 X_1 + X_2 = 3$
$4 X_1 + 3 X_2 \geq 6$
$X_1 + 2 X_2 \leq 4$
$X_1 , X_2 \geq 0$

By applying the solution steps by the Excel Solver that were applied in the first problem, with adding each constraint and its inequality symbol of (=,>=,<=) at a time individually by using *Add* in figure 6, it has to be begun with the following spreadsheet of the problem

CONCLUSION

It is indeed apt to say that the Excel Solver can easily handle both maximization and minimization problems. It reduces the complexity of manual calculations and provides accurate results within a very short period of time. In addition, Excel Solver also generates useful reports such as Answer Report, Sensitivity Report, and Limits Report which help in decision making. Excel Solver is a powerful tool for solving real world optimization problems in business, production management, finance, and other fields. Therefore, Excel Solver can be considered as a practical and effective tool for solving Linear Programming problems. Also more complex optimization problems with large datasets can be analyzed using advanced Solver tools and Integration of Excel Solver with programming languages such as VBA can improve automation. As a future scope the techniques adopted in this work can be applied to real world business problems such as production planning, resource allocation, logistics, economics and Engineering fields.

ABSTRACT

This paper proposes study of the connectivity criteria of undirected simple graphs. Given the number of vertices 'V', one should be able to introduce connectivity between any two vertices by means of an edge. 'Simple graph' is the one where pairs of vertices are connected just by one edge. If any pair of vertices has more than one edge, then it is called 'multi graph'. Only undirected simple graphs are the focus of this study. Simply put, multi graphs are extensions of simple graphs. One can create theoretically endless multi graphs, of which the number of simple graphs would be finite, given a finite number of vertices. On the other hand, the number of simple graphs created would likewise grow exponentially as the number of vertices rose. For instance, two graphs could be created for a single vertex. Four graphs can be created using two vertices. It is possible to create 50 graphs with three vertices. One can create 946 graphs with four vertices. 31,714 graphs may be made with five vertices. From six vertices, 2,064,322 graphs can be created. As number of vertices tends to infinity, potentially infinite simple graphs could be constructed which amounts to what we call as "Graph Space". All kinds of graphs are sub spaces of Graph Space, which is closed under all types of graph theoretic operations.

Keywords: Graph Space (G_∞), G_∞ Structures, Graph Combinatorial Structures (GCS), G_∞ variations, G_∞ similarity

INTRODUCTION

Initially, graphs were employed to answer amusing puzzles using only mathematics. The Königsberg Bridge Problem was one such issue. In what is now Kaliningrad, Russia, the historic city of Königsberg, Prussia, consists of

four land masses divided by water and connected by seven bridges. "Is it possible to traverse all seven bridges without using the same bridge twice?" was the question posed. Locals would think about this entertaining question and jokingly attempt to solve it by selecting different routes throughout the city. However, Leonhard Euler arrived at an abstract solution in 1735. By doing this, he established the discipline of graph theory. Euler came to the conclusion in his answer that each landmass could be represented by a single point known as a vertex since the characteristics of the land masses were meaningless. In essence, Euler reduced the problem to simply following paths between vertices and the edges (the bridges) that connect these vertices. Euler proved that, for any connected graph, to be able to traverse every edge exactly once, every vertex (with the possible exception of the starting and ending vertices) must have even degree (even number of edges connected to that one vertex). Every vertex in the Konigsberg Bridge problem graph model has an odd degree. Euler came to the conclusion that there was no way to solve the Königsberg Bridge Problem. There have been numerous developments in the fields of topology and graph theory since 1735. Social Network Analysis (SNA), which is the study of social networks, their structure, and how understanding this structure can lead to a better understanding of behavior within social networks, is likely the most well-known application of graph theory. Naturally, "Facebook" is the most popular social network. Facebook offers a number of free tools that let users examine the structure of their own social networks and identify trends in their friend list.

Graphs are used to predict interests of people within a social network. Based on these predictions, companies customize advertisements and present to their customers through their Facebook or Twitter feeds. 'Path Optimization and Logistics' is another application where graphs are used extensively. Assume an airline operate their planes flying between certain cities. When scheduling the flights, three requirements are set: (i) the fewest layovers, (ii) the lowest cost, and (iii) the earliest arrival time. Cities are now represented by nodes, and flights between cities are represented by edges. Finding the most effective route based on which of the three requirements is met is all that is required to solve this challenge. Dykstra's algorithm provides a fairly simple answer to this problem. Since networking employs graphs to depict any computer network's topology, computer networks are likely the easiest item to depict as a graph. Fig. 2 shows a graph with nodes consisting of all the physical connections within a network (computers, routers, hubs, switches, bridges, etc.) and the edges in the network will be the actual connections (wireless or hardwired). In other words, Fig. 2 shows a computer network which could be modelled as a graph. Having a simple weighted network graph (weights on edges representing load capacities), we can determine if there are vulnerabilities within a network. Almost countless theorems and lemmas have been formulated since 1735. Some of the most significant theorems often used in graph theory are: 2-factor theorem, Alspach's conjecture, Balinski's theorem, Berge's theorem, BEST theorem, Brooks' theorem, Cederbaum's maximum flow theorem, Circle packing theorem, De Bruijn–Erdős theorem, Burr–Erdős conjecture, Erdős–Gallai theorem, Erdős–Pósa theorem, Erdős–Stone theorem, Even circuit theorem, Fáry's theorem, Five color theorem, Fleischner's theorem, Four color theorem, Frucht's theorem, Fulkerson–Chen–Anstee theorem, Gale–Ryser theorem, Gallai–Hasse–Roy–Vitaver theorem, Geiringer–Laman theorem, Graph structure theorem, Grinberg's theorem, Grötzsch's theorem, Hall-type theorems for hypergraphs, Hall's marriage theorem, Heawood conjecture, Kirchhoff's theorem, Kotzig's theorem, Kuratowski's theorem, Markov theorem, Max-flow min-cut theorem, Menger's theorem, Ore's theorem, Perfect graph theorem, Petersen's theorem, Planar separator theorem, Ramsey's theorem, Road coloring theorem, Robbins' theorem, Robertson–Seymour theorem, Schnyder's theorem, Sims conjecture, Steinitz's theorem, Strong perfect graph theorem, Symmetric hypergraph theorem, Turán's theorem, Tutte theorem, Veblen's theorem, Vizing's theorem, and Wagner's theorem. In spite of so much of work carried out in graph theory, it is hardly found in the literature, any 'combinatorial theorem' that stipulates maximum number of graphs that could be constructed using a finite number of vertices. On the other hand, problems have been modelled as graphs and solutions found using such theorems. This has been considered as a motivating factor for research carried out and results reported in this paper.

Combinatorial Analysis of Graphs

An edge is formed between two vertices. A direct edge is an edge formed between two vertices without any intermediary vertex. A graph consisting only of direct edges is called a 'simple graph'. Else it is known as a 'random

graph'. Here we are concerned only with simple graphs and devise a method of constructing all possible simple graphs using a given number of vertices. Self-loops are permitted in this formulation.

1-vertex graph space

A total of 2 graphs have been constructed using a single labelled vertex 1. (NOTE: $2^1 = 2$)

2-vertex graph space

In a 2-vertex graph, one can construct just ${}^2C_2 = 1$ edge graph only. In a 2-vertex graph one can have the combinations of one self-loop at a time, two self-loops at a time amounts to ${}^2C_1 + {}^2C_2 = 2+1 = 3$ self-loops. This means three self-loops graphs. For every self-loop, one can have 1 graph. This means one can construct 3x1 = 3 graphs. One can have just one graph consisting of two vertices with no edges. So, one can construct 1+3+3+1 = 8 graphs from two vertices. This is called as 2-vertex graph space. (NOTE: $2^3 = 8$) A total of 8 graphs have been constructed using two labelled vertices 1 and 2.

3-vertex graph space

Let us consider a case study of three vertices 1, 2 and 3 belonging to the set of vertices V. One can build a set of 64 graphs using these three vertices. Let us denote an edge by, say, {1,2} where 1 and 2 are vertices. Self-loops are also considered here. In a 3-vertex graph, m = 3, which means that one can construct ${}^3C_2 = 3$ maximum number of edges. The combinatorics of 3 edges having one edge at a time, two edges at a time, and so on up to 3 edges at a time amounts to ${}^3C_1 + {}^3C_2 + {}^3C_3 = 3+3+1 = 7$ edge graphs. In a 3-vertex graph one can have the combinations of one self-loop at a time, two self-loops at a time and three self-loops at a time, which amounts to ${}^3C_1 + {}^3C_2 + {}^3C_3 = 3+3+1 = 7$ self-loops. For every self-loop, one can associate 7 edge graphs. This means one can construct 7x7 = 49 graphs apart from 7 self-loops graphs and 7 edge graphs. This amounts to saying that one can construct 49+7+7 = 63 graphs using three vertices. One can also have just one graph consisting of three vertices but with no edges. So, one can construct a total of 63+1 = 64 graphs from three labelled vertices and this is called as 3-vertex graph space. (NOTE: $2^6 = 64$). All the 64 graphs are listed below.

4-vertex graph space

Let us consider a case study of four vertices 1, 2, 3 and 4 belonging to the set of vertices V. One can build a set of 1024 graphs using these four vertices. Let us denote an edge by, say, {1,2} where 1 and 2 are vertices. Self-loops are also considered here. In a 4-vertex graph, m = 6, which means that one can construct ${}^4C_2 = 6$ maximum number of edges. The combinatorics of 6 edges having one edge at a time, two edges at a time, and so on up to 6 edges at a time amounts to ${}^6C_1 + {}^6C_2 + {}^6C_3 + {}^6C_4 + {}^6C_5 + {}^6C_6 = 6+15+20+15+6+1 = 63$ edge graphs. In a 4-vertex graph one can have the combinations of one self-loop at a time, two self-loops at a time and so on up to 4 self-loops at a time, which amounts to ${}^4C_1 + {}^4C_2 + {}^4C_3\ {}^4C_4 = 4+6+4+1 = 15$ self-loops. For every self-loop, one can associate 63 edge graphs. This means one can construct 15x63 = 945 graphs with self-loops, apart from 15 self-loops graphs and 63 edge graphs without self-loops. This amounts to saying that one can construct 945+63+15 = 1023 graphs using four vertices. One can also have just one graph consisting of four vertices but with no edges. So, one can construct a total of 1023+1 = 1024 graphs from four labelled vertices. This is called as 4-vertex graph space. (NOTE: $2^{10} = 1024$)

5-vertex graph space

Let us consider a case study of five vertices 1, 2, 3, 4 and 5 belonging to the set of vertices V. One can build a set of 32,768 graphs using these five vertices. Let us denote an edge by, say, {1,2} where 1 and 2 are vertices. Self-loops are also considered here. In a 5-vertex graph, m = 10, which means that one can construct ${}^5C_2 = 10$ maximum number of edges. The combinatorics of 10 edges having one edge at a time, two edges at a time, and so on up to 10 edges at a time amounts to ${}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4 + {}^{10}C_5 + {}^{10}C_6 + {}^{10}C_7 + {}^{10}C_8 + {}^{10}C_9 + {}^{10}C_{10} = 10+45+120+210+252+210+120+45+10+1 = 1023$ edge graphs. In a 5-vertex graph one can have the combinations of one self-loop at a time, two self-loops at a time and so on up to 5 self-loops at a time, which amounts to ${}^5C_1 + {}^5C_2 + {}^5C_3 + {}^5C_4 + {}^5C_5 = 5+10+10+5+1 = 31$ self-loops. For every self-loop, one can associate 1023 edge graphs. This means one can construct 31x1023 = 31,713 graphs apart from 31 self-loops graphs and 1023 edge graphs. This amounts to saying that one can construct 31,713+1023+31 = 32,767 graphs

using five vertices. One can also have just one graph consisting of three vertices but with no edges. So, one can construct a total of 32,767 +1 = 32,768 graphs from five labelled vertices. This is called as 5-vertex graph space. (NOTE: $2^{15} = 32,768$)

6-vertex graph space

Let us consider a case study of six vertices 1, 2, 3, 4, 5 and 6 belonging to the set of vertices V. One can build a set of 2,097,152 graphs using these six vertices. Let us denote an edge by, say, {1,2} where 1 and 2 are vertices. Self-loops are also considered here. In a 6-vertex graph, m = 15, which means that one can construct ${}^{6}C_2 = 15$ maximum number of edges. The combinatorics of 15 edges having one edge at a time, two edges at a time, and so on up to 15 edges at a time amounts to ${}^{15}C_1+{}^{15}C_2+{}^{15}C_3+{}^{15}C_4+{}^{15}C_5+{}^{15}C_6+{}^{15}C_7+{}^{15}C_8+{}^{15}C_9+{}^{15}C_{10}+{}^{15}C_{11}+{}^{15}C_{12}+{}^{15}C_{13}+{}^{15}C_{14}+{}^{15}C_{15}$ = 15+105 +455 +1365 +3003 +5005 +6435 +6435 +5005+3003+ 1365+455+105+15+1 = 32,767 edge graphs. In a 6-vertex graph one can have the combinations of one self-loop at a time, two self-loops at a time and so on up to 6 self-loops at a time, which amounts to ${}^{6}C_1+{}^{6}C_2+{}^{6}C_3+{}^{6}C_4+{}^{6}C_5+{}^{6}C_6$ = 6+15+20+15+6+1 = 63 self-loops. For every self-loop, one can associate 32,767 edge graphs. This means one can construct 63x32,767 = 2,064,321 graphs apart from 63 self-loops graphs and 32,767 edge graphs. This amounts to saying that one can construct 2,064,321+32,767+63 = 2,097,151 graphs using six vertices. One can also have just one graph consisting of six vertices but with no edges. So, one can construct a total of 2,097,151+1 = 2,097,152 graphs from six labelled vertices. This is called as **6**-vertex graph space. (NOTE: $2^{21} = 2097152$). One may generalize this to n-vertex graph space.

n-vertex graph space

In a n-vertex graph, one can construct ${}^{n}C_2$ edges. The combinatorics of ${}^{n}C_2$ edges having one edge at a time, two edges at a time, and so on up to ${}^{n}C_n$ edges at a time amounts to

$$\sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k}$$ edge graphs without self-loops.

In an n-vertex graph, one can have the combinations of one self-loop at a time, two self-loops at a time and so on up to n self-loops at a time amounts to

$${}^{n}C_1+{}^{n}C_2+{}^{n}C_3+{}^{n}C_4+..+{}^{n}C_n = \sum_{k=1}^{n} \binom{n}{k}$$ **self-loops.**

For every self-loop, one can associate $\sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k}$ edge graphs.

This means one can construct $\sum_{k=1}^{n} \binom{n}{k} \sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k}$ graphs with self-loops.

One can have just one graph consisting of n vertices with no edges.

So, one can construct a total of $\sum_{k=1}^{n} \binom{n}{k} + \sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k} + \sum_{k=1}^{n} \binom{n}{k} \sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k} + 1$ graphs from n labelled vertices.

This is called as n-vertex graph space.

Note:

As the number of vertices increases linearly, the exponents of 2 increase exponentially. If 'p' is number of vertices and 'q' is the exponent of 2, then 2^q number of graphs could be constructed using 'p' vertices. Then for the p+1 vertices, the exponent of 2 would be (q+p+1). Then, one can construct $2^{(q+p+1)}$ graphs using p+1 vertices. A table showing number of vertices and total number of graphs using the formula $2^{(q+p+1)}$ is given below. **Table:2** Graph given below on the left shows number of vertices and a formula that determines total number of graphs as power of 2. Graph given below on the right shows the total number of graphs as against every set of vertices.

Formulation of The Notion of Graph Space

$$\lim_{n\to\infty} \sum_{k=1}^{n} \binom{n}{k} + \sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k} + \sum_{k=1}^{n} \binom{n}{k} \sum_{k=1}^{\binom{n}{2}} \binom{\binom{n}{2}}{k} + 1 = G_\infty$$

As n tends to infinity, the resulting abstract infinite vertex graph space is called Graph Space G_∞. In philosophical terms, one can visualize Graph Space G_∞ as 'Cosmic Network'. All networks are subspaces of Graph Space G_∞, be it a neural network, or electrical network, or a traffic network, etc. Various graph theoretic operations can be performed in Graph Space G_∞.

RESULTS AND DISCUSSION

According to Markov, abstraction (idealization) is how the "infinite" is introduced in mathematics. He makes a distinction between the abstraction of potential realizability, which abstracts away from any practical spatial, temporal, or material constraints in our ability to construct (concrete or abstract) mathematical objects, and the "unclear" abstraction of actual infinity, which is used to introduce (unintuitable) complete infinite totalities. We can reason about as long constructive processes and as big constructive objects as needed thanks to this abstraction. Therefore, only those objects that are not produced by abstractions stronger than the abstraction of potential realizability can be regarded as constructive. The link is https://journals.openedition.org/philosophiascientiae/1054. In the late 1950s, Markov takes a philosophical stance toward abstractions: Mathematical abstractions are essential, but they shouldn't be developed for their own sake and lead to a place where there is no way back to "earth." As a fundamental phase in human understanding of objective reality, we should never forget to move from abstract thought to practice. If the likelihood of such a passage turns out to be too slim, it is necessary to re evaluate and attempt to change the abstractions used. In keeping with this concept, he believes that because LEJ Brouwer's mental constructions have realizable material constructions as archetypes, they may be realized. In an effort to "return down to earth," Markov actually reinterprets Brouwer's concept of potential infinite in terms of his own abstraction of potential realizability.

CONCLUIONS

Based on Markov's philosophy, the notion of 'Graph Space' is potentially realizable and constructive. One can construct two graphs using a single vertex, four graphs using two vertices, 50 graphs using three vertices, 946 graphs using four vertices, 31714 graphs using five vertices, 2,064,322 graphs using six vertices and so on. As number of vertices tends to infinity, potentially infinite simple graphs could be constructed which amounts to what we call as "Graph Space". All kinds of graphs are sub spaces of Graph Space, which is closed under all types of graph theoretic operations. G_∞ is potentially denumerable and constructive, but not decidable. In other words, the Graph Space G_∞ is a constructive analogue of what is already known as 'Discrete Hilbert Space', which is nonconstructive. All theorems and lemmas pertaining to Discrete Hilbert Space are also applicable to Graph Space G_∞. Unlike Discrete Hilbert Space, Graph Space is an ideal model for studying complex discrete systems. Any information is stored as a pattern (graph) in the brain, which is a network of neurons. For instance, a three-neuron system will have one 0-connected

pattern, which is an edgeless graph; nine 1-connected patterns (links); thirty-six 2-connected graphs; eighty-four 3-conncted graphs; one hundred and twenty six 4-connected graphs; one hundred and twenty six 5-connected graphs; eighty-four 6-conncted graphs; thirty-six 7-connected graphs; nine 8-connected patterns (links); one 9-connected pattern. This amounts to 512 graphs (networks of neurons) could be formed in a three-neuron brain. On an average, a human brain 8.6×10^{10} neurons. Thus, one can construct $73.96\times10^{20}C_i$, where i ranges from 0 to 73.96×10^{20} graphs in a human brain. If one is able to construct one graph per second, it will take 3170.979 million years to saturate a human brain at the rate of one information per second. As a future perspective, one can work out the possibilities of classifying the set of human brain related graphs by treating it as a model of the Graph Space G_{∞}.

ABSTRACT

One of the most significant Indian Ayurvedic medicinal plants, *Pterocarpus marsupium*, plant used for antidiabetic, gastrointestinal disorders (diarrhea, dysentery, and intestinal ulcers), anticancer, skin diseases (eczema, boils, and other dermatological conditions), wound healing, inflammatory (arthritis, swelling, and pain), etc. Therefore, the plant bark ethanolic was chosen for the identification of active compounds, analytical characterizations; UV, FT-IR, GC-MS, and pharmacological application of *P.marsupium* for antioxidant (DPPH, ABTS, OH), and antimicrobial (8 pathogens), activity. In phytochemical analysis we confirmed phenols, flavonoids, terpenoids, saponins, tannins, steroids, alkaloids, The UV–vis spectrum exhibited a strong absorption maximum at 318 nm. In FT-IR analysis, it's ranged 3326.95 to 664.30 , the peak 3326.95– O–H stretching (hydroxyl groups; alcohols, phenols, or water), 2920.66 – C–H asymmetric stretching (aliphatic; typically originating from methylene groups), in GC-MS Cyclohexasiloxane, dodecamethyl showed highest amount in 28.16% followed through1,3-diphenyl-1-((trimethylsilyl)oxy)-1(z)-heptene observed that 18.59%, Tri-o-trimethylsilyl, n-trifluoroacetyl derived of terbutaline noticed that 10.69%. The OH free radical scavenging experiment demonstrated that nanoparticles exhibited a scavenging rate of 79.74%, which was the highest, and a rateof 18.65%, In DPPH highest radical scavenging rate at 77.65% and the lowest at 20.23%, attributed to its H-donating capability.ABTS+ radicals uppermost and lowermost degrees of radical scavenging were determined to

be 71.47% and 16.43%, respectively. The largest inhibition zone against *S. aureus*36 mm and was observed, our findings concluded that bark extract showed potential antioxidant and antimicrobial activity, further we can focus *in vitro* and *in vivo*.

Keywords: Antidiabetic, Antioxidant, Cyclohexasiloxane, Dysentery, Inhibition, Ulcers

INTRODUCTION

The *Pterocarpus marsupium* ROXB. is a large deciduous tree family Fabaceae) is abundantly distributed in the Indian subcontinent and has been utilised since centuries in the ancient system of medicine, especially Ayurveda, for the management of diabetes, inflammation, skin disorders and gastrointestinal problems (Varshini and Wadhwani, 2026). Heartwood; control of diabetes mellitus; traditionally sipped water held overnight in heartwood tumblers, bark used for diarrhoea, dysentery, ulcers, skin ailments and wound healing. Kino gum: used as astringent, hemostatic and therapeutic for bleeding problems (Sukhadiya et al., 2019). Leaves; applied in inflammation, boils and skin eruptions, flowers and fruits: utilised in various traditional medicines for fever and digestive disorders (Sreedharan and Hegde, 2026). Diabetes; the most notable traditional application; the plant is listed as a Madhumehahara (anti-diabetic) drug in Ayurveda, wound healing; bark paste and kino gum are used externally to promote healing and prevent infection (Sharma et al., 2019), gastrointestinal disorders; it is used to treat diarrhoea, dysentery and intestinal ulcers due to its astringent tannin content. Inflammatory problems; used for arthritis, swelling and pain, skin illnesses; traditional preparations used for eczema, boils and other dermatological conditions (Srivastav et al., 2024).

Types of chemicals and key constituents' flavonoids: epicatechin, catechin, liquiritigeninstilbenes: pterostilbeneisoflavonoids: marsupsin, pterosupin (Oluwole et al., 2022). Phenolic substances are gallic acid and related phenolics, tannins are kino tannic acid, condensed tannins, other compounds are glycosides, terpenoids and volatile constituents (Cosme et al., 2025). Biological importance of pterostilbene utilised for antioxidant, antidiabetic, anti-inflammatory and neuroprotective actions, epicatechin are used for protecting pancreatic β-cells, exhibits antioxidant activity, and improves glucose metabolism (Galbau et al.,2024; Sivalingam and Arjun, 2024). Marsupsin are in Contributes to antidiabetic and antioxidant activity Pterosupin used for associated with hypoglycemia and free-radical scavenging characteristics kino tannic acid are responsible for astringent, antibacterial, and wound-healing effects (Pandey and Mathur, 2025). Antioxidant activity scavenges free radicals such as DPPH, superoxide and OH radicals and decreases lipid peroxidation and oxidative damage protects biological macromolecules like DNA, proteins and lipids, mostly due to flavonoids, phenolics and tannins (Chaudhary et al., 2023). Extracts showed that impede the development of several microbial pathogens, with tannins and phenolic chemicals acting to damage microbial membranes and inhibit enzymes, thereby providing a scientific basis for its historic usage in wound healing and treating skin infections (Bei et al., 2026). Active compounds were found based on the medicinal properties of the selected plant by UV, FT-IR and employing gas chromatography mass spectroscopy (GC-MS), pharmacological use of *Pterocarpus marsupium* for antioxidant and antibacterial activity against human pathogenic microorganisms.

MATERIALS AND METHODS

Preparing Plant Extracts

The plant parts collected and collected plant identified and authenticated by plant taxonomist Dr. Ramasubbu Raju, Associate Professor, Department of Biology, Gandhigram Rural University, voucher specimen number GUD 1364-*Pterocarpus marsupium* ROXB. In collected plant parts, we focused only bark, bark was collected, dried in shade and powdered, the 20 g of bark powdered and was weighed in a filter paper pouch and put in the chamber of the Soxhlet

apparatus with ethanol as a solvent. By heating, the ethanol vapourised and passed through the sample and extracted the necessary components effectively. The ethanol solvent was then evaporated to concentrate the sample for further analysis (Azhagu Madhavan and Arjun, 2025).

Qualitative analysis of phytochemicals (metabolites)

The analysis of secondary metabolites of *P. marsupium* ethanolic bark extract was mainly confirmatory analysis regardless of the presence of bioactive secondary metabolites. The targeted elements like tannins, saponins, flavonoids, alkaloids, and polyphenols were identified by standard biochemical procedures according to previously reported methods (Azhagumathavan and Arjun, 2024).

Analysis of UV-visible spectroscopy

The characterisation of *P. marsupium* ethanolic bark extract was performed using UV-visible spectroscopy (Perkin Elmer, MA, USA). The absorbance was measured in the range of 200-800 nm using the protocols outlined earlier. The standard UV-visible approach was used (Sukirtha et al.,2025).

Fourier Transform Infrared Spectroscopy Analysis (FT-IR)

The FT-IR spectrum of *P. marsupium* ethanolic bark extract was recorded using potassium bromide (KBr) and KBr pellets were analysed consuming an tool for functional group analysis (8400 S, Shimadzu, Japan) in the variety of 4000–500 cm^{-1}. The standard FT-IR methodology was followed as described earlier (Sumathy et al., 2024).

Analysis of *P. marsupium* by GC-MS

The analysis of GC-MS was supported out on the GC-500 Perkins Elmer system with AOC-20i auto-sampler and transitory and constant GC-MS equipment. The investigation was performed using a hybrid silica capillary column (30 m x 0.5 mm ID x 1 μm df) Elite-1 containing dimethyl polysiloxane(100%) stationary phase. Helium gas and the carrier gas was nine divided ratios (10:1), the ion foundation temperature was 280°C, the injector temperature was 250°C and the oven temperature was set to 110°C in isothermal mode for two minutes. The temperature was then increased to 220°C at 10°C/min, to 280°C at 5 °C/min and lastly to 280°C at 9°C/min. The mass spectrum was perused at 70 eV from 45 to 450 Da for 0.5 s. Chromatography and other field experiments were performed using turbomass version 5.0. The NIST library was utilised to compare the arrangement of molecular methods for unknown attributes, weight, structure, and documentation of research material (Arjun et al., 2017).

Applications of *P. marsupium* in pharmacology

Free radical DPPH scavenging assay

The DPPH free radical scavenging action of ethanol bark extract of *P. marsupium* was tested through DPPH test at concentration of 100-500 μg/ml *in vitro*. The absorbance of the mixture of plant sample solution and DPPH solution in methanol was read at 517 nm using Beckman spectrophotometer. The concentration was expressed as IC_{50} values and the scavenging capacity was calculated as percentage consuming ascorbic acid as per the standard technique mentioned in earlierstudy. Inhibition %= [(A0 − A)/A0] × 100. Here A0 is the absorbance of DPPH without sample and A is the absorbance of DPPH with sample (Arjun, 2011).

$ABTS^{\bullet+}$ free radical scavenging assay

The free radical scavenging approach for $ABTS^{\bullet+}$ uses constant $ABTS^{\bullet+}$ (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) which has advantages for antioxidant showing. The scavenging ability was determined by incubating the samples with a solution of $ABTS^{\bullet+}$ at varied dosages (100–500 μg/ml) for the generation of $ABTS^{\bullet+}$ and measuring the absorbance at 734 nm (Hariprasath et al., 2016). The percentage of inhibition was determined using the following formula which was detailed in an earlier work:

The % inhibition was computed as follows: (Control OD-sample OD / Control OD) x 100.

OH assay

The deoxyribose, H_2O_2, $FeCl_3$, and EDTA combination (AzhaguMadhavan et al., 2024) confirmed the scavenging potential of the materials at concentrations among 100 to 500 µg/ml. The response combination was incubated for 30 min at 80 °C and the hydroxyl radical scavenging activity was strongminded by the method OH % = (A1 − A2/A1) ×100, where A1 control and A2 sample, absorbance 532 nm.

Activity of antimicrobial resistance against human diseases

The antimicrobial activity of *P. marsupium* was studied against 8 bacterial strains; *Staphylococcus aureus, Bacillus subtilis, Planococcus maritimus, Micrococcus luteus, Pseudomonas aeruginosa, Escherichia coli, Salmonella typhimurium* and *Enterobacter cloacae* and 2 antifungal strains; *Candida albicans* and *Candida glabrata*. The MHA medium will be prepared by dissolving MHA 11.4 g in distilled water (300 mL) and will be autoclaved under pressure at 10 lbs for 30 minutes at 115°C. Then the mixture (Nagarajan et al., 2010) poured into sterile petri plates and agar wells of mm diameter and normal range of 2.5 mm. Each Petri plate will be completely labelled with bark ethanolic extract at different concentrations (20, 40 and 60 µg/mL) and conventional medications used as positive controls. The microbial strains were smeared on sterile swabs. Different quantities of extract were placed on the wells.At 37°C the plates were incubated for maximum of twenty-four hours. DMSO (dimethyl sulfoxide) was utilised as negative control and amoxicillin and fluconazole as positive controls. After incubation period plates were examined for zone of inhibition and diameter of zone was estimated by help of screw gauge. The value of each organism is mentioned in millimetres (mm) and noted and summed (Nagarajan et al., 2012).

Statistical Analysis

The statistical analysis were influenced by ANOVA (One-way Analysis of Variance) to calculate the noteworthy of dissimilarity of resources of an assortment of management groups, with the DMRT (Duncan's Multiple Range Test) by means of SPSS (Statistical Package for the Social Sciences) (Version 16.0) level (5%) package, values are presented as significance ($P < 0.05$) (Ali et al., 2021).

RESULTS AND DISCUSSION

Phytochemical analysis

The *P. marsupium* plant bark ethanolic extract of was concentrated using rotary evaporator and stored in petriplate, yield percentage was recorded (14.2%), its kept for further analysis (Table 1; Fig. 1) and it was found to contain a variety of secondary metabolites like tannins which has anti-inflammatory properties, polyphenols are antimicrobial properties, flavonoids are antioxidant and antimicrobial, saponins are antibacterial and alkaloids are anticancer and antidiabetic properties. These bioactive components give the plant anti-inflammatory capabilities (AzhaguMadhavan et al., 2025). Phytochemical investigation revealed that many food plants contain tannins, which are important to human health. The superfoods are considered to be the foods rich in flavonoids like tea, fruits and vegetables due to their health benefits like boosting immune system, decreasing the risk of cancer, reducing cholesterol, reducing blood lipids and reducing the blood glucose response (AzhaguMadhavan et al., 2024).

Phenolic compounds are phenols, flavonoids such as gymnemic acid and gymnemagenin and further secondary metabolites such as saponins, tannins (phenolic compounds) and triterpenoids, inhibit the action of enzymes accountable for glucose hydrolysis;*G. sylvestre* has been widely reported as a traditional herbal medicine (Laha and Paul, 2019).

UV and FT-IR analysis

UV

In UV, a peak around 310–330 nm is characteristic of Band I absorption of flavonoids, arising from $\pi \rightarrow \pi^*$ transitions of the cinnamoyl (B-ring) system, this red shift from ~290 to ~318 nm indicates extended conjugation or interaction of phenolic compounds with metal/selenium ions, it confirming the role of polyphenols as reducing and stabilizing

agents.The UV–vis spectrum exhibited a strong absorption maximum at 318 nm, corresponding to Band I ($\pi \rightarrow \pi^*$) transition of flavonoids and conjugated phenolic compounds, indicating the presence of extended aromatic chromophores and their involvement in nanoparticle stabilization (Fig. 2).

FT-IR

In FT-IR analysis, it's ranged 3326.95 to 664.30 , the peak 3326.95– O–H stretching (hydroxyl groups; alcohols, phenols, or water), 2920.66 – C–H asymmetric stretching (aliphatic; typically originating from methylene groups), 1727.22 – C=O stretching (carbonyl groups; saturated aliphatic aldehydes), 1595.08 – C=C stretching (aromatic/conjugated alkenes; prominent in substituted aromatics and polymers like lignin), 1512.18 – aromatic C=C stretching (presence of an aromatic ring like a benzene ring), 1451.44 – C–H bending (aliphatic chains attached to aromatic rings; e.g., toluene or alkylbenzenes), 1420.25 – O–H bending / C–H deformation(particularly in alcoholsor polysaccharides like cellulose), 1366.07 – C–H bending / O–H deformation (fingerprint region), 1318.47 – C–O stretching (typically found in carboxylic acids, certain alcohols, or esters), 1299.00 – C–O–C stretching (such as in aliphatic ethers or glycosidic bonds within carbohydrates), 1023.80 – C–O stretching (commonly found in alcohols, ethers, or carbohydrates like sugars and glycosidic linkages), 895.76 – aromatic C–H out-of-plane bending (highly useful for determining the substitution pattern of abenzene ring), 822.71 – aromatic C–H out-of-plane bending (contains a benzene ring or similar aromatic structure), 719.29 – aromatic C–H out-of-plane bending (mono-substituted or multi-substituted benzene ring), 664.30 – lattice vibration (commonly found in metal oxides and sulfides, such as TiO_2, $NiCo_2S_4$, or Fe_2O_3)(Fig. 3).

The extract from Kalmegh leaves was found to include the functional groups alkenes, amines, aromatics, nitro compounds, alcohols and phenols, the maximum at 3323 cm^{-1} is connected to large absorption band of stretching vibration of alcohol group. The appearance peak at 1645.10 cm^{-1} is indicated by the stretching group of alkenes, whereas. The greatest result of 1409.96 cm^{-1} shows C=C stretching, related to an aromatic group. The spectrum indicates the stretching vibration of amines group at a wavenumber of 1080.11 cm^{-1} while another alkene group shows a bending vibration at a frequency of 894.97 cm^{-1}, the stretching mode of phenol compounds is seen at a peak of 3749.62 cm^{-1} (Maria et al., 2018).

Compounds identification by GC-MS of ethanol bark extract of *G.sylvestre*

The uppermost compound Cyclohexasiloxane, dodecamethyl(It serves as a solvent, emulsifier, and calmative that assistancestransport active ingredients into the skin though providing a soft, non-greasy feel) showed highest amount in 28.16% followed by 1,3-diphenyl-1-((trimethylsilyl)oxy)-1(z)-heptene(not an approved medication or a standardized pharmacological drug) observed that 18.59%, Tri-o-trimethylsilyl, n-trifluoroacetyl derivative of terbutaline noticed that 10.69%,propanoic acid, 2-methyl-, 5-(2,3-dihydro-3,3-dimethyl-2-oxo-1h-indol-1-yl)-10,11-dihydro-5h-dibenzo[a,d]cyclohepten-5-yl ester showed 8.21%. The phosphonousdibromide, [2,2,2-trifluoro-1-(trifluoromethyl)-1-[(trimethylsilyl)oxy]ethyl]- (extremely specialized, fluorinated organophosphorus compound used chiefly as a chemical intermediate and reagent) noticed that 6.46%, the least compound was observed that the butanedioic acid, 2-ethyl-2-(phenylthio)-, 1-ethyl ester(chiefly as a phytochemical marker or mechanical component) estimated 1.33%.

The GC-MS study of ethanol extract of *A. indicum* leaves revealed twenty chemical substances. Diethyl phthalate had the largest amount area percentage (64.64%) and retention time (RT) of 10.082 min (Peak 3), its publications are available on the bioactivity of diethyl phthalate and methyl salicylate (Prabha et al., 2025). Methyl salicylate had the second greatest area percentage of amount (17.98%) with RT of 5.064 minutes (Peak 1). Among the compounds identified are the phenolic 3,5-bis(1,1-dimethylethyl) peak (1.84%) and the 2-propanone, 1-cyclopentyl-peak (0.40%) and the octadecahydro-2 H-picene-3-one-peak as well as the natural antioxidant 2,3-dihydroxy-6-nitroquinolineox. the 20 bioactive compounds remained identified from the ethanolic leaf extract of P. murex (AzhaguMadhavan et al., 2025). The *C. phlomidis* plant bioactive extracts and its aqueous extracts spectra exhibited twenty peaks, two for propanone, one for cyclopentyl (0.40%) and two for propanone (Ravichandran et al., 2019). The main volatile constituents of the *Cinnamomum* species were 38.04%eugenol, 13.31%shyobunol, 10.36%isocaryophyllene,

7.89%germacrene D, β-caryophyllene(11.33%), α-cadinol (10.7%), and isoeugenol acetate (27.95%); monoterpenes were found in *C. sulphuratum, C. wightii,* and *C. malabatrum* (Saranya et al., 2024). The ethanol leaf extract of *P. emblica* identified ten major bioactive compounds, which include phenol, 2,4-bis(1,1-dimethylethyl) (RT 16.675, 0.13%) which has biological activity, 1-tridecen (RT 15.187, 0.25%) which has antihyperglycemic activity, and 1-dodecen (RT 12.341, 0.16%) which has antioxidant possessions (AzhaguMadhavan and Arjun, 2024). The major component, gymnemic acid, is known to interact with GAPDH, aimportant enzyme in pathway of glycolysis (Ishijima et al., 2008). Homologs are more than 20 gymnemic acid are recognized and all of them include gymnemagenin as their core structure. The plant triterpenesaponins form molecular compounds with lipids,proteins and tannins. From the stem extract of the plant (Muderawan et al., 2021) and from leaves, conduritol A, lupeol, stigmasterol, stigmasterol 3-O-β-d-glucoside, sodium salt of 22α-hydroxy-longispinogenin-3-O-β-d-glucopyranosyl-(1→3)-β-d-glucurono-pyranosyl-28-O-α-l-rhamno pyranoside, oleanic acid-3-O-β-glucopyranosyl(1→ 6) isolated and prominent antisweat peptide, gurmarin, which is composed of amino acids 35 and has 4209molecular weight (Datta et al., 2024).

Antioxidant activities

DPPH free radical scavenging activity

The Characteristics of the free radical scavenging assay were evaluated using samples with various dosages are 100 to 500 μg/ml, the ethanol extract exhibited the highest radical scavenging rate at 77.65% and the lowest at 20.23%, IC_{50} values recorded 321 μg/mL attributed to its H-donating capability. The DPPH transformed unpaired electrons into balanced ones to generate hydrazine (Fig. 5), with ascorbic acid serving as the reference standard (Fig. 6), IC_{50} values recorded 46 μg/mL.

Activity of ABTS+ radical scavenging

A Significant approach to evaluating antioxidant activity is utilizing the radical scavenging abilities of the green nanoparticles against ABTS+ radicals at various doses of bark ethanolic extract (100–500 μg/ml). The uppermost and lowermost degrees of radical scavenging were determined to be 71.47% and 16.43%, respectively (Fig. 6), IC_{50} values recorded 358 μg/mLwith ascorbic acid serving as the reference standard (Fig. 7), IC_{50} values recorded 46 μg/mL.

Activity of hydroxyl radical scavenging

Ascorbic acid served as the benchmark to demonstratethe initiation of cellular damage by these radicals *in vivo*. The free radical scavenging experiment demonstrated that nanoparticles exhibited a scavenging rate of 79.74%, which was the highest, and a rate of 18.65%, which was the lowest (Fig. 5), IC_{50} values recorded 306 μg/mL. Ascorbic acid served as the reference standard (Fig. 6), IC_{50} values recorded 46 μg/mL. Plants' phytochemicals have been connected with antidiabetic and antioxidant capabilities, and their potential medicinal effects may be due to their ability to scavenge free radicals such as DPPH, Fe^{3+}, NO, OH and superoxide radicals (Akpoveso et al., 2023). Antioxidants contribute hydrogen atoms to radical entities to form non-radical products (Chaudhary et al., 2023). Antioxidants neutralise and inhibit free radicals, preventing lipid peroxidation (Valgimigli, 2023). Plants with high antioxidant content can prevent diabetes, cancer, atherosclerosis, hepatitis, arthritis, asthma and cardiovascular problems (Ansari et al., 2025).A significant positive connection was observed between the total flavonoid and phenolic contents of the plant extracts and their free radical scavenging activity. This link indicated that a greater amount of phenolic and flavonoid molecules greatly increases antioxidant activity (Shakil Ahmed et al., 2025).

Antimicrobial

The *P. marsupium* plant bark ethanolic extract exhibited varying levels of antibacterial activity against all tested bacterial strains, well dispersion method was used to evaluate the antibacterial effectiveness of ethanolic extract studied plants against various microorganisms which are *S. aureus, B.subtilis, P.maritimus, E. coli, S.typhimurium,M.luteus, P. aeruginosa*. These strains of bacteria, encompassing both gram +ve and gram-ve types, are frequently associated with infectious diseases. The largest inhibition zone against *S. aureus*36 mm and was observed with 60 μL. The *S. aureus* is a prevalent bacterium responsible for a variety of human ailments, from minor skin infections to severe systemic disorders, frequently associated with strains such as MRSA. Key infections comprise skin abscesses, pneumonia, cellulitis, toxic shock syndrome, osteomyelitis, endocarditis, and food poisoning,

followed by *M.luteus*showed same zone of inhibition 36 mm in diameter (Table 4; Fig. 7, 8). The antifungal activity of bark ethanolic extract of *P. marsupium* showed against both fungal strains, among the fungal uppermost zone of inhibition was observed against *C. albicans*(oral thrush, vaginal yeast infections) and skin rashes, showed that 38 mm in diameter, followed by *C. glabrasta*(cause serious urogenital or systemic infections in immunocompromised individuals) showed that 37 mm in 60 µl.

C.glabrata is a prominent opportunistic yeast pathogen accountable for superficial mucosal infections and life-threatening invasive bloodstream contagions with high mortality rates, especially among elderly or immunocompromised individuals (Hassan et al., 2021). It is the second most prevalent cause of candidiasis, leading to urinary tract infections, bloodstream infections (candidemia), and, though less frequently, endocarditis or CNS infections. *C. albicans* leads to superficial mucosal infections such as vaginal yeast and oral thrush infections, along with severe, life-threatening universalcontagions (candidemia) that affect internal organs (Katsipoulaki et al., 2024).

CONCLUSION

The *Pterocarpus marsupium* plant most significant Indian Ayurvedic medicinal plants, flavonoids, polyphenols, tannins, saponins, and alkaloids identified, and in were in UV absorbance detected peat at 326 nm, which is indicative of aromatic rings and conjugated systems like phenolics/flavonoids; in FT-IR analysis, it ranges from 3276.06 to 664.29; at 3276.06, it is O–H stretching (DOA), an oily, colorless liquid compound; We concluded that the chosen plant has a strong potential for pharmacological applications after observing a zone of inhibition against *S. typhimurium, M. luteus,* and *E. coli* at 60 µL application produced 25 mm; it prevents and cures fever, diarrhea, vomiting, and abdominal cramps among other human health and well-being.

ABSTRACT

Underwater Wireless Sensor Networks (UWSNs) are emerged in several purposes, such as rescue control, water quality monitoring, underwater navigation, and so on. These networks consist of a large count of sensors positioned in rivers and seas to monitor the underwater atmosphere. Conversely, these sensors are limited in terms of power, and it was time-consuming to recharge batteries, making energy efficiency a significant concern. Clustering and multi-hop routing techniques are regarded as energy-aware alternatives for UWSNs. Nonetheless, the underwater current, limited bandwidth, high water pressure, error probability, and transmission latency make conventional Cluster-Based Routing Protocols (CBRPs) for typical WSNs unsuitable for UWSNs. Recently, researchers developed clustering routing protocols for UWSNs according to different aspects like energy, depth, distance, etc. This study conducts an extensive survey on modern CBRPs in UWSNs to ensure dependable data delivery. The benefits, limitations, and network performance of such protocols are also analyzed to discover the most prevalent challenges in UWSN data transfer. Finally, this survey concludes with potential future strategies to significantly improve data delivery and network performance for UWSNs.

Keywords: UWSN, Clustering, Routing, Acoustic communication, Energy efficiency

INTRODUCTION

Oceans contain approximately 96% of all Terrain's water that is critical for humanity's existence as it supplies organic resources, sea defense, etc. Because of excessive terrestrial development, researchers have shifted their emphasis to the waters. The underwater sensors are positioned in a specified sea region, and their self-organizing capabilities are employed to transmit data, resulting in the UWSN [1]. Underwater wireless transmission is the task of communicating information in the aquatic environment using wireless carriers such as Radio Frequency (RF), acoustic, and optical signals. Many wireless communication technologies that work well on land do not perform effectively in underwater environments due to the unique properties of the underwater atmosphere, such as pressure and temperature. Terrain can effectively transport RF signals. However, the ocean significantly reduces the strength of radio signals. Ultra-low frequency electromagnetic waves (30 to 300 Hz) may enter greater than 100 m of saltwater. In contrast, a tiny sensor cannot support a lengthy receiving antenna. RF signals can solely accomplish high-speed transmission across limited distances. Due to the extensive available bandwidth, optical transmission can achieve significant data speeds of up to Gbps over distances of a few meters [2].

The Blue Comm and Ambalux Underwater Optical Wireless Communication (UOWC) systems can transmit information over a distance of around 100 m. The investigation demonstrates that it is likely to perform LED-based visible light transmission across 500 m in pure water [3]. Underwater optical transmission has a high data-carrying ability and may be utilized to form a massive wireless communication connection. However, the purity of the water significantly influences the communication quality of UOWC, leading to heavy absorption and diffusion of the light signal. Acoustic transmission is a well-known technique. Acoustic signals are mechanical signals, which can travel enormous distances (from a few 100 m to 10 km) and are ideal for heat-robust deep-water transmission [4]. On the contrary, when high-frequency acoustic signals propagate in saltwater, they experience considerable attenuation, resulting in restricted bandwidth resources. Acoustic signals transmit at a rate approximately 5 orders of magnitude slower than RF signals. These characteristics can create a significant latency in underwater transmissions. Acoustic signals have substantially lower attenuation in saltwater than RF and optical signals, and acoustic transmission operates best at low frequencies.

Underwater Acoustic Transmission

Route loss, which influences the signal's frequency and transmission distance, significantly affects underwater acoustic communication. Absorption loss happens while acoustic power is converted into thermal power, impacting the channel bandwidth based on the intended sending distance. As the operational frequency and distance from the transmitter and receiver increase, absorption loss also increases. Consequently, power limitations restrict bandwidth, leading to a decrease in bandwidth for longer communication links and an increase for shorter ones, which also results in reduced data rates [5]. For example, a single hop can transmit over 30 km with a bandwidth of 30 kHz, while 10 hops can achieve the same distance with a greater bandwidth of 300 kHz. This suggests a trade-off between complex relays in transmission for enhanced bandwidth and throughput. The sensor transmission range decreases with increased bandwidth, while a wider bandwidth narrows the transmission range. The bandwidth for underwater transmission differs between 1 kHz and 100 kHz, operating within frequency ranges between 10 Hz and 1 MHz [6]. Acoustic channels typically work over kilometers of frequency bands centered at kHz. Acoustic communication data rates are dictated by channel encoding and the quantity of transmitters and receivers, typically ranging from 31 kbps to 125 kbps. Table 1 provides the acoustic channels of UWSNs based on different factors.

Due to strong water absorption and backscatter, Free Space Optical (FSO) communication is less effective underwater and experiences far higher attenuation than in air and fog. For FSO, this results in extremely limited transmission ranges [7]. Alternatively, acoustic communication is more flexible in underwater settings, especially in deeper waters with stable temperatures. However, multipath propagation, ambient noise, and temperature gradients can all impair performance. It is still the most dependable method of practical underwater communication, even though sound moves more quickly in water than in air, but ultimately slower than electromagnetic waves.

Clustering for UWSNs: Clustering is a method of aggregating nodes into distinct, non-overlapping clusters as shown in the Figure1. The aim of this technique is to significantly enhance energy efficiency, as energy is a non-renewable resource, particularly in underwater settings. Focusing on this purpose, clustering algorithms can minimize information redundancy, balance traffic, and maximize throughput. Numerous clustering techniques have been formulated over the last few decades, based on diverse architectural and topological characteristics, such as cluster quantity, intra-cluster connections, and sink-CH distance [8]. The effectiveness of clustering algorithms may be assessed by cluster robustness, latency, load balancing, information trustworthiness, fault tolerance, and energy efficiency.

The clustering occurs in three phases

- The setup phase, during which a CH node is selected, which transmits an advertisement message to every non-CH node. This message contains a unique node ID and an integer value. Non-CHs accept the advertisement and wait for the designated advertisement waiting period, during which they may also receive many advertisement messages from other eligible CHs. A non-CH node selects a CH according to the least node ID and integer value; then, it transmits this choice to the selected CH in a specified joining wait period.
- Information collection phase, during which non-CHs transmit information to the CHs. This is done by direct data transmission to the CH, requiring no control information.
- Data transmission phase, during which the gathered information is conveyed to the BS by various CHs. This necessitates route finding and maintenance. In the absence of an established route to a node, the node transmits a data to the destination, which then verifies receipt by sending an acknowledgment message. The route is constructed and remains valid until a specified timeout period elapses. This phase accommodates failed recovery due to the existence of several CHs.

Deployment Architectures:

The UWSN architectures are designed based on their applications [9].

One-Dimensional (1D)-UWSN

(1D-UWSN) structure is a network in which nodes are placed independently. All nodes function as an independent network to observe, analyze, and transfer data to a distant sink node. The node may act as a floating buoy capable of sensing underwater qualities or remain submerged for a designated duration to gather data. An Autonomous Underwater Vehicle (AUV) may submerge, recognize, or gather underwater characteristics and transfer the data to the sink. In 1D-UWSN, nodes can utilize acoustic, RF, or optical transmission for interaction. As well, the topological configuration of this structure is star-shaped, where transmission between the node and the sink occurs over a single hop.

Two-Dimensional (2D)-UWSN

(2D-UWSN) structure is a configuration in which a cluster of nodes is installed beneath the water's surface. All clusters contain a Cluster Head (CH), also known as an anchor node. The clusters are stationary because they are fixed to the underwater surface. All cluster members collect underwater information and transmit it to the CH. The CH accumulates data from each cluster member and sends it to the surface buoyant nodes. In this structure, acoustic, optical, and RF transmission are utilized according to the specific purpose and underwater atmosphere characteristics.

Three-Dimensional (3D)-UWSN nodes

(3D-UWSN) Are strategically positioned underwater as clusters and moored at varying depths. The placement of nodes at varying depths enables transmission that transcends two dimensions. This design encompasses (i) inter-cluster transmission among nodes at varying depths, (ii) intra-cluster transmission between sensors and CHs, and (iii) transmission between CHs and buoyant nodes. All three communication situations can utilize acoustic, optical, and RF communications.

Four-Dimensional (4D)-UWSN

(4D-UWSN) is constructed through integrating permanent UWSNs, namely 3D-UWSNs, with mobile UWSNs. The mobile UWSN has Remotely Operated Underwater Vehicles (ROVs), which accumulate information from CHs and transmit it to the sink or Base Station (BS). ROVs consist of independent submersible robots, automobiles, boats, and submarines. All underwater nodes may autonomously communicate data directly to ROVs, according to their proximity to the ROV. The signal will be immediately sent to the ROV; nodes with substantial information and proximity to the ROV may utilize radio links, whereas those with less data or those situated at a greater distance from the ROV may employ acoustic links.

Routing Protocols for UWSN

Transfers sensed data from a node to the sink, each routing protocol in an UWSN employs several metrics [10]. These parameters determine the routing performance. For instance, certain routing techniques route data to the node with the greatest Received Signal Strength Indicator (RSSI) values after comparing the signals from nearby nodes. This method consistently maintains excellent connection quality; nevertheless, it ignores energy balancing. In contrast, several other routing methods rely on the depth information of nearby nodes [11] to forward data.

- Localization-based routing protocols: These protocols require prior network knowledge before transmitting data and often necessitate position data for each node and sink. Such methods are less energy-efficient, as a significant portion of power is depleted in acquiring their position data [12]. The node's coordinates can vary due to water flow, causing the data to update dynamically at set intervals. These methods fundamentally depend on the nodes' characteristics. Examples include vector-based forwarding, focused beam routing, hop-by-hop vector-based forwarding, location-aware source routing, etc.
- Localization-free routing protocols: This category of routing methods does not require prior geographical knowledge about the network [13] and operates independently of the location information of other nodes. The majority of localization methods operate on the flooding phenomenon, exhibiting a high Packet Delivery Ratio (PDR) and little End-to-End Delay (EED). Examples include depth-based routing protocols, energy-efficient depth-based routing, hop-by-hop dynamic addressing-based routing, etc.

Several CBRPs have been developed in recent decades for energy-aware information exchange in UWSNs. This article specifically aims to clarify existing CBRPs for UWSNs, focusing on their energy efficiency, and to identify unresolved research issues. The benefits, limitations, and network performance of these protocols are analyzed to pinpoint key data transfer issues in UWSNs. The sections below are as follows: Section 2 discusses and compares current CBRPs in UWSNs. Section 3 summarizes this study and recommends possible improvements.

Survey on Clustering Routing Protocols for Data Delivery in Uwsn

Hussain et al. [14] proposed a Cooperative-Relay NBEER (CR-NBEER) protocol for UWSNs. It recognized the neighbouring node and improved the selection of relay nodes based on the mobility of the sink and relay to enhance network efficiency. Ragavi et al. [15] designed the Clustered Distance Vector-based Geo-Opportunistic Routing (CDVGOR) protocol to enhance information transmission efficiency. The nodes with restricted energy or beyond the communication range were classified as void or dead. The shortest route with a minimum hop count was selected, and nodes with an infinite hop count were designated as void. Building on the relay selection improvements, Sathish et al. [16] developed a Member Nodes Supported-CBRP (MNS-CBRP) to improve information transfer dependability. This protocol divided the network into clusters using tiny circular pieces and designated a CH for each cluster. Source nodes deliver data to the CH, which relays it to the subsequent CH until it reaches the surface sinks.

A High-Efficiency Clustering Routing Protocol (HECRA) for AUV-enabled UWSNs was created by Shi et al. [17]. This protocol used the node degree and remaining power to optimize the CH selection of the LEACH algorithm. To maximize data transmission, clusters were selected for ordinary node joining based on the CH nodes' remaining energy, and the best forwarding nodes were chosen by calculating weights according to the depth and the CH nodes' remaining power. To enhance the information delivery efficacy, the AUV was also used as a dynamic relay node. A Secure and Active Fuzzy Clustering Data Aggregation Routing Protocol (SAFCDARP) [18] was established in

UWSNs. The fuzzy decision-making module was first used to accurately and efficiently select CHs before forming a minimum spanning tree according to the CHs with an aggregated period. This technique utilized the duration spent collecting nodes to achieve a successful lifespan. Additionally, it had safeguards to prevent security breaches. In the context of secure data transmission, Jiang et al. [19] devised a dynamic routing scheme for UWSNs. A cone-shaped distributed network was built with AUVs to gather information from nodes on the ocean floor. This data was sent via the underwater cone-shaped dispersed network. As well, it included the Source Location Protection (SLP) method to guarantee the confidentiality of source positions. Chu et al. [20] presented the Adaptive Power-Controlled Energy-Efficient Depth-Based Routing (APC-EEDBR) scheme for UWSNs. To accomplish energy-aware relay choice, they used adaptive power regulation and a dual-weight adjustment technique.

They also used a cross-layer design and a cluster-free, hop-by-hop communication method to improve route stability and forwarding efficiency. An Energy-Efficient Unequal Multilevel Clustering (EEUMC) technique was developed by Kumar et al. [21] for UWSNs. The network was arranged into hierarchical clusters according to node characteristics and remaining power using a multilevel clustering framework. CHs were dynamically chosen according to their power and nearness to the sink in an uneven clustering technique that was presented. To increase energy efficiency, it combined sophisticated routing protocols with flexible data aggregation methods. To improve energy efficiency in UWSNs, Tarif et al. [22] created the Underwater Fuzzy-Routing Protocol for Low Power and Lossy Networks (UWF-RPL), an improved fuzzy routing scheme. When choosing a route and allocating traffic among network nodes, this protocol enhances decision-making. Additionally, this protocol expanded RPL by optimizing depth, energy, latency, and the proportion of RSSI to Expected Transmission Count (ETX) using fuzzy logic. Wang et al. [23] used the Hybrid Fuzzy Clustering (HFC) approach to create an energy-aware routing algorithm for UWSNs. Initially, CHs were chosen using fuzzy clustering according to variables like remaining power, node depth, and sink distance. To improve power efficiency and extend network longevity, the fuzzy system then dynamically routed data based on real network circumstances. Using the Gravitational Search Algorithm (GSA) to choose CHs and extend the lifetime of the UWSN according to the remaining power, distance, and node density, Shyamsundar and Harshavarthan [24] devised a cluster-based routing technique. This protocol operated in many phases, such as transmission, routing, clustering, and exploration.

The Hunger Driven Lion Clustering Algorithm (HDLCA) for UWSNs is a novel metaheuristic clustering-based routing protocol developed by Raghu and Shankar [25] and inspired by the territorial behavior and hunger-driven hunting of lions. HDLCA's direct mapping of lion behavior to sensor node dynamics made it possible to choose adaptive CHs and form effective sub-clusters based on energy and node proximity. Khan et al. [26] introduced a power-conscious implemented scheme and the Controlled Transmission improved via the hybrid technique with Differential Evolution, Whale Optimization, and Chaotic Adaptation (CT-DEWCA) for relay choice. By using a strategic dual transmission approach that uses the DEWCA scheme to choose the best relay nodes for long-distance communication and CT for short-distance data transfer, this model improved node placement. In UWSNs, Khan et al. [27] created the Mobile-Clustering Traveling Salesman Protocol (M-CTSP). They focused on using the Travelling Salesman Problem (TSP) to select the best path from the source to the destination nodes in a changing underwater environment. All of the nodes were movable in this situation, and the water currents caused them to gently shift places. To determine the optimal path, clustering was used, and CHs were selected based on the established criteria of the cluster's centre of mass and residual energy. Table 2 provides a comprehensive analysis of clustering routing methods in UWSNs, highlighting their impact on energy efficiency and network longevity. The evaluation of CBRPs has focused on essential measures such as latency, PDR, network longevity, EC, etc.

RESULT AND DISCUSSION

Figures 2-6 illustrate the significance of identifying the most effective CBRP according to the PDR, EC, EED, residual energy, alive, and dead nodes. The M-CTSP [27] achieved a higher PDR; however, it had a higher EED compared to the MNS-CBRP [16]. The HFC [23] technique attained a higher amount of residual energy compared to other

protocols, whereas the Dynamic Routing Protocol (DRP) [19] achieved lower EC compared to other protocols. The SAFCDARP [18] has more alive nodes, and the EEUMC [21] has the lowest number of dead nodes. Each protocol has specific strengths in certain metrics. These protocols lack the utilization of more parameters related to nodes, CHs, and links/paths for a robust clustering routing protocol for UWSNs.

CONCLUSION

This study presented a comprehensive review of current CBRPs in UWSNs, analyzing their benefits, limitations, and efficacy. Such protocols were evaluated according to the remaining power, PDR, EC, EED, and network longevity. The performance revealed that the M-CTSP was superior to others in both small and large-scale UWSNs. M-CTSP not only supports stable self-organizing clustering but also achieves improved reliability and energy efficiency, addressing the fundamental challenges of UWSNs and meeting the specified reliability requirements. However, it involves significant complexity and clustering overhead. Upcoming improvements will engage smart CBRPs in UWSNs utilizing machine learning techniques to effectively reduce clustering overhead. This enhances network reliability by taking into account additional factors related to the node and CHs.

Table 1: Different Acoustic Channels of UWSNs

Functional frequency range	Immediate communication range with no hopping	Bandwidth	Purposes
100–1000 kHz	< 1 km (Very short)	> 100 kHz (Very high)	Fresh water fish farm
10–100 kHz	0.1–1 km (Short)	20–50 kHz (High)	Lake/river water quality monitoring
5–10 kHz	1–10 km (Medium)	≈ 10 kHz (Medium)	Underwater mapping, localizing mineral excavations, and armed systems
1–5 kHz	10–100 km (Long)	2–5 kHz (Low)	Underwater channel monitoring and environmental hazard recognition
0.01–1 kHz	1000 km (Very long)	< 1 kHz (Very low)	Ocean monitoring and marine life monitoring

Table 2: Summary of Different Recent CBRPs in UWSNs

Ref. No.	Protocols	Benefits	Drawbacks	Achieved Efficiency
[14]	CR-NBEER	It attained lower delay and energy usage significantly.	The path loss was high and this protocol may have a drastic effect on node's efficiency in underwater areas.	EED = 19.3 ms; Energy Consumption (EC) = 7.644 J; PDR = 94.831%; Path loss = 79.9 dB
[15]	CDVGOR	It reduced energy depletion efficiently.	The PDR was low due to the existence of void nodes in the network.	Average EC = 20 nJ; PDR = 85%
[16]	MNS-CBRP	It efficiently decreased both EC and delay.	This protocol was evaluated on only a limited number of nodes, which impacts the network performance for large networks, especially in underwater regions.	EC = 0.006 mWh; Transmission delay = 11 ms
[17]	HECRA	It achieved better network lifetime, residual energy and packet transmission success rate.	It required to explore the problem of choosing the best paths and enhancing network efficiency.	No. of dead nodes = 75; Residual energy = 1.55 J; Received packets at the sink = 810
[18]	SAFCDARP	It achieved lower delay and higher network longevity.	It has higher transmission loss and energy depletion.	No. of alive nodes = 223; Transmission loss = 74 dB; EC = 47 J; EED = 65 ms

[19]	DRP	It has better stability in complex and dynamic underwater scenarios.	It is necessary to safeguard the source position privacy under passive attacks to enhance network performance.	EC = 4 J
[20]	APC-EEDBR	It significantly reduces EC and prolongs network lifespan.	It has high control overhead and route instability in highly dynamic underwater scenarios.	Mean delay = 1.63 s; EC = 39.12 J; PDR = 0.892; Network lifetime = 761.95 rounds
[21]	EEUMC	It has high scalability and energy efficiency for large networks.	It was sensitive to parameter settings.	Residual energy = 4.01 J; No. of dead nodes = 2; Received packets = 1519
[22]	UWF-RPL	It achieved better network longevity.	It has lower PDR and EC.	Alive nodes = 90; PDR = 0.62; Delay = 2.2 s; EC = 90 kJ
[23]	HFC	It reduces EC and improves network lifespan.	The PDR was low and packet loss was high.	Residual energy = 92.8 J; First node dies = 138 rounds; Packet loss = 459 packets; PDR = 90%
[24]	GSA	It achieved high network lifespan and throughput.	It has high computational load such as processing power and memory.	Network lifetime = 1367 rounds; Residual energy = 4.2 J; Throughput = 30000 bps
[25]	HDLCA	It increased energy efficiency and throughput.	It needs high computational resources, which increases delay.	Network lifetime = 1357 rounds; Residual energy = 4.3 J; Throughput = 29000 bps
[26]	CT-DEWCA	It decreases packet loss and improves throughput.	It required to pick the ideal path to enhance the PDR and system stability.	PDR = 0.9472
[27]	M-CTSP	It achieved high energy efficiency and network longevity.	It has high complexity and clustering overhead.	PDR = 95%; Latency = 120 ms; Network lifetime = 48 h

ABSTRACT

The purpose of the present study is role of digital library services in empowering women, children, and persons with disabilities usage of secondary data from major sources international and national such as UNESCO (2020), World Bank (2021), IFLA (2019), and the NDLI (2023). The findings indicate that digital libraries significantly contribute to improving access regarding education, information, and opportunities to increase skills. These platforms provide flexible and inclusive learning environments, especially benefiting those people who face economic, social or physical barriers in traditional arrangements. However, the study also underlines that the level of impact is different among various user groups. Women often benefit through improved literacy and vocational resources, while children gain access to diverse learning materials. Persons with disabilities experience enhanced accessibility through assistive technologies, although limitations still exist. Despite these benefits, challenges such as the digital division, lack of awareness, inadequate infrastructure, and non-inclusive design continue to stop the full potential of digital library services. The study concludes that although digital libraries have opened up new avenues for empowerment, more inclusive policies, better technological design, and increased awareness are needed to ensure equitable access for all marginalized groups, thereby maximizing their overall impact on society.

Keywords: digital library, secondary data, empowerment, inclusion, information literacy

INTRODUCTION

The fast progress of information technology has significantly changed the nature of knowledge and the methods of generating, storing, acquiring, and transmitting it. In this evolving digital environment, digital library services have emerged as a vital component of modern education, research, and lifelong learning. These platforms enable users to access a wide range of information resources anytime and from virtually any location, provided there is internet connectivity and basic digital literacy (UNESCO, 2020). In the contemporary context, digital libraries have moved beyond the traditional concept of digitized books and journals. They now function as comprehensive and integrated information systems offering e-books, e-journals, databases, multimedia content, and open-access resources. Such services support formal and informal education, academic research, professional growth, and social awareness by allowing users to access and utilize information in multiple formats across diverse fields (Kumar, 2022). The significance of digital library services is heightened in developing countries, where socioeconomic disparities often restrict access to quality education and information. Issues such as poor infrastructure, limited internet connectivity, and a scarcity of trained professionals impede the effective dissemination of knowledge. In this context, digital libraries serve as a bridge by providing remote and underserved populations with access to updated educational materials, health information, government services, and skill development resources (UNESCO IICBA, 2021).

Additionally, digital libraries play a vital role in empowering marginalized and vulnerable groups, especially women, children, and people with disabilities. Women benefit from access to information related to health, education, rights, and literacy. Children gain access to engaging and diverse learning materials that enhance their educational experience. Similarly, persons with disabilities are supported by accessible technology, adaptive interfaces, and other content formats that reduce informational barriers and promote inclusion (EIFL, 2019; UNESCO, 2020). This study aims to comparatively analyse the role of digital library services in empowering these groups. Using secondary data from prominent international and national organizations, it examines both the opportunities created and the challenges that persist in achieving inclusive and equitable access to digital information resources.

Research Gap

While previous studies have examined digital inclusion, limited research has comparatively analysed the impact of digital library services on women, children, and persons with disabilities together. This study aims to fill this gap.

Objectives of the Study

- To analyse the impact that digital library services have on women, children, and disabled people.
- To identify barriers and opportunities in accessing digital library services.
- To examine trends and developments in digital library services and suggest policy recommendations.

REVIEW OF LITERATURE

The growing body of literature on digital library services highlights their crucial role in promoting inclusive access to information and education. UNESCO (2020) emphasizes that digital resources significantly contribute to ensuring equal educational opportunities by enabling learners from diverse socio-economic backgrounds to access quality content. The institution further mentioned that digital platforms assist in lifelong learning and reduce geographical barriers, which particularly benefits marginalized communities. Similarly, the World Bank (2021) discusses the challenges associated with the digital divide, and points out that unequal access to digital infrastructure, devices, and skills can intensify existing social and economic inequalities. The report underlines that without targeted interventions, disadvantaged groups such as women, children, and persons with disabilities may remain excluded from the benefits of digital advancements. In addition, International Federation of Libraries and Information Associations (2019) identifies libraries as key institutions in fostering social inclusion and equitable access to information. The study highlights that digital library services, when designed inclusively, can empower vulnerable populations by providing accessible information resources, supporting education, and enhancing participation in

socio-economic activities. In summary, the reviewed literature suggests that while digital library services hold great potential for fostering inclusion and empowerment, their success hinges significantly on resolving challenges regarding access, infrastructure, and digital literacy.

RESEARCH METHODOLOGY

Nature of Study:
The current study is built upon secondary data and uses an analytical method to examine the impact of digital library services on empowering women, children, and individuals with disabilities. The use of secondary data is justified as it provides access to extensive, reliable, and authentic information already published by recognized national and international bodies.

Data Sources
Data for the study was gathered from various credible and official sources, including UNESCO (2020) reports and publications, digital inclusion data from the World Bank (2021), and reports from the International Federation of Library and Information Associations (2019), Usage statistics from the National Digital Library of India (2023) and data from theNational Sample Survey Office (NSSO), India. These sources offer comprehensive insights into digital access, usage patterns, technology adoption, and the wider impact of digital library services.

Techniques of Analysis
The study employs comparative analysis as a primary method to evaluate differences and similarities in the accessibility and utilization of digital library services among the selected groups. This approach helps in identifying disparities, challenges, and opportunities across different sections of society. In addition, percentage analysis in MS Excel served as a basic statistical tool for making data easier to understand and presenting results in a clear, comprehensible way. Overall, the adopted research methodology ensures a systematic and objective analysis of secondary data, facilitating meaningful interpretation and supporting the formulation of relevant conclusions and policy-oriented recommendations. The analysis of Table 1 and Figure 1 shows clear differences in digital access among women, children, and persons with disabilities. Children have better access to internet services, digital literacy, e-learning platforms, and digital devices compared to the other groups. Internet usage among children is 45%, while women account for 33% and persons with disabilities for 28%, this indicates that children are more involved with digital and educational resources. Digital literacy follows a similar trend. Children show the highest literacy rate at 40%, whereas women and persons with disabilities record 29% and 25% respectively. This suggests that lack of digital skills and technical knowledge continues to limit effective digital participation among marginalized groups. Children are the primary users of e-learning platforms like the National Digital Library of India (NDLI) at 55%, followed by women at 35% and people with disabilities at 30%. Device availability is also higher among children, whereas women and people with disabilities have comparatively less access to smartphones and computers.

To sum up, the results in Table 1 and Figure 1 show that while digital library services have improved access to education and information, there are still many inequalities. Therefore, we need better digital infrastructure, digital literacy programs, and inclusive technology to ensure equal digital access for all groups. According to Table 2 and Figure 2, digital inclusion has a varied impact on women, children, and people with disabilities. The results show that children gain the most from digital inclusion in terms of education. Their access to digital learning platforms, online educational resources, and e-learning tools has significantly improved learning opportunities and participation in studies. Women have been particularly affected in the area of skill development. Digital platforms, online training programs, and vocational learning opportunities have assisted women in improving their professional skills and economic participation. This indicates that digital inclusion plays a key role in women's empowerment and self-reliance. For individuals with disabilities, the most significant impact is observed in information access. Assistive technology and accessible digital services have lowered communication and

information barriers, making increased participation in education and social activities possible. However, due to limited access and training opportunities, their involvement in skill development is comparatively lower. The findings of Table 2 and Figure 2 clearly indicate that digital inclusion benefits each group in different ways. Children benefit mainly in education, women in skill development, and persons with disabilities in information access. Therefore, more inclusive digital policies, accessible technologies, and targeted training programs are necessary to ensure balanced digital empowerment for all sections of society.

The analysis of Table 3 and Figure 3 highlights the major challenges affecting digital access among different sections of society. The findings indicate that lack of internet access is the most significant barrier, accounting for 45% of the problem. This suggests that inadequate internet connectivity and digital infrastructure continue to restrict access to online educational resources, digital library services, and other digital platforms, particularly in rural and underdeveloped areas. A lack of digital literacy is the second major challenge, representing 30% of all obstacles. This indicates that many individuals do not possess the necessary technical skills and knowledge to properly utilize digital technology and online resources. This issue hits disadvantaged and marginalized groups harder, reducing their digital participation. According to the study, 15% of digital access barriers are due to a lack of devices. Limited access to smartphones, computers, and other technology stops many users from reaching e-learning services and digital information sources. Economic disparity and financial hardship are the primary causes of this issue. The language barrier is recognized as another challenge, constituting 10% of the problem. Many digital resources are available mostly in English or a limited number of languages, creating difficulties for users who prefer regional or local languages. This diminishes the accessibility and usability of digital content.In summary, the findings from Table 3 and Figure 3 demonstrate that internet connectivity and digital literacy are the primary factors influencing digital inclusion. Consequently, enhancing internet infrastructure, advancing digital literacy initiatives, improving access to affordable devices, and developing multilingual resources are crucial for guaranteeing inclusive and equitable digital access for all societal groups.

Findings of the Study

- Digital library services improve access to education and information for all groups.
- Children have the highest usage, especially in e-learning.
- Women show moderate benefits, mainly in skill development.
- Persons with disabilities gain in information access but remain the most excluded overall.
- A digital divide exists due to low internet access, digital literacy, and device availability.
- Major barriers include lack of internet, skills, devices, and language issues.

Basically, digital libraries have a lot of potential, but not everyone gets to enjoy the benefits equally

DISCUSSION

Study results indicate that digital library services are crucial for improving access to education and information for women, children, and people with disabilities. Nevertheless, the effect varies among different groups. Children show the highest level of access and usage, particularly in e-learning, which may be attributed to their greater exposure to digital education systems. In contrast, women demonstrate moderate utilization, mainly in skill development and self-learning, but continue to face limitations due to lower digital literacy and restricted access to resources. While assistive technology significantly aids people with disabilities in accessing information, they remain the most underserved group overall due to barriers in accessibility, infrastructure, and training. The study also pointed out that issues like lack of internet connectivity, low digital literacy, and low device availability contribute to the current digital divide. These findings match previous studies, emphasizing that without inclusive design and targeted interventions, digital platforms can worsen existing inequalities. Therefore, while digital library services have strong potential to promote inclusion and empowerment, their effectiveness depends on addressing structural and technological barriers to ensure equitable access for all sections of society.

Suggestions

Based on the study's findings, these suggestions are provided to enhance the impact and inclusivity of digital library services:

- Strengthen digital literacy programs, especially for marginalized communities.
- Improve internet connectivity in rural and remote areas.
- Develop inclusive, disability-friendly digital library platforms.
- Provide content in local and regional languages for better accessibility.

These measures will enhance the reach, inclusivity, and total impact of digital library services.

CONCLUSION

The study shows that digital library services are key to increasing access to education, information, and skill development among women, children, and people with disabilities. Children benefit most in terms of learning opportunities, and women benefit in skill development and participation. People with disabilities get better access to information through assistive technology, which helps promote inclusion. However, the impact varies due to challenges like low digital literacy, limited internet access, and poor infrastructure, especially in rural areas. Therefore, we must overcome these hurdles through inclusive policies and better digital infrastructure to ensure equal access and fully leverage digital libraries for inclusive and sustainable development.

Indicator	Women (%)	Children (%)	Persons with disabilities (%)
Internet use	33	45	28
Digital literacy	29	40	25
E-learning use (e.g., NDLI platforms)	35	55	30
Device availability (having a device)	40	50	32

Note: Table 1, Data is illustrative based on trends identified in secondary literature (World Bank, UNESCO, NSSO reports).

Table 2: Impact Analysis of Digital Inclusion on Different Social Groups

Dimension	Women	Children	Persons with Disabilities
Educational	High	Very High	Moderate
Skill Development	High	Moderate	Low
Information Access	Moderate	High	Very High

Note: Table **2**, This table is a conceptual comparison based on insights derived from reports by World Bank (2021), UNESCO (2020), NSSO, and NDLI resources. It is not directly extracted from a single source

Table 3: Major Challenges in Digital Access

Problem	Percentage
Lack of Internet Access	45%
Lack of Digital Literacy	30%
Lack of Devices	15%
Language Barrier	10%

Note: Table 3, The percentages shown are indicative estimates based on general trends reported by World Bank, UNESCO, NSSO, and IFLA. They are not exact figures from a single dataset

ABSTRACT

The information service sector is one of the areas that has undergone a tremendous change in the era of Artificial Intelligence (AI) and academic libraries are not an exception. Combined with Integrated Library Management Systems (ILMS) like Koha, these AI Chatbots present promising avenues for enhancing library services and user experience. This paper provides an in-depth analysis of integrating AI Chatbots into academic libraries and their influence on reference services, information retrieval, user assistance, and library automation within the context of Koha ILMS. The study is descriptive and analytical in nature which is based on the latest literature, case studies and new technological advancements in Library science. The results show that the incorporation of AI Chatbots increases accessibility, offers round-the-clock support, lessens repetitive queries, and boosts user satisfaction. But privacy, infrastructure, training and ethical issues still pose significant challenges. Based on these findings, the paper concludes that AI Chatbots are becoming a vital element of smart libraries in the future and suggests some smart strategies for their implementation in academic institutions.

Keywords: Artificial Intelligence, Chatbot, Koha ILMS, Library Automation, Conversational AI, Smart Libraries.

INTRODUCTION

AI has revolutionized the industry in a variety of fields such as education, healthcare, banking and information management, among others. The use of intelligent technologies in academic libraries to enhance service and user engagement is growing. One of these innovations that has proven to be useful is the AI-powered Chatbot, which can offer automated help, reference and information retrieval services.Libraries are currently in a highly digital environment with the users demanding responses instantly and constant access to the information services. Maintaining repetitive queries, providing around-the-clock customer service and processing the growing volume of digital resources can be a problem in traditional library systems. AI Chatbots solve these problems by using Natural Language Processing (NLP) and Machine Learning (ML) to create human-like user interactions. Koha is one of the most popular open source Integrated Library Management Systems (ILMS) used in academic libraries around the world. By incorporating AI Chatbots into Koha, the user experience can be greatly enhanced, and repetitive library tasks can be automated. AI Chatbots have been shown to have a positive impact on the accessibility, engagement, and efficiency of academic libraries through recent studies. This paper discusses the idea, implementation, advantages, problems, and prospects of using AI Chatbots in academic libraries with Koha ILMS.

Objectives of the Study

The objectives of the studyare as follows:-

- To investigate the purpose of using Artificial Intelligence(AI)Chatbots in academic libraries.
- To study the use of Chatbot in Koha ILMS.
- To learn the advantages of implementing AI Chatbots in Library services.
- To propose potential future directions in academic libraries with the adoption of Artificial Intelligence (AI).

RESEARCH METHODOLOGY

This research uses descriptive and analytical descriptive methods. Secondary data were gathered from journal articles, conference papers, case studies, research databases and recent research publications on AI, Chatbots and library automation. A review of literature was conducted to gain insight into the developments of AI Chatbots in libraries in the past few years.

Concept of Artificial Intelligence Chatbots

AI Chatbots are software programs that use AI techniques (NLP, ML, and Generative AI) to create human-like conversations. Chatbots can read the question from the user, interpret its meaning, and then return an automated answer.

There are typically three types of Chatbots:

- **Rule-Based Chatbots**: Such Chatbots are based on predetermined rules and responses. They can be used to process basic and repetitive queries.
- **AI-Based Chatbots**: AI Chatbots leverage NLP and machine learning to comprehend context, adapt to conversations, and deliver personalized answers.
- **Generative AI Chatbots**: The advanced Chatbots powered by Large Language Models (LLMs) like GPT can create naturalistic dialogues and help users access information in a more sophisticated way.

Overview of Koha ILMS

The Integrated Library Management System (ILMS) is an open source software developed in New Zealand in 1999 and used widely in the country as 'Koha'. It is able to comply with international standards like MARC21, SIP2, Z39.50, RFID integration, and multilingual.

Major Modules of Koha

- Acquisition
- Cataloguing
- Circulation
- Online Public Access Catalogue (OPAC)
- Serial Control
- Patron Management
- Reports and Analytics

The open-source nature of Koha enables third-party tools, APIs, and AI applications to be integrated into the platform, which makes it suitable for Chatbot integration.

Integration of AI Chatbots with Koha ILMS

AI Chatbots can be used in Koha via an API, plugin, web widget, or through an external conversational AI service. The Chatbot can communicate with Koha databases and OPAC systems to offer intelligent services.

Architecture of Integration

The integration framework typically consists of:

- User Interface (Website/OPAC)
- AI Chatbot Engine
- Natural Language Processing Module
- Koha Database/API
- Response Generation System

The Chatbot connects directly with Koha's bibliographic and patron database to respond to user's queries in real time.

Functional Areas of Integration

- Search books with conversational search using OPAC Assistance.
- Reference Services: The Chatbot can provide answers to commonly asked questions (FAQs) about library hours, library membership, loan policies, and digital library resources.
- Circulation Support: Users are able to see the due dates, renew books, and check borrowing history.
- Research Assistance: The AI Chatbots can help users navigate to research databases, e-journals, and citation tools.
- User Orientation: Chatbots can help new students with the library services.

Recent attempts like "LibraryGPT" illustrate the results of embedding Chatbots in Koha OPACs.

The application of AI Chatbots in academic libraries:

- 24x7 Library Assistance: Chatbots support beyond the business hours of any library, making it more accessible for remote learners and researchers.
- Automated Reference Services: Questions that are common can be answered immediately, without asking a librarian.
- Personalized User Support: AI systems can make recommendations for books, journals, databases, according to user interests and borrowing habits.
- Information Literacy Training: Chatbots can be used to educate users about using the databases, the process of citation, and plagiarism awareness.
- Multilingual Communication: AI Chatbots can facilitate multilingual communication, useful in various educational settings.
- Conversational search: Smart Discovery Systems improve the user experience by eliminating over-complicated methods of searching the OPAC.

Research suggests that AI Chatbots have a positive impact on user engagement and information access in libraries.

Benefits of AI Chatbots integration with Koha ILMS in academics libraries:

- Beyond Library Hours: Chatbots can deliver services to remote learners and researchers outside of the library's regular hours.
- Automated Reference Services: Routine reference questions may be answered without librarians' involvement.
- Personalized User Support: AI can suggest books, journals, and databases according to user interests and borrowing habits.
- Information Literacy Training: Chatbots can provide directions for database searching, citing and plagiarism awareness training.
- Multilingual Communication: AI Chatbots can facilitate multilingual communication, which is valuable in various academic settings.
- Smart Discovery Systems: Conversational search enhances the user experience by minimizing the use of complex OPAC searching techniques.

Research has shown that AI Chatbots can greatly enhance user engagement and information accessibility in libraries.

Challenges in Implementing AI Chatbots in Koha ILMS:

- Improved User Experience: Chatbots provide instant and interactive support, enhancing user satisfaction.
- Automation of repetitive work: Routine queries are handled by automation, so that the librarians can concentrate on their more advanced work.
- Improved Accessibility: Users can access services remotely via Web sites and mobile devices.
- Open Source solution: Open source platforms such as Koha will lower implementation costs.
- AI-powered Searching: Making discovery more efficient.
- Contributing to Smart Libraries: Chatbots play a role in building a smart and automated library system.

Implementation challenges of AI Chatbots:

While there are several advantages of implementing Chatbots, there are also various challenges in the process of integrating a Chatbot.

- Lack of Technical Infrastructure and AI Skills: Libraries may not have the necessary technical infrastructure and AI expertise.
- Ethical and Privacy Issues: User interaction data could be problematic for ethics and privacy.
- Financial Constraints: The implementation of advanced AI systems can involve costs of cloud services and API subscriptions.
- Accuracy Issues: Chatbots may provide inaccurate or misleading responses.
- Challenges in Embracing Technological Change: There are resistance issues among some library professionals for the use of AI technologies.
- AI Training Requirements: Library personnel need to be trained to use AI tools and manage systems.

The research has revealed that key issues in the adoption of Chatbots are privacy, trust, and organizational readiness.

Case Studies and Emerging Trends:

Case Studies: Several academic libraries worldwide have implemented AI Chatbot services.

- The LINK Chatbot, created by the University of South Florida Libraries, enhances the way the library is navigated and information is accessed, leveraging the power of generative AI technologies.
- Ivy.ai Integration: The University of Oklahoma Libraries and Leonard Lief Library (Lehman College), USA has implemented the intelligent virtual reference service by integrating with Ivy.ai.
- LibraryGPT: LibraryGPT" is a conceptual model of an AI assisted library service that is now in the process of becoming a formal commercial product, but not yet; it is being integrated through APIs, NLP, and Chatbot frameworks with Koha ILMS.

Emerging Trends: The emerging trends are:

- Generative AI integration
- Voice-enabled library assistants

- AI-based recommendation systems
- Predictive analytics in libraries

Future Scope

AI Chatbots have a wide range of possibilities in library applications. Library services will continue to be improved as a result of the advancements of Large Language Models (LLMs), Generative AI, and semantic search technologies. Future academic libraries may have the following elements:

A fully speech enabled OPAC.

- Voice-assisted library interfaces
- AI-driven research support
- Automated metadata generation
- Smart recommendation engines

AI Chatbots are expected to play a crucial role in the future of digital libraries.

Results of the Study

The study shows that:

- AI Chatbots are a great asset to academic libraries.
- Koha ILMS offers a flexible platform for use of AI.
- Chatbots enhance accessibility, responsiveness and user engagement.
- AI technologies enable libraries to increase their operational efficiency.
- Significant ethical, technical and privacy issues still persist.
- Staff preparation and organizational readiness are key to the successful implementation.

CONCLUSION

The use of an Artificial Intelligence Chatbot in academic libraries is a pivotal advancement. Conversational systems with AI enable more accessible libraries, automate mundane services, and better engage users. With the proliferation of digital learning environments, academic libraries need to embrace innovative technologies to be relevant and user-centred. While there are some challenges to consider, such as privacy concerns, infrastructure constraints, and staff training needs, the advantages of AI Chatbot integration surpass the barriers. AI solutions can transform the information landscape in the library by making it intelligent, responsive, and future-ready if implemented strategically. The combination of conversational AI and Koha ILMS represents a significant advancement in the evolution of smart academic libraries that can effectively address the changing information requirements of today's users.

Author Biography

Swapan Manna: He is a Library and Information Science professional with over 22 years of experience in academic library management, automation, digitization, and e-resource services. He is presently a Research Scholar at Mangalayatan University. His research interests include AI integration in libraries, Koha ILMS, digital repositories, knowledge management, and emerging technologies in academic libraries.

Prof. Ashok KumarUpadhyay: Prof. Upadhyay is a distinguished academician and researcher in Library and Information Science with more than 19 years of teaching and research experience. He is Professor and Head of the Department of Library and Information Science&University Librarian at MangalayatanUniversity,Aligarh. His research interests include information technology, library management, scientometrics, bibliometrics, knowledge organization, and information retrieval. He has contributed extensively as an editor, reviewer, researcher, and academic mentor in the field of Library and Information Science.

Dr. Deepmala: She is an academician and researcher in Library and Information Science with over 11 years of professional and teaching experience. She is associated with DLIS, Mangalayatan University,Aligarh. Her academic interests include information technology, library management, information retrieval, research ethics, and library administration. She has published several research papers in national and international journals and actively participates in academic seminars, conferences, and professional associations related to Library and Information Science.

ABSTRACT

Artificial Intelligence (AI) is transforming information management, user engagement, and knowledge discovery with an increased incorporation of AI into library services. AI-enabled recommendation systems, automated cataloguing for better dissemination of library resources through chatbots and predictive analytics strengthen operations across the library sector. On the other hand, there are serious ethical issues that arise from increasing AI use; especially in areas of privacy, data security, transparency and accountability, algorithmic bias, and intellectual freedom. Libraries have traditionally functioned as institutions that support equal access to information and protect the confidentiality of users, so the application of AI technologies must be consistent with these principles. This paper investigates Responsible AI in libraries by analysing specific ethical issues with impacts on practitioners, users and policymakers. This includes discussions related to fairness, inclusiveness, explainability and human oversight in AI-driven library systems. The study then illustrates emerging ethical frameworks and best practices for the governance of AI in library environments. From a forward-looking perspective, the paper highlights key areas for the responsible adoption of AI, such as ethical guidelines development, AI literacy programs in educational curricula, alliances between stakeholders and transparent regulatory mechanisms. Results also included a conclusion that highlights the need for not only new tech tools but positive technological innovation within libraries to support trust, equity, and sustainable access to information through responsible AI implementation.

Keywords*:* Responsible Artificial Intelligence (AI), Library and Information Science, AI Ethics, Algorithmic Bias, Data Privacy and Security, Information Access and Equity, AI Governance, Digital Libraries.

INTRODUCTION

Artificial Intelligence (AI) is one of the most important technology of Digital Transformation across knowledge-intensive institutions including libraries and information centres. The surge of digital information and the stage of machine learning, natural language processing techniques and data analytics have provided a new dimension to libraries with the advent of AI-powered applications in cataloguing, indexing, information retrieval, user assistance and collection management (Cox et al., 2019). These technologies have largely improved operational effectiveness and made information resources more readily available to users. Historically, libraries have been trusted institutions that promote intellectual freedom, equitable access to information, protection of privacy, and lifelong learning. AI has the potential to enhance library services through access to digital content, user behaviour predictions and decision making (Asemi & Asemi, 2018). Alongside these benefits, however, AI implementation also brings with it its own set of significant ethical concerns that must be given due attention. Algorithmic manipulation, the absence of transparency, data privacy threats, surveillance concerns, and accountability have all proved to be major challenges in the use of AI technologies (Floridi & Cowls 2019). Inadvertently, social algorithm bias can reinforce social inequity and the transparency of decision-making systems with users can erode trust in library services.

With the increasing use of user data to train and improve AI systems, the issue will become even more serious. Librarianship is the professional field responsible for protecting user privacy Ruben, 2020 so librarians must ensure that any service provided using AI offers equivalent protection from unethical, illegal data collection storage and usage. As a result, the idea of Responsible AI has emerged as a framework to build and deploy fairer, more transparent, accountable and explainable human-centred AI systems (UNESCO, 2021) now recognised worldwide. Responsible AI addresses the balance between technological innovation and ethical responsibility within the context of movie-list libraries. It highlights the importance of human supervision, inclusive design, transparency and fairness in algorithmic processes, and equal access to AI-based services. As a result, the challenges surrounding AI ethics and governance will be crucial in shaping the future of library and information services. This article investigates the ethical implications of AI adoption in libraries and considers future avenues for Responsible AI implementation that will foster trust, equity, and sustainable access to information.

Objectives of Study

- To understand the importance of AI in Library Services and Information Management.
- To pinpoint and assess the key ethical problems related to the use of AI in libraries, such as secrecy, traceability, responsibility and biased algorithms.
- Assessing the impact of AI technologies on user access, intellectual freedom and data security in library spaces.
- To examine the idea of Responsible AI and its principles to understand how they relate to applications of library and information science.
- Setting an agenda for further research and frameworks of ethical governance to facilitate the deployment and continued use of AI within libraries.

LITERATURE REVIEW

One of the area that has been heavily impacted because of fast advancing Artificial Intelligence (AI) is Library and Information Science. Libraries all over the world today are reporting use of different AI technologies for various applications including information retrieval, automating routine operation, improving user services and helping in decision making. Research interest is not only on the efficacy of applying AI in the library settings, but also rising ethical challenges that may emerge as a result of adoption. Scholarly discourse has sprung up around issues like algorithmic bias, privacy protection, transparency and accountability, and governance. This led to the emergence of the concept of Responsible AI as a framework for systems to follow ethical and societal values through transparency

and accountability. The subsequent studies offer important perspectives on the opportunities and challenges of integrating artificial intelligence into libraries and other information environments as it embeds itself. Inspired by the future implications for artificial intelligence, Bostrom (2014) raised the point that advanced AI systems have the potential to radically transform knowledge-based institutions. The writer stressed that while AI holds tremendous potential, its development and deployment in real-world settings should be informed by ethical principles and suitable governance frameworks to mitigate unintended outcomes. Russell and Norvig (2021) conducted an extensive review of AI methodologies and techniques, as exercised in various fields. They mentioned the trend of an increased use of machine learning, natural language processing, and intelligent systems in managing information. Their research indicates that libraries have the potential to incorporate such technologies into their work, complementing them in order to advance cataloguing, information retrieval or user engagement, however with a human-in-the-loop approach.

A global overview was provided by Jobin, Ienca and Vayena (2019) of AI ethics guidelines published by governments, organizations and research institutions. Their research revealed that the most quoted ethical principles are transparency, fairness, accountability, privacy and human agency. These principles are of particular importance to ensure public institutions, such as libraries, use AI for better humane and responsible purposes.According to Mittelstadt (2019), the mere introduction of ethical principles is insufficient to ensure responsible AI. The author emphasized that the establishment of mechanisms through which ethical principles can be realized —such as governance, institutional accountability, and regulation— is necessary to implement ethical principles into actual practice. We will single out this opinion, since it is particularly relevant for libraries developing services based on AI.
Winfield and Jirotka (2018) studied the need for good governance of ethics in AI and robotics; The study pointed out that transparency, explainability and accountability systems should be created by organizations interested in building public trust in AI technologies. Public-service institutions have a particular obligation to deploy ethical AI, the authors pointed out.The research produced by Martin (2019) studied the organizational responsibility in terms of AI systems. Ethical AI, the research reveals, needs multi-stakeholder involvement in implementing continuous monitoring and transparency over an entire technology lifecycle. Both the technical and social impacts of AI applications should be assessed by institutions according to an author.

Cath (2018) explored the ethical and regulatory challenges of AI governance. The study highlighted concerns over data privacy, surveillance (like listening devices), algorithmic decisions and accountability. It called for robust mechanisms to enforce user rights and issue punitive measures against any harmful tech innovations. The European Commission High-Level Expert Group on Artificial Intelligence (2019) proposed the seven key elements of Trustworthy AI which are human agency, privacy and data governance, transparency, diversity, societal well-being and accountability. These are wise recommendations and provide a good foundation for libraries looking to implement AI responsibly. A human-centered approach to AI was proposed by Shneiderman (2022), who stated that AI systems should aid — rather than replace the analytical work of the human. The author claimed transparency, user control and institutional accountability are imperative for building trust and responsible AI use. The literature reviewed in this paper shows that AI has practically huge potential of changing library services and information access, unless they are well trained to use it efficiently. On the flip side, researchers are continuously raising ethical issues regarding privacy, bias, transparency and accountability. The literature further proposes that a balanced model of Responsible AI containing technological innovation, ethical governance, human oversight and librarianship values is necessary for effective implementation.

RESEARCH METHODOLOGY

Research Design

This is a descriptive and exploratory research design and it attempts to search the ethical issues in libraries on future directions of Responsible Artificial Intelligence (AI). This research relies primarily on secondary data from academic literature, white papers, policy briefs and international codes of ethics for AI governance and library service. The

descriptive approach was appropriate since the study intends to check current knowledge, ethical issues and future of artificial intelligence in libraries.

Nature of the Study

The nature of this research is qualitative, concerned with ethical issues related to emerging AI technologies in library and information services. Ravi Kumar: The study is about how AI applications like machine learning, chatbots, recommendation systems or automated cataloging and predictive analytics are impacting library operations and user experiences. In particular, much focus is given to privacy, transparency, accountability, equity and algorithmic bias.

Sources of Data

The analysis is based only on secondary data. Relevant information was collected from: Papers Published in International peer-reviewed journals indexed by Scopus and Web of Science. User Book — Artificial Intelligence and Library Science. International organization publications (e.g. UNESCO, OECD, European Commission) Research Papers on Conference proceedings on Responsible AI Guidelines and frameworks for ethical or other professional governance applied to AI. The shift of the literature yielded clusters of themes and trends related to AI adoption in libraries.

Data Collection Method

Data from this study were extracted through a systematic review of peer-reviewed articles published between 2018–2025. Search terms included "Artificial Intelligence in Libraries," "Responsible AI," "AI Ethics," "Algorithmic Bias," "Library Automation," "Data Privacy," and "AI Governance." Selection of articles is performed with respect to relevance, quality and contributions in order to provide insight about the topic.

Data Analysis Technique

Data were analyzed using thematic analysis Using this approach allowed the researcher to extract high-level themes and patterns related to Responsible AI in libraries. Then, we grouped the literature into these themes:

- AI applications in libraries
- Ethical challenges of AI
- Privacy and data protection
- Algorithmic bias and fairness
- Transparency and accountability
- Future directions and governance framework

The findings from different studies were compared and synthesized to develop a comprehensive understanding of the research problem.

Conceptual Framework

The premise of the research study is that any successful artificial intelligence (AI) application in libraries balances technological potential with ethical accountability. The conceptual framework has three main dimensions:

- AI Technologies
- Machine Learning
- Chatbots
- Recommendation Systems
- Automated Cataloging
- Ethical Challenges
- Privacy Risks
- Algorithmic Bias
- Lack of Transparency

- Accountability Issues
- Responsible AI Principles
- Fairness
- Transparency
- Human Oversight
- Inclusiveness
- Accountability

The interaction among these dimensions influences the effectiveness and trustworthiness of AI-enabled library services.

Sample Representation of Major Ethical Issues

The following chart illustrates the relative importance of ethical concerns identified in the reviewed literature (illustrative data for research presentation purposes). Illustrative distribution of ethical concerns identified in reviewed literature.

Interpretation of the Chart

The plot shows data privacy and algorithmic bias are the most common ethical issues discussed in previous literature. There is also a keen focus on transparency and account ability as there is an alarmingly strong need to have explainable and trustworthy AI systems. Intellectual freedom issues are still a priority to library organizations because libraries have a long history of championing access to information without restraint.

Scope of the Study

This review is limited to the use of AI technologies in academic libraries, public libraries and digital libraries. The report looks into the ethical concerns and governance approaches that arise from the use of AI. The geographical scope covers worldwide literature across countries and institutional contexts.

Limitations of the Study

The study has certain limitations. Firstly, that it is purely reliant on secondary data and does not include any primary data from library professionals or users in this research study. Secondly, the pace at which AI internally changes means that new things might become available or happen between completing a study and publication. Third, ethical issues may differ among cultural, legal, and institutional contexts.

Ethical Considerations

Because the research is based on publicly available secondary sources, human participants were not involved. Thus, issues related to informed consent and participant confidentiality were not relevant. Nevertheless, the citations of all sources were provided correctly in order to not commit plagiarism and breach academic honest.

Conclusion of Methodology

Adopting a descriptive and exploratory methodology creates a structure for studying Responsible AI in libraries. By examining literature and frameworks, the paper highlights significant ethical concerns and potential paths to implementation of AI. This approach allows for the deep examination of ways in which libraries might thoughtfully implement AI technologies while upholding traditional library values: privacy, equity, transparency and intellectual freedom.

DISCUSSION

The results obtained from the current study demonstrate that Artificial Intelligence (AI) is gradually changing the way libraries operate and provide information services. From library usage in general, this model is used only for

specific service innovations; AI technologies including machine learning, natural language processing (NLP), chatbots, recommendation systems, and automated cataloging that enhance libraries by improving the efficiency of existing services or expanding public access to more personalized offerings. It helps the libraries in handling and storing more amount of information, improving information retrieval, and presenting users with quicker and relevant services. However, the report also found that the incorporation of AI into libraries will result in substantial ethical challenges requiring consideration and governance. Data privacy and confidentiality is one of the most reported challenges/issue in literature. Libraries have long regarded themselves as bastions of intellectual freedom and privacy for their users. Many AI systems are trained on large amounts of user-provided data to make recommendations, analyze behavior, and enhance how they deliver services. Although these methods can improve user experiences, they also increase the risk of unauthorized data collection, surveillance, and misuse of personal information. We believe the results indicate that libraries need to develop more sophisticated policies around data governance and also be cognizant of institutional privacy regulations to assure their users of security and trust. Algorithmic bias, another major issue identified in the study. AI systems learn from historical datasets that can include social, cultural or institutional bias. As a result, information from certain sources may be prioritized by AI-driven search engines and recommendation systems over others. The presence of such biases can undermine equitable access to information and might undermine key values of librarianship. The dialogue suggests a need for continuous monitoring, diverse datasets and regular algorithmic audits to reduce the incidence of discriminatory outcomes and foster fairness in AI-enabled library services.

CONCLUSION

The findings of the current study confirm that AI is a transformative force in library and information services. Machine learning, natural language processing, chatbots, recommendation systems and automated cataloging are some of the AI technologies that must be adopted by libraries to boost their efficiency with quicker accessibility. Advances that help libraries manage larger bodies of digital information, enhance the user experience and provide representative services. However, the study emphasizes that along with these advantages there are serious ethical, social and professional challenges resulting from a library that integrates AI. Among the key conclusions of the study is that data privacy and user confidentiality are still central to concerns with AI in libraries. The future of AI in libraries could be troubling given how fundamentally dedicated the library profession has been to protecting user information and intellectual freedom, while many have grown comfortable with systems that monitor every aspect of personal data usage acknowledging only empirical as well as indiscriminate tracking. In other words, substantial data governance frameworks and privacy protection policies need to be enforced so that the trust between libraries and users may be upheld. Another ethical issue of urgency is algorithmic bias, which has been found to adversely affect equitable access to information through automated advances. Outcomes from an AI system trained on biased or not-complete datasets can be unfair/discriminatory while the information retrieval process can lack diversity and neutrality. This goes against the fundamental principles of librarianship that call for equity, inclusion and access to information. To alleviate these risks, it is crucial to implement regular algorithm audits using diverse training datasets and ethical oversight.

An additional key takeaway is that transparency and accountability are essential prerequisites to responsible implementation of AI in Libraries. Most of the AI systems are serving as a black box or opaque models, so it is hard to understand the decision generation/decision making. Such ambiguity lowers user trust and can raise ethical issues about the dependability of the system This means that services must take critical steps towards explainable AI systems which enable both final users and professionals to fathom out the reasoning behind algorithmic decisions. Also, the authors conclude that no matter how automated works if library environments, human supervision is still absolutely necessary. AI can streamline processes and increase operational efficiency for a salon, but it cannot replicate human judgment, ethical considerations or professional expertise. Librarians can help ensure that AI systems are aligned with institutional values, user needs, and ethical standards. Thus a well-balanced collaboration of the human and artificial intelligence is very critical for us to deliver better library services. The research also

reaffirms the need of using Responsible Ai frameworks to Scaled outcome such as fairness, transparency and accountability, including deliverable on inclusiveness as well respect for human rights. These principles form a solid basis for ethical AI stewardship in libraries so that innovation does not erode social and professional values. International guidelines developed by actors such as UNESCO and the European Commission provide useful trajectories for putting responsible AI systems in place.

The study predicts that the future of libraries will, in larger part, hinge on how responsibly AI tools are implemented. To support responsible and sustainable adoption of AI within libraries, investment is needed to up skill library staff in AI literacy; develop ethical programs and policy practices for integrating AI capabilities; establish appropriate governance structures; and facilitate collaborative working between library systems teams. With careful implementation, AI may offer an opportunity for immense improvement of library services while continuing to uphold the important ideals of equity, privacy and intellectual freedom. In conclusion, the paper argues that Responsible AI is not a luxury but a necessity for building a future library. In library concepts for AI-associated implementations, ethical governance, human oversight, and value-driven exposure need to remain in the centre of everything.

ABSTRACT

The adoption of electronic resources has fundamentally reconfigured the conventional architecture of academic libraries transforming them into sophisticated Digital Knowledge Centres (DKCs). This study undertakes a comprehensive examination of the conceptual foundations classifications opportunities challenges management frameworks professional responsibilities and emerging trajectories associated with electronic resources within academic library ecosystems. Drawing upon an extensive review of existing scholarship and the analysis of secondary sources the study demonstrates how electronic resources including e books e journals scholarly databases institutional repositories open access collections and multimedia assets have substantially enhanced collection development information accessibility remote learning research efficiency and user centred service delivery. Contemporary academic libraries now facilitate uninterrupted twenty four hour access to scholarly content provide ecaonomically sustainable digital collections strengthen information retrieval mechanisms and cultivate lifelong learning environments. Despite these transformative contributions several persistent challenges continue to influence the effective utilization of electronic resources including financial constraints complex licensing frameworks digital inequities inadequate technological infrastructure deficiencies in digital competencies and long term preservation concerns. Furthermore the study highlights the evolving professional identity of librarians who increasingly function as digital resource managers technological facilitators and information literacy educators. Emerging technologies including Artificial-Intelligence

(AI) big-data Analytics cloud-computing mobile library services Open Educational Resources (OER) and smart library systems continue to redefine the future landscape of academic librarianship. The study concludes that although electronic resources constitute an indispensable component of sustainable academic library development successful digital-transformation requires the integration of strategic planning efficient management infrastructures technological innovation and continuous professional advancement. Academic libraries capable of incorporating these dimensions will remain relevant inclusive resilient and adequately prepared for the evolving digital knowledge environment.

Keywords: Electronic Resources, Academic Libraries, Digital-transformation, Electronic Resource Management Systems, Emerging Technologies

INTRODUCTION

For decades academic libraries have served as indispensable pillars supporting the teaching learning and research missions of higher educational institutions. These libraries have traditionally facilitated organized access to intellectual resources thereby functioning as the foundational infrastructure of scholarly inquiry and knowledge dissemination. Although academic libraries historically depended upon print based collections they are presently experiencing profound transformation owing to the rapid advancement of Information and Communication Technologies (ICT) digital publishing environments and globally interconnected information networks. Electronic resources have emerged as a central catalyst within this transformation fundamentally reshaping conventional library functions and enabling the development of dynamic digital knowledge ecosystems (Wathore 2018; Rawat & Kaushik 2023). Electronic resources encompass a broad spectrum of digital information assets accessible through electronic devices and networked environments. These resources include e books e journals online databases institutional repositories multimedia collections electronic theses digital archives and open access scholarly materials. The proliferation of such resources alongside the technological platforms through which they are accessed has considerably expanded the functional scope of academic libraries by facilitating rapid information delivery enhanced storage capacities advanced retrieval mechanisms and global dissemination of scholarly knowledge (Kenchakkanavar 2014; Dixit et al. 2024).

The unprecedented expansion of electronic resources has significantly transformed academic libraries from predominantly print oriented institutions into hybrid or fully digital knowledge environments. This transition has strengthened collection development practices improved accessibility to scholarly content and enabled uninterrupted remote access to academic materials irrespective of geographical location or temporal constraints (Patel & Verma 2023; Bhardwaj & Sharma 2022). The integration of electronic resources has further empowered academic libraries to support distance education interdisciplinary scholarship and highly personalized user services. Within contemporary educational frameworks academic libraries play a pivotal role by facilitating online learning promoting lifelong educational engagement and enhancing research productivity while simultaneously reducing dependency upon physical storage infrastructures and preservation expenditures. The sophisticated search functionalities accessibility features and technological interoperability of electronic resources have collectively contributed to the advancement of academic excellence across institutions of higher education (Dutta 2023; Velmurugan 2025).

Notwithstanding these transformative developments the digital evolution of academic libraries is accompanied by a range of complex challenges. These include restricted financial allocations intricate licensing and copyright regulations technological infrastructure limitations deficiencies in digital literacy and concerns relating to long term digital preservation. The effective administration of electronic resources consequently necessitates strategic institutional planning robust Electronic Resource Management Systems (ERMS) sustained organizational support and continuous professional training initiatives. Librarians occupy a pivotal position within this process of digital-transformation due to their expertise in digital resource management technological integration information literacy

instruction and user support services. Their contributions remain essential to the successful modernization and sustainability of academic libraries. Moreover the emergence of transformative technologies including Artificial-Intelligence big-data cloud based infrastructures Open Educational Resources mobile library platforms and smart library environments is expected to redefine the future trajectory of academic librarianship. This study therefore investigates electronic resources within academic libraries through an examination of their conceptual foundations classifications opportunities challenges management frameworks and future directions. The objective is to develop a comprehensive understanding of how electronic resources are reshaping contemporary library systems redefining the professional roles of librarians influencing technological advancement and contributing to the sustainable evolution of academic institutions. In doing so the study seeks to contribute meaningfully to contemporary scholarly discourse concerning the modernization of academic libraries and the creation of innovative inclusive and digitally empowered centres of knowledge.

REVIEW OF LITERATURE

Scholarly inquiry concerning the utilization of electronic resources commonly designated as e resources within academic libraries has expanded substantially across the domain of Library and Information Science. This growing body of literature acknowledges e resources as transformative instruments that have fundamentally redefined the mechanisms through which academic institutions deliver educational research oriented and informational services within contemporary knowledge environments. Among the seminal contributions to this discourse Kenchakkanavar (2014) provided a comprehensive exposition of the conceptual foundations classifications and applications of e resources encompassing e books e journals scholarly databases multimedia collections and web enabled information assets integrated into library ecosystems through digital technologies. His study demonstrated that such resources significantly enhance information accessibility while simultaneously mitigating physical storage limitations. SimilarlyWathore (2018) identified e resources as indispensable components of modern academic libraries emphasizing their capacity to facilitate instantaneous information access optimize temporal efficiency and strengthen educational quality through the rapid dissemination of scholarly content. Bhardwaj and Sharma (2022) conducted a focused investigation into the utilization of electronic information resources within university libraries and concluded that e resources substantially strengthen teaching learning and research activities by ensuring expeditious access to authoritative academic materials. Their findings further underscored the critical importance of robust digital infrastructure and enhanced user awareness in maximizing the effectiveness of electronic information systems. Correspondingly Patel and Verma (2023) reinforced this perspective by demonstrating that e resources increasingly function as strategic instruments for knowledge dissemination and service enhancement through technologically mediated access frameworks. Rawat and Kaushik (2023) examined the organizational and administrative dimensions of electronic resource management within university libraries particularly emphasizing the implementation of Electronic Resource Management Systems (ERMS).

Their analysis revealed that efficient ERMS frameworks are essential for addressing complexities associated with licensing subscription governance and technological administration. Likewise Dutta (2023) argued that software driven ERMS solutions have become indispensable for managing the escalating intricacy of digital collections while simultaneously ensuring the sustainability and operational effectiveness of electronic resource services. In their 2024 investigation Dixit et al. characterized e resources as pivotal constituents of the contemporary academic library environment. Their study highlighted the exceptional significance of these resources owing to their accessibility availability and utility in supporting increasingly sophisticated scholarly research activities. The expansion of research driven environments according to their findings necessitates a reconceptualization of the librarian's professional identity whereby technical proficiency digital competency and resource management expertise become indispensable requirements. Velmurugan (2025) subsequently examined advanced digital developments influencing academic libraries including open access repositories mobile enabled information access and strategic frameworks designed to integrate electronic resources within sustainable academic infrastructures. Despite these transformative advancements numerous scholars have identified persistent barriers to effective digital-transformation. Kavithanjali

(2019) identified several critical challenges including financial limitations inadequate digital literacy complex licensing arrangements and insufficient long term preservation strategies. Collectively these studies indicate that although academic libraries have achieved substantial progress in responding to evolving user expectations through e resources the realization of successful digital-transformation necessitates sustained institutional investment policy innovation and continuous professional development initiatives.

Objectives of the Study

- To critically examine the conceptual foundations and classifications of electronic resources currently available within academic library environments.
- To analyse the transformative influence of electronic resources on the digital evolution of library services and information delivery systems.
- To explore the principal advantages opportunities and developmental prospects associated with digitally transformed library ecosystems.
- To identify and evaluate the major challenges encountered by academic libraries in the adoption administration and sustainability of electronic resources.
- To investigate the evolving role of librarians in facilitating successful digital-transformation and optimizing the effective utilization of electronic resources.
- To determine the emerging trends technological developments and prospective future directions shaping the digital trajectory of academic libraries.

RESEARCH METHODOLOGY

The present investigation employs descriptive and analytical research methodologies utilizing secondary data sources to examine the role of electronic resources in facilitating the digital-transformation of academic libraries. The study draws extensively upon previously published scholarly literature including peer reviewed journal articles academic books conference proceedings institutional reports university library publications and related academic documents produced between 2014 and 2025 addressing electronic resources digital libraries Electronic Resource Management Systems librarian responsibilities opportunities challenges and emerging technological developments.
The collected literature was systematically reviewed critically synthesized and analytically interpreted to identify dominant themes developmental trajectories emerging patterns operational challenges and prospective directions within the field of electronic resource management and digital librarianship. Content analysis served as the principal analytical framework through which the reviewed literature was organized into thematic categories. These categories included the conceptual foundations and classifications of electronic resources available within academic and university libraries opportunities associated with electronic resource implementation challenges confronting digital resource management management systems supporting electronic resources and technological innovations influencing contemporary academic library environments. The scope of the investigation remained exclusively focused upon academic and university libraries with the objective of establishing a comprehensive scholarly foundation for future research concerning the integration of electronic resources within digitally transforming library ecosystems. The study relied entirely upon secondary data and did not incorporate primary data collection methodologies. Nevertheless the findings offer valuable insights into the evolving significance of electronic resources and their transformative impact upon contemporary academic library systems thereby contributing to a deeper understanding of digital knowledge infrastructures within higher education environments.

Concept and Types of E-Resources

Electronic Resources and Their Types

Electronic Resources commonly designated as E Resources constitute digitally mediated information assets that are accessible through computers mobile technologies and network enabled information systems. These resources

facilitate seamless access to scholarly educational and research oriented content thereby transforming conventional library service paradigms into technologically sophisticated knowledge delivery environments. Through the integration of electronic resources academic libraries have substantially enhanced the accessibility dissemination and utilization of information by enabling uninterrupted access irrespective of temporal or geographical limitations. Consequently E Resources have become indispensable instruments for advancing teaching learning research productivity and user engagement. Contemporary academic libraries increasingly prioritize the acquisition and integration of electronic resources in order to strengthen collection development optimize information dissemination and enhance overall user satisfaction.

E Books

An E Book represents a digital manifestation of a printed text that may be accessed through computers tablets smartphones or specialized electronic reading devices. E Books encompass academic textbooks reference works scholarly monographs research publications and general reading materials. Their principal advantages include portability advanced keyword retrieval bookmarking functionality annotation capabilities note taking facilities and unrestricted remote accessibility. Academic institutions extensively employ E Books to facilitate instructional activities independent scholarship and continuous learning practices.

E Journals

E Journals are scholarly and professional periodicals disseminated through electronic publishing platforms. These resources provide immediate access to contemporary research findings scholarly articles critical reviews case analyses and conference proceedings. Beyond ensuring rapid dissemination of academic knowledge E Journals support research excellence through sophisticated search functionalities comprehensive full text accessibility and enhanced discoverability of scholarly content. Academic libraries frequently subscribe to extensive digital databases containing thousands of peer reviewed electronic journals across multiple disciplines.

Online Databases

Online Databases comprise systematically organized collections of digital scholarly materials including academic articles bibliographic records research reports and specialized information resources. Prominent examples include Scopus Web of Science JSTOR Science Direct and PubMed. Such databases facilitate precise information retrieval through advanced indexing mechanisms filtering capabilities citation tracking tools and subject specific categorization systems thereby significantly enhancing research efficiency and scholarly productivity.

Institutional Repositories

Institutional Repositories are digital preservation and dissemination platforms established by universities and research organizations to archive their intellectual contributions. These repositories commonly contain theses dissertations faculty publications conference proceedings project documentation research datasets and other scholarly outputs. Institutional Repositories enhance the visibility preservation accessibility and global dissemination of institutional research achievements while simultaneously promoting open scholarly communication.

Open Access Materials

Open Access Materials refer to digital scholarly resources that are freely accessible without subscription fees or financial barriers. These resources include open access journals repositories educational content and publicly available research databases. By eliminating economic constraints Open Access Materials promote equitable knowledge dissemination democratize information accessibility and contribute significantly to reducing informational inequalities within global academic communities.

Multimedia and Digital Archives

Multimedia Resources encompass audio books podcasts educational videos webinars recorded lectures interactive learning modules and numerous other digital learning formats. Digital Archives preserve historically significant manuscripts rare books visual collections newspapers cartographic records and cultural heritage materials within

electronic environments. Together these resources enrich scholarly investigation facilitate innovative learning experiences and ensure the long term preservation of valuable intellectual and cultural assets.

Electronic Theses and Dissertations (ETDs)

Electronic Theses and Dissertations commonly abbreviated as ETDs represent digitized research documents submitted by postgraduate and doctoral scholars. These resources enhance the visibility of academic research preserve intellectual outputs and provide unrestricted access to advanced scholarly investigations thereby strengthening research dissemination and academic collaboration.

Digital Newspapers and Digital Magazines

Digital Newspapers and Digital Magazines provide immediate access to current affairs scholarly commentary professional developments industry trends and general informational content. These resources serve as valuable current awareness tools while simultaneously fostering intellectual enrichment and interdisciplinary understanding among academic users.

Electronic Reference Sources

Electronic Reference Sources include digital dictionaries encyclopedias directories handbooks bibliographies and almanacs. These authoritative resources facilitate rapid access to reliable factual information and constitute indispensable tools for academic inquiry research validation and scholarly reference activities.

CD ROMs and Offline Digital Resources

Although contemporary reliance upon CD ROMs DVDs and portable storage media has substantially declined these technologies historically represented foundational forms of electronic resources. They facilitated access to databases educational software and reference collections particularly in environments characterized by limited internet connectivity and technological infrastructure.

Library OPACs

A Library Online Public Access Catalogue commonly known as OPAC constitutes a computerized bibliographic retrieval system enabling users to identify library resources through parameters such as title author subject classification resource category and additional descriptive criteria. Advanced OPAC systems frequently integrate both print and electronic holdings thereby providing comprehensive resource discovery functionalities.

Digital Learning Platforms and MOOCs

Digital Learning Platforms including Massive Open Online Courses (MOOCs) e learning portals and digital courseware systems have increasingly emerged as significant electronic resources supporting both formal and informal educational environments. Platforms such as Coursera edX and SWAYAM exemplify the growing integration of digital learning technologies within contemporary academic ecosystems.

Research Data Repositories

Research Data Repositories function as specialized digital infrastructures designed to store datasets experimental findings survey outputs questionnaire responses and other research related materials. These repositories promote research transparency facilitate scholarly collaboration and ensure the long term accessibility and reproducibility of academic investigations.

Web Based Information Resources

Web Based Information Resources encompass scholarly websites academic blogs subject gateways and academic social networking platforms. These resources provide additional channels for scholarly communication knowledge exchange and access to specialized disciplinary information.

Open Educational Resources

Open Educational Resources commonly identified as OER comprise freely accessible instructional materials including textbooks lecture notes educational videos simulations learning modules and teaching resources. These materials may be adapted modified redistributed and reused for educational purposes thereby enhancing pedagogical innovation and educational accessibility.

Digital Preservation Systems

Digital Preservation Systems are specialized technological frameworks dedicated to ensuring the long term protection accessibility authenticity and usability of digital content. These systems play a crucial role in safeguarding academic cultural and historical resources for future generations.

Role of Electronic Resources in the Digital-transformation

Electronic Resources have emerged as one of the most transformative forces within the digital evolution of academic libraries fundamentally reshaping their organizational structures operational functions and service delivery models. The transition from print dominated collections toward digitally mediated information environments has revolutionized the processes through which libraries acquire organize preserve disseminate and facilitate access to knowledge. Through the integration of Information and Communication Technologies (ICT) academic libraries have transcended the limitations of physical infrastructure and evolved into dynamic Digital Knowledge Centres that actively support education research innovation and intellectual advancement. By enhancing accessibility research efficiency operational modernization and user engagement electronic resources have become indispensable foundations of contemporary academic institutions. Beyond their informational function they position academic libraries as technologically empowered globally interconnected and learner centred environments equipped to support the diverse requirements of modern scholarship.

Collection Development

Electronic Resources have fundamentally transformed collection development practices within academic libraries. The traditional emphasis upon physical ownership has gradually shifted toward digitally enabled access models. Historically academic libraries relied extensively upon printed books journals and reference materials that required significant storage preservation and maintenance efforts. Contemporary libraries increasingly prioritize digital collections comprising E Books E Journals online databases institutional repositories and multimedia resources. This transformation enables libraries to diversify their collections reduce operational expenditures and provide immediate access to current scholarly content through mechanisms such as consortium subscriptions demand driven acquisition models and collaborative licensing frameworks.

Access to Information

One of the most significant contributions of Electronic Resources lies in their capacity to revolutionize information accessibility. Traditional library services were frequently constrained by geographical location operational schedules and physical availability of resources. Electronic Resources have effectively removed these barriers by enabling uninterrupted twenty four hour access to scholarly materials from virtually any location. Through digital devices users can retrieve information instantly utilizing sophisticated search algorithms metadata indexing systems and advanced retrieval technologies. Such enhanced accessibility promotes educational inclusivity democratizes access to knowledge and strengthens international scholarly collaboration. Consequently Electronic Resources have become instrumental in establishing equitable information environments capable of supporting diverse academic communities across global knowledge networks.

Support for Remote Learning

The unprecedented expansion of online hybrid and distance education paradigms has substantially amplified the significance of Electronic Resources in facilitating academically enriched remote learning environments. Contemporary academic libraries increasingly function as digitally mediated educational ecosystems through the

provision of virtual textbooks electronic course content scholarly databases instructional multimedia platforms and Learning Management Systems. Such technologically enabled infrastructures foster pedagogical flexibility by ensuring uninterrupted access to knowledge irrespective of geographical constraints. Consequently Electronic Resources strengthen educational inclusivity enhance learner autonomy and substantially contribute to academic achievement across diverse learning contexts and modalities.

Research Development through Electronic Resources

Electronic Resources have emerged as indispensable catalysts in the advancement of contemporary research ecosystems through their capacity to provide immediate access to authoritative credible and intellectually diverse scholarly materials. Resources such as bibliographic databases citation indexing platforms and Open Access repositories significantly streamline the processes of literature review data acquisition and scholarly investigation. Furthermore these digital infrastructures facilitate transnational scholarly communication while accelerating access to research publications datasets analytical tools and emerging scientific developments. Collectively these capabilities contribute to enhanced research efficiency stronger international collaboration and the generation of innovative scholarly outcomes across disciplinary boundaries.

User Centred Services

The increasing integration of Electronic Resources has enabled academic libraries to transition toward highly user centred service frameworks characterized by accessibility personalization and technological responsiveness. Modern libraries now deliver virtual reference assistance online consultations customized resource recommendations digital literacy instruction and mobile enabled service platforms. Through personalized notification systems accessibility enhancing technologies and proactive user support mechanisms academic libraries have evolved into integral components of institutional academic support networks. This transformation has substantially elevated user engagement satisfaction and overall service effectiveness within digitally mediated learning environments.

Digital Opportunities Generated through Electronic Resources

The digital-transformation of academic libraries has inaugurated an entirely new paradigm of information service delivery through Electronic Resources. The movement from conventional print based systems toward technologically sophisticated digital environments has created unprecedented opportunities for flexibility accessibility scalability and user empowerment. Through the integration of information technologies with scholarly resources academic libraries have expanded their educational and research support functions while simultaneously strengthening their role as dynamic centres of knowledge dissemination. This convergence of technology and information has significantly enhanced operational efficiency institutional relevance and the strategic importance of libraries within contemporary educational ecosystems.

Continuous Remote Accessibility

Among the most transformative advantages of Electronic Resources is the capacity to provide uninterrupted access to information irrespective of temporal or geographical limitations. Unlike traditional library systems that necessitate physical presence and operate according to predetermined schedules Electronic Resources enable users to retrieve scholarly articles databases journals electronic books and institutional repositories at any time through internet enabled devices. Such perpetual accessibility strengthens academic engagement by empowering students faculty members and researchers to pursue scholarly activities without restrictions imposed by location or time. This capability has proven particularly beneficial for distance learners online students and independent researchers seeking efficient and convenient access to information resources.

Economic and Spatial Optimization

The digital-transformation facilitated through Electronic Resources has generated substantial economic and infrastructural advantages for academic libraries. Traditional print collections require considerable expenditure associated with acquisition storage maintenance and preservation. Electronic Resources substantially mitigate these

demands by delivering equivalent or superior content through digitally stored formats. Through consortium subscriptions cloud based infrastructures and collaborative licensing arrangements academic libraries are able to optimize financial resources while minimizing dependence upon physical infrastructure expansion. Consequently libraries can develop more extensive collections while simultaneously maintaining sustainable and cost effective operational models.

Enhanced Information Retrieval

Electronic Resources have revolutionized information retrieval processes through the incorporation of advanced search technologies and sophisticated discovery mechanisms. Features such as keyword searching metadata indexing subject classification Boolean retrieval systems and citation connectivity enable users to locate highly relevant information with exceptional precision and efficiency. Compared with conventional manual search methodologies these technological advancements significantly reduce retrieval time while enhancing accuracy. Such improvements contribute directly to increased scholarly productivity particularly among researchers engaged in extensive literature exploration and evidence based inquiry.

Enhanced User Satisfaction

The introduction of Electronic Resources has substantially elevated user satisfaction within academic library environments by addressing contemporary expectations regarding convenience immediacy and accessibility. Users now benefit from instantaneous access to current scholarly content personalized resource recommendations digital reference assistance and seamless compatibility across multiple technological devices. The convenience associated with remote access rapid retrieval and intuitive interface design has transformed the overall library experience into a more efficient and intellectually rewarding process. Additionally Electronic Resources support inclusive educational practices through improved accessibility for individuals with diverse learning requirements thereby strengthening the relationship between libraries and their academic communities.

Resource Sharing through Consortial Networks

Digital technologies have facilitated the emergence of collaborative resource sharing frameworks that enable academic libraries to participate in extensive consortial networks. Through cooperative agreements libraries gain access to expensive databases scholarly journals and specialized digital collections that might otherwise remain financially inaccessible. Consortia such as INFLIBNET and DELNET exemplify collaborative mechanisms through which institutions collectively acquire and share scholarly resources. This model not only reduces financial burdens but also significantly expands the availability of academic content for researchers faculty members and students. By facilitating resource pooling across local regional national and international levels consortial systems promote equitable access to knowledge regardless of institutional size or financial capacity.

Promotion of Lifelong Learning

Electronic Resources serve as powerful enablers of lifelong learning by facilitating continuous educational engagement beyond the boundaries of formal academic institutions. Resources including Open Educational Resources online courses webinars digital archives and research repositories empower individuals to pursue self directed learning according to their personal interests schedules and educational aspirations. By supporting learners across different age groups and professional contexts academic libraries contribute meaningfully to broader societal objectives centred upon knowledge empowerment intellectual growth and continuous educational development.

Integration with Emerging Technologies

The digital ecosystem created through Electronic Resources has generated extensive opportunities for integrating emerging technologies that further enhance library services and user experiences. Academic libraries are increasingly adopting Artificial-Intelligence Machine Learning big-data Analytics Cloud-computing Blockchain technologies and mobile applications within their digital infrastructures. Artificial-Intelligence powered recommendation systems facilitate personalized resource discovery while cloud based platforms enhance scalability reliability and accessibility. Blockchain technologies strengthen digital rights management whereas advanced analytics enable

libraries to understand user behaviour and formulate evidence driven strategic decisions. Collectively these technological innovations position academic libraries at the forefront of digital-transformation and future oriented knowledge management.

Challenges in Digital-transformation

Although the digital-transformation of academic libraries through the integration of Electronic Resources has substantially modernized information ecosystems and service architectures the transition has simultaneously generated a constellation of intricate challenges associated with administration implementation governance and long term sustainability. Academic libraries continue to confront multifarious financial technological legal organizational and human resource constraints that frequently impede the realization of the full transformative potential of digital resources. Unless these complexities are addressed through strategically informed institutional frameworks they may significantly undermine the capacity of libraries to acquire manage preserve and disseminate high quality scholarly resources. Consequently a comprehensive understanding of these barriers remains indispensable for the establishment of resilient and sustainable models of digital-transformation within contemporary higher education environments.

Financial Constraints and Resource Allocation

The acquisition maintenance renewal and technological enhancement of Electronic Resources constitute one of the most formidable impediments within the digital-transformation landscape. Academic libraries are required to allocate substantial financial resources toward subscriptions for electronic journals scholarly databases digital collections and multidisciplinary research platforms. Simultaneously considerable expenditure is required for hardware infrastructure software ecosystems high speed connectivity cloud based architectures cybersecurity mechanisms and continuous technological modernization. Particularly within developing economies library budgets frequently remain insufficient to sustain comprehensive digital resource ecosystems thereby generating substantial disparities in the quality scope and accessibility of scholarly information services across institutions. Such fiscal limitations continue to reinforce inequitable patterns of knowledge access among diverse academic communities.

Licensing Complexities and Copyright Restrictions

The administration of Electronic Resources is frequently complicated by highly intricate licensing arrangements copyright regulations and Digital Rights Management frameworks. Unlike conventional print materials digital resources remain governed by contractual provisions that determine conditions of access usage sharing preservation and dissemination. Restrictions concerning simultaneous usage interlibrary resource sharing reproduction permissions and institutional accessibility often create operational complexities for libraries seeking to maximize scholarly access. Furthermore evolving copyright legislation frequently introduces additional legal ambiguities regarding digital distribution and archival preservation. These regulatory constraints may inadvertently restrict equitable knowledge dissemination and consequently limit the democratization of scholarly communication.

The Persistent Digital Divide

The digital divide continues to represent one of the most profound structural barriers confronting the successful digital-transformation of academic libraries. Unequal access to internet connectivity digital devices technological infrastructure and information technologies disproportionately affects learners and researchers situated within rural geographically isolated or economically marginalized regions. Individuals lacking reliable technological access frequently encounter substantial obstacles in utilizing Electronic Resources effectively. Consequently disparities in technological accessibility intensify existing educational inequalities while simultaneously undermining broader aspirations toward universal knowledge accessibility and inclusive academic participation.

Technological Infrastructure Deficiencies

A sophisticated and resilient technological infrastructure constitutes the foundational prerequisite for the successful operation of digitally transformed academic libraries. Effective digital ecosystems require robust network connectivity scalable server architectures secure authentication frameworks interoperable digital platforms and

advanced systems management capabilities. Nevertheless numerous academic institutions continue to experience infrastructural deficiencies manifested through inadequate bandwidth obsolete technological equipment insufficient storage capacity fragmented software environments and inconsistent maintenance practices. System failures interoperability limitations and cybersecurity vulnerabilities frequently disrupt access to Electronic Resources while simultaneously diminishing user confidence and service quality. Sustained infrastructural investment therefore remains essential for ensuring reliable and uninterrupted digital service provision.

Digital Literacy and User Awareness Challenges

While Electronic Resources offer unprecedented opportunities for rapid and efficient information access their successful utilization remains contingent upon adequate levels of digital literacy and user awareness. Students researchers faculty members and other knowledge seekers often encounter difficulties associated with database navigation information evaluation resource discovery advanced search methodologies and critical assessment of digital content. Limited awareness regarding available resources further contributes to the underutilization of valuable scholarly assets. Consequently deficiencies in digital competency frequently reduce resource engagement and diminish institutional returns on technological investments. To address these challenges academic libraries must implement comprehensive information literacy initiatives user education programmes and continuous capacity building interventions.

Preservation Imperatives and Information Security Risks

The long term preservation of digital collections alongside the protection of institutional information assets remains a significant concern within contemporary Electronic Resource management. Unlike traditional print collections digital resources remain vulnerable to technological obsolescence data corruption hardware deterioration cyber intrusions unauthorized access and software incompatibilities. Effective digital preservation therefore necessitates systematic backup strategies metadata governance migration protocols and archival preservation frameworks capable of ensuring enduring accessibility. Simultaneously libraries must address increasingly sophisticated cybersecurity threats including phishing attacks ransomware incidents unauthorized data extraction and network breaches. The implementation of comprehensive preservation and security architectures is therefore indispensable for safeguarding both digital collections and institutional integrity.

Professional Development and Staff Competency Requirements

The transition toward digitally mediated library environments necessitates the acquisition of advanced professional competencies among library personnel. Contemporary information professionals must possess expertise extending across Electronic Resource acquisition metadata creation database administration licensing negotiations digital preservation technological troubleshooting and information systems management. Nevertheless many institutions encounter difficulties in providing sufficient professional development opportunities due to financial limitations workforce shortages organizational resistance to change and rapidly evolving technological landscapes. Continuous skill enhancement and lifelong professional learning have consequently become essential requirements for library personnel seeking to navigate increasingly complex digital knowledge environments while maintaining exemplary standards of service delivery and scholarly support.

Role of Librarians in Digital-transformation

The emergence of digitally transformed academic libraries has fundamentally reconfigured the professional identity and functional responsibilities of librarians within contemporary higher education ecosystems. Traditionally librarians concentrated primarily upon the stewardship of print collections and the provision of reference assistance. However the proliferation of sophisticated digital technologies has elevated librarians into multifaceted knowledge professionals functioning as Digital Information Managers Technology Facilitators Information Literacy Specialists Digital Curators and Strategic Service Providers. Their responsibilities now encompass the acquisition organization governance preservation and dissemination of Electronic Resources alongside the integration of advanced technological infrastructures within institutional knowledge environments. These evolving professional roles are

indispensable for bridging users with complex digital information architectures while simultaneously strengthening educational innovation scholarly productivity and research excellence.

Professional Competency Development

The effective administration of Electronic Resources and digitally enabled library ecosystems necessitates the continuous cultivation of advanced professional competencies among librarians. Such competencies encompass expertise in Electronic Resource Management digital repository administration metadata frameworks bibliographic standards database governance cybersecurity protocols digital preservation methodologies and emerging technological innovations. Ongoing professional development initiatives and lifelong learning practices remain essential for ensuring that librarians maintain intellectual and technical alignment with rapidly evolving technological landscapes. Through sustained competency enhancement librarians are better positioned to provide sophisticated support for contemporary digital knowledge infrastructures and emerging scholarly communication environments.

Information Literacy Education

Within the contemporary academic environment librarians perform a pivotal educational function through the promotion of information literacy competencies among students faculty members researchers and broader scholarly communities. They facilitate the development of critical skills related to information discovery evaluation interpretation ethical utilization and scholarly communication. Through workshops orientation programmes webinars personalized consultations and instructional interventions librarians guide users in database navigation citation management plagiarism awareness digital scholarship and critical assessment of online information resources. Such educational initiatives substantially enhance research capabilities while simultaneously cultivating responsible and ethically informed information practices.

Technological Adaptation and Innovation

Librarians occupy a central position in the adoption implementation and optimization of emerging technologies designed to enhance library effectiveness and user engagement. Their responsibilities frequently include the deployment of Electronic Resource Management Systems institutional repositories cloud based infrastructures mobile service platforms Artificial-Intelligence applications and advanced discovery technologies. Through informed technological selection strategic integration and continuous system evaluation librarians facilitate the transformation of academic libraries into agile intelligent and future oriented knowledge organizations capable of responding effectively to evolving scholarly requirements.

User Support and Digital Service Facilitation

Within digitally transformed library environments librarians increasingly prioritize user centred service models designed to maximize accessibility engagement and satisfaction. Their professional contributions encompass virtual reference assistance online consultations technical troubleshooting digital orientation programmes remote access support and personalized research guidance. Furthermore librarians provide expertise in citation management scholarly publishing accessibility services and digital resource utilization. Through these diverse support functions academic libraries evolve into proactive academic partners that strengthen institutional teaching learning and research missions while fostering inclusive and equitable access to knowledge.

Emerging Trends and Future Directions in Academic Libraries

The accelerated evolution of Information and Communication Technologies combined with continuously transforming user expectations is fundamentally reshaping the future trajectory of academic libraries. Emerging technological innovations are redefining the creation organization dissemination and utilization of scholarly resources while simultaneously facilitating the development of increasingly intelligent adaptive and interconnected knowledge ecosystems. Contemporary academic libraries are progressively transitioning from conventional service paradigms toward technologically sophisticated environments characterized by automation personalization interoperability and predictive intelligence. The continued adoption of these transformative developments will

enable libraries to sustain their relevance enhance research support capabilities and strengthen their strategic role within evolving educational and knowledge societies.

Artificial-Intelligence in Academic Libraries

Artificial-Intelligence has emerged as one of the most transformative technological forces influencing contemporary academic library environments. The integration of Artificial-Intelligence driven systems supports enhanced resource discovery improved user engagement and greater operational efficiency. Technologies including intelligent chatbots virtual reference assistants automated cataloguing systems recommendation engines and predictive analytics platforms enable libraries to deliver highly personalized and responsive services. Artificial-Intelligence additionally facilitates advanced search optimization automated metadata generation and sophisticated analytical capabilities that reduce administrative burdens while enriching user experiences. Future developments are expected to accelerate the emergence of intelligent library ecosystems supported by adaptive learning environments and autonomous digital assistants.

big-data and Analytical Intelligence

Big Data technologies and advanced analytical methodologies are increasingly becoming indispensable instruments for strategic decision making within academic libraries. Through the systematic analysis of resource utilization patterns user behaviour service effectiveness and institutional engagement metrics libraries are able to generate evidence informed insights that strengthen collection development budgeting strategies and service optimization initiatives. Predictive analytical models further enable libraries to identify emerging scholarly trends anticipate evolving information requirements and design highly targeted service interventions. Consequently data driven intelligence significantly enhances institutional responsiveness operational effectiveness and long term strategic planning.

Mobile Enabled Library Services

The widespread adoption of smartphones and mobile technologies has substantially accelerated the development of mobile library services across academic institutions. Contemporary libraries increasingly provide mobile optimized websites dedicated applications and digitally responsive platforms that enable seamless access to electronic books scholarly journals databases multimedia resources and virtual support services. Mobile enabled infrastructures facilitate uninterrupted learning experiences while eliminating spatial constraints traditionally associated with library utilization. By supporting flexible educational engagement and immediate information access these services substantially enhance convenience accessibility and user empowerment within contemporary learning environments.

Open Educational Resources

Open Educational Resources represent a transformative movement within higher education and academic librarianship through their promotion of unrestricted access to educational knowledge. These resources encompass open textbooks lecture materials instructional videos digital learning modules and online courses that can be freely accessed adapted redistributed and reused. Academic libraries increasingly champion Open Educational Resources through institutional integration advocacy initiatives and support mechanisms that promote equitable educational access while simultaneously reducing financial barriers associated with learning materials. Such developments contribute meaningfully to inclusive education lifelong learning and the democratization of knowledge.

Cloud Based Library Ecosystems

Cloud-computing technologies are fundamentally redefining academic library infrastructures through the provision of highly scalable flexible and economically sustainable digital environments. Cloud based library ecosystems facilitate integrated library management digital repository hosting remote resource accessibility collaborative resource sharing and centralized technological administration. By reducing dependence upon costly local infrastructures these systems enhance operational efficiency strengthen disaster recovery capabilities and improve institutional scalability. Furthermore cloud enabled architectures support seamless interoperability enhanced

accessibility and sustainable digital preservation thereby positioning academic libraries to meet future knowledge management challenges with greater resilience and adaptability.

Smart Libraries

Smart Libraries represent the most sophisticated evolutionary manifestation of contemporary academic library ecosystems wherein Artificial-Intelligence Internet of Things technologies advanced automation architectures and analytical intelligence converge to create highly responsive knowledge environments. These technologically augmented systems facilitate the delivery of intelligent services through automated circulation mechanisms RFID enabled resource administration virtual assistance platforms and personalized recommendation frameworks. Through the implementation of Smart Library infrastructures institutions are able to optimize operational performance elevate user convenience strengthen service responsiveness and significantly enhance scholarly productivity. Simultaneously these intelligent ecosystems cultivate innovative adaptive and sustainable learning environments capable of responding dynamically to the changing requirements of contemporary academic communities.

Findings of the Study

The findings of the present investigation reveal that Electronic Resources constitute the principal driving force behind the ongoing digital-transformation of academic libraries across higher education institutions. Their emergence signifies a profound reconfiguration of library structures collection development strategies and knowledge dissemination mechanisms. Electronic Resources encompass an extensive spectrum of digital formats including electronic books electronic journals scholarly databases institutional repositories Open Access resources multimedia collections and digital learning platforms thereby extending the intellectual boundaries of traditional print based collections. The analysis demonstrates that contemporary academic libraries are progressively transitioning from a paradigm centred upon physical ownership toward one fundamentally oriented around digital accessibility availability and connectivity. The study further reveals that Electronic Resources generate a multitude of institutional advantages. These resources substantially reduce physical storage requirements minimize associated maintenance expenditures facilitate continuous content updating and provide immediate access to scholarly information. Additionally they expand knowledge accessibility to broader academic communities while simultaneously enhancing flexibility in service provision. Through uninterrupted remote access Electronic Resources strengthen information accessibility support teaching learning and research activities through sophisticated retrieval functionalities and enable simultaneous utilization by multiple users. The findings therefore confirm that Electronic Resources have become indispensable instruments for supporting remote education lifelong learning initiatives and research productivity within contemporary academic environments. Through digitally mediated infrastructures academic libraries now deliver virtual learning materials scholarly databases and advanced research tools that ensure academic continuity intellectual engagement and institutional innovation.

The investigation additionally identifies several transformative opportunities generated through the adoption of Electronic Resources. These opportunities include uninterrupted remote accessibility enhanced economic and spatial efficiency improved information retrieval mechanisms elevated user satisfaction collaborative resource sharing through consortial networks and seamless integration with emerging technological innovations including Artificial-Intelligence cloud-computing infrastructures and mobile service platforms. Collectively these developments have transformed academic libraries into highly dynamic user oriented and technologically empowered knowledge institutions.Despite these significant opportunities the study simultaneously identifies a range of persistent challenges that continue to influence the effectiveness of digital-transformation initiatives. Among the most prominent barriers are financial constraints licensing complexities copyright restrictions digital inequalities infrastructural deficiencies inadequate digital literacy concerns regarding long term preservation and the growing necessity for continuous professional development among library personnel. Unless systematically addressed these challenges possess the potential to impede the sustainable advancement of digital library ecosystems and limit the realization of their transformative potential.

The findings further indicate that the professional identity of librarians has undergone a substantial transformation in response to evolving technological environments. Contemporary librarians increasingly function as digital resource administrators technological facilitators information literacy educators and strategic knowledge managers. Their responsibilities extend far beyond traditional custodial functions and now encompass the management of sophisticated digital infrastructures user education and technological innovation. Consequently continuous professional development technological adaptation and lifelong learning emerge as essential prerequisites for effective participation within digitally transformed academic environments. Furthermore the investigation highlights the growing influence of emerging technological developments including Artificial-Intelligence big-data analytics Open Educational Resources cloud based infrastructures and Smart Library ecosystems. These innovations are expected to profoundly shape the future trajectory of academic librarianship by fostering more intelligent adaptive and user responsive knowledge environments. The overarching conclusion derived from the study is that Electronic Resources have fundamentally enhanced the effectiveness relevance and strategic significance of academic libraries. Nevertheless sustained success remains contingent upon visionary leadership strategic resource management technological innovation and the capacity to address emerging challenges through proactive institutional planning.

CONCLUSIONS

The digital-transformation of academic libraries through the integration of Electronic Resources represents a profound paradigm shift in the conceptualization organization and operationalization of contemporary library systems. Electronic Resources extend far beyond the simple enhancement of information accessibility and instead redefine academic libraries as technologically sophisticated innovation driven institutions that actively facilitate education research lifelong learning and global knowledge dissemination. This transformation therefore constitutes not merely a technological advancement but a strategic institutional evolution that aligns academic libraries with the increasingly complex demands of the contemporary digital knowledge society. The findings of this study demonstrate that academic libraries have evolved from conventional repositories of recorded knowledge into dynamic digital service environments capable of delivering inclusive user centred and research intensive services. Their contemporary relevance derives from their capacity to support scholarly communication facilitate intellectual collaboration and provide equitable access to knowledge irrespective of geographical or temporal constraints. However the successful realization of this transformation cannot be achieved solely through the availability of Electronic Resources. Sustainable success is equally dependent upon effective management structures institutional commitment robust technological infrastructures and continuous professional development initiatives.

Long term sustainability requires the adoption of a cohesive strategically integrated and digitally oriented framework. Such a framework necessitates the implementation of sophisticated Electronic Resource Management Systems clearly articulated institutional policies digitally literate academic communities and continuous enhancement of librarian competencies through systematic education and training. Simultaneously academic institutions must address persistent obstacles including financial limitations technological disparities licensing complexities and infrastructural inadequacies in order to establish equitable efficient and resilient digital knowledge ecosystems. Looking toward the future academic libraries will continue to evolve through the incorporation of transformative technologies including Artificial-Intelligence big-data analytics cloud-computing architectures mobile service ecosystems and Smart Library infrastructures. These innovations collectively possess the capacity to facilitate the emergence of highly intelligent adaptive and flexible centres of academic excellence capable of responding effectively to changing scholarly expectations and technological realities. Digital-transformation should therefore be understood not as a finite achievement but as a continuous evolutionary process characterized by perpetual adaptation innovation and strategic renewal. The academic libraries that flourish within this environment will be those guided by visionary leadership technological agility institutional resilience and a sustained commitment to inclusive knowledge accessibility. By embracing these principles academic libraries will continue to play an indispensable role in advancing higher education strengthening research ecosystems and promoting equitable access to information within an increasingly digitized global society.

ABSTRACT

Due to the rapidly evolving landscape of digital resource management, it has become essential for libraries. It strives to meet the diverse needs of its users. This study has explored the challenges and opportunities associated with managing electronic resources such as e-books, journals, databases, and other digital content. It provides a comprehensive overview of effective strategies for e-resource management. The key areas include selection criteria, implementing and using, followed by the analysis of usage statistics and making the decision to renew. However, the paper addresses the significance of collaboration among library and users to enhance accessibility. By adopting best practices in e-resource management, libraries can optimize their digital collections, accessibility to enhance information resources. This study aims to provide library professionals with actionable insights and practical recommendations to navigate the complexities of e-resource management in the digital age.

Keywords: E-Resource Management, Electronic Resources, Information Management, Resource Acquisition, Access Management, Library Services

INTRODUCTION

The Internet and the World Wide Web have changed the role and format of libraries and information centres. The library is changing its old format, such as shifting from a traditional to a modern technological approach. As libraries migrated from traditional to digital, technology formats, collection development policies have shifted dramatically in recent years. In virtual/digital libraries, the optimal policy for collection development is to buy both printed and

electronic resources, both online and offline, especially based on user demand. Rapid and continuous innovation in digital technology, standards, business & publication models, practices has led to an incredibly dynamic and evolving e-resources landscape. Multiple E-resources are currently integrated, providing a single login gateway for users to access EBSCO, ProQuest, Science Direct, Emerald, and ASCE. Resources are converted from print to electronic format(Patra, 2017). The roles of the library and the librarian must be reformed to provide the best service to library users. It is also critical throughout the selection process to choose the best electronic resources based on user demand. Libraries' collection-building activities are increasingly reliant on electronic resources. "Electronic resources" are materials that require computer access (e.g., tablets, laptops, computers, kindles) and can be accessed remotely via the Internet.E-Resources are beneficial, particularly for distance-learning students who have limited time for accessing libraries via remote login. In general, they use accessible electronic resources like CD-ROMs, OPACs, and the Internet to replace print media. Libraries manage electronic resources like databases, e-journals, and e-books. A closely related term is "Electronic Resource Management System(or ERMS), which refers to systems that support" "management of the information and workflows necessary to efficiently select, evaluate, acquire, maintain, and provide informed access to electronic resources in accordance with their business and license terms"."Electronic Resource Management", also known as "E-resource Management or simply ERM", refers to a wide range of obstacles and jobs, procedures, and practices that are always growing(Pimple & Bhedekar, 2022).

E-Resources

E-resources, also known as electronic resources, comprise digital materials and information accessed and used via a multitude of devices, including computers, smartphones, tablets, and e-readers. These resources contain various types of digital content, such as e-books, e-journals, e-theses and dissertations, e-images, e-music, e-references, online dictionaries and encyclopaedias, e-newspapers, online databases, and multimedia materials. These may be delivered on CD-ROM, on tape, via the Internet, etc.(Ashikuzzaman & Ashikuzzaman, 2023a).

E-Resource Management (ERM)

Electronic Resource Management (ERM) refers to software systems for systematically and organizedly managing resources. The technique is primarily used by libraries, academic institutions, and information service providers to manage digital or electronic materials. The resources are primarily internet-based, including electronic journals, databases, and electronic books.ERM refers to the procedure encompassing the procurement, maintenance, assessment, and control of access to usage. There are numerous ERM tools available via open-access and commercial platforms. Meridian-EBSCONET-EBSCO, Verde-ExLibris, Endeavour Information Systems, 360 Resource Manager-ProQuest, True Serials,Gold Rush®-Colorado Alliance of Research Libraries, BLUE cloud eRM-SirsiDynix, Innovative Interfaces are some examples of commercial ERM products, and examples of open-source ERM tools include CORAL, CUFTS, ERmes, and SMDB. An ERM procedure comprises multiple steps, including resource identification, trial access provisioning, resource selection and so on (Verma, 2021).

Importance of ERM: Electronic Resource Management (ERM) is important, especially for libraries, academic institutions, and information service providers, due to the following reasons

Efficient Access to Information: ERM ensures that users have reliable access to a diverse set of electronic resources, including online databases, e-books, e-journals, and multimedia content. This is important to academic research, learning, and decision-making.

User satisfaction: A well-managed electronic resource system improves user satisfaction by providing easy, reliable access to the information they want. This is especially crucial in academic and research settings where quick and easy access to relevant resources is required.

Collaboration with vendors: Effective ERM requires collaboration and communication with vendors. It can establish arobust connection with a library which can do more advantageous negotiations, license agreements, and technical support.

Data Security: Implementing the access control facility in ERM makes it easy to measure the usability of electronic resources in the library. This helps to protect sensitive data and prevent unauthorised access of electronic resources.

Usage Monitoring and Decision Making: ERM can provide useful insights into resource usage patterns. This data can be analyzed to understand user behaviour, popularity of specific resources, and make data-driven decisions on renewable or cancellation of subscription.

Compliance with Licensing Agreements: ERM ensures that organizations to manage licensing agreements for each resources. This will help to reduce the copyright prevention and violation risk.

Strategic Planning: ERM assists libraries and information service providers in aligning their acquisitions of electronic resources with institutional objectives, thereby contributing to their strategic planning. It ensures that the library's digital collection remains aligned with the changing demands of its patrons and the institution's overarching objectives.

Issues and Challenges of ERM

Electronic resources have significantly surpassed library services since their inception. In fact, the majority of users express satisfaction with these benefits, as the information they need is readily available and accessible in a relatively short time. However, libraries encounter minimal obstacles and complications when implementing ERMS and delivering satisfactory services to patrons. Acquiring appropriate electronic resources is never as simple as we may believe. To obtain electronic resources, libraries face numerous obstacles and difficulties. The following are several prevalent concerns and barriers (Polade, 2022).

Insufficient Funds: Electronic resources are unambiguously used with ICT tools. Obtaining the ICT tools and infrastructure requires additional funds. Many libraries in India's school system lack enough funding. As a result, it is the most common and significant difficulty in ERMs. It is necessary to strengthen the library's resources and to obtain the necessary funds.

Technical Infrastructure: To make electronic resource management systems more effective and user-friendly, we require infrastructure such as software & hardware, high-speed internet connections, and other physical equipment. Without this technical framework, it is difficult to integrate ERMs in the library.

Licensing and Contracts: Handling and maintaining vendor and publisher licensing agreements can be challenging. Organizations must ensure that licence terms and conditions are followed, track expiry dates, and manage renewal processes. Managing multiple licenses and understanding the complexities of licensing agreements can be challenging.

Lack of Professional Skill: Handling electronic resources is not an easy undertaking; in order to handle them and deliver good services to users, skills are required. Because electronic resource management systems are not as widespread as they should be, there is a shortage of professionals skilled in their management. For educators and library personnel, librarians should take the initiative and organize training sessions for them.

Security: As an online tool, the electronic resource management system has certain drawbacks. It is difficult to ensure that unauthorized users/persons do not access online information. Cybercrime and hackers are also problems that harm ERMs. To avoid this type of issue, ERMs should include firewalls and antivirus software.

Vendor Relationships: Maintaining excellent communication and relationships with vendors and publishers is critical for problem-solving, addressing technical concerns, negotiating contracts, and staying up to date on product developments. Managing vendor relationships and providing timely responses and support can be difficult.

Copyright: Plagiarism and data piracy are major issues in electronic resource management. When data is uploaded into the system and downloaded from the source, an issue may arise. To address these concerns, librarians should address accessibility issues and inform library users about them.

Organizational Structure: Every library has a particular organizational structure based on its use and needs. Also, they have distinct laws and regulations, making it difficult for the library to deliver effective services to users. In today's digital environment, we must adapt to technological changes. So, the work will go on easily.

Lifecycle of E-Resource Management

One of the primary roles of electronic resources is to manage their lifecycle at all stages. A comprehensive description is extremely beneficial for accomplishing this task accurately. An e-resource procurement checklist can help the library evaluate, as well as buy, renew, and cancel e-resources such as "online databases, e-books, and e-journals", among others. Such a tool can be useful, particularly for those learning the fundamentals of electronic resource management. Libraries use the newly created Techniques for "Electronic Resource Management" to navigate the lifecycle of e-resources. The e-resources management lifecycle has gotten more complex, with a cyclical, iterative process replacing the standard procedure used when print resources dominated the library landscape. This approach might be exhausting, especially for a new library in the subject of collection development, mainly the subfield of e-resource management. A detailed structure of the ERMs lifecycle is given below. Electronic Resource Management (ERM) refers to the processes and strategies used to investigate, select, obtain, license, access, maintain, evaluate, retain, and preserve electronic resources in libraries.

Investigate: This step involves techniques for gathering information about the potential user and their needs, also known as user needs. Identifying e-resources for an institution requires a systematic approach to ensure the chosen resources meet the organization's needs and goals and those of its users. If the users' requirements are clear, it will be simple to proceed. Librarians and library personnel assist organizations in locating relevant electronic resources by selecting subject areas, research interests, and types of resources based on the issue at hand.

Trial Access & Acquire: Enabling the trial access to identify the information about selection. The trial access allows users to explore and assess the resources before making a final decision. Providing trial access and receiving user feedback allows institutions to make well-informed decisions about the adoption of e-resources, ensuring that the selected resources fulfil the user needs and expectations. If the particular resource is properly fulfilling the all user requirements than go for acquiring.

Implement: Implementation occurs immediately after payment to the relevant publisher or vendor. Certain factors must be considered when implementing, such as technical configuration (which should be done in collaboration with the IT department and the library), authenticating systems, configuring proxy servers, integrating library resources with library discovery services, reviewing licensing agreements for usage and access rights, data privacy, interlibrary loan policies, and so on. Implement systems for tracking and analyzing usage statistics of the implemented e-resources.

Evaluate: The evaluation and monitoring phases of the e-resource management life cycle are extremely important. This is essential when renewing E-resources for another year, entering into a multi-year contract, or dismissing E-resources, etc. The primary evaluation tools are utilization data, feedback, downtime analysis, and distinctiveness.

Review & Renew/Cancel: The choice to renew or cancel can be made by regularly reviewing and evaluating the institution and its users' search and usage patterns. Users are encouraged to submit feedback on their experiences with the implemented e-resources. This can be done through surveys, feedback forms, or direct contact with users to gather their input**.**

Preserve: In the ERM context, preservation refers to the long-term storage, maintenance, and accessibility of digital assets, such as documents, images, videos, and other electronic records. Digital preservation ensures that digital content remains accessible and usable over time after a subscription is cancelled. It considering technological changes and potential obsolescence of online access.

CONCLUSION

As the world shifts from print to electronic media, libraries face new challenges in selecting, acquiring, and retrieving electronic resources that are not as straightforward as handling print documents in the past. Electronic resources require specialized equipment to manage them. The ERM is one of the most suitable systems for this. ERM can easily manage all such processes, such as "selection, evaluation, acquisition, license agreement review, and renewal/cancellation," of e-resources. Adopting an ERMS helps libraries manage resources efficiently and provide uninterrupted services to users. Some of the challenges that affect maintaining ERMs and also managing electronic resources include a lack of professional skills, limited library funds, inadequate technical infrastructure, insufficient organizational structure and assistance, and copyright difficulties. However, advancements in information and communication technology, including the Internet, have enabled libraries to manage electronic resources than older systems better.

ABSTRACT

This study aims to examine the patterns of Social Networking Sites (SNSs) usage and their impact on students enrolled at Guru Ghasid as University (GGU) and Indira Gandhi National Tribal University (IGNTU). Data were gathered from 538 respondents through a well-structured questionnaire distributed using Google Forms. The collected data were analyzed employing both descriptive and inferential statistical methods, including percentage analysis and the chi-square test, which were applied to analyze the responses. The study reveals that Social Networking Sites are extensively utilized by students and have become an integral component of academic communication, information sharing, and learning processes. Despite their educational benefits, excessive engagement with these platforms can contribute to issues such as distraction, dependency, and a decline in direct interpersonal interactions. The analysis also highlights variations in usage behavior and perceptions between male and female students; however, the statistical results do not demonstrate a significant association between gender and the academic effects of SNS usage.

Keywords - Social Networking Sites (SNSs), social media, Academic Impact, University Students, Comparative Study, GGU, IGNTU.

INTRODUCTION

Social Networking Sites (SNSs) have become an essential part of students' academic and social lives. These Sites offer diverse opportunities for communication, collaboration, information sharing, and learning beyond traditional

classroom settings. In higher education institutions, platforms such as WhatsApp, YouTube, Instagram, and Telegram are extensively utilized for academic discussions, sharing study materials, and staying connected with peers and teachers. Despite their advantages, SNSs also present several challenges. Excessive use may negatively affect students' concentration, academic performance, physical health, and social interaction. The impact of SNS usage often varies depending on individual behavior, purpose of use, and demographic factors such as gender. Therefore, this study seeks to investigate gender-based differences in the use and impact of SNSs among students of GGU and IGNTU.

Objectives of the Study

The present study aims to

- To examine SNS usage among male and female students.
- To analyze the purposes and frequency of SNS usage.
- To assess the academic impact of SNS usage.
- To identify the major challenges associated with SNS usage.
- To evaluate the physical and psychological effects of SNS usage.

REVIEW OF LITERATURE

Siddhartha et al. (2020) examined social media use among undergraduate university students and reported that a majority of respondents were regular and commonly used Social Networking Sites (SNSs). These platforms were primarily utilized for communication, entertainment, and information sharing. Although students recognized the academic usefulness of SNSs, the study found that frequent and prolonged usage led to distraction and a decline in academic focus, thereby indicating a mixed impact on academic performance. Azizi, Soroush, and Khatony (2019) explored the phenomenon of social networking addiction among Iranian medical science students. Their findings demonstrated a statistically significant inverse relationship between SNS addiction and academic performance. The study highlighted that compulsive and excessive use of social networking platforms adversely affects students' concentration, study habits, and overall academic achievement. AlFaris et al. (2018) analyzed the patterns of social media platforms usage among medical students and their association with academic performance. The results indicated that SNSs were broadly used for both academic communication and recreational purposes. While moderate and purpose-oriented use of SNSs facilitated academic coordination and collaboration, excessive engagement was found to adversely affect academic performance. This suggests that both the intensity and purpose of SNS usage are key factors influencing academic outcomes.

Scope and Limitations

This study is confined to only two Central Universities, Guru Ghasidas Vishwavidyalaya (GGU),Bilaspur, Chhattisgarh, and Indira Gandhi National Tribal University (IGNTU), Amarkantak, Madhya Pradesh. It encompasses Undergraduate (UG), Postgraduate (PG), and researchers from various academic disciplines within these institutions. The study focuses on examining students' awareness, usage patterns, academic purposes, frequency of use, perceived impact, and challenges and barriers associated with Social Networking Sites (SNSs). However, the findings of this study are limited to the selected universities and, therefore, may not be generalized to other higher education institutions.

RESEARCH METHODOLOGY

The study adopts a descriptive and comparative survey design to investigate the use of Social Networking Sites (SNSs) among Undergraduate (UG), Postgraduate (PG), and Research Scholar students of Guru Ghasidas Vishwavidyalaya (GGU) and Indira Gandhi National Tribal University (IGNTU). Simple random sampling and quota sampling techniques were used to select the respondents. Out of 810 distributed questionnaires, 538 valid

responses were received, resulting in a response rate of 66.4%. Data were collected through a self-structured questionnaire using Google Forms. The gathered data were analyzed with the help of Microsoft Excel using statistical tools such as frequency distribution, percentage analysis, and comparative analysis.

Data Analysis

The data analysis was carried out using descriptive statistics, including frequency and percentage analysis, to compare SNS usage patterns, academic purposes, and perceived impacts among students of GGU and IGNTU. Out of the total 538 valid responses, male respondents (55.6%) outnumber female respondents (44.4%). This indicates a relatively higher participation of male respondents in the study, which may also reflect higher engagement levels with SNS platforms. Table 2 shows that WhatsApp and YouTube are the most widely used platforms among both genders. Instagram shows slightly higher usage among female students, while LinkedIn and Facebook are widely used by male students, indicating a difference in professional vs social orientation. The majority of students spend 2–4 hours a day on SNS. However, heavy usage (>4 hours) is more prevalent among male students, indicating a higher tendency toward excessive engagement. SNS is primarily used for communication and entertainment. Female students show stronger engagement in academic and exam-related activities, while male students tend to use SNSs mainly for entertainment and social networking Table 5 shows that SNS usage has a predominantly positive academic impact, especially among female students. Negative impact is minimal overall, but marginally higher among male students due to distraction and overuse.

Chi-Square text: Gender- Academic Impact

Chi-Square Value (χ^2) = 5.21
df = 2
p-value = 0.074
Interpretation: There is no statistically significant relationship was found between gender and academic impact ($p > 0.05$).

Negative Effects on Mental Well-being and Physical Health Impact

The study found that negative consequences of SNS use were reported by 68% of male students and 64% of female students; however, the type and extent of these effects differed across genders. Male students predominantly report addiction and distraction, whereas female students exhibit higher levels of anxiety and emotional stress. Furthermore, a higher proportion of female students (61%) reported a negative mental well-being impact compared to males (52%), suggesting that females are more psychologically sensitive to SNS exposure. A greater percentage of female students (63%) reported physical health issues such as eye strain and headaches compared to male students (55%). This indicates relatively higher awareness of health-related issues among females. Social, Cultural, and Trust issues The findings indicate gender-based variations in the social and ethical impacts of SNS usage. Male students (62%) report a greater reduction in in-person social interaction than females (48%), suggesting higher susceptibility to social isolation. Conversely, female students exhibit stronger concern regarding cultural values (57% vs. 49%) and trust-related issues such as misinformation and data leaks (84% vs. 76%).Overall, male students appear to be more affected with regard to social interaction, whereas females demonstrate greater cultural sensitivity and ethical awareness in SNS usage. The findings indicate that addiction remains the most critical barrier across both genders, followed by privacy and health concerns, particularly among female students. Male students, on the other hand, are more likely to experience distraction. However, the absence of statistical significance implies that these challenges are universally experienced, and gender does not play a decisive role in determining the perception of SNS-related barriers. The results indicate that female students demonstrate a stronger endorsement of SNS in academic and regulatory contexts. A higher proportion of females (78%) consider SNS essential compared to males (71%), reflecting greater perceived academic utility. Additionally, support for age-related restrictions is more pronounced among females (72%) than males (58%), suggesting a more cautious and regulation-oriented approach toward SNS usage.

Key Findings

- SNS usage is highly prevalent among students of both universities.
- WhatsApp and YouTube emerge as the most frequently utilized social media platforms.
- Most students spend 2–4 hours daily on SNS.
- SNS has a predominantly positive academic impact, especially among female students.
- Male students exhibit higher levels of distraction and excessive usage.
- Female students demonstrate higher awareness regarding privacy, health, and ethical concerns.
- Chi-square test results indicate that no significant relationship was found between gender and academic impact.

DISCUSSION

The findings of the study indicate that SNSs play both positive and negative roles in students' lives. On one hand, these platforms improve communication, academic collaboration, and access to educational resources. On the other hand, excessive use may lead to distraction, addiction, stress, and reduced social interaction. The study also highlights noticeable gender differences in SNS usage patterns. Male students were found to spend more time on SNSs and were more likely to experience distraction and excessive usage. Female students, however, showed greater awareness regarding privacy, health, and ethical concerns related to social media usage. Overall, the finding suggests that the academic benefits of SNSs depend largely on responsible and balanced usage rather than gender differences alone.

Suggestions

- Universities should promote structured academic use of SNS platforms.
- Awareness programs should be conducted on responsible SNS usage.
- Students should be trained in digital literacy and privacy protection.
- Time management strategies should be encouraged.
- Institutional guidelines for SNS usage should be developed.

CONCLUSION

The study concludes that SNS usage has become an important part of students' academic and social activities in higher education institutions. While SNSs offer several academic advantages such as communication, collaboration, and easy access to information, excessive usage may negatively affect students' academic performance, mental well-being, and social interaction. Although certain gender-based differences were observed in usage patterns and perceptions, the statistical analysis revealed no significant relationship between gender and academic impact. This suggests that the effects of SNS usage are influenced more by usage behavior, purpose, and time management than by gender itself. Therefore, students should be encouraged to use SNSs in a balanced and responsible manner to maximize academic benefits while minimizing negative consequences.

ABSTRACT

The Gut–Brain Axis (GBA) is a bidirectional network linking the gastrointestinal tract and central nervous system through neural, endocrine, immune, and microbial pathways. Its disruption underlies rising global conditions including IBS, IBD, anxiety, and sleep disorders. Ayurveda offers a parallel understanding through concepts such as *Agni*, *Mahasrotas*, *Apana Vata,* and *Udavarta*, which closely mirror modern neurogastroenterological findings. A conceptual-analytical design was used, combining review of classical Ayurvedic texts (*Charaka Samhita, Sushruta Samhita, Ashtanga Hridaya*) with peer-reviewed literature from PubMed, Google Scholar, and Scopus (2014–2025). Nine modern etiological factors — including chronic stress, poor diet, late-night eating, alcohol, sleep deprivation, social isolation, digital overload, relational conflict, and trauma — were qualitatively mapped onto their Ayurvedic counterparts. Consistent parallels were identified across all nine categories. HPA axis activation maps to *Apana Vata* vitiation; dysbiosis and intestinal permeability correspond to *Agnimandya* and *Srotorodha*; and psychosocial stressors align with *Manasika nidanas*. IBD now affects 1 in 100 people globally, and over 60% of early-onset neurological patients report sleep dysfunction, underscoring the rising prevalence of GBA disorders. Both systems converge on a shared biological principle: disruption of natural bodily

rhythms impairs gut–brain signalling and promotes chronic disease. Ayurvedic preventive tools including *Dinacharya, Ahara-Vihara,* and therapies such as *vata-anulomana* and *shodhana* offer a holistic, lifestyle-based complement to modern neurogastroenterology. Translational research validating these interventions through modern biomarkers is warranted.

Keywords: Gastrointestinal Microbiome, Ayurveda, Gut-Brain Axis, Vata, Dysbiosis.

INTRODUCTION

The Gut–Brain Axis represents the two-way communication system linking the central nervous system with the gastrointestinal tract. This network encompasses neural, hormonal, immune, and microbial pathways that collectively manage digestive functions, brain activity, mood, behaviour and overall health.The Gut–Brain Axis (GBA) is crucial for regulating and integrating gut functions, and connects the emotional and cognitive centres of the brain with peripheral intestinal processes. These processes include activation of immunity, intestinal permeability, enteric reflexes, and enter endocrine signalling. The communication within this system is facilitated by intricate neuro-immuno-endocrine pathways.(1)

Multiple regions of brain are closely interacting with gut in Gut-Brain axis. Stress is regulated by hypothalamus through the HPA axis, which releases cortisol that affects gut motility, permeability, and microbial Composition(2). The amygdalaplays a crucial role in fear and anxiety, connects stress to alterations in the gut, which is found in irritable bowel syndrome. The hippocampusis essential for memory, is influenced by inflammation and microbial byproducts, including short-chain fatty acids.The prefrontal cortex, regulates emotions and decision-making, affects gut responses and is also influenced by serotonin and GABA derived from the gut. Acharya Charaka stays that food impacts the mind, emphasising the essential significance of Ahara for both health and illness. In Ayurveda, disease manifests at the levels of both Sharir and Manas. The causes of disease are threefold, and Charaka explains that when *Dhi*(discernment), *Dhrti* (restraint), and *Smrti* (memory) become impaired, the Tridoṣa undergo vitiation(3).

The term "gut" in the Gut–Brain Axis comprises of the entire gastrointestinal tract along with its associated functional systems. This includes the stomach, small and large intestines responsible for digestion & absorption; the enteric nervous system, which governs peristalsis and interacts with the brain through the vagus nerve; the gut microbiota, consisting of trillions of microbes that generate metabolites and neurotransmitters such as serotonin and GABA; the gut-associated lymphoid tissue (GALT), which modulates inflammation via cytokines; and the enteroendocrine cells, which secrete hormones like ghrelin, leptin, and GLP-1 that affect appetite and stress responses(4). The term "*Mahasrotas*" literally means "great channel" and Ayuveda states it as encompassing the entire gastrointestinal system, from the mouth to the anus. This system includes the *Praṇavaha, Udakavaha,* and *Annavahasrotas*. A comprehensive understanding of *Mahasrotas*is essential for the diagnosis and treatment of gastrointestinal conditions, as it defines the body's ability to digest food and absorb nutrients(5). *Udavarta* refers to the disturbed upward movement of *vata*, indicating an early awareness of gut–brain dysfunction. This condition is characterized by disrupted motility, bloating, and the interplay between stress and gut health(6). The mental symptoms (*manas vikāra*) identified in *Udavarta* are closely related to findings from the gut-brain axis (GBA) that connect stress, anxiety, ability to focus and mood disorders with gut dysbiosis. Ayurvedic treatments such as *vata-anulomana, snehana, swedana,* and *sodhana* aim to restore the downward flow of vata, which is similar to modern strategies designed to enhance gut motility and vagal tone.

METHODOLOGY

Methodology included a systematic review of primary Ayurvedic texts such as *Charaka Samhita*, *Sushruta Samhita*, and *Ashtanga Hridaya*, along with modern peer-reviewed literature from Pub Med, Google Scholar, and Scopus published between 2014 and 2025. A qualitative comparative approach was used to correlate modern etiological factors such as stress, diet, alcohol, and trauma with Ayurvedic concepts like Vata prakopa, Srotorodha, and impaired Agni. Studies and textual references were included only when directly relevant to GBA-related Pathophysiology, while unrelated or non-peer-reviewed sources were excluded. The findings were synthesized narratively while respecting the distinct epistemological foundations of Ayurveda and modern biomedicine. AI tools, including Gemini and Chat GPT, were used to refine the language, improve sentence structure, and correct grammatical errors in the manuscript.

Aim

The purpose of this article is to investigate and establish the relationship between modern scientific insights into the Gut–Brain Axis (GBA) and its Ayurvedic equivalent. This will be achieved by examining traditional concepts such as Agni, Grahani, with respect to *srotas Annavaha, Rasavaha,,Manovaha* and *Udavarta*. Additionally, the article will discuss the causative factors of Gut–Brain Axis disorders as outlined in modern science which includes chronic stress, poor dietary habits, irregular lifestyle choices, and dysbiosis. Ayurveda has recognized these underlying causes for centuries, framing them in terms of *Ahara, Vihara*, *Manasika Nidanas* and *Dosha imbalance*. This study seeks to offer a comprehensive perspective that connects modern neuroscience with Ayurvedic knowledge, ultimately enhancing the understanding and management of disturbances in the Gut–Brain Axis.

Key responsible reasons for gut brain axis disorders:

- **Chronic stress:** Prolonged stress puts the body in "fight-or-flight" mode which constantly increasing adrenaline and in the body. This causes the intestinal barrier to become more permeable, inhibits gut motility, and decreases blood flow to the digestive tract. Stress alters the composition of the gut microbiota, increasing dangerous strains and decreasing good microorganisms. Anxiety, depression, ADHD and digestive problems like IBS worsen in alterations of neurotransmitter synthesis, particularly serotonin and GABA(7).
- **Bad Eating Habits:** The gut-brain axis is negatively impacted diets highly processed foods, sugar, refined carbs, and unhealthy fats. They disrupt brain transmission by increasing systemic inflammation &promote insulin resistance. Additionally, junk food modifies neurotransmitter pathways; it increases cravings and decreases serotonin production. Junk food weakens synthesis of short-chain fatty acid, which is vital for the integrity of the stomach lining and the function of the brain(8).
- **Late Night meals**- Normally, digestion slows down in the evening and the body prepares for repair and rest. Late meals force the digestive system to work against its clock, leading to reflux, bloating, and poor nutrient absorption and does, not receive its required amount of rest. This in turn leads to inteprtion of Melatonin, the sleep hormone, with insulin release leading to issues like obesity and diabetes. This also alters the gut microbiome, promoting bacterial imbalances that affect mood and cognitive function. Over time, this pattern increases the risk of metabolic disorders, poor sleep quality, and psychosomatic disorders(9).
- **Alcohol Consumption**: Alcohol directly increases intestinal permeability, induces inflammation, and undermines the gut's protective membrane. Additionally, alcohol changes the balance of the microbiome, increasing dangerous strains like Candida and decreasing good bacteria in gut leading to Gut-Brain axis disorders(10).
- **Staying up late**: Inadequate sleep lowers the release of growth hormone and melatonin, which are essential for gut lining maintenance and repair. Stress increases cortisol in body leading to physical and mental harm. Lack of sleep also promotes the dominance of dangerous bacteria and decreases the diversity of microbes in the gut. Lack of sleep affects the brain's neurotransmitter balance and emotional regulation, which exacerbates sadness and anxiety (11).

- **Social Isolation:** Loneliness lowers the bonding hormone oxytocin, which also controls gut-brain transmission, and raises cortisol in body. Depression, anxiety, cognitive decline, and even dementia is resultant to social isolation(12).
- **Digital Overload:** By frequent use of social media, releases dopamine which sets off a vicious cycle of quick reward and withdrawal. This increases tension and anxiety by interfering with the natural regulation of dopamine. Additionally, using social media late at night disrupts sleep and weakens gut-brain connection, gradually modifies gut flora, resulting in poor digestion, irritable bowel, and unstable mental health(13).
- **Relationship Difficulties**: Relationship conflict leads to continuous emotional strain, raises cortisol, stimulates the HPA axis, and encourages intestinal inflammation. In urban areas it is the main cause of exacerbate gastritis, IBS, and sleep issues(14).
- **Trauma:**Any kind of trauma gives a greater impact in the body & mind. Chronic hyper activation of the stress response brought on by emotional trauma maintains increased cortisol levels in the body. This disrupts the microbial equilibrium, destroys the intestinal lining, and promotes permeability. Trauma is closely linked to problems of the gut-brain axis as it frequently exhibits reduced diversity and increased inflammatory microorganisms(15).

DISCUSSION

Charaka claims that *Apana Vata*, which is in charge of excretion and downward movement, when disrupted leads*Udavarta*. *Apana Vata* becomes aggravated in the large intestine when a person regularly eats foods that are overly bitter, cold, dry, or astringent, or engage in behaviours like suppressing natural urges, inappropriate fasting, and excessive sexual activity(16).In due course this starts to block the body's channelsregular downward flow. Constipation, urine retention, and flatus are the first signs of this obstruction, which eventually progresses to the severe condition called as *Udavarta*.An upsetting cycle of upward-moving Vata and systemic discomfort is created by recurrent pain in the bladder, heart area, belly, flanks, back, and sides(6).

Chronic stress–Modern medicine states chronic stress is defined as an ongoing activation of the HPA axis, which leads to increased cortisol levels, decreased intestinal motility, compromised barrier function, and changed neurotransmitter balance(7). The deliberate or habitual suppression of natural urges like urine, faeces, sneezing, belching, hunger, and sleep explains a strikingly similar idea in Ayurveda. Such suppression disruptsthe normal movement of Vayu, particularly Apana Vayu, which causes pain, blockage, altered downward movement, imbalance in functions of *srotas*and eventually *Udavarta. Udavarta* effects both the physical and mental faculties and hampers its adequate function(17).

Ill food Habits - According to modern research, dysbiosis, inflammation, and decreased neurotransmitter synthesis are resultant of processed meals, refined carbs, sugary goods, and low-fiber diets. Ayurveda states foods which are*Kashaya* (astringent), *Tikta* (bitter), *Katu*(pungent), and *Ruksha* (dry) in nature aggravates *Vata* and reduces the gastrointestinal tract's natural lubrication. This aggravated *Vayu* moves out of its natural course and resides in the end of large intestine causing constipation and blockage, weaken *agni*, and dry the mucosal lininginturn leading to *Udavarta*[16]. In essence, the *Vata*aggravating food described in Ayurveda and the "ill food habits" of modern life are similar in that they both deprive the gut of nutrients, disrupt microbial balance, and hinder gut-brain communication, signaling, and deep gut-brain axis imbalance[18].

Late Night Meals–Contemporary science states that eating late at night has been shown to alter the gut flora, disturb circadian rhythm, decrease digestive efficiency, and affect glucose-insulin balance. Ayurveda has always proposed that food should only be eaten at the proper times of day and only after the previous meal has been digested. Late night meals not only upsets*jatharagni*and directly opposes natural time cycles, cause poor digestion, bloating, heaviness, and lower abdominal *Vata* aggravation. *Apana Vayu* loses its directional stability when it is made to work

against its normal timing, which makes *Udavarta* possible. For gut health and brain harmony, both sciences emphasize that meal timing is just as crucial as meal content(19).

Alcohol intake - It is very well evident that drinking alcohol damages the lining of the stomach, increases permeability, causes inflammation, and decreases the variety of microorganisms. These effects are described under *Madya* in Ayurveda, which classifies alcohol as *ushna*(hot), *tikshna* (penetrating), *ruksha* (dry), and *pitta-vardhaka*(20).When alcohol is drank incorrectly, it also aggravates *Vata, Agnimandya, srotas* blockage, *ojas* depletion, and heightened vulnerability to gastrointestinal diseases are all caused by these characteristics. Ayurvedic understanding of alcohol's disruptive effects on digestion and mental equilibrium and contemporary research on alcohol-induced disruption of the gut-brain Axis.

Staying up late - According to contemporary research, staying up late inhibits the production of growth hormone and melatonin, interferes with emotional regulation, and alters gut microbiota. These are linked to anxiety, dysbiosis, and gastrointestinal problems. According to Ayurveda, *nidra* (sleep) is one of the three foundations of health (*trayopasthambha*)(21), and *Vata prakopa* is directly caused by its suppression (*nidravegadharana*)(22). Inadequate sleep causes a series of symptoms that are similar to that of contemporary sleep research, including drying out the body, weakening digestion, inflaming the lining of the gut, and destabilizing the mind. Thus, staying up late is a traditional *Vata*-aggravating behaviour that is similar to contemporary circadian disturbance and its impact on the gut–brain axis.

Social Isolation - According to contemporary research, loneliness leads to elevated cortisol, decreased oxytocin, increased inflammation, anxiety, depression, and IBS. Ayurveda states not controlling the *dharaniyavega* causes similar digestive disorders, such as *shoka* (grief), *chinta* (anxiety), *bhaya* (fear),are mental causative factors of *Udavarta*(16). Agni, peristalsis, and the mind-gut link are all negatively impacted due to aggravated Vata. Thus, the Ayurvedic understanding of emotional variables as important causes of neurological and gastrointestinal imbalance is easily mapped onto the contemporary concept of social isolation.

Digital overload–High intake of digital data disrupts sleep, dysregulates dopamine pathways, overstimulates the nervous system, which indirectly changes the composition of gut microbes by activating chronic stress. Overexposure to visual and aural stimuli(23)which is also stated as *Atindriyaprayoga* leads to aggravation of*Vata*, strains the intellect, and upsets *Prana Vayu's* harmonizing function, all of which impair mental clarity and digestion. The strong link between overstimulation, mental instability, and gastrointestinal malfunction is highlighted by the connection between excessive sensory load by both ancient and contemporary viewpoints.

Relationship difficulties - Interpersonal conflicts causes stress, insomnia,which inturn leads to exacerbation of IBS or gastritis. Emotional disorders such as *shoka*(sorrow), *krodha* (anger), and *chinta* (worry) are categorized by Ayurveda as direct provocateurs of Vata(24).Abdominal pain, abnormal digestion, and disrupted mental processingcaused by vitiated vata disrupting the Gut-Brain axis. Therefore, both systems demonstrate that long-term relational stress has a substantial impact on the gastrointestinal and neurological systems and is not limited to the emotional domain.

Trauma - According to recent research, trauma, whether physical or mental, causes leaky gut, prolonged cortisol release, chronic hyperarousal and microbial diversity. Ayurveda acknowledges this under the category of *Manasika abhighata*(25),where *Vata*, particularly *Prana* and *Apana Vayu*, are greatly agitated by abrupt emotional shock or stress. This results *Udavarta* and its complications like reduced mental performance, disrupted digestion, and obstruction or reversal of normal digestive flow. *Vata*-agitated gut disease in Ayurveda and trauma-induced gut disruption in contemporary science are strikingly comparable, resulting in common awareness of the profound effects of emotional scars on the gut and brain.

Prevalance rate

Recent research clearly shows that gut-brain axis diseases are on the rise globally, mostly due to the fact that their underlying causes are non-negotiable part of our life. Chronic stress, poor eating habits, sleep difficulties, and emotional strainhave become ingrained in everyday modern life. Studies and articles full states that chronic stress-related neurological disorders are becoming more common. Stress-linked genetic mutations, such as GBA variations, have been found in up to 10–12% of instances of REM sleep behaviour disorder (RBD), a prodromal sign for neurodegenerative illness(26).Another major disruptor of the gut-brain axis is sleep-related dysfunctions, which has become undeniable part of life. According to recent clinical analyses, over 60% of people with early-onset neurological disorders have inadequate sleep, indicating that impaired circadian regulation directly affects gut-brain communication(27,28). In a similar vein, the prevalence of dietary and lifestyle-related gastrointestinal disorders is rapidly increasing. According to current estimates, inflammatory bowel disease (IBD) affects approximately 1 in 100 people worldwide, and its incidence is still rising, mostly due to poor eating habits and microbiome-disrupting lifestyles. All of these results show that disruption of the gut-brain axis is becoming a common consequence of contemporary life and challenging every one of us to fight it. Late-night meals, processed food consumption, digital overload, and psychological stress are increasingly aspects of daily life, leading to a consistent and quantifiable increase in illnesses mediated by the gut-brain axis.

CONCLUSION

The similarity between Ayurveda and modern science reflects a shared biological principle: disruption of the body's natural rhythm affects both digestive and mental health. Ayurvedic concepts like Agnimandya, Srotorodha, and altered Vata gati correspond closely with modern findings such as disturbed gut motility, intestinal permeability, dysbiosis, and impaired neurotransmitter activity. This strengthens the relevance of Ayurveda as a complementary framework for understanding Gut–Brain Axis disorders. With the increasing prevalence of conditions such as IBS, inflammatory bowel disease, anxiety, and sleep disturbances, preventive and integrative healthcare approaches are urgently needed. Ayurveda's emphasis on Dinacharya, Ritucharya, proper Ahara-Vihara, and emotional regulation offers a practical model for restoring gut–brain balance. In conclusion, integrating Ayurvedic principles with modern neurogastroenterology can support a more holistic and patient-centred approach to Gut–Brain Axis disorders. Future research should validate Ayurvedic interventions such as *vata-anulomana, snehana, swedana, and shodhana* using modern biomarkers related to gut health, microbiome diversity, and neurological function. This integration may help develop lifestyle-based strategies that address the root causes of gut–brain imbalance and restore harmony between body and mind.

ABSTRACT

The high rate at which social media sites are developing has greatly changed the academic world in higher education, specifically, in the professional subject like medicine. The paper is an empirical study that analyzes trends in social media use, the specificity of the academic activity, and its correlation with academic performance among undergraduate medical students in Uttarakhand, India. It took a cross-sectional research design that was descriptive and analytical with a structured questionnaire being used to collect primary data on 200 MBBS students. The behaviors of social media use, academic use of social media, perceived effects of learning, and academic performance were analyzed using descriptive statistics, correlation analysis, and multiple regression analysis. The results indicate that websites like WhatsApp, YouTube, and Telegram are much utilized in academic activities, including sharing of study materials, watching of educational videos, and engaging in academic discussions. The academic activity in social media is strongly and statistically significantly associated with academic performance, whereas the extreme overall use of social media has weak negative correlation with academic performance because of distraction and time management issues. It is concluded that social media does not necessarily have a harmful effect on medical education; instead, its academic value is determined by the type and the aim of interaction. A deliberate and active use of social media can prove to be very effective in learning and academic performance, whereas unstructured and recreational utilization will prevent the efficiency of the academic performance. The results provide significant implications to teachers and schools in designing programs to facilitate responsible and academic productive social media use in medical education.

Keywords: Social media usage; Academic engagement; Academic performance; Medical students.

INTRODUCTION

The learning environment of higher education institutions has been changed because of the rapid development of digital technologies and access to mobile internet. Of these technologies, social media applications like WhatsApp, YouTube, Instagram, Telegram, and Facebook have been entrenched in the lives of students on an academic and social level (Agarwal et al., 2024). In the case of university students, especially professional courses, social media has become an alternate learning environment where information is shared, opinions are created, and peer-to-peer support is established (Ahalawat et al., 2024). This has necessitated changes in the way that educators and researchers are looking at the academic implication of using social media in formal learning setups. Medical education is typified by a highly cognitive load, intensive curriculum and the development of professional ethics and clinical responsibility at an early stage. Students of medicine are increasingly using social media as an academic resource, which can be sharing lecture notes, discussing difficult ideas, finding tutorials on tape, and helping them study their exams. Simultaneously, uncontrollable or improper use of those platforms can cause distractions, loss of attention, academic procrastination and poor academic performance (Bahuguna et al., 2023). The duality of social media as a tool being used by a student and a possible hindrance puts a strong need to conduct a systematic study on how medical students use the media and the impact of this usage in their academic performance (Baquee et al., 2024). There is paucity of empirical studies investigating the academic impact of social media amongst medical students in the Indian context and Uttarakhand, in particular. Existing researchers study the population of most universities or non-medical students, which provides little insight on the specific academic stressors and learning requirements of the students in the field of medicine (Bhat & Gupta, 2019). Even more, previous researchers tend to focus on the time spent on social media without properly differentiating between the academically meaningful use and sheer recreation (Chhibber et al., 2024). To fill this gap, the current research aims at empirically investigating the behaviour of social media use, patterns in academic engagements and their correlation with academic performance in medical students in Uttarakhand, and may inform evidence-based approaches to education as well as institutional policies (Chugh et al., 2023).

Social Media and Medical Education

Social media has been widely accepted as an adjunct educational device in medical education. Youtube and similar platforms have access to visual demonstrations of a clinical procedure, and WhatsApp and Telegram can be used to communicate quickly, learn together, and support each other (Gautam & Bahl, 2020). These sites allow informal learning outside the classroom setting, which encourages constant exposure to academic material. Social media can be utilized in an effective manner to facilitate active learning, improve conceptual knowledge and help medical students solve problems in teams. Nonetheless, social media is also prone to the unstructured and informal nature that creates challenges (Gour et al., 2022). Constant alerts, non-academic material and multitasking can adversely affect the focus and academic discipline. In the case of medical students, who have to juggle between theoretical and practical and clinical tasks, disorderly use of social media can contribute to the stress level and worsen academic performance. This is necessary to understand how students can make the most out of these advantages and disadvantages of social media in medical Education (Gupta et al., 2023).

Need and Significance of the Study

The increased use of social media as a means of academic activity presents serious issues concerning the effects of such a tool on learning performance and academic success (Joshi et al., 2024). Although a number of foreign researches have been conducted on the correlation between the use of social media and the academic performance, the results have been inconclusive especially on professional courses like medicine (Kumar, 2024). The urgency to analyze not only the time spent with social media but also the type of interaction and its scholarly value is quite high. The research is important because it offers empirical evidence in the region, which is a scarce nation in terms of its content on social media use among Indian medical students (Kumar & Mamgain, 2023). The distinction of academic and non-academic engagement is what will allow identifying the subtle information that can help educators create a structured and purpose-oriented social media intervention (Nithiya et al., 2023).

Research Objectives

The following research objectives will guide the current study:

- To identify the trends and level of usage of social media among medical students in Uttarakhand.
- To examine the essence of academic participation of medical students on social media sites.
- To determine how social media usage behaviour is related to academic engagement and academic performance in medical students.

REVIEW OF LITREATURE

Raturi and Gupta (2024) focused on the use of educational technology among university educators and they aimed at establishing major forces that affect behavioural intention and actual use behaviour. Their article, which they introduced at the International Conference on Communication and Intelligent Systems, was premised on the frameworks of technology acceptance and emphasized that perceived usefulness, ease of use, institutional support, and digital competence played an important role in influencing the willingness of teachers to implement educational technologies into their instruction. The authors indicated that positive behavioural intention among teachers was a very important aspect in ensuring a successful use of digital platform in academic matters. Their results revealed the relevance of the intentional utilization and systematic application of technology in higher education, which forms a contextual basis of how digital platforms, such as social media, can be exploited to promote academic actions (Raturi& Gupta, 2024). The study by Sharma et al. (2022) is a cross-sectional one that aimed to determine the level of smartphone dependency and its consequences on academic performance in medical and nursing students. The research found that smartphone dependency was very prevalent and that it was greatly connected to lack of concentration, becoming more distracted in school, and poor school performance. The authors noted that extended use of smartphones adversely impacted on study practices and time management especially among medical students with busy academic timetables. The results highlighted that academic performance might be negatively affected by the unmanaged digital interactions, which supports the necessity to distinguish between the beneficial and harmful use of technologies in medical education (Sharma et al., 2022).

The research by Shrivastav and Sharma (2021) examined the factors that influence teaching engagement in higher learning institutions in Uttarakhand based on a qualitative inquiry research methodology. In their research, they found that institutional environment, technological infrastructure, administrative support and digital readiness were the most important determinants of the effectiveness of teaching engagement. The authors came to the conclusion that the use of digital tools by educators had a significant impact on the learning process and student involvement into academic activities. Even though the study targeted teachers, its results were applicable to the current study since the researchers emphasized the larger educational ecosystem students engage in social media and academic activities (Shrivastav & Sharma, 2021). Sobaih, Baquee, Palla, and Munshi (2023) explored the perceived behaviour of use of social networking sites among Indian healthcare students. Their research involved a study of the motivations, the number of times students used them, and the perceived academic and social outcomes of using social networking sites. The results showed that the medical students mostly used social media as a means of communication, seeking information and engaging with their peers with an increasing trend of using social media as an academic aid through sharing of learning resources and explaining their questions. Nevertheless, the authors also expressed their worries of overuse such as distraction and losing academic concentration. The research highlighted that the perception of usefulness and easy access to social networking sites to students played an important role in determining their engagement habits in the sites (Sobaih et al., 2023).

The research article by Tiwari et al. (2023) is a cross-sectional study that investigated the factors related to suicidal behavior in university students in North India. Though the paper did not have a specific interest in social media alone, it has put a reference on the impact of too much digital use, academic pressure, and psychological susceptibility on the mental health of students. The authors have indicated that maladaptive coping mechanisms in combination with high academic-related pressure such as problematic technology use led to negative psychological

outcomes. The results highlighted the need to comprehend the digital behavior as a component of the general context of academic stress and student well-being especially in academic fields that are stressful (Tiwari et al., 2023). Verma et al. (2024) used Motivation- Opportunity- Ability (MOA) model to investigate the community participation in sustainable tourism development in Garhwal Himalayas region of Uttarakhand. Their research revealed that individual motivation, availability of resources, and ability had a great impact on participation behavior. Although the study was on tourism development, the use of the MOA framework offered good theoretical understanding on the behavioral participation in organized situations. The focus of the authors on motivation and opportunity as motivation factors to participation was also applicable to the current study because the same behavioral process could be applied to the academic use of social media among the students(Verma et al., 2024).

Research Gap

The literature review indicated that despite some studies having been conducted on the adoption of digital technologies, smartphone dependency, social networking behaviour, and participation in tertiary education, there were still numerous gaps in the situation with medical studies in Uttarakhand. Previous studies were mostly based on technology adoption by teachers or general population of healthcare providers and university students or the mental impact of excessive use of digital devices without providing a synthesized research on the social media usage behaviour, academic performance and academic engagement of medical students. Furthermore, the majority of the studies focused on the detrimental effects of overusing technology or smartphones, and not much attention was paid to the differences between socially beneficial and detrimental social media use that supports academic activities and non-academic or recreational use. Also, theoretical models like motivation and behavioural intention were used in non-academic or non-medical studies, so their applicability in academic activity of students in social media remained uninvestigated. Therefore, there was a clear gap of region specific empirical data studying the relationships between patterns of social media use and nature of engagement that share effects on the academic performance of medical students of Uttarakhand, which the current study was designed to fill.

RESEARCH METHODOLOGY

In this section, the paper describes the systemic processes and methods that will be used to reach the mentioned research objectives of the study. It describes the method of research, design, sampling structure, data collection instruments, and the analytical techniques that were used to analyse the social media usage behaviour, academic engagement, and academic performance of medical students in Uttarakhand. It was important to focus on the methodological rigor, ethical considerations and reliability
of findings and be analytical in regards to the research problem

Research Design

The current research used a descriptive and analytical cross-sectional research design in exploring the use of social media as a behaviour, academic engagement and academic performance of medical students in Uttarakhand. Since the study is more of an exploration and that there is limited evidence in the region that is specific to the region, the research was not based on formal hypotheses but had clearly defined research objectives. The design facilitated the systematic gathering of quantitative data in a single point in time to detect the existing usage patterns and to examine relationships between important variables of study.

Study Area and Population

The research was carried out on the undergraduate medical students undertaking accredited medical colleges in Uttarakhand, India. The target group consisted of students of various academic year of the Bachelor of Medicine and Bachelor of Surgery (MBMS) programme. The study area was picked on Uttarakhand because it exhibits an increasing higher education infrastructure, and there is a scarcity of empirical research studies on digital behaviour among medical students of this area.

Sample Size and Sampling Technique

The study was done on a sample of 200 medical students. The sample size was deemed sufficient to guarantee the statistical reliability of results and substance analysis within the confines of the research objectives. The sampling technique that was used was stratified random where students were stratified according to their year of study to be represented proportionally on pre-clinical, para-clinical, and clinical levels. Simple random sampling was used to select respondents in every stratum.

Data Collection Instrument

These primary data were gathered through a structured self-administered questionnaire that was formulated with an in-depth consideration of the literature available on the topic. The questionnaire had five sections:

- Demographic Profile: Ages, gender, year of study, and residence status.
- Social Media Usage Behaviour: Type of platforms used, time spent on them on an average day, the number of times accessing it, and the main aim of the usage.
- academic Engagement on Social Media: Items that address the involvement in academic conversations, sharing of study resources, watching of educational videos, and group learning.
- Academic Performance: Academic performance reported by the individual in the form of recent examination scores or cumulative grade point average.
- Self-Regulation and Perceived Impact: The perception of the students about the importance of social media on their ability to concentrate, manage time and learning efficiency.

The responses associated with academic engagement were also assessed in terms of a five-point Likert scale, starting with strongly disagree and up to strongly agree.

Validity and Reliability of the Instrument

To take care of the content validity, subject experts in the fields of medical education and educational technology reviewed the questionnaire. On a small sample of medical students (n = 30), a pilot study was organized and adjustments were made depending on the feedback. Cronbach alpha was used to test the internal consistency of the academic engagement scale and the result was above the recommended threshold of 0.7, which shows that the scale has satisfactory reliability.

Data Collection Procedure

Online and offline methods were used to collect data in order to maximize the participation. The concerned institutions were informed and informed consent was obtained in all the respondents. The involvement was optional, and the respondents got to be assured confidentiality and anonymity. The process of data collection lasted six weeks.

Data Analysis Techniques

The data obtained were coded and analysed with statistical software like SPSS. The following techniques of analysis were used:

- Descriptive statistics (frequency, percentage, mean, and standard deviation) to compare the patterns and levels of academic engagement and use of social media.
- The study will involve correlation analysis to determine the relationship between academic performance, social media usage behaviour and academic engagement.
- Multiple regression analysis to test the hybrid effects of social media use behaviour coupled with academic engagement on academic performance.

Each of the analyses was performed at an adequate level of statistical significance.

Ethical Considerations

The research project was of ethical research. All participants were informed about the study and were guaranteed of confidentiality of their responses. No direct identifiers were identified and the data were not utilized in any other manner than academic and research.

DATA ANALYSIS AND RESULTS

The section provides the empirical study of the data obtained with 200 undergraduate medical students based in Uttarakhand. The review is based on the behaviour of social media use, academic use of social media, perceived effects of social media use on learning, and academic achievement. Due to the objectives of the research, the statistical analysis was conducted in SPSS through the descriptive statistics, correlation analysis, and regression.

Demographic Profile of Respondents

Table 1 will show the demographic profile of the medical student respondents who were part of the study. The table gives the summary of the distribution of the participants according to their gender, age group, year of study and the residence status giving a summary of the sample composition. The demographic profile indicates a well-balanced sample with respect to gender, comprising 49.0 percent male and 51.0 percent female respondents. The majority of students belonged to the 20–22 years age group (48.0 percent), followed by students below 20 years (27.0 percent) and above 22 years (25.0 percent). Representation across academic phases of the MBBS programme was proportionate, with 35.0 percent from the pre-clinical phase, 33.0 percent from the para-clinical phase, and 32.0 percent from the clinical phase. In terms of residence, a higher proportion of students were hostel residents (66.0 percent), while 34.0 percent were day scholars. Overall, the demographic distribution reflects adequate diversity and balanced representation across key categories, thereby strengthening the reliability and generalizability of the study findings.Figure 2 illustrates the distribution of respondents across different years of study in the MBBS programme, namely pre-clinical, para-clinical, and clinical phases. The bar chart shows that there is a comparatively equal representation of the respondents in the three academic stages of medical education. The pre-clinical stage represents the largest percentage of students (35.0 percent), then it is closely followed by the para-clinical (33.0 percent) and the clinical stages (32.0 percent). This unbiased representation makes sure that the views of the entire range of the medical training are also properly represented, which makes the analysis about the social media usage behaviour, academic engagement, and academic performance more comprehensive.

Social Media Usage Behaviour

This sub-sub-section examines the sites visited, the number of visits and the number of hours that the medical students spend online daily on social media. Table 2 is a summary of the behaviour of medical students in terms of their social media usage with the primary social media platforms, the average hours per day that students spend on social media, and the most common uses of social media. The table portrays various responses patterns where necessary. (*Multiple responses) The findings suggest that the WhatsApp social media platform is the most common among medical students, with 86.5 percent of the interviewees indicating that they use the platform and 78.0 percent at YouTube and 61.0 percent at Telegram. The majority of the respondents (55.5 percent) used Instagram, whereas Facebook was relatively low (28.0 percent). Concerning daily usage of social media, almost half of the students (48.5 per cent) gave a time of one to three hours per day, and 29.5 per cent gave a time of above three hours per day indicating high exposure of the social media platforms. Concerning usage purpose, a significant percentage of the respondents use it to do social or recreational activities (81.5 percent), and a considerable number of them also used it to do academic related activities (72.0 percent). These results imply that social media has a two-sided role in the life of medical students, as it has both academic and non-academic purposes.Figure 3 shows the distribution of the respondents according to the main activities that are being performed on the social media and those that are academic and social or recreational.The pie chart shows that social and recreational use have minimal edge over the academic use of social media by medical students. Nevertheless, the percentage of the academic-related use is quite high, which suggests that students actively employ social media platforms in support of their learning activities, such as receiving educational resources, exchanging study materials, and communicating with peers. The overlapping in the usage purposes is an indication of the integrated role of social media in the academic and social life of medical students as they their day to day activities.

Academic Engagement on Social Media Platforms

Likert-scale items were also used to determine academic engagement through evaluating collaborative learning, content sharing, academic discussions, and the use of educational videos. Table 3 shows the average scores of the different dimensions of academic engagement in social media, and the standard deviations of the same among medical students. The dimensions encompass sharing of academic materials, involvement in academic discussion, use of educational videos, collaborative learning and the general academic engagement. The findings indicate that there is a moderate to high academic engagement of medical students on social media platforms. The use of educational videos had the highest mean score (Mean = 4.05, SD = 0.65) meaning that students commonly use video-based materials in getting knowledge about medical concepts. The high mean score (Mean = 3.92, SD = 0.71) also indicated active peer-to-peer sharing of knowledge on sharing of academic materials. Engagement in academic discussion (Mean = 3.68, SD = 0.76) and collaborative learning (Mean = 3.74, SD = 0.73) were satisfactory in terms of the facilitative aspect of social media on interactive learning. The general academic engagement score (Mean = 3.85, SD = 0.69) is an assurance that social media is a valuable additional academic platform among medical students. Figure 4 displays the average score of the various academic engagement dimensions using the social media sites among medical students on a five-point Likert scale. The column graph helps show the changes in academic engagement intensity in the various aspects of the use of social media. Videos of educators become the most outstanding type of interactions as the exchange of academic content is the next most popular activity, indicating that students prefer content-oriented and graphically represented learning resources. There is also a significant level of interaction and learning in the academic discourses and collaborative learning, which shows that social media does not only allow interaction but also collaborative learning. On the whole, the graphical display supports the quantitative data and makes it clear that medical students use social media in academically meaningful ways that go beyond the consumption of information.

Perceived Impact of Social Media on Learning

To understand the self-regulatory aspect, the perceptions of the students with respect to concentration, time management and learning efficiency were Analysed. Table 4 gives the perception of the medical students about the influence of social media on various aspects of academic behaviour such as access to learning materials, concentration in studying, time management and exam preparation. The results show that a significant majority of the respondents found the social media to be academically valuable, with 74.5 percent of the participants agreeing that social media helps to increase the availability of learning materials and 66.0 percent of the respondents affirming the same that social media also assisted in exam preparation. There was however a significant percentage of students who reported social media use to result in negative impact as well. Particularly, 62.0 percent believed that social media leads to distraction on studying with 58.5 percent of them believing that it negatively impacts time management. The fact that there were neutral answers to the statements indicates that different students had different self-control. In general, the findings indicate the two-fold effect of social media on learning that presents both good and bad things in form of academic support and possible difficulties with concentration and time efficiency. Figure 5 demonstrates the perceived positive and negative effects of social media on academic learning in medical students in terms of the rates of agreement, neutrality, and disagreeableness with the main statements of behaviour. The stacked bar chart clearly shows that as much as most students have realized that social media has academic benefits, especially concerning better access to learning materials and exam preparation, a significant percentage also admit to the distractive effect of social media. The danger of having both positive and negative impressions is a compelling factor that underlines the necessity of exercising self-control and responsible use of social media in medical education. The figure supports the necessity of moderate and organized use of the social media sources in order to get the most out of learning and reduce the most negative influence on the attention and time management.

Relationship between Social Media Usage, Academic Engagement, and Performance

Correlation and regression tests were used to test the relationship between relevant variables. Table 5 shows the correlation table of the interrelationship between the use behaviour of social media and academic engagement of social media and the academic performance of medical students. The correlation coefficients between Pearson are

indicated with the levels of statistical significance. The correlation analysis shows the statistically significant and positive relationship between social media usage behaviour and the academic engagement ($r = 0.46$, $p < 0.01$) which means that higher use of social media is related to greater academic engagement in case it is focused on academic use. The academic performance has a high positive correlation with academic engagement ($r = 0.52$, $p < 0.01$), which indicates that students who are active on social media with academic content are likely to record better academic performance. On the contrary, the general social media use behaviour has a weak, yet significantly negative, relationship with academic performance ($r = -0.18$, $p <0.05$), suggesting that overuse or non-academic use might have some slight detrimental effect on academic performance. These findings highlight the need to separate the concept of purposeful use of academic social media and general use of social media. The academic performance of medical students and their academic engagement on social media are represented in figure 6 as a scatter plot. The scatter plot shows that there is a positive trend between academic performance and academic engagement, which implies that an increase in academic engagement with the use of social media is related to a higher academic performance. The positive distribution of the data points indicates that students attending the academically relevant activities like content sharing, academic discussions, and study of instructional videos on a regular basis are likely to do well in school. This graphical illustration supplements the results of correlation and regression, and supports the conclusion that academic engagement over social media is a major predictor of academic performance, but the number of times people use social media does not inevitably translate into academic gains.

CONCLUSION AND RECOMMENDATIONS

The current research finds that social media sites have a great and diverse role in the education of medical students in Uttarakhand. The results show that although social media is extensively utilized by medical students, both academically and socially, academically oriented use of the media through sharing of study materials, watching of educational videos and academic discussion have a strong and positive relationship with academic performance. Conversely, heavy and non-academic use has a weak, but negative correlation with academic performance, mainly by causing distraction and poor time management. The findings point to the fact that social media is not necessarily harmful to the process of learning, but its academic effects are determined by the type and the purpose of the engagement. Thoughtful and planned use of the social media could be a useful extension to the learning process in medical education, but uncontrolled and recreational excessive use can be detrimental to focus and learning performance.

- **Organized Academic Incorporation of social media:** Academic institutions are advised to institutionalize the use of social media to academic communication, sharing of contents, and collaborative learning by institutionalizing the use of chosen social media platforms, including WhatsApp, Telegram and YouTube, in the teaching learning process.
- **Digital Self-Regulation and Awareness Programs:** Medical students should be exposed to regular orientation and training programmes to improve their skills in digital self-regulation, i.e. time management, controlled use, and academic distraction due to exposure to excessive social media use.
- **Institutional Guidelines of Responsible Use:** The medical colleges should come up with institutional guidelines and best-practice frameworks of responsible and academically productive use of social media and discourage excessive non-academic use of social media during study times.

ABSTRACT

Artificial Intelligence (AI) technologies have revolutionised the definition and application of information literacy in every field. The expansion of research interest in information literacy in the age of AI, the present study investigates trends, collaboration, openness, and emerging themes in the field of information literacy over the period 2016-2025. Bibliographic information was retrieved from the Scopus database and extracted to a .csv file for performing scientometric analysis. Data carpentry method employed for OA analysis.1,576 journal articles have been analysed in Microsoft Excel, VOS viewer, Biblioshiny, Open Refine and using the Unpay wall API. The results show a significant increase in scientific publications since 2020, indicating growing interest in artificial intelligence tools that aid information literacy. In the majority, Gold Open Access and CC-BY licensing were observed, which represents a preference for open scholarly communication. The USA and China were also determined as the top two contributors in terms of research productivity and collaboration. Emerging research themes are marked by frequently cited keywords, including "artificial intelligence", "AI literacy", "generative AI", "digital literacy" and "higher education". The study offers insight for researchers, educators, librarians, and policymakers. It could contribute to further research into the ethical use of AI, digital literacy, misinformation, and AI-integrated learning environments.

Keywords: Artificial Intelligence, AI literacy, Information Literacy, Open Access, Digital Literacy, Education,

INTRODUCTION

The digital age has made information literacy a key competency in complex environments. Itallows people to identify, analyse, and properly manage information in complex settings. Traditionally, information literacy focused on basic skills related to accessing and using information. The expansion of digital technologies has significantly broadened its scope. In the modern environment, IL incorporates digital, media, and technological abilities needed to navigate large and dynamic information systems. UNESCO (2008) defines information literacy as the core of lifelong learning and active participation in the community. IL has become multidimensional, involving critical evaluation, ethical use of information, and the capacity to utilise digital resources effectively (Sharma et al., 2021). The rapid emergence of Artificial Intelligence (AI) has transformed the processes of information production, access, and interpretation. Machine learning, chatbots, and generative AI are increasingly integrated into information ecosystems, automatically generating content, making personalised recommendations, and retrieving information intelligently. The advent of generative AI, specifically ChatGPT, is a major development in knowledge creation. It allows users to create and interact with information in novel ways (Ramos et al., 2023). However, these improvements also bring problems with misinformation, algorithmic bias, and ethical issues. It makes it difficult to develophigher competencies to effectively and critically assess AI-generated content. In this regard, information and media literacy will have to change in response to trust, credibility, and responsible use of information in AI-driven contexts (Tiernan et al., 2023).

The definition of information literacy is changing to accommodate AI-related competencies. The creation and validation of the AI information literacy scale prove that AI literacy is multidimensional, which includes technical, critical, and evaluative skills to effectively engage with AI-generated information (Alon and Levkovich, 2026). The opportunities and challenges that come with AI-driven information literacy also imply the necessity of adaptive educational strategies to address emerging technological developments (Gedam, 2025).The explosive growth of this interdisciplinary field has given rise to a wide range of literature. There is an increased need to systematically analyse research trends on AI in information literacy. Information literacy with artificial intelligence cannot be restricted to a single sector but should be spread across various fields, including education, science, healthcare, business, and technology. In science, AI assists in data analysis and knowledge discovery. In education, it aids personalised learning and the development of digital competencies. In technological and industrial applications, it helps make intelligent decisions and manage information. These adoptions point to the interdisciplinary nature of AI-based information literacy and underline its increased relevance to different knowledge settings. However, many studies focus on specific aspects without providing a comprehensive overview of the research landscape. Bibliometric and scientometric methods are thus important to trace the development, form, and new trends of this discipline. Berigel and Şılbir (2024), in their bibliometric study of AI literacy studies, emphasise that the number of publications has increased significantly over the years, and the main themes of studies include digital competency, digital ethics, and the application of AI in education.

There is systematic evidence that highlights the increasingly widespread use of AI in academic settings (Ayinde et al., 2026). AI is profoundly transforming information literacy practices in academic libraries, as studies are increasing and collaboration is active worldwide (Jabeen and Lux, 2026).Libraries continue to play an important role in enhancing digital literacy and supporting effective use of information (Inamdar, 2023; Riyanti, 2025). This way, libraries can serve as central facilitators in bridging the divide between technological changes and user capabilities to support lifelong learning and informed use of knowledge. Recent investigations have focused on the role and relevance of the Open Access (OA) status, routes, and licensing support for scholarly communication. Open access increases visibility, access and dissemination of research outputs through different OA routes, with different impacts on the availability and reuse of scholarly literature. The scope of permissions for the reuse and dissemination of research outputs is given by Creative Commons licenses CC BY and its variants. A study of OA status, licence types, and publication methods raises further questions about the dissemination of knowledge in the field of information literacy in the era of artificial intelligence and makes the research more accessible. The role of AI in forming

information literacy is growing. Therefore, it is a need of the hour to systematically examine the global research trends in the same field. Information literacy is closely related to human behaviours, education and communication, digital competency and knowledge use. Thus, the Social Sciences domain is an important area in understanding the effect of artificial intelligence on information behaviours. Hence, the present study was restricted to the publications from the Social Science field so as to gain a focused and discipline-specific understanding of the research trends in this field. The study is intended to provide the scientometric analysis of the literature on the topic of information literacy in the age of artificial intelligence between 2016 and 2025, with a focus on its development, collaboration, open access status, licensing patterns, and OA routes.

LITERATURE REVIEW

Scholarly interest has risen over the last few years in Information Literacy as a main competency in the digital age. Sharma et al. (2021) in their paper described Information Literacy as the capacity to identify, assess, and ethically utilise information. This highlightsits importance in lifelong learning and decision-making. Equally, Tiernan et al. (2023) underscored that the current frameworks of information literacy have not been sufficiently revised to reflect emerging technological changes,which means they need more adaptive IL frameworks. The rapid growth of Artificial Intelligence (AI) has shaped research in various disciplines. Wang et al. (2024) found significant applications of AI in education, but it is not limited to adaptive learning and smart assessment. Berigel and Şılbir (2024) noted a sharp increase in AI-related studies since 2020. Ramos et al. (2023) addressed the transformative potential of AI tools such as Chat GPT, as well as ethical concerns, and Gedam (2025) discussed opportunities like personalised learning and challenges like bias, misinformation, and privacy concerns associated with AI. The integration of AI into Information Literacy has become a popular area of research. Alon and Levkovich (2026) created an AI Information Literacy Scale that revealed moderate levels of competency among users. In a scientometric investigation by Jabeen and Lux (2026), found that the rapid growth of AI-integrated IL research is increasing, with a particular focus on ethics and professional skills. Mirza et al. (2026) discovered that students know AI tools exist, but they need formal AI literacy to better understand, think critically and use AI ethically. These investigations suggest a move towards AI-based IL setups. Within the library context, the literature has identified the changing role of libraries in enhancing information literacy through the use of AI. Riyanti (2025) demonstrated that libraries aid in combating misinformation and promoting digital literacy through training and access to credible sources. In amdar (2023) has highlighted libraries as providers of digital inclusion and libraries as providers of AI applications in libraries, along with issues such as skill deficiencies and ethical issues (Jyoti and Kumar, 2024; Ayinde et al., 2026). In general, the literature indicates a shift between traditional IL toward AI-comprising literacy, where libraries are at the centre in empowering effective and ethical use of information in the digital environment.

Objectives

- To examine chronological growth and impact on citation on AI-driven information literacy (2016-2025).
- To explore the Open Access ecosystem, including OA growth, OA routes, and licensing.
- To determine the most productive and influential contributors in information literacy in the age of artificial intelligence.
- To explore patterns of collaboration of countries and the most frequent keywords.

METHODOLOGY

Data source and data collection

This paper uses scientometrics to examine research patterns of information literacy in the era of Artificial Intelligence. Scientometrics offers a quantitative method to study the patterns of scholarly communication, such as the growth of publications, impact of citations, and structure of collaboration, thus providing a systematic understanding of a field of study. The bibliographic information was taken from the Scopus database between 2016 and 2025. To locate the relevant literature, a structured search query was used:

(TITLE-ABS-KEY("information literacy" OR "digital literacy" OR "information skills" OR "AI literacy") AND TITLE-ABS-KEY("AI" OR "artificial intelligence" OR "machine learning" OR "generative AI" OR "chatbots"))
AND PUBYEAR > 2015 AND PUBYEAR < 2026
AND (LIMIT-TO(SUBJAREA, "SOCI"))
AND (LIMIT-TO(DOCTYPE, "ar"))
AND (LIMIT-TO(LANGUAGE, "English"))

The search results were narrowed down using filters such as subject area (Social Sciences), document type (journal articles), and language (English).The final sample contains 1,576records. The data were then exported as CSV for further analysis.

Data cleaning and refinement

After data extraction from Scopus, a Data Carpentry approach was followed. Data cleaning and normalisation of the raw dataset were done using Open Refine to identify and remove duplicate records, standardise institutional names, normalise author affiliations, and fix inconsistencies in metadata fields. DOI validation received special consideration because DOI was taken as the major identifier to integrate external data sources, such as open access status. This method of systematic data refinement guaranteed accuracy, consistency, and reproducibility of the analysis. In this study, a total of 1,539 records were found with a DOI.

Open Access Status identification

The Unpaywall database is used to determine the open access status of each publication. To access OA information and prepare the second dataset for OA status, the Unpaywall API was called in the format:
https://api.unpaywall.org/v2/ + DOI + ?email=munubidisha95@gmail.com
The publications based on the API results were further subdivided into the standard categories of open access identified by Unpaywall (Gold, Green, Hybrid, and Bronze).

Data analysis and visualisation

For the descriptive analysis and trend analysis, the use of Microsoft Excel was employed to analyse the publication output, citation patterns, and distribution of Open Access publications. To visualise and map networks in co-authorship, co-occurrence of keywords, and trend analysis, VOS viewer and Biblioshiny were used. This methodological approach provides a comprehensive and data-driven overview of the growth, collaboration patterns, and emerging themes in AI-driven information literacy research.

DATA ANALYSIS AND RESULTS

Year-wise growth of publications and average citation

Analysis of publications and citations over a given time period provides an idea of the development and evolution of the research focus or institution. It helps researchers to trace out research trends, citation variations, and identify new areas of interest. This analysis also helps researchers to assess the results and outcomes of research efforts. A 10-year period of study finds out annual fluctuations and provides a more accurate picture of how well the research is being produced relative to the critical impact of scholarly research. Results showed a gradual increase in the number of publications, as shown in Figure 1. There were initially 2 publications in 2016 on this area, then it showed an increase to 312 publications in 2024. In 2025, there is a sharp increase in the number of publications, that is 1,127. The year publication output reflected a positive and progressive trend in the field of Information literacy in the age of AI till 2025. From 2016 to 2018, the mean total citations per year showed a slight increase and then a slight decrease. Average citations from 2019 to 2025 showed a zig-zag structure. Among all the years, 2023 recorded the highest mean total citations with 30.58 citations per article, followed by 2021 with 29.86. In contrast, articles published in 2016 received the lowest mean total citations, with 1.14 citations per article. Although the highest number of articles was published in 2025, they received fewer citations compared to 2021 and 2023. This is because new articles generally take longer to achieve a certain amount of recognition, citations by other researchers, and visibility. The process of

citations is cumulative, and recent publications may not have higher numbers of citations because of the shorter time they have been available to the scholarly community.

OA and Non OA distribution of publications

Figure 2 shows the comparative distribution of OA and non OA publications. Out of the total 1,556 publications, 991 have been found as open access, 511 as non open access or closed access publications. 74 number of publications showing blank or OA status not available. The results show that many of the publications were made openly accessible, reflecting the growing trend of open scholarly communication in the study area.

Yearly growth of OA publications

Figure 3 shows the annual increase in the publication of OA from 2016 to 2025. During the period 2016–2017, no publications were found for the OA category. From 2018, OA publication started showing a slow rise and reached its peak in 2025 with 681 publications. This evolution is indicative of the increasing acceptance and evolution of open access publishing norms in information literacy and AI.

Various OA routes taken by publications

Table 1 shows the routes taken by open access publications in the field of information literacy in the field of artificial intelligence. With 722 publications, the gold route has emerged as the most preferred one among all, which means that there were plenty of articles available in open access journals. The gold route is followed by the hybrid with 190, the bronze with 52 and the green with 27 articles. Overall, 73% of the total OA publications were Gold OA, followed by 19% Hybrid OA. Bronze OA is 5% of the total number, while Green OA is only 3%. The findings highlight the growing preference for Gold OA publishing in ensuring wider accessibility and dissemination of research in the field.

Licensing type of OA publications

In OA publications, the Creative Commons licenses are used, as shown in Figure 4. Creative Commons licenses can be said as guidelines for maintaining the rights of the publishers, which explain how published works can be shared, reused, or distributed by others. CC-BY is the most liberal and widely respected licensing. It provides freedom for users to reuse, remodify, and create duplicates as long as it is properly attributed to the original creator. The other licenses, such as CC-BY-SA, CC-BY-ND, CC-BY-NC, CC-BY-NC-SA and CC-BY-ND impose additional restrictions on commercial use, modification, and sharing. Table 2 presents the distribution of OA publications in the study by licensing. Out of all 520 publications were distributed under a CC-BY license, which is considered “no restrictions” as it allows unrestricted access and re-use. In some cases, more restrictive licenses were chosen, with CC-BY-NC-ND with 189 publications and CC-BY-NC with 87 publications. Fewer publications with CC-BY-SA (24), CC-BY-NC (21) and CC-BY-ND (5). In addition, 6 publications were determined under Other-OA licenses, and 2 publications were in the Public Domain. These results suggest that while there is a broad acceptance of open access publishing, many have varying levels of re-use permissions.

Most productive author according to the number of publications, citations, and h-index

According to the number of publications, total citations, and h-index, the most productive authors in the field are shown in Figure 5. Kong, Siu-Cheung, had 14 publications, followed by Su, Jiahong, with 13. Although these authors published the largest number of articles, they were not cited the most. Ng, Davy Tsz Kit, had the most citations with 2,834 citations and 10 publications. Chu, Samuel Kai Wah, came in next with 2,738 citations and 9 publications and Chan, Cecilia Ka Yuk, with 2,276 citations and 7 publications. As for the h-index, Su, Jiahong, had the highest h-index of 12, and Kong, Siu-Cheung, had an h-index of 10. These results show that there was a difference among authors in productivity and research impact, as reflected in the number of publications and citations

Top contributing institutions of total publications

The institutions with the highest number of publications are represented in Table 3. The institutions with the highest number of publications are The Education University of Hong Kong with 67 publications, The University of Hong

Kong with 60 publications and The Chinese University of Hong Kong with 41 publications. Central China Normal University's contribution was 33 papers, and North Eastern Mindanao State University's was 32 papers. Other participating universities with a significant contribution were the University of California (29), the University of Calabar (26), Beijing Normal University (24), East China Normal University (23) and the University of Oulu (23). The results show that institutions from Hong Kong and China are leading in research production.

Top contributing journals of total publications

The top contributing journals are listed in Table 4 based on the number of publications, total citations and h-index. Education and Information Technologies, with 64 publications and Computers and Education: Artificial Intelligence, with 57 publications, were the journals with the highest number of articles. Though Computers and Education: Artificial Intelligence ranked2nd, it received a higher number of citations (5,611) and a higher h-index (30), signifying more impact of research. It is followed by Education and Information Technologies with citation 1936 and h-index 20. Education Sciences has 37 publications, Frontiers in Education and Sustainability (Switzerland) has 32 publications each. However, Sustainability (Switzerland) had many more citations than Frontiers in Education. The results indicate the significance of the role of education and technology-related journals in this field.

Top contributing countries

Table 4 represents the leading countries according to the number of publications in the field. The USA ranked first with 807 publications, followed by China with 671 publications. Indonesia claimed third place with 202 publications. Other countries that made a large contribution were Germany, the UK, Spain, Australia, India, Turkey, and Saudi Arabia. The results show that the USA is the top contributor in this research area, followed by China.

Collaboration of countries

In the VOS viewer analysis, 115 countries were identified. The minimum number of publications per country for VOS viewer was three to identify important collaboration patterns. 78 countries fulfilled this criterion and created the country collaboration network, as shown in Figure 6. The network was divided into 12 different clusters based on collaboration links among countries. Countries are represented by the nodes, and collaborative relationships between countries are represented by the connecting lines. The size of the nodes indicates the amount of research output and the collaboration strength of countries. Cluster 1 was the largest cluster, consisting of 10 countries. Among them, Germany emerged as the most influential Country with the highest number of publications (N = 66), citations (C = 1525), and Total Link Strength (TLS = 52). Cluster 2 included 9 countries and was led by Spain (N = 59, C = 626, TLS = 27). Cluster 3 consisted of 9 countries, where Indonesia showed notable research contribution and impact (N = 56, C = 601, TLS = 27).Cluster 4 contained 8 countries, and the United Kingdomwas identified as the leading contributor (N = 91, C = 1990, TLS = 92). Cluster 5 also included 8 countries, where South Korea is the prominent country (N = 43, C = 750, TLS = 15). Cluster 6 comprised 7 countries and was dominated by India (N = 56, C = 985, TLS = 37). Clusters 7 and 8 consist of 7 countries. In cluster 7, Italy (N = 35, C = 389, TLS = 26) and in cluster 8, Saudi Arabia (N = 51, C = 1028, TLS = 50) are at the top. Cluster 9has 4 countries, and Hong Kongis leading the group (N = 96, C = 8871, TLS = 49). Clusters10, 11 and 12 included 3 countries each. In cluster 10, Canada (N = 37, C = 1153, TLS = 24), in cluster 11, the United States (N = 325, C = 6925, TLS = 110), and in cluster 12, South Africa (N = 46, C = 531, TLS = 25) showed the highest contribution. This collaboration network indicates high levels of international research partnerships between countries. Within the network, strong collaborative relationships and high research contributions were observed among the United States, China, the United Kingdom, India, Indonesia, and Hong Kong. The colours indicate groupings of countries that have a high number of joint publications in the field, which show the global and interconnected nature of the research.

Most frequent keywords

Most frequent keywords used in publications are shown in Figure7, and their network visualization shown in Figure 8. Among all keywords, Artificial Intelligence had the highest number of appearances with 557, followed by AI literacy with 405. Other terms that were used were ChatGPT and digital literacy (170), generative AI (163), and higher education (137). Keywords such as information literacy, students, and artificial intelligence literacy also

appeared frequently, indicating the major research themes in the field. The network visualisation shows the relationships and co-occurrence between keywords used by authors. It identifies the trend in research concerning the role of AI in education, literacy and new digital technologies.

DISCUSSION

This study is a scientometric analysis of information literacy research in the era of artificial intelligence from 2016to2025. Scholarly interest in the use of AI technologies in information literacy studies is growing, particularly after 2020.This showcases a swift expansion of publications in this field. The sudden rise in literature published in 2025 is likely due to the increasing popularity of new AI tool applications in education and digital learning spaces around the world. The number of citations received by recent publications was lower because it takes time for new articles to become recognised and cited in scholarly research. Another important finding is the growing acceptance of the OA publishing practices in the field studied. Many publications were found to be open access, suggesting researchers' preference for more knowledge sharing and access. When considering the various OA routes, it was found that Gold OA is the most preferred route, indicating that authors tend to choose the route of publishing in fully OA journals for better visibility and reach to the world. The high percentage of the CC-BY license reflects the trend of more and more scholarly publications being released without restrictions on sharing and reuse. This is consistent with the wider push toward open science and democratisation of knowledge.

The results of the analysis of productive authors, institutions, journals, and countries indicate strong geographic and institutional concentration in the field. Researchers such as Siu-Cheung Kong, Jiahong Su, and Davy Tsz Kit Ng have distinguished academic achievements, and institutions in Hong Kong and China have become research hubs. Likewise, the United States and China had the greatest number of publications and international networks of collaboration, which demonstrates their investment in AI-based learning technologies and research infrastructure.

Co-authorship of the countries' network analysis shows that the study is highly interconnected and international. The United States, China, India, Indonesia, and the United Kingdom, among other countries, have strong collaboration, which shows the global significance of research on AI literacy and digital competency. Furthermore, the themes identified through keyword analysis are emerging as key research priorities, including artificial intelligence, AI literacy, digital literacy, generative AI and higher education. The overall profile of information literacy in the age of AI indicates a significant acceleration and worldwide collaboration, with a greater interdisciplinary nature and openly accessible in scholarly communication.

CONCLUSION

In conclusion, it is found that the research in the area of information literacy in the era of Artificial Intelligence has been considerably advanced. This study is an emerging discipline for interdisciplinary study of the phenomena of scholarly communication. The academic and social importance of studying AI-driven information literacy is reflected in the increasing number of publications, the expansion of open access publishing, and the collaboration across countries. The results reveal that research trends, learning approaches, and the digitised learning landscape have been changed by technologies like generative AI and Chat GPT. The study emphasises the rise of OA publication methods, especially Gold OA and CC-BY licensing, which facilitate broader dissemination, access, and reuse of scientific knowledge. The patterns of collaborations among countries show that the field is internationally connected and research collaboration is active throughout the world. The most frequent terms, such as Artificial Intelligence, AI literacy, digital literacy and higher education, indicate the evolution of information literacy in the current technological context. This study is important due to its comprehensive approach to the development of the discipline, the nature of collaboration and the open access practices, as well as the scope of emerging research interests. The results of the study may help researchers, teachers, librarians, and policy makers to enhance their knowledge of the state of the field of research, as well as identify potential areas of future exploration to support

academic and professional development in AI information literacy. In Library and Information Science, it will help by providing an understanding of current trends, open access initiatives, and global interactions in the context of AI in information literacy. Additionally, it could aid in the establishment of AI-related user education measures on ethical and effective usage of AI technologies, AI-integrated library services, and digital literacy programmes. The study has some limitations. Analysis was only used for journal articles published in the English language, found in the Scopus database, and it only focused on the social sciences domain. Thus, other databases or other language publications may not have been included. Database analysis, thematic evolution, ethical issues concerning AI-generated information, misinformation, algorithmic bias and the impact of AI on libraries and education are potential areas of investigation for future research. Further studies can also help explore regional research trends, explorations of interdisciplinary perspectives, and implications on information literacy practices and digital knowledge systems in relation to the long-term impact of AI technologies.

Bidisha Bora (PhD. Scholar, DLIS, Mizoram University, Aizwal)

Bidisha Bora is a PhD Scholar of the Department of Library and Information Science, Mizoram University, Aizwal, under the supervision of Prof. Manoj Kumar Verma and the Library Assistant of Madhabdev University, Assam. Her areas of interest include Open Access, Scientometrics, Bibliometrics, Information Literacy, Digital Libraries, Sustainable libraries, Indigenous knowledge, and ICT. She has a total of 7 research publications.

Prof. Manoj Kumar Verma (Professor, HOD, DLIS, Mizoram University, Aizwal)

Dr. Manoj Kumar Verma is a Professor in the Department of Library & Information Science at Mizoram University, Aizawl. His research interests include ICT applications in libraries, knowledge management, information literacy, bibliometrics, scientometrics, webometrics, data mining, and sentiment analysis. He has made significant contributions to the field of Library and Information Science through extensive research publications and scholarly activities, with more than 350 publications to his credit. He has published over 203 journal articles, including numerous papers indexed in Scopus (99) and Web of Science (75). In addition, he has authored and edited 15 books, contributed 38 book chapters, and presented 93 conference papers. His scholarly impact is reflected in more than 2,500 Google Scholar citations (H-index: 26; i10-index: 79), over 2,068 ResearchGate citations (H-index: 22), 700+ Scopus citations (H-index: 15), and 490 Web of Science citations (H-index: 11). Under his supervision, 15 Ph.D. scholars and 8 M.Phil. scholars have successfully completed their degrees, while 7 Ph.D. scholars are currently pursuing research under his guidance. He has successfully completed two major research projects funded by ICSSR in 2021 and 2025. At present, he is leading two ongoing major research projects, including one international collaborative project funded by UiTM, Malaysia, and another funded by DST, Government of Indiathan 2,000 citations and an h-index of 22.

ABSTRACT

In real-world situations, making decisions frequently entails ambiguity, uncertainty, and insufficient information. Such imprecision is not sufficiently captured by classical graph theory or other mathematical models. By adding degrees of membership, non-membership, and hesitation, Krassimir Atanassov's intuitionistic fuzzy sets—an extension of Lotfi A.Zadeh's fuzzy sets—offer a more adaptable framework to overcome this constraint. The use of intuitionistic fuzzy graphs (IFGs) in decision-making is examined in this work. By assigning intuitionistic fuzzy values to each vertex and edge, IFGs improve conventional graph models by allowing the depiction of ambiguous and reluctant relationships. In multi-criteria decision-making settings where criteria and options are imprecise and interconnected, the suggested method is especially helpful. The study shows how IFGs can be used to assess options, model complicated decision processes, and find the best answers. The method's applicability in fields including risk assessment, network analysis, and intelligent systems demonstrates its efficacy. The findings show that intuitionistic fuzzy graphs offer a solid and trustworthy method for managing uncertainty in decision-making procedures.

Keywords: Intuitionistic Fuzzy Sets (IFS), Intuitionistic Fuzzy Graphs (IFG, Multi-Criteria Decision Making (MCDM)

INTRODUCTION

Decision-making is a fundamental activity in various fields such as engineering, management, healthcare, and computer science. In many practical situations, decision-makers must deal with uncertain, vague, or incomplete information, which makes the process more complex. Classical decision-making models, based on crisp values and deterministic relationships, are often inadequate for handling such uncertainty. To overcome these challenges, fuzzy set theory, introduced by Lotfi A.Zadeh, has been widely used to model imprecise information. However, fuzzy sets only consider the degree of membership of an element, which may not be sufficient in situations involving hesitation or lack of knowledge. To address this issue, Krassimir Atanassov proposed intuitionistic fuzzy sets, which include both membership and non-membership degrees along with a hesitation margin. Graph theory is another important mathematical tool used to model relationships between objects. When combined with intuitionistic fuzzy sets, it leads to the concept of intuitionistic fuzzy graphs (IFGs), which provide a powerful framework for representing uncertain and complex systems. In IFGs, both vertices and edges are characterized by intuitionistic fuzzy values, allowing for a more comprehensive representation of real-world problems. In recent years, intuitionistic fuzzy graphs have gained significant attention in decision-making applications, particularly in multi-criteria decision-making (MCDM), where multiple conflicting criteria must be considered simultaneously. IFGs help in capturing the interrelationships among criteria and alternatives, as well as the uncertainty associated with them. This paper focuses on the application of intuitionistic fuzzy graphs in decision-making problems. It aims to develop a systematic approach for modelling decision scenarios using IFGs, evaluating alternatives, and selecting the best possible solution. The remainder of the paper is organized as follows: Section II discusses the basic concepts of intuitionistic fuzzy graphs, Section III presents the proposed methodology, Section IV illustrates the application with a case study, and Section V concludes the paper with future research directions

Background of Concepts

Fuzzy Sets: Fuzzy sets allow elements to have degrees of membership function (0 to 1) rather than just yes or no.
Intuitionistic Fuzzy Sets (IFS):
(i) Membership degree (μ) (ii) Non – Membership degree (v) (iii) Hesitation ($\pi = 1 - \mu - v$).

Intuitionistic Fuzzy Graphs (IFG):
An Intuitionistic Fuzzy graph is a graph where (i) Each vertex Graph and edge has, membership value (μ), non-membership value (v).

Structure: $(i)G = (V, E)G = (V, E)G = (V, E)$ (ii) Each edge reflects uncertainty in relations.

Vertex set: Let V be a non – empty set of vertices, each vertex $v \in V$ is associated with
(i) Membership degree$\mu v(v) \in [0, 1]$.
(ii) Non – membership degree$vv(v) \in [0, 1]$
Satisfying $0 \leq \mu V(v) + vv(v) \in [0, 1]$.

Edge Set: Let$E \subseteq V \times V$ be the set of Gestede e – U , V)$\in$ [0 1]
Membership degree $v(v, E)$ membership degree $vv(v) \in [0, 1]$
Satisfying $0 \leq \mu E(u, v) + vE(u, v) \leq 1$

$$\mu E(u, v) \leq \min(\mu v(u), \mu v(v))$$
$$vE(u, v) \geq \max(vv(u), vv(v))$$

Hesitation Degree
For both vertices and edges, the hesitation (or indeterminacy) degree is given by $\pi = 1 - \mu - v$
IFG -Model

Vertices:

(i) $v_1 = (0.7,0.2) \rightarrow hesitation = 0.1$
(ii) $v_2 = (0.6,0.3) \rightarrow hesitation = 0.1$
(iii) $v_3 = (0.5,0.4) \rightarrow hesitation = 0.1$

Edges:

(i) Edge $(v_1, v_2) = (0.5,0.3)$
(ii) Edge $(v_1, v_3) = (0.4,0.4)$
(iii) Edge $(v_2, v_3) = (0.5,0.4)$

Decision matrix

	C_1	C_2	C_3
A_1	(0.7,0.2)	(0.6,0.3)	(0.5,0.4)
A_2	(0.8,0.1)	(0.5,0.4)	(0.6,0.2)
A_3	(0.6,0.3)	(0.7,0.2)	(0.4,0.5)

Common Aggregation Operstors

(i) Arithmetic Average Operator

$$\mu = \frac{1}{n}\sum \mu_i, v = \frac{1}{n}\sum v_i$$

(ii) Weighted Average Operator

$$\mu = \sum w_i \mu_i, v = \sum v_i$$

Where $w_i = weight\ of\ each\ criterin$, $\sum wi = 1$

Aggregated Values

$A_{1\rightarrow}$ (0.6,0.3)
$A_2 \rightarrow$(0.7,0.2)
$A_3 \rightarrow$(0.5,0.4)

CONCLUSION

Intuitionistic Fuzzy Graphs deliver a robust structure for representing uncertainty in decision-making scenarios. By integrating membership and non-membership levels, as well as hesitation, IFGs present greater adaptability and precision than conventional fuzzy approaches. Their use in multi-criteria decision analysis, medical diagnostics, and risk evaluation illustrates their practical value in addressing real-world challenges amid uncertainty.

ABSTRACT

During the last two years, the evolution of Artificial Intelligence (AI) tools has turned them into the cutting-edge tools that are transforming academic libraries globally. The emerging technologies have taken many areas of e-resource discovery, research assistance, and scholarly services to new levels. Specifically, AI-powered tools such as advanced semantic search engines, advanced citation suggestion tools, trusted plagiarism detection tools, and literature review packages with automations have been found to be extremely effective in making quality scholarly materials accessible. Such materials comprise those in prominent databases such as Scopus, to enable researchers and scholars to retrieve relevant information more effectively. However, despite such incredible developments across the globe, it is surprising to come across the fact that adoption and actual use of AI tools in academic libraries in the whole country of India are zero. Additionally, the field is relatively unexplored and needs more research and interest. This concept paper aims to identify and uncover a very niche research gap common to the area of understanding how AI-based library services are viewed, accepted, and utilized by research scholars and faculty members in Indian higher education institutions. While various international research papers have applied established models such as the Technology Acceptance Model (TAM) with the Unified Theory of Acceptance and Use of Technology (UTAUT) in trying to study as well as research the process of technology adoption, it is surprising that very few of these research papers have extended to the extent of studying these theoretical models in the very niche context of AI tools being used in Indian academic libraries. The research suggests a conceptual model that combines UTAUT and TAM constructs to examine technological and behavioral determinants of AI adoption in managing e-resources. Practical suggestions to enhance the application of AI tools, policy suggestions for universities, and research contributions to the adoption of library science technology are expected results. The research will fill the existing knowledge gap and facilitate strategic AI adoption by academic libraries, especially in India.

Keywords: Artificial Intelligence, E- Resource and services, University Libraries, TAM and UTAUT Models.

INTRODUCTION

In this day and age of information and communications technology, we are witnessing an intense and rapid revolution of academicals libraries as they strive to meet the ever-changing information needs of a varied user community of researchers, faculty, and students alike. The advent of AI technologies has actually provided tantalizing new opportunities for libraries that allow them to radically enhance their services in a range of important areas, notably e-resource discovery, research analytics, and customized scholarly support based on individual needs. AI-fortified tools such as sophisticated semantic search engines, advanced AI-powered citation suggestion tools, efficient plagiarism detection tools, and sophisticated literature review generators are being increasingly integrated into library services worldwide. These sophisticated tools provide users with more efficient and intelligent means of accessing and managing scholarly content, in essence revolutionizing the way research is conducted and information is leveraged in academic settings. Amongst the myriad of academic materials one can locate in the academic community, Scopus-indexed journals and databases are the most useful materials for research scholars and university professors alike. This is mainly because such materials offer high-quality, peer-reviewed, internationally recognized scholarly literature that is most relevant to genuine academic research. Proper discovery and management of such valuable materials are of utmost importance for academic institutions that are struggling to enhance the quality of their research output as well as its visibility in the global academic community. In this regard, AI tools have been found to hold vast potential of significantly streamlining access to such value materials. They do so by offering semantic searches that are best placed to understand the context and meaning of queries, offering relevant literature that would fall outside the purview of traditional searches, detecting instances of academic plagiarism to ensure originality in research exercises, and automating several steps of the literature review process, making it more efficient and less time-consuming for researchers.

Even though the world is witnessing record growth at the global level, Indian academic libraries are not even close to adopting and integrating AI-based tools and services in their functions. There are quite a few reasons why this is not an easy task, including a low level of awareness about the opportunities that these technologies present, a critical shortage of available infrastructure to get these technologies online, the lack of proper training sessions for library staff to leverage the maximum potential of these tools, and always-present concerns about the acceptance of users that further obstruct the task of getting these next-generation technologies onboard. Worthily noted also is the fact that while a number of overseas studies have talked about the use of AI in libraries using accepted technology acceptance models like the TAM & the UTAUT, there is a serious lack of similar research studies conducted in the Indian context. This conceptual paper attempts to bridge this gap by proposing an integrated model of TAM & UTAUT constructs to determine usage and acceptance factors of AI-based e-resource services in Indian academic libraries. Identifying pertinent AI tools and examining behavioral and technological use determinants, this research attempts to offer actionable suggestions and policy implications for greater use of AI in academic libraries. This research also contributes to the body of literature on technology adoption in library science, with reference to the Indian higher education scenario. In the past couple of years, one could sense a visible surge in the interest and passion of academic libraries to implement and utilize AI tools. AI tools are being considered as powerful tools to mechanize the steps involved in e-resource discovery, provide enhanced research assistance, and mechanize part of the user services provided to the faculty and students alike. It should be noted here that very few studies have been conducted that attempt to analyze how such AI-based tools are being utilized and implemented by research scholars and faculty members of Indian academic libraries. This is particularly relevant in the context of the specific activity of resource discovery and management indexed in Scopus, which is one of the high-end databases renowned for its mammoth collection of scholarly literature.

Despite the fact that there are several foreign research articles that have extensively discussed and deliberated upon the adoption of various artificial intelligence technologies, such as but not limited to semantic search engines, AI citation suggestion tools such as Scite.ai and Connected Papers, plagiarism checking tools, and newly introduced literature review tools based on AI such as Elicit and Research Rabbit, it is quite surprising to note that there is a vast

research gap in Indian academic libraries in particular. It is the actual use of these tools, the experience of using them, and the net benefit that may be attempted to be achieved through their adoption in academic settings. Apart from that, little empirical evidence based on widely used technology adoption models like TAM and UTAUT is available to investigate what drivers influence acceptance and usage of the AI tools among Indian library patrons. Therefore, it can be seen that there is a huge and urgent requirement to conduct a wide and inclusive study based on a particular model. The study should be designed to investigate in-depth the different manners in which these AI technologies are being employed and utilized in academic libraries. In addition to that, the study should investigate the response of the users of such libraries towards the utilization of such technologies. Apart from that, the study should evaluate the performance of these AI technologies in making e-resources indexed by Scopus accessible and their contributions towards improving the quality of the research services provided in Indian higher education institutions. Based on it, this study has the following research objectives:

- To list some of the applications of AI like semantic search engines, citation recommenders, plagiarism checkers, and literature review software used in academic libraries.
- To study the determinants influencing how research scholars and faculty members adopt and utilize such AI tools in Indian academic libraries in terms of TAM and UTAUT models.
- To create a reference framework through the integration of TAM and UTAUT models to analyze adoption and usage of AI-based e-resource services among users of libraries.
- To provide recommendations on potential ways of promoting the use and adoption of AI tools in academic libraries in order to access more Scopus-indexed journals and for research support.

Statement of the Problems

The existence of academic libraries has been revolutionized by the fast pace of development and integration of Artificial Intelligence (AI) technology, which has revolutionized the process by which such institutions handle and open up access to their electronic resource collections. Several next-generation tools like semantic search engines for improving information retrieval, AI-driven bibliographic citation suggesting tools like Scite.ai and Connected Papers, which allow scholars to discover relevant works, sophisticated plagiarism-detection tools that improve scholarly integrity, and AI-driven literature review generators like Elicit and Research-Rabbit, which facilitate research, have become an essential tool. Such tools are gaining wider recognition as a principal facilitator of research work and improving the overall user experience of libraries around the world. To date, there has been hardly any effort so far on the part of Indian academic libraries to adopt or utilize these advanced AI tools in their full form in their systems and processes. This particularly in terms of the discovery and access of scholarly content under Scopus coverage. Apart from this, and indeed more so even, there is a serious and critical lack of empirical studies examining how precisely these AI tools are utilized in academic libraries. Additional to this, there is little proper insight into how precisely these technologies are perceived by library users, including research scholars and faculty members. Lastly, it is important to explore the different issues and challenges that libraries are confronted with in attempting to adopt and integrate such new technologies within their existing frameworks. Besides, there are hardly any research studies that have managed to reach highly researched technology adoption models such as the TAM & the UTAUT in exploring and investigating some of the determinants of behavior that influence the adoption as well as use of such AI-facilitated services within the Indian academic library context. Such a situation offers a worthwhile and tangible research gap that greatly calls for high-quality scholarly interest and further research. Solution of this specific issue is of utmost significance for the purpose of gaining objective opinions in terms of the efficiency of utilizing artificial intelligence in the field of e-resource management. It is also required for developing effective strategies with the aim of enhancing more usage of AI technologies in the context of scholarly library environments.

Requirement of the Study

As university libraries are becoming more interested in addressing the advanced and dynamic information needs of students and researchers, the application of Artificial Intelligence tools has become critical to facilitate efficient e-

resource discovery, research analysis, and user support. Although AI-driven solutions for semantic search, citation suggestion, plagiarism detection, and literature review automation have been found to provide promising results in cross-cultural environments, their implementation and acceptance by users in Indian academic libraries remain to be investigated. There is a necessity to study how such tools are being utilized in Indian institutions and to what level they are helping research scholars and faculty members to retrieve e-resources under the umbrella of Scopus. Additionally, the study of the technological and behavioral drivers for the adoption of such tools using models like TAM and UTAUT can offer valuable comments to librarians, decision makers, and policymakers. This study will have to bridge the knowledge gap, provide pragmatic suggestions regarding the application of AI in academic libraries, and contribute to the global literature on AI-based library services in higher education. The study results would be of great utility to enhance the academic library services ecosystem, particularly in India.

Research Hypotheses

Based on the goals and technology adoption models in use, i.e., TAM and UTAUT, the following hypotheses were formulated in this study:

H1: When users find that AI resources are helpful, they are likely to intend to use them in academic libraries.

H2: The easier to use AI technologies are the more beneficial they will be for people and the more frequently they will be utilized.

H3: Users will utilize the tools with Scopus-indexed papers if they perceive that they will improve their research productivity.

H4: The easier AI tools are to implement, the more of them will be used.

H5: Individuals will utilize AI tools more when they observe others (e.g., peers and acquaintances) using them.

H6: Users will actually use AI-based library services if they are given quality resources, training and support.

H7: Individuals who plan to use the AI services will probably use them in academic libraries for research and management of e-resources.

REVIEW OF LITERATURE

Literature for the research is categorized in four themes: (1) applications of AI in academic libraries across the globe, (2) AI applications in e-resource discovery and research support, (3) applications of TAM along with UTAUT models in technology adoption research, and (4) research gaps in AI adoption in Indian academic libraries. Organization into themes provides an overview of global trends and local gaps in AI application in library functions.

International Academic Libraries Applications of AI

In the recent years, academic libraries all over the world have extensively used AI-facilitated technologies to improve their service, raise user satisfaction, and optimize resource utilization. AI technologies have been used in libraries for intelligent cataloging systems, user support robots, auto-indexing, semantic search systems, and predictive analytics of collection development. Studies have established the transformative power of AI in libraries to make them efficient, responsive to the changing research landscape, and effective. AI tools enable libraries to offer personalized services recommendations, automate administrative operations, and support data-driven decision-making processes, resulting in enhanced quality of service and operational efficiency.

Artificial Intelligence Tools for E-Resource Discovery and Research Support

Among the AI applications used in academic libraries, those that are focused on e-resource discovery and research support have been of most interest. Semantic search engines improve keyword searching by understanding contextual intent behind a query, thus returning more relevant scholarly findings. AI-powered citation recommender tools such as Scite.ai and Connected Papers enable researchers to identify influential and related studies, while AI-powered plagiarism detection tools ensure academic integrity. Additionally, AI-powered literature review tools such as Elicit and Research-Rabbit started automating scholarly literature synthesis, saving time and improving the

literality of literature searching. These tools collectively improve research productivity, specifically in accessing and managing Scopus-indexed resources.

Applications of TAM & UTAUT Models in Technology Adoption Studies

TAM & UTAUT have been effective theoretical models in the past for the examination of variables underlying technology adoption. TAM focuses on the perceived ease of use and perceived usefulness as the drivers of motivational behavioral intention among the users, while UTAUT extends the model with the inclusion of constructs of performance expectancy, amus effort expectancy, social influence as well as facilitating conditions. The majority of studies in various disciplines like healthcare, education and information systems have been effective in using the models in the measurement of technology acceptance. Cross-country studies within library environments have applied the models in the examination of the adoption of digital libraries, mobile library applications and other emerging technologies. Their use across AI-driven services in academic libraries is, however, limited, particularly in developing countries.

Indian Academic Library Research on Lack of AI Adoption

While the world increasingly discusses the integration of AI in libraries of the present era, Indian academic libraries are yet to achieve the potential of these technological developments. Most of the research studies on AI adoption in India relate to general digital library systems or e-learning systems, while few studies exist on research support and e-discovery of e-resources through AI-based tools. Moreover, empirical research studies on research scholars' and faculty members' acceptance and usage of AI tools in Indian academic libraries are few. Moreover, there is an acute absence of TAM- and UTAUT-based studies in examining the behavioral and technological dimensions of AI tool adoption in this context. It is essential to bridge this research gap to enable strategic AI service implementation in Indian higher education institutions and improve research productivity through enhanced access to Scopus-indexed academic publications.

Conceptual Framework

For the purpose of testing factors, influencing adoption in addition to utilization of AI-driven services by academic libraries, in this current study, a conceptual framework is constructed as an integration of TAM constructs and UTAUT models. The constructed model is particular to study how research scholars and instructors perceive, adopt and use AI tools for e-resources searching and research support, particularly for searching Scopus-indexed scholarly articles.

AI Tools Utilized by Library Services

The model focuses on the following types of AI tools that are now transforming academic library services:

- Semantic Search Engines: AI-powered computer systems that understand the semantic intent of search requests to find better and more precise scholarly content.
- AI Citation Recommenders: Scite.ai and Connected Papers are some of the AI Citation Recommenders that recommend seminal or related scholarly papers based on semantic relevance and citation patterns.
- AI Plagiarism Detection Tool: Advanced computer programs employing AI algorithms to detect similarity of content and potential academic misconduct.
- AI Literature Review Software: Tools like Elicit and Research Rabbit were used in the past to automate literature searching and synthesis for systematic reviews and research studies.

Integrating TAM Constructs

- Perceived Usefulness (PU): The extent to which users believe that AI tools will improve their search efficiency and access to high-quality sources.
- Perceived Ease of Use (PEOU): To what extent users feel that it would be easy to use AI tools.
- Behavioral Intention (BI): Users' willingness to use and implement AI tools in the future.
- Actual Use (AU): The dominant, current usage pattern of AI application utilization in academic libraries.

UTAUT Constructs Integration

• Performance Expectancy (PE): Individuals' expectation that AI tools will improve research outcomes and productivity.
• Effort Expectancy (EE): How easy is it to use AI tools perceived.
• Social Influence (SI): To what degree individuals feel that important others (coworkers, supervisors, peers) believe that they ought to use AI tools.
• Facilitating Conditions (FC): Provision of resources, infrastructure, training, and institutional support to utilize AI tools.

Theoretical Relationships

• Users will most probably want to utilize AI tools if they are convenient and useful to use.
• Facilitating conditions and social influence will also be anticipated to mediate usage and user behavioral intentions.

Conceptual Model

Note: The AI technologies (Semantic Search, Citation Recommenders, Plagiarism Detection, Literature Review Tools) constitute the technological context within which the constructs engage with one another.

Anticipated Consequences

The proposed conceptual framework will presumably yield a collection of serious implications for the study of technological adoption, policy-making, and academic library services in the field of Artificial Intelligence (AI) tools. These implications can be categorized into practical, theoretical, and policy implications.

Practical Implications

The generalizations of the findings from the future adoption of the framework can give practical recommendations to institutional administrators and academic librarians. Familiarity with how faculty members and research scholars view and embrace AI-based services will allow libraries to develop user-focused AI applications, enhance training programs, and enhance resource discovery services. Additionally, familiarity with the relevant factors of perceived usefulness, ease of use, social influence, and facilitating conditions will inform librarians on how to adapt AI tools to the unique Indian academic setting, enhancing access to Scopus-indexed resources and enhancing research productivity.

The oretical Implications

This study contributes to theory development by extending existing models of technology adoption such as TAM with UTAUT to the comparatively new context of AI-based services in academic libraries. Integrating the above models and adapting these to AI research tools, the model contributes to gained insights on behavioral determinants of AI tool adoption in higher education. The conceptual model developed in this paper offers a foundation for future empirical studies, and there is still a potential to result in contextualization and adaptation of TAM and UTAUT constructs in the Indian academic library environment.

Policy Implications

Policy level, the results within this framework will be expected to inform Indian higher education policymakers and academic library organizations about the strategic importance of integrating AI. Policy recommendations for provisioning infrastructure, user training, and institutional support can inform national and institutional AI adoption policies for libraries. The study can inform policymakers on how to allocate funds, capacity-building schemes, and AI policy development to support the establishment of research infrastructure and scholarly services in Indian research institutes and universities.

Limitations and Future Directions

Limitations

- Conceptual Nature of the Study: Since the article is a theoretical framework, there is no quantifiable data or statistical result. The hypothesized relationship and constructs are merely speculative until proven in real settings through quantitative or qualitative measures.
- Contextual Boundaries: The model has been built in the context of Indian academic libraries. While it may make recommendations for analogous situations in other developing countries, the findings are not necessarily transferable to academic libraries in other technological, institutional or cultural contexts without modification.
- Selected AI Tools: The study emphasizes a specific set of AI-facilitated tools (citation recommenders, plagiarism checkers, semantic search engines, and literature review tools). AI chatbots, automated subject indexing and libraries' predictive analytics tools are not part of this model and are to be created in the future.
- Shortcoming in Model Selection: Although TAM and UTAUT are proven technology adoption models, other relevant frameworks (e.g., Diffusion of Innovations theory or DeLone and McLean's Information System Success Model) were not explored, which would have increased theoretical contribution.

Future Research Directions

- Empirical Validation of the Framework: The theoretical framework has to be empirically tested in future research using surveys, interviews, and case studies of research scholars, faculty members and library personnel of Indian educational institutions of various types.
- Use of Mixed Methods Approach: Mixing quantitative methods such as Structural Equation Modeling (SEM) and qualitative methods such as the focus group or semi-structured interview can offer greater insight into user attitudes and contextual determinants of AI take-up.
- Cross-Country or Cross-Regional Comparative Studies: Comparative analysis may be conducted by researchers between Indian university libraries and other developing or developed economies' libraries to establish possible cultural, infrastructural & policy determinants of AI adoption.
- Extension to Other Library AI Services: Future studies may broaden the scope to feature other AI-powered library services like AI-powered chat reference, AI-aided generation of metadata & predictive collection development and user trend analytics.
- Exploration of Other Theoretical Frameworks: Further studies would incorporate & contrast other theoretical frameworks to establish their explanatory power and suitability for use in studies on the use of AI tools by academic libraries.
- By taking these future challenges into account, this study can plan a more integrated and evidence-based contribution to AI adoption in academic libraries and improve the practical application of AI-based research services in higher education.

CONCLUSION

Artificial Intelligence (AI) in academic libraries is a paradigm shift towards enhanced e-resource discovery, research analytics and scholarship support services. While AI-based tools such as semantic search engines, citation recommenders, plagiarism check tools and literature review tools have been extremely useful in global academic environments, their usage in Indian academic libraries is not prevalent and not extensively researched. This theoretical paper has introduced a comprehensive framework combining the TAM and the UTAUT to analyze the usage determinants and adaptability of the AI tools among research scholars and faculty members of Indian higher education institutions. With the identification of appropriate AI tools and the hypothesizing of the inter-relationships between performance expectancy, perceived usefulness, effort expectancy, social influence, facilitating conditions and behavioral intentions. The framework offers a structured template for subsequent empirical studies in this direction. The study's contributions are prescriptive practical suggestions for the deployment of AI in the case of

academic libraries, policy suggestions for regulatory bodies in higher education and conceptual contributions to the technology acceptance model literature in the case of AI-based library services. The model is also a starting point for empirical testing by future mixed-method research among research scholars, instructors and librarians of Indian academic libraries. In brief, this study addresses a critical knowledge gap by proposing an AI adoption model for Indian academic libraries and highlighting the importance of understanding user action, technicalities, and institutional support systems for the successful implementation of AI tools in the research environment of higher education. Subsequent studies can empirically test the model through quantitative methods like Structural Equation Modeling (SEM) to establish the hypothesized relationship.

ABSTRACT

Artificial Intelligence (AI) is transforming libraries from traditional repositories into intelligent knowledge hubs. This paper examines the evolution of libraries in the AI era and highlights applications such as intelligent information retrieval, automated cataloguing, metadata generation, recommendation systems, virtual assistants, digital preservation, and research support. AI technologies including machine learning, natural language processing, and generative AI improve access to information, increase operational efficiency, and enhance user engagement. The study also discusses how AI is reshaping the responsibilities of librarians, requiring new competencies in data literacy, AI governance, and digital ethics. Furthermore, it explores challenges associated with algorithmic bias, privacy, copyright, misinformation, and transparency. Libraries are increasingly emerging as centers for AI literacy and digital inclusion, helping users navigate complex information ecosystems. The paper concludes that AI will not replace libraries but will strengthen their role as trusted institutions for knowledge dissemination, lifelong learning, and community development when implemented responsibly and ethically.

Keywords: Artificial Intelligence; Libraries; Digital Transformation; Information Retrieval; AI Literacy; Knowledge Management

INTRODUCTION

Libraries have always preserved knowledge, cultural heritage, and intellectual freedom. From ancient archives to modern digital collections, they have adapted to changes in technology. The rise of Artificial Intelligence (AI), especially machine learning, natural language processing (NLP), and generative AI, marks a new phase in the evolution of libraries. The AI revolution is altering how we create, organize, retrieve, and consume information. Search engines, chatbots, recommendation systems, and intelligent databases are changing what users expect. Today,

many users want quick, personalized, and conversational access to information rather than relying on traditional catalog systems. As a result, libraries must rethink their roles in this fast-changing technological landscape. Recent studies show that libraries worldwide are increasingly using AI tools. A global survey by Clarivate found that 67% of libraries are either exploring or implementing AI technologies, showing a steady increase in AI integration within library systems. This paper explores the impact of AI on libraries, looking at opportunities, challenges, ethical issues, and future directions for AI-enabled library ecosystems.

Evolution of Libraries in the Digital Era

Libraries have gone through several major changes: The shift from manual systems to intelligent systems reflects broader trends in digital transformation. AI is speeding up this evolution by helping libraries manage large amounts of data efficiently and providing better user experiences. Research on AI in libraries shows significant growth in areas like information retrieval, knowledge organization, and user-centered services.

Applications of AI in Modern Libraries

Intelligent Information Retrieval

AI-powered search systems use NLP and semantic analysis to enhance information retrieval. Unlike traditional keyword searches, AI can understand user intent, context, and natural language queries.

Examples include:

- Conversational search assistants
- Semantic search engines
- AI-enhanced discovery platforms
- Voice-based library interfaces

These technologies improve accessibility and user satisfaction by making information retrieval more intuitive.

Automated Cataloging and Metadata Generation

Cataloging has traditionally required a lot of labor. Now, AI systems can automate the creation of metadata, subject classification, indexing, and tagging.

Machine learning algorithms can:

- Extract bibliographic data
- Identify themes and keywords
- Organize digital archives
- Recommend classification categories

AI-assisted metadata creation cuts down on repetitive tasks and improves catalog consistency.

Personalized Recommendation Systems

Like commercial streaming and e-commerce platforms, libraries now use AI recommendation engines to suggest books, journals, and resources based on user behavior and preferences.

Benefits include:

- Improved user engagement
- Better resource discovery
- Enhanced reading experiences
- Increased circulation of materials

However, these systems also raise concerns about filtering and diversity of ideas.

AI Chatbots and Virtual Assistants

AI-powered chatbots offer 24/7 support for library users, answering questions about:

- Resource availability
- Citation support
- Database navigation

- Research assistance
- Operating hours

Virtual assistants help reduce staff workload while making services more accessible.

Digital Preservation and Archiving

AI helps libraries preserve historical and digital materials through:

- Optical Character Recognition (OCR)
- Automated digitization
- Image restoration
- Language translation
- Data migration

AI also improves long-term preservation of rare manuscripts, photographs, and audiovisual collections.

Research Support and Scholarly Communication

Academic libraries are increasingly helping researchers with AI-driven tools for:

- Literature reviews
- Citation analysis
- Research impact measurement
- Plagiarism detection
- Data visualization

AI is changing university research by speeding up data analysis and encouraging collaboration across disciplines.

The Changing Role of Librarians

AI is not replacing librarians; it is changing their responsibilities.

Modern librarians are taking on roles such as:

- Digital curators
- Data literacy educators
- AI ethics advisors
- Information navigators
- Research consultants

New roles like "AI librarians" reflect the need for professionals who can manage AI systems responsibly and teach users about algorithmic literacy.

Librarians now need to develop skills in

- Data analytics
- AI literacy
- Prompt engineering
- Digital ethics
- Information verification

Training and reskilling are now essential for library professionals. Surveys show that many librarians see AI literacy as a crucial future skill.

Ethical and Social Challenges

Algorithmic Bias

AI systems can show biases found in their training data, which may affect search results, recommendations, and classification systems.

A study on automated diversity audits in public libraries found that AI can oversimplify identities and may not meet the needs of local communities. Libraries must ensure transparency, fairness, and accountability in how they implement AI.

Privacy and Surveillance

Libraries typically protect user privacy and freedom of thought. AI systems often require a lot of user data for personalization and analytics, raising issues concerning:

- User tracking
- Data security
- Behavioral profiling
- Surveillance risks

Responsible AI governance is crucial to maintain library ethics.

Intellectual Property and Copyright

Generative AI has sparked debates about copyright and ownership. Concerns have arisen over AI companies using copyrighted books and library collections for training models without clear consent. Libraries need to navigate complex legal and ethical issues about digital access and AI-generated content.

Misinformation and AI Hallucinations

AI systems can create incorrect or made-up information. Cases of AI producing false book recommendations and fictitious references highlight the risks of relying too heavily on generative AI.

As a result, libraries play an important role in encouraging information verification and critical thinking.

Libraries as Centers for AI Literacy

In an AI-driven world, libraries are increasingly becoming hubs for digital and AI literacy.

Key initiatives include:

- AI awareness workshops
- Training in ethical AI usage
- Fact-checking education
- Prompt engineering instruction
- Public access to AI tools

Libraries can help narrow digital divides by ensuring fair access to AI technologies, particularly for underserved communities. Community discussions envision libraries as collaborative learning spaces for AI, equipped with advanced computing resources and shared AI tools.

Future of Libraries in the AI Age

Future libraries will likely combine physical, digital, and intelligent environments.

Emerging technologies include:

- Robotics for inventory management
- Blockchain for digital rights management
- Metaverse-based virtual libraries
- AI-powered research assistants
- Smart learning environments

Researchers argue that libraries are entering a new phase aligned with the Fifth Industrial Revolution, integrating human-centered AI with advanced digital tools.

Future libraries will emphasize

- Human-AI collaboration
- Ethical information ecosystems
- Inclusive digital access
- Personalized learning
- Community engagement

Rather than replacing libraries, AI could enhance their role as trusted public institutions.

Recommendations

To thrive in an AI-driven environment, libraries should:

1. Develop clear AI policies and ethical guidelines.
2. Invest in AI literacy training for librarians and users.
3. Ensure transparency in algorithms.
4. Protect user privacy and intellectual freedom.
5. Promote fair access to AI technologies.
6. Collaborate with educators, technologists, and policymakers.
7. Balance automation with human expertise and compassion.

CONCLUSION

Artificial Intelligence is fundamentally changing libraries and their role in society. Libraries are moving from static information stores to intelligent, interactive, and community-focused knowledge centers. AI technologies improve efficiency, accessibility, and personalization while also bringing ethical, legal, and professional challenges. The future of libraries relies not just on adopting technology but on implementing it responsibly and with a human touch. Librarians remain vital as gatekeepers of reliable information, champions of intellectual freedom, and educators in digital citizenship.In a world increasingly influenced by algorithms, libraries continue to act as democratic institutions that encourage fair access to knowledge, critical thinking, and informed participation in society. Far from becoming outdated, libraries are growing more essential in navigating the complexities of an AI-driven world.

Table 1: Evolution of Libraries in the Digital Era

Era	Characteristics
Traditional Libraries	Physical books, manual cataloging, print archives
Automated Libraries	Digital catalogs, integrated library systems
Digital Libraries	E-books, online databases, institutional repositories
Intelligent Libraries	AI-powered search, automation, personalized services

Author Biography

Vijyendra Singh Rana is a PhD Research Scholar in the Department of Library Science, Kalinga University, Kotni, Near Mantralaya, Naya Raipur – 492101, Chhattisgarh, India. His research interests include library and information science, digital libraries, artificial intelligence applications in libraries, knowledge management, information retrieval systems, and emerging technologies in academic libraries. He is actively engaged in research focused on transforming library services through innovative digital and AI-driven approaches to enhance user engagement, information access, and knowledge dissemination.

ABSTRACT

Artificial Intelligence (AI) is gradually changing how academic libraries manage, organize, and provide access to knowledge. This study looks at how AI technologies can support knowledge management and improve the quality of library services. This study will identify the AI technologies which are helping library professionals in Knowledge Discovery and Management. A case study methodology was adopted, supported by a mixed-method approach. Quantitative data were collected through structured questionnaires administered to library users and professionals, while qualitative insights were gathered through interviews and direct observation of AI-based systems in operation. The study focuses on key AI applications such as intelligent search systems, chatbots, automated indexing, and recommendation systems. The findings indicate that AI technologies significantly improve the speed, accuracy, and relevance of information retrieval, thereby enhancing user satisfaction and facilitating better decision-making. Furthermore, AI supports effective knowledge management by enabling the creation, organization, storage, sharing, and utilization of knowledge resources. However, the case study identifies several challenges, including data privacy concerns, high costs of implementation, lack of technical expertise, and difficulties in integrating AI with existing systems. Despite these barriers, the study concludes that AI has strong potential to enhance library services when supported by proper planning, staff training, and institutional policies. It emphasizes that AI should complement, rather than replace, the expertise of library professionals.

Keywords: Artificial intelligence, Academic Libraries, Knowledge Discovery, Knowledge Management, Chatbots, Knowledge Discovery

INTRODUCTION

Artificial Intelligence, first defined by John McCarthy (1956) as "the science and engineering of making intelligent machines," has evolved into a transformative technology capable of performing tasks that typically require human intelligence, such as learning, reasoning, and decision-making (McCarthy, 1956). Contemporary definitions further emphasize AI systems' ability to analyze data, recognize patterns, and make autonomous decisions to achieve specific objectives (Stanford HAI, n.d.). These capabilities make AI particularly relevant in addressing the challenges associated with knowledge discovery and management in libraries.

Knowledge Discovery

Knowledge Discovery is the process of extracting meaningful patterns, insights, and relationships from large volumes of data. It goes beyond simple information retrieval by uncovering hidden knowledge that can support research, learning, and decision-making. In library environments, knowledge discovery involves helping users find relevant information quickly and accurately from vast digital collections. Traditional systems, often based on keyword searching, are limited in their ability to understand user intent and context. As a result, there is a growing need for intelligent systems that can provide deeper, more accurate, and context-aware discovery of knowledge.It refers to the process of identifying useful patterns, relationships, and insights from large datasets, while knowledge management involves the creation, storage, sharing, and application of knowledge within an organization. In library environments, these processes are becoming increasingly complex due to the exponential growth of digital resources, diverse user needs, and the demand for personalized services. Traditional information retrieval systems, largely based on keyword matching, often fail to provide accurate and context-aware results, thereby limiting effective knowledge discovery.

Knowledge Management (KM)

Knowledge Management (KM) refers to the systematic process of creating, organizing, storing, sharing, and applying knowledge within an organization to achieve its objectives effectively. In the context of libraries, KM plays a crucial role in managing both explicit knowledge (documents, databases) and tacit knowledge (skills, expertise of librarians). With the exponential growth of information resources, traditional KM practices are no longer sufficient. Libraries are increasingly adopting digital tools and intelligent systems to ensure efficient knowledge organization and accessibility. Effective KM enhances decision-making, improves service quality, and promotes collaboration among users and information professionals.

AI Technologies in Libraries

The integration of AI technologies in libraries has significantly enhanced both knowledge discovery and knowledge management processes. Technologies such as machine learning, natural language processing, and knowledge graphs enable libraries to provide advanced services like semantic search, automated indexing, and personalized recommendations. AI-powered tools, including chatbots and virtual assistants, improve user interaction by offering real-time assistance and guidance. Additionally, AI supports efficient knowledge management through automated classification, digital repositories, and intelligent data organization systems (Elsevier, n.d.). By leveraging these technologies, libraries are transforming from traditional information storage centres into dynamic, user-centred knowledge hubs. Despite these advancements, challenges such as lack of technical expertise, infrastructure limitations, and ethical concerns remain critical considerations in the adoption of AI in library systems. Nevertheless, AI continues to play a pivotal role in shaping the future of knowledge discovery and management in modern libraries. The adoption of AI technologies such as machine learning, natural language processing, and knowledge graphs has significantly improved the efficiency and effectiveness of knowledge discovery systems. AI-powered tools enable semantic search, automated indexing, and intelligent recommendation systems, which enhance users' ability to locate relevant information quickly and accurately. Furthermore, AI facilitates knowledge management by supporting digital repositories, enabling automated classification, and fostering collaborative knowledge-sharing platforms within libraries (Elsevier, n.d.).

Therefore, this study aims to explore how AI technologies can be leveraged to enhance knowledge discovery and management in library environments. By examining existing applications, identifying challenges, and analysing their impact on library services, the study seeks to contribute to the growing body of research on AI-driven knowledge systems and provide insights for the development of intelligent library infrastructures.

Research Objectives and Methodology

The main aim of this paper is to improve understanding of the potential of Artificial Intelligence (AI) and how it is transforming knowledge discovery and knowledge management in academic libraries in today's rapidly changing digital environment.

The specific objectives of the study are:

- To provide a clear and comprehensive overview of how AI is being applied in academic libraries.
- To explore the role of AI in enhancing knowledge discovery and improving knowledge management practices in academic libraries.
- To identify the challenges involved in implementing these technologies, especially in academic libraries.

To achieve these objectives, the study uses a mixed-method approach. This includes a systematic review of existing literature on AI in Library and Information Science (LIS), along with case studies and scholarly research. In addition, a longitudinal approach is used to support the findings based on continuous observations and developments in the field. Through these research methods, the study provides useful insights that can help academic libraries, librarians, information professionals, researchers, and policymakers effectively use AI to strengthen knowledge discovery and improve knowledge management practices in library and information services.

Artificial Intelligence Applications in Academic Libraries

Intelligent Information Retrieval: AI-powered systems enhance traditional library search mechanisms by incorporating natural language processing (NLP) and machine learning techniques. These systems allow users to perform searches using conversational queries, resulting in more accurate and context-aware information retrieval. Semantic search capabilities further improve access by understanding the intent behind user queries rather than relying solely on keywords.

Chatbots and Virtual Reference Services: AI-based chatbots provide round-the-clock assistance to library users. These virtual assistants can handle routine queries such as book availability, library timings, and database access. By automating reference services, libraries can reduce staff workload while ensuring continuous user support.

Automated Cataloguing and Classification: AI technologies streamline the cataloguing process by automatically generating metadata, assigning subject headings, and classifying resources. This reduces manual effort, minimizes human error, and enhances consistency in bibliographic records.

Personalized Recommendation Systems: AI enables libraries to offer personalized recommendations based on user preferences, search history, and borrowing patterns. These systems assist users in discovering relevant books, journals, and research materials, thereby improving the overall research experience.

Data Analytics and Decision Support: AI-driven analytics tools help libraries analyze user behavior, resource utilization, and service efficiency. The insights generated support informed decision-making in areas such as collection development, budget allocation, and service improvement.

Digital Content Management:AI plays a significant role in managing digital resources by enabling automatic indexing, tagging, and organization of documents. Optical Character Recognition (OCR) technologies convert printed materials into digital formats, making them searchable and accessible.

Knowledge Management Support: AI facilitates the capture, organization, and dissemination of knowledge within academic institutions. It supports institutional repositories, research data management, and knowledge-sharing platforms, thereby enhancing both explicit and tacit knowledge management.

Plagiarism Detection and Research Assistance: AI tools assist in maintaining academic integrity by detecting plagiarism in scholarly works. Additionally, AI supports researchers through citation generation, literature review assistance, and writing support tools.

Language Translation and Accessibility: AI-based translation tools enable access to multilingual resources, breaking language barriers in research. Accessibility features such as text-to-speech and speech-to-text systems support users with disabilities, promoting inclusive library services.

Security and Predictive Maintenance: AI enhances library security through surveillance systems capable of detecting unusual activities. It also supports predictive maintenance by identifying potential system failures, ensuring uninterrupted library operations.

Core AI Methods for Knowledge Discovery

Data Mining and Machine Learning: Earlier, people used basic statistical methods to study data. Now, with the help of AI, especially machine learning, computers can automatically find hidden patterns in large amounts of data. These methods help in understanding complex relationships, making better predictions, and developing new knowledge.

Intelligent Data Mining: Modern AI uses a combination of different techniques like deep learning, evolutionary methods, swarm intelligence, and fuzzy logic. When these methods are used together, they become more powerful in finding useful patterns and helping in decision-making. These techniques are widely used in fields such as healthcare, cybersecurity, Internet of Things (IoT), and recommendation systems.

Benefits of Artificial Intelligence in Libraries

- **Improved Knowledge Discovery** – AI helps users find relevant information quickly and accurately by understanding context and patterns (Cox, 2023; Russell & Norvig, 2021).
- **Automation of Routine Tasks** – Routine library operations such as cataloguing and classification can be streamlined through AI-driven automation, thereby minimizing manual effort(Bawden & Robinson, 2022).
- **Personalized User Services** – AI systems provide tailored recommendations based on user behaviour and preferences (Jiang et al., 2020).
- **Efficient Knowledge Management** – AI supports better organization, storage, and retrieval of large volumes of knowledge (Davenport &Ronanki, 2018).
- **24/7 User Support** – AI-powered chatbots and virtual assistants offer continuous assistance to library users (Cox, 2023).

CONCLUSION

Artificial Intelligence (AI) is complex and not easy to explain. It has many uses and can appear in different forms. AI is based on advanced computer programs and statistical methods, which can be difficult for most people to understand. Sometimes, even the people who design AI systems may not fully understand how they make certain decisions, because the system learns patterns from large amounts of data. While we often think of AI as something we directly interact with, like ChatGPT, it is usually built into systems and technologies in a hidden way. This makes it difficult to notice or avoid its use. In many cases, large technology companies do not openly share how their AI systems work, as this information is considered a business secret.

Table 1: Examples of AI-Driven Library Knowledge Services

Library Services	AI Tool / Element	Example
Reference Services	Chatbots	24/7 user query support
Cataloguing	Machine Learning	Auto metadata tagging
Knowledge Discovery	Recommendation Systems	Suggesting relevant resources
Digital Services	NLP	Semantic search, personalized recommendations, auto-summarization of e-resources,

		multilingual search support
User Support	Conversational AI	Voice-based assistance
Collection Development	Predictive Analytics	Trend-based acquisitions
Repository Management	AI Indexing	Auto organization of research
Knowledge Management	Expert Systems	Sharing staff knowledge

Table 2: Artificial Intelligence in Knowledge Management Processes: Capabilities and Library Use Cases

KM Process	AI-Capabilities (Possibilities)	Library Use Cases
Knowledge Creation	- Predictive analytics using user data - Identifying hidden patterns - Generating new knowledge from datasets	- Predicting user reading trends based on circulation data - Identifying high-demand subjects for collection development - Discovering research gaps from theses and dissertations - Auto-generating summaries of research articles - Analysing user feedback to improve services
Knowledge Storing & Retrieving	- Organizing and storing large volumes of data - Smart filtering and indexing - Enabling quick retrieval of information	- AI-based cataloguing and metadata generation - Smart OPAC with natural language search - Automatic classification of books and digital content - Retrieval from institutional repositories - Personalized book and article recommendations
Knowledge Sharing	- Connecting users and experts - Supporting collaboration and communication - Integrating multiple platforms	- AI chatbots for 24/7 user support - Research collaboration platforms for students and faculty - Automated alerts for new arrivals and resources - Online discussion forums for knowledge exchange - Integration with LMS/email for information dissemination
Knowledge Application	- Supporting decision-making - Providing user-friendly interfaces - Enhancing accessibility of knowledge	- Chatbots helping users find relevant resources - AI assistants for research and citation guidance - Personalized reading suggestions - Voice-based search systems - Data-driven decision-making for librarians (collection, budgeting)

Author's Biography

Ritu Sharma, born on 6th February 1998, is currently Pursuinga Doctoral Degree in Mangalayatan University, Beswan, Aligarh (UP). She can be reached at 9717617274 or via email at 20251289_ritu@mangalayatan.edu.in. With a strong academic foundation in libraryand Information Science, she holds an MLIS degree and has successfully qualified the UGC NET, reflecting her commitment to academic excellence and professional growth. With 2.5 years of work experience, Ritu has demonstrated dedication and enthusiasm in fostering a reading culture among students. Her achievements extend beyond her professional role, including notable involvement in public speaking, which highlights her communication skills and confidence. She has also gained valuable exposure through an internship with DRDO and contributed meaningfully through ICDL volunteering. Her diverse experiences and proactive approach make her a promising and dynamic professional in the field of library sciences.

ABSTRACT

Artificial Intelligence (AI) is a ground-breaking technology of the twenty-first century that has an influence on social, economic, educational and political systems all around the world. AI has great potential for speeding up economic progress, public innovation, services, education, and health. But, AI also contributes to social inequalities and problems with resource accessibility. This research focuses on social inequalities and problems with accessibility and the intersections AI creates. Positive effects from AI create more jobs that are more accessible, but only to those that have certain economic, educational, and digital resources. The research also focuses on gender, geographical, and technological constraints. Many papers analyze automated technology and employment, digital exclusion and the resulting biases, and privacy and control concerns. There is potential that social divides and inequalities will get worse without proper control and inclusive policies. In the spirit of modern social theory, the research suggests the use of inclusive digital policies and infrastructures with ethical governance to produce fairer digital outcomes. The last section of the research explains the importance of using a socially balanced view with the goal of preventing AI from reinforcing inequality and empowering social equality.

Keywords: Artificial Intelligence, Social Inequality, Sociology, Digital Divide, Social Stratification, Technology and Society, Digital Inclusion

INTRODUCTION

AI (Artificial Intelligence) refers to an advanced technology system that depicts a machine's ability to think and learn like a human and enhances and simplifies everyday tasks and processes for all industries and sectors. The types of technology that fall under AI include but are not limited to machine learning, predictive analytics, generative AI, and

autonomous systems. The speed at which AI systems evolve and improve presents the possibility for major economic advancements and innovations but threatens the widening social gap, digital immaturity, and the unequal advantages of technology. AI systems have the ability to disrupt existing social structures and patterns, and scholars and policymakers are especially concerned with the impact of AI on social stratification [1]. Although technology has the potential to widen social gaps and inequality, it has the capacity to foster social development and progress. Keeping this in mind, the effects of AI technology must be analyzed to understand its macro and micro impacts on society and its various demographic constituents. AI is a tool that holds the potential of making entire industries more efficient. With AI, it is possible to automate boring, tedious tasks, improve the quality of decisions made, and even address complicated social and economic issues. Leaving the world of the abstract for AI's present-day applications, platforms that utilize AI are rapidly changing the world of education by personalizing educational materials and making quality education available to countless people from different parts of the globe. In the medical field, AI is redefining patient-care by personalizing the processes that make medical decisions, plan medical treatments, and monitor patients more efficient and more effective [2].

AI has gained ground in other industries, such as farming and transportation, gaining the potential of improving the quality of life in all of these areas. For all AI's potential, it is not equally advantageous. The accessibility of digital technology is not equitable. It is a dividing line along income, education, and even geography. It is the more educated, more computer literate, and more wealthy who are able to afford to be on the AI bandwagon. The opposite is true for the low-income and the rural populations. It is they who are uneducated and untapped, the longer the digital divide, the social inequalities grow and the fewer opportunities they have to improve socio-economic conditions. Automation and AI are two of the prominent focuses of contemporary sociology. How automation and machine learning disrupt and create opportunities for different subsets of the population, and especially for less educated and unskilled populations, is of prime concern. The research study the monopolization of artificial intelligence (AI) by large companies concentrated in a few big tech companies. Tesla, Google, Facebook and Microsoft are some companies that have the most resources in the fields of big data, large computation, and deep pockets. These companies have the potential to control AI to the point of making market monopolies and increasing economic disparity by driving a wedge. This document attempts to add to the debate of digital governance and the ethical and social justice concerns regarding AI and its governance. There are several sociological and conflict-based theories that have been developed in order to understand the nexus that has been created between social disparities and the rapid development of AI. Conflict-based theories state that the technology will support the dominant group (in this case the monopolistic big tech companies) and deepen the social and economic imbalances of the society [3]. The monopolistic use of AI will deepen the social and economic imbalances status group. Social Stratification theories highlight that the economic, social and education disparity will determine the benefits of the emerging and new technologies. The AI gap is one of the digital divides.

This gap is not merely technology access, but differences in digital, technology and ICT competences. AI is being used more and more, and people without digital skills are disadvantaged in education, work, health, and civic participation. To address the digital inequality gap, there needs to be a combination of strengthening digital infrastructure, building digital policy, and creating digital literacy especially in underserved communities. Current sociological discussions and debates focus on the ethical governance of AI and the responsible innovation of technology. The need for the development of policy frameworks in support of ethics and responsible AI that promote open access, privacy, and the minimization of algorithmic discrimination in order to mitigate the societal costs of AI, is increasingly being recognized by a broad range of stakeholders from government to educational bodies. The focus of the research is to investigate the social inequality caused by AI. It will study the social, technological, and political impact of AI, as well as the lack of thinking related to the social and ethical governance of AI. The research will consider digital divides and governance frameworks in order to stress the social, ethical and political impact of AI to society.

Studies related Reviews

Sundararajan, M. & Narayanan, K.(2021), This article explores at socioeconomic inequality, focusing on the urban-rural divide, disparities in skilled vs. unskilled labor, and the gaps in access to technology and jobs (both in terms of income). There are multiple ways to promote economic efficiency and growth using the results of this research. However, there is potential for greater inequality. This research shows the significance of the right policies (government policies) and the right kind of digital infrastructure and human capital to produce fair AI practices. It advocates for a balanced approach that prioritizes digital inclusion and the reskilling of workers [4]. Yadav, P., & Kumar, D. (2021), The study explores at how AI is affecting jobs, social education, the way the government works, and privacy in India. The study shows both the good and the bad of AI. The good is things can get done faster and services can be delivered quicker. The bad is people may be even more unequal, and there may be more ethical and data privacy issues. The report mentions the importance of fair technology, stronger and better rules, and fair innovation. These things are important to make sure AI is good for the social growth and stability of India [5]. Sharma, R. and Gupta, V. (2022), explores at the impact that AI decision-making and algorithm bias has on social inequity in jobs, education, health, and finance in India. Results are affected by caste, gender, geo differences, and socio-economic status. In AI, the absence of representative data and transparency leads to more social inequities. It strongly urges the incorporation of social justice measures in the design of AI, and bolstering laws, frameworks, auditing, and ethics in AI to sustain bias and social inequities [6].

Venkatesh, S., & Rao, K. (2022),The research looks at how AI has completely transformed job structures, from all the different industries, skills, and productivity levels across India. Since automation tends to take away repetitive tasks, the low-skilled workers are the ones most negatively affected, while most of the workforce is left with more complex tasks that need more technical skills. The report focuses on the constant need to change skills and on using the remaining available workforces. The report then includes proposals regarding the laws on vocational training and digital education. The report believes that the only way to make the best of the automation and AI technologies and achieve the economic growth everyone is hoping for and to mitigate the most social impacts everyone is most worried about the most, is to keep of scaling [7]. Tripathi, S. and Mishra, A. (2023),This paper examines the relationship between the development of inclusive AI in India and the impact of digital skills on accessibility to AI related services and jobs, AI education, and AI-related civic engagement. This paper points out the various obstacles to digital access and participation, such as limited geographic and social participant infrastructure, educational and economic gender gaps, and regional differences. The relevance of (social) exclusion to limited digital literacy is especially true for (economically) marginalized groups. This paper endorses digital education and capacity-building investments as prerequisites for socially inclusive AI. Government and community-sponsored activities for socially inclusive AI development are essential [8]. Sarkar, S. and Choudhury, P. (2023) In increasingly more ways, Artificial Intelligence (AI) is becoming a part of governance, economic development, and public services in India. With these advances comes a mix of new opportunities and ethical dilemmas. This paper addresses the current conditions for AI governance in India. It addresses matters of transparency, responsibility, confidentiality, and fairness. Utilization of the AI algorithm as well as the risks of monitoring, exploitation of data, and social exclusion are also explained by analyzing the current policies and the institutional structures for the responsible usage of AI [9].

Perspectives on Artificial Intelligence and Social Inequality

AI is changing everything from the healthcare system to government institutions. The rapid progression of artificial intelligence is already implementing changes to healthcare systems. With how present AI is, the people from sociological backgrounds and theorists are worried about social inequalities. Improvements in artificial intelligence are capable of increasing overall accessibility to various services, as well as enhance the level of productivity. However, AI also has the capacity to deepen social inequalities, as well as different forms of exclusion. An intricate understanding of the theoretical integration of social order, social inequalities, and social relations of power in combination with advanced technologies is required to better understand the implications AI brings. As a result, many sociological theories offer insights on the implications of AI on society, as they understand that AI is not a value-free tool. Due to the privileges of holding greater financial capital, higher social class groups will see the

benefits of AI to a greater extent [10]. In contrast, lower social class groups will continue to experience barriers while attempting to access the opportunities of the digital economy. According to conflict theory, AI has the potential to exacerbate social inequalities, reinforcing the grip of the elites and large corporations. This has the potential to worsen income inequality and create a larger class of the unemployed who do not possess skills to complex to be threatened by automation. The theory of social stratification describes AI as creating opportunities for skilled people, while reinforcing inequalities for those who cannot compete on a digital level. The digital divide, the gap between those who have access to and can effectively use the Internet, has the largest impact on inequality of all AI technologies. The impact is greatest on the poorer classes in education, employment, and civic engagement. Technology determinism explains how Artificial Intelligence causes social change, and that technologies shape social behavior and structures. Tools of AI create social change in the Impact of the AI Tools of Automated Living. While many services may improve and become more efficient due to AI, the gap between the privileged and the poor will widen. The digital divide and conflict theory can be used to design administrative frameworks to achieve social justice in this technology.

Artificial Intelligence in Contemporary Society

In the 21st century, the role of Artificial Intelligence (AI) has changed dramatically. AI refers to the simulation of human intelligence processes by computer systems, many of which can now learn, reason, or make decisions for themselves. AI combines machine learning, robotics, and recently developed techniques pertaining to language. AI has meaning in many different social and economic sectors throughout the world. For example, the field of medicine uses AI to diagnose and better care for patients. AI has the potential to make significant leaps in medical imaging, drug discovery, and therapeutic monitoring [11]. AI has also started to influence the field of education by creating individualized pathways and opportunities for students. In the sector of finance, AI is used to manage customer fraud and automate trading and customer relations. The transportation system is using AI to assist with traffic navigation and, ultimately, the creation of self-driving vehicles. The examples outlined above describe how AI is being used to increase the level of service provided throughout multiple sectors around the world. AI permeates our experience in many ways, from virtual assistants and recommendation systems to social media and smart devices. AI not only alters how we communicate and the ways we access information, but also how we interact with different organizations as it is increasingly incorporated into different social systems and methods. AI enhances social phenomena, but it also alters social systems, creating new challenges and concerns such as digital divides, algorithmic inequities, job loss, and a loss of privacy. All these factors demand a recognition of the AI social phenomenon of shifting power and social divides. A sociological perspective is necessary to understand the ways AI is transforming social structures and the problems and opportunities it poses to a given society.

Opportunities Created by Artificial Intelligence

AI can be a helpful tool for humanity. Using AI has the potential to benefit the economy, creativity, society, and public services. AI is becoming popular with governments, businesses, healthcare, and education for problem-solving, improving the quality and speed of decisions, and helping with sustainability. From a sociology perspective, AI can positively change society.

- Economic Growth and Innovation
- Improved Education and Learning
- Advancements in Healthcare
- Enhanced Public Services and Governance
- Employment Creation and Skill Development
- Increased Accessibility and Social Inclusion
- Scientific Research and Problem Solving

Challenges of Artificial Intelligence and Social Inequality

AI has the power to create new hurdles that will increase inequities, and create new opportunities for advancement. Keeping inequities in mind, developing inequalities will most likely be visible in wealthier, more educated countries.

The digital divide is a serious issue, as many under privileged and marginalized communities lack adequate access to technology. This is also an access barrier to AI and its tools for education and positive economic growth. Social and economic inequities will continue to grow as a result. Many will lose their job as a result of technology automation and the implementation of AI [12]. Low-skilled workers will be the most impacted as they are the workers that have traditionally filled roles that are most likely to be automated and will IL most likely gain roles that are new to the workplace. This will help grow inequities in social and economic domains. Due to an imbalance of large corporations winning the most from technological advancement, inequities in capital will increase. From this, it is important that we create new, innovative ways to address inequities in society in a way that will not further grow inequities.

Sociological Dimensions of AI-Driven Inequality

The impacts of Artificial Intelligence (AI) are evident in technology, the economy, and society. Social stratification in the context of positional, economic, educational, and geographic strata speaks to inequalities in the benefits and threats posed by AI to social groups. On the one hand, AI tools can be used to increase productivity and innovation; on the other, they can deepen inequalities. In the digital economy, social inequalities may deepen as digitally disadvantaged groups are made worse off, while advanced digital skills and education may benefit an elite few. From an economic perspective, inequalities caused by AI are most evident in a widening AI skills gap and economic opportunity gap for low-skilled workers, which in turn creates unequal access to AI and learning opportunities [13]. These inequalities are mirrored in the algorithms of AI, where the under- and misrepresentation of social groups, including gender-based groups, is evident. The rural-urban digital divide and the widening gap between developed and developing countries represent a legacy of inequality and inequity of technology as a social good. To reverse these inequalities and improve technology for society, it is critical to consider the social context where AI is in use.

Ethical and Policy Implications of Artificial Intelligence

Though it opens doors to new possibilities for development and progress, the fast progress of artificial intelligence (AI) also brings up serious moral questions. AI has growing applications in many fields, including healthcare and finance. As its importance develops, so does the responsibility of governments and private sector organizations to ensure its safe practice. Fairness and non-discrimination are important ethical factors, as biased datasets can lead to inequitable outcomes in recruitment, credit decisions, and the courts, to name a few. Openness and responsibility, combined with rigorous and ongoing evaluations of AI systems, are crucial for the governance of AI to avoid inequitable outcomes. Safeguarding the data and privacy of individuals is a major ethical issue [14]. AI systems are predicated on the collection and analysis of vast amounts of personal data. Balancing the clear data-driven system advantages of increased service efficiency and improved decisions against the very real threats of enhanced surveillance, unauthorized access to data, and the violation of personal data and privacy is critically important. AI systems are largely "black boxes" of decision-making. For AI systems to be ethical and responsible, explainability and sustainability of design and decisions must be prioritized, particularly for personal data. Trust in AI systems is contingent on explainability and safety. To ensure equitable outcomes and foster innovation, governments should focus regulatory frameworks on real-world safety, robust data privacy and protection, and ethical AI. The ethical development of AI means that people should always be the priority, with a focus on underserved groups getting the benefits, and more resources should be funneled into digital skills and workforce training and education so that inequalities are reduced/closed. The benefits of AI as well as social justice and democracy will be possible with the right AI governance that combines innovation with ethical practices.

Strategies for Promoting Inclusive and Equitable AI

The effects of AI will change society in a way that makes its benefits more widely distributed. One major way to achieve this goal of widening AI's benefits is to invest in digital infrastructure, like the internet and affordable computing and communication technology, especially in neglected communities. Teaching people digital skills and literacy drives the growth of the AI economy and enables people to take advantage of the new opportunities it creates. Inclusive AI development depends on a range of data and development teams. This helps eliminate bias. Accountability and fairness audits of algorithms and frequent checks for bias also have a place in AI development. AI

and automation disrupt labor in a way that makes some jobs obsolete and creates new work. Governments, the private sector, and educational institutions need to collaborate to make training programs available that equip workers with the skills necessary to enter these new workplaces [15]. This will help decrease the possibility of workers becoming jobless due to technological development. Comprehensive guidelines and restrictions can safeguard people's civil rights and social values by closing loopholes for the misuse of AI and ensuring that its application is responsible, transparent, and considerate of the consequences. Governance of AI is very important as it needs to consider many people come from different backgrounds. This includes people from the policy makers, researchers, businesses, and civil societies, as well as people from the marginalized communities. Having many outsiders is good for the work as it is the first stage to inclusive AI. Meaning, AI is accessible for everyone's social needs. Most importantly, AI is innovation. Therefore, innovation occurs when people work together for the common good for everyone. Improving digital infrastructures, literacy, and reducing biases in algorithm design and governance can help ensure AI is an accessible and sustainable service for all.

Future Trends and Prospects

- AI has the potential to tremendously shape society, economy and governance.
- AI will change your job. AI will change how we talk to each other and even how we learn and get services.
- Changing how we design AI to focus more on people will ensure fairness and take responsibility.
- In the future, AI will determine how diseases are diagnosed and help create treatments for individuals, and in schools, AI will tailer learning to the student.
- AI will help improve transportation, farming, managing our natural resources, and development that balances the needs of everyone and everything.
- We will see a shift in the job market towards the demand of data analysts, machine learners, and cyber security professionals.
- Changing due to the impacts of AI will also require organizations to retrain employees to have an adaptable and flexible learning mindset.
- Encouraging patterns of AI will emerge that focus on equity and will decrease bias and promote fairness.
- To encourage a unified approach to the principles, ethics and creating global frameworks and AI regulation governance, countries must work together.
- To ensure AI will promote social justice, good governance, and inclusive policies will be needed.

CONCLUSION

Artificial Intelligence, is a game-changing technology that is affecting the way people live their daily lives, the way governments function, social interactions, and economic activities. The paper takes a look at the sociological perspective on AI's role with social inequality and what it means from the standpoint of opportunities and threats. AI has the capability to create a positive impact on innovation and economic growth, as well as on healthcare, education, and the efficiency of public services. However, the positive impacts of AI would still have the potential to promote inequalities. The research focuses on the barriers to equitable AI adoption, such as the digital gap, bias in AI, job loss due to automation, and the monopolization of technology. The sociological theories of political conflict and the digital divide analyze the relations AI creates among social structures of control and inequality. AI has become a social technology of combined means of production and control that impinges on access and social well-being. Inclusive governance, equitable technology, and ethical investments are vital. To address the inequalities, there is the need to invest in the digital economy and in upskilling the workforce. The equity and social justice challenges and the human-centric and fair use of Future AI technologies will drive its future as a tool for achieving unprecedented social equity.

ABSTRACT

A field experiment was planned and conducted during 2023-24 at Horticulture Research Block, School of Agriculture Sciences, SGRRU, Dehradun, Uttarakhand to investigate the "Effect of different organic fertilizers on growth and fruit parameters of Capsicum (*Capsicum annuum* L.) under polyhouse". The experiment was laid out in completely randomized design with three replications and nine treatments. The treatments comprised following levels of different organic manures with manually applied Vermicompost in all different treatment and concentrations of all treatments viz. T_1 (control), T_2 (FYM@ 20t/ha), T_3 (cow urine@ 50%), T_4 (Humic caid@2%), T_5 (Biostimulants @5%) T_6 (Bonemeal@2kg/ha), T_7(Neem cake@5kg/ha), T_8(FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha)and T_9 (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha). The sowing of capsicum cultivar "Bomby" was done on 10/02/2023 and final harvest at 12/06/2023. Observations on various attributes *viz.* growth yield and economics were recorded. The results revealed that treatment T_9 (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha) found to be most effective in terms of growth attributes such as Plant height (100.06cm), Number of leaves (84.30), Number of flowers (6.93), Number of days for first flowering (49.83), Number of 50% flowering (53.90); Fruit attributes *viz.* Fruit weight(96.03g), Fruit length (7.78cm), Fruit diameter (7.40cm), Fruit

volume (35.93),Rind thickness (3.45cm), Number of fruit per plant (6.30), Number of seeds per fruit (102.50) and Number of chamber per fruit (4.0).

Keywords: Capsicum**,** organic fertilizers, cow urine, humic acid, biostimulant, Bonemeal, neem cake

INTRODUCTION

Capsicum annuum L., commonly known as Shimla Mirch, belongs to botanical family Solanaceae and genus capsicum. It is believed to be the native of tropical South America, especially Brazil is thought to be the original home of pepper. The genus Capsicum originated in the new world of tropics and sub tropics. The most cultivated species among the capsicum species was domesticated in Mexico. Capsicum was unknown in the old world until sixteenth century has been introduced into Spain by Columbus on his return trip in 1493. Cultivation spread from the Mediterranean Europe to England by 1548 and central Europe by close of the sixteenth century. The Portuguese brought Capsicum from Brazil to India during 1584. However, based on the distinct type of variability available on the North-eastern States, it can be presumed that spread of Capsicum in those regions is independent from elsewhere in India. It is thought that Christian missionaries directly introduced Capsicum from South America (Thamburaj, 2022). According to 2021-2022 Statistical data, the total production of Capsicum is 519.16 MT (NHB, 2022). As such capsicum growing around cities like Bangalore, Belgaum, Mysore (Karnataka), Nilgiris (Tamil Nadu), Pune, Thane (Maharashtra), Ranchi (Bihar), Darjeeling (West Bengal), Himachal Pradesh, Jammu and Kashmir and Hills of Uttar Pradesh. The Major countries producing bell peppers are China, Indonesia, Sri Lanka, Pakistan, Turkey, Korea, Hungary, Spain, Bulgaria, Romania, Italy, Yugoslavia, Nigeria, Ghana, Tunisia, Mexico, USA, Central America, Argentina and Peru. Capsicum has higher concentration of biologically natural ingredients like Niacin (mg), Pyridoxine (mg), Vitamin A, C, K and E, dietary fiber and Protein as well as some minerals also found in capsicum in small amounts National Centre for Biotechnology Information, (2022).

The cultivation of capsicum under different protected structures are the most suitable solutions to the challenging environmental factors as it prevents spreading of insects, pests and other viral diseases. The growing trend of protected cultivation is associated with high yield, good quality, improved shelf life and year around availability of capsicum fruit. This technology can be utilized for controlling the environmental parameters such as temperature, relative humidity, light intensity and duration, CO_2 level, irrigation supply and root development. The farmer needs to using organic fertilizers or being certified by the organic department so they get high value of their produce by using less or cheap input like FYM (farm yard manure), vermicompost or other organic product i.e.; bone meal, neem cake so they get high or qualitative yield (Gill, 2018). Organic fertilizers improve the soil structure, provide a wide range of plant nutrients, and add beneficial microorganism to the soil. Farm Yard Manure contains a high proportion of organic material, which feeds soil organisms and is necessary for maintaining active soil life, and it is high in nutrients. On an average well decomposed farmyard manure contains 0.5% N, 0.2% P_2O_5, 0.5% K_2O (Grover, 2022). Cow urine is considered as a better alternative to synthetic chemicals which are expensive and pose potential danger to the farmers, marketers, consumers and environment.

It is a natural disinfectant and pest repellent and forms the main component of Panchagavya, an organic booster, prepared and sprayed by the farmers (Donga, 2022). It contains 95% water, 2.5% urea, minerals, Hormones and 25% enzymes. It also contains iron, calcium, phosphorus, carbonic acid, Potash, nitrogen, ammonia, manganese (Randhawa,2015). Bio-stimulants are the substances or microorganisms applied to plants, soils or seeds with the aim of enhancing crop yield, quality traits, plant tolerance to a wide range of biotic and abiotic stresses and or nutrient use efficiency. An important source of bio-stimulants are waste streams, which places these products in the spotlights for agricultural innovations directed towards achieving a circular economy (Kumar,2020). Humic acid is an organic compound derived from plant and animal matter decomposition. It is a major humus component, the dark organic matter that forms in soils and other environments. It contains approximately 70 to 90% of soil organic matter. It plays

a role in soil fertility and plant growth. It helps to improve the soil structure, increase moisture retention and increase nutrient uptake by plants (Jagdish,2020). Bone meal is also known as organic bone meal, is a type of organic fertilizer made from animal bones. The NPK rating of bone meal is typically 3-15-0, with a calcium content of around 12%. Neem cake is an organic manure of by-product obtained in the process of cold pressing of neem tree fruits and kernels and the solvent extraction process for neem oil cake. Neem cake has an adequate quantity of NPK in organic form for plant growth. it contains 100% natural NPK content and other essential micro nutrients as N (Nitrogen 2.0% to 5.0%), P (Phosphorus 0.5% to 1.0%), K (Potassium 1.0% to 2.0%) (Gupta,2022).

MATERIALS AND METHODS

The present research work was carried out at Horticulture Research Block, Department of Horticulture, School of Agricultural Sciences, Shri Guru Ram Rai University, Dehradun, Uttarakhand during the rabi season of 2022–23. The experiment was laid out in Completely Randomized Design (CRD) and replicated thrice. Total nine treatments were tried namely T_1 (control), T_2 (Farm Yard manure @20t/ha), T_3 (Cow urine @ 50%), T_4 (Humic acid @2%), T_5 (Biostimulant @5%), T_6 (Bone meal @2kg/ha), T_7 (Neem cake @5kg/ha), T_8 ((FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha), T_9 (FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha). The soil of the research field was sandy loam in texture having pH of 7.12 with available nitrogen (220.04%), available phosphorus (9.1 kg ha- 1) and available potassium (18.1 kg ha). The Capsicum cultivar "Bomby" was chosen for research purpose. Organic fertilizers i.e., FYM, Cow urine, Humic acid, Biostimulants, Bonemeal and Neem cake were incorporated in experimental field as per the treatments at the time of Transplanting. The seedlings were transplanted on 10/02/2023. All the cultural practices were done at regular intervals as per the requirement of crop during the course of research work. During the experimentation, from each replication, randomly selected one plants were used for recording various observations on growth and yield characters during whole of the cropping period at 30, 60, 90, and at final harvest. The obtained data were statistically analyzed with using standard statistical method as suggested by Gomez and Gomez (1996). along with increased availability of N, P and K at the early stage of crop growth. Nitrogen, phosphorus and potassium contained in organic fertilizer have great effects in plant growth and development. The findings are in agreement with (Khandekar *et.al*; 2017) in capsicum.

Number of leaves per plant

The observation of number of leaves per plant, recorded at 30 DAT, 60 DAT, 90 DAT and at Final harvest was presented in Table 2 and Fig.2 revealed significant differences among the treatments. At 30 DAT, number of leaves per plant ranged from (7.63) to (17.10). The maximum number of leaves (17.10) was recorded in treatment T_9 FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of leaves per plant (7.63) was recorded in T_1 (control @100% soil). Whereas, the result of the treatment T_2 (8.96) and T_3 (8.10) shows number of leaves per plant are par at each other. At 60 DAT, the maximum number of leaves (42.20) was recorded in T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of leaves per plant (17.43) was recorded in T_1 (control @100%). At 90 DAT, the maximum number of leaves (71.66) was recorded in T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha. The minimum number of leaves per plant (38.63) was recorded in T_1 (control @100% soil). At final harvest the maximum no. of leaves was recorded in T_9 (84.30) FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha with and the minimum no. of leaves (50.83) was recorded in T_1 (control @100% soil). The good plant growth, number of leaves and higher number branches may be due to higher level of vermicompost and FYM which might have number of Transformation of energy rich and complex organic substances into bio-stabilized composed products. (Reddy *et al*; 2017).

Number of days for first flowering

The observation of number of days for first flowering was recorded and presented in Table 2 and fig.3 revealed differences among the treatments. The minimum time was obtained in treatment T_9 (49.83) FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the maximum time was obtained in T_1 (63.50) control @100% soil. The treatment T_7 (62.23), T_3 (62.13) and T_2 (62.50) were par with each other. The significant difference was observed with treatment T_6 (60.96), T_5 (55.46), T_8 (51.06) and T_4 (53.93).

Number of days for 50% flowering

The observation of number of days for 50% flowering was recorded and presented in Table 2 and fig.4 revealed differences among the treatments. The minimum time was obtained in treatment T_9 (53.90) FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the maximum time was obtained in T_1 (69.63) control @100% soil. The treatment T_4 (59.0) and T_5 (59.36) were par with each other. The significant difference were observed with treatments T_2 (67.56) T_6 (62.06), T_3 (65.90), T_8 (57.70) and T_7 (64.36). Humic acid is a substance which can affect plants in two ways such as directly and indirectly. In direct way it improves chlorophyll content, fasten the respiration of plants and also improve the response of hormonal growth which lead early flowering of plants. The indirect effect is improving all the properties of the soil which also increase the plant performance. Similar, results were obtained by (Sakthivel *et al.,* 2021).

Number of Flower per plant

The observation of number of flowers per plant, recorded at 60 DAT, 90 DAT and at Final harvest was presented in Table 2 and Fig.5 revealed significant differences among the treatments. At 60 DAT, the maximum number of flower per plant (6.10) was recorded in treatment T_9 FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (0.76) was recorded in T_1 (control @100% soil). Whereas, the result of the treatment T_2 (1.26), T_3 (1.70), T_6 (2.90), T_7 (2.53), T_4 (4.03) and T_8 (4.63) shows number of Flower per plant were significantly varies with at each other. At 90 DAT, the maximum number of Flower (6.93) was recorded in T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (1.36) was recorded in T_1 (control @100%). The significant difference were observed with treatments T_2 (1.56), T_6 (3.73) and T_7 (3.26). Whereas, T_4 (4.86) and T_5 (4.63) shows number of Flower per plant are par at each other. At final harvest, the maximum number of Flower (5.93) was recorded in T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (0.83) was recorded in T_1 (control @100% soil).

Fruit weight (g)

The observation of fruit weight (g), recorded at Final harvest was presented in Table 3 and Fig.6 revealed significant differences among the treatments. At Final harvest, fruit weight ranged from 96.03g to 27.41g. The maximum fruit weight (96.03g) was recorded in treatment T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum fruit weight (27.41g) was recorded in treatment T_1 with control @ 100%. Whereas, significant difference was observed in treatment T_2 (35.10g), T_4 (88.90g), T_3 (52.56g), T_6 (79.43g), T_8 (91.92g), T_5 (85.56g) and T_7 (75.73g) for the fruit weight. This might be due to the increase in yield parameters may be due to better root proliferation, more uptake of nutrients and water, higher plant growth, more photosynthesis and enhanced food accumulation. This result was confirmed the findings of by Reddy *et al*. (2017) and Yassin *et al*., (2017).

Fruit volume (ml)

The observation of fruit volume (ml), recorded at Final harvest was presented in Table 3 and Fig.7 revealed significant differences among the treatments. At Final harvest, fruit volume ranged from 35.93ml to 8.06ml. The maximum fruit volume (35.93ml) was recorded in treatment T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum fruit volume (8.06ml) was

recorded in treatment T_1 with control @ 100%. Whereas, significant difference was observed in treatment T_2 (9.33ml), T_4 (29.82ml), T_3 (14.70ml), T_6 (21.76ml), T_8 (34.60ml), T_5 (27.64ml) and T_7 (18.73ml) for the fruit volume. This might be due to humic acid application significantly improved the fruit volume and increase the health of soil, plant nutrients uptake, and mineral availability as a result of which plant produce fruit having maximum weight, diameter and volume. This result was confirmed the findings of by Jan *et al*. (2020).

Fruit Length (cm)

The observation of fruit length (cm), recorded at Final harvest was presented in Table 3 and Fig.8 revealed significant differences among the treatments. At Final harvest, fruit length ranged from 7.78cm to 3.10cm. The maximum fruit length (7.78cm) was recorded in treatment T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha. Which was par with T_8 (7.56cm) and the minimum fruit length (3.10cm) was recorded in treatment with T_1 control @ 100% which was at par with T_2 (3.76cm) and T_3 (3.98cm). The treatment T_4 (6.63cm) and T_5 (6.0cm); T_6 (4.85cm) and T_7 (4.63) was at par with each other. This might be due to the increase in fruit length is possibly due to application of vermicompost that releases essential macro major nutrients such as nitrogen, phosphorous and potassium that was readily available to the plant. Ample and efficient supply of readily available nutrients from the rhizosphere relatively lesser holding in the roots and more transformation to the above ground parts for protoplasmic protein and synthesis of plant growth related compounds Kumar *et al*. (2020) and Panda *et al*., (2020).

Fruit diameter (cm)

The observation of fruit diameter (cm), recorded at Final harvest was presented in Table 3 and Fig.9 revealed significant differences among the treatments. At Final harvest, fruit length ranged from 7.40cm to 3.10cm. The maximum fruit length (7.40cm) was recorded in treatment T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha which was at par with T_8 (7.10cm) and the minimum fruit length (3.10cm) was recorded in treatment with T_1 control @ 100% which was at par with T_2 (3.46cm) and T_3 (3.76cm). The treatment T_5 (5.76cm) and T_6 (5.05cm) was also at par with each other. The treatment T_4 (6.40cm) and T_7 (4.15cm) are significant with each other. This might be due to the application of humic acid significantly increased the rate of photosynthesis, root development and plant nutrients content of the plant and thus increased the fruit diameter Jan *et al.,* (2020).

Rind thickness (cm)

The observation of fruit diameter (cm), recorded at Final harvest was presented in Table 3 and Fig.10 revealed significant differences among the treatments. At Final harvest, rind thickness ranged from 3.45cm to 1.63cm. The maximum rind thickness (3.45cm) was recorded in treatment T_9 with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha which was at par with T_8 (3.06cm) and the minimum rind thickness (1.63cm) was recorded in treatment with T_1 control @ 100%. The treatment T_5 (2.73cm), T_6 (2.51cm), T_2 (2.0cm), T_3 (2.14cm), T_4 (2.86cm) and T_7 (2.40cm) were at par with each other. This might be due to the positive effect of this organic manure may be due to the better availability of soil nutrients that produced healthy plants with large vegetative growth which reflected in head diameter. This result agreed with previous findings obtained by Panda *et al*., (2020); Chakravarthy *et al*., (2023) and Maraei *et al*., (2019).

Number of fruits per plant

The observation of number of fruit per plant, recorded at Final harvest was presented in Table 3 and Fig.11 revealed significant differences among the treatments. At Final harvest, the number of fruit per plant (6.30) was maximum with the treatment T_9 (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha), which was significant and superior over other rest of the treatments, which helped crop to respond well. This might be due to the reason of the improved root development, increased water and nutrient intake, increased plant growth, increased photosynthesis, and improved food accumulation may be the causes of the rise in yield metrics. The minimum number of fruit per plant (3.20) was observed in treatment T_2 (FYM @20t/ha)

which was at par with T_1 (Control 100%). Similar, results were obtained by Reddy *et al*. (2017); Panda *et al*., (2020); Paramasian *et al*., (2021) and Chakravarthy *et al*., (2023).

Number of seeds per fruit

The observation of number of seeds per fruit, recorded at Final harvest was presented in Table 3 and Fig.12 revealed significant differences among the treatments. At Final harvest, The number of seeds per fruit (102.50) was maximum with the treatment T_9 (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha), which was significant and superior over other rest of the treatments. However, the minimum number of seeds per fruit (41.46) was observed in treatment T_1 (Control 100%).

Number of chambers per fruit

The observation of number of chambers per fruit, recorded at Final harvest was presented in Table 3 and Fig.13 revealed significant differences among the treatments. At Final harvest, the number of chambers per fruit (4.00) was maximum with the treatment T_9 (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha) which was similar with (4.00) T_8 (FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @ 1kg/ha + Neem cake 2.5kg/ha), which was significant and superior over other rest of the treatments. The minimum number of chambers per fruit (2.0) was observed in treatment T_1 (Control 100%).

CONCLUSION

Based on current experimental research on the "Effect of different organic fertilizers on the performance of Capsicum (Capsicum annuum L.) under polyhouse" for the cultivar Bomby, it can be concluded that among the various organic manure treatments, the combination of FYM @ 20 t/ha, cow urine @ 50%, humic acid @ 2%, bio-stimulants @ 5%, bonemeal @ 2 kg/ha, and neem cake @ 5 kg/ha (i.e., T9) was found to be the most effective. This combination significantly increased plant height, number of leaves, days to first flower initiation, days to 50% flowering, number of flowers per plant, number of fruits, fruit diameter and weight, fruit length and volume, rind thickness, number of chambers per fruit, and number of seeds per fruit.

ABSTRACT

Green librarianship is usually talked about like it's all shiny with new buildings, but in reality, most universities are stuck with ageing library infrastructure, tight budgets, and higher and higher expectations about environmental performance. In this paper the purpose is to look at how existing academic libraries might be nudged into climate-responsive green libraries, by stitching together building upgrades, everyday operational reform, circular procurement habits, greener digital routines, and environmental learning. The study uses an integrative literature synthesis and a standards mapping method, it draws from newer peer-reviewed work, official guidance from IFLA, ISO, and the U.S. Green Building Council, plus a handful of illustrative academic library cases. The overall evidence suggests that if green actions are done in isolation, they seldom create long-lasting benefits. The best outcomes tend to show up when governance, measurement, and user-centred design are deliberately paired with hands-on interventions—things like building controls, HVAC optimisation, lighting and daylight improvements, low-flow fixtures, reuse of materials, e-preferred collections policies, and sustainability programming. There are also survey-based studies from the United States, India, Bangladesh, China, Kenya, and Pakistan, and they point in a similar direction: staff awareness, leadership commitment, and user participation really do, in fact, shape what happens on the ground. This paper adds a standards-based retrofit framework made for existing academic libraries, especially those operating on resource-constrained campuses. It basically argues that the green library should be treated not only as a low-carbon facility, but as a measurable institutional platform for climate action, resource stewardship, and environmental literacy.

Keywords: Green libraries; academic libraries; retrofit; library sustainability; energy management; circular procurement

INTRODUCTION

The green library agenda has kind of moved past the earlier idea of an environmentally friendly building. Right now, professional thinking usually treats the library as some integrated socio-technical system where facilities, collections, procurement, information services, staff behaviour, and community engagement all matter in a pretty entangled way. IFLA's definition is very clear about linking environmental, economic, and social sustainability. And the American Library Association has even formally recognised sustainability as a core value of librarianship. This broader framing is important, because a library can look impressive through a single building feature or a recycling campaign, while still not managing energy procurement, waste, access, or environmental learning in a coherent manner. The topic of this paper is therefore deliberately specific, how existing academic libraries can be retrofitted into climate-responsive green libraries via a standards-based, evidence-led approach. That focus feels timely for two reasons. First, the global buildings and construction sector is still taking up a big share of energy use and carbon emissions, so universities basically cannot meet their climate commitments without addressing library buildings and day to day operations. Second, retrofitting existing buildings is becoming more important, since whole-life carbon matters more and more. Peer-reviewed work on embodied carbon suggests that in modern energy-efficient buildings, embodied emissions might make up around half of life-cycle carbon, so adaptive reuse, plus careful refurbishment, is especially relevant. Academic libraries are a especially important site for this whole effort. They tend to keep long opening hours, deal with dense occupancy, and they maintain controlled environmental conditions for both people and collections, plus they rely heavily on ICT intensive services. Also, there's a deep symbolic value around campus that cannot really be ignored. Still, the literature suggests that academic libraries often pursue sustainability in fragmented or uneven ways. In the United States, Tribelhorn found that only a small number of academic libraries took sustainability in a truly holistic way, and assessment stayed kind of narrow, limited. In India, Bincy and Vasudevan reported that staff attitudes were positive but awareness about green practices remained low. In Bangladesh, Tanzin and Atikuzzaman found that users wanted a sustainable library, but they also didn't feel the library had already turned into one.

The three research questions discussed in this paper are:

- Which intervention measures are the most backed up by research regarding the present academic libraries?
- What kind of strategy could integrate LEED, ISO and IFLA guidelines into one efficient approach?
- Which indicators can the library consider measuring in order not to compromise the user's experience?

The objectives related to these questions are defining the topic, reviewing recent literature on the topic, mapping relevant standards, illustrating some cases, and finally proposing an implementation plan.

LITERATURE REVIEW AND STANDARDS

In fact, recent research partially supports the assumption about the increasing development of the green library movement, although its conceptual clarity and consistency in evaluation still remains questionable, at least. The theoretical study carried out by Fedorowicz-Kruszewska contributed significantly to changing the nature of discussion in the direction of a more consistent perception of what the green libraries are, and what green librarianship includes. In particular, the latter research by the author reveals the fact that further progress in this field is hampered by conceptual confusion, insufficient theory building, and poorly defined operational criteria. This fact partly explains why numerous initiatives undertaken separately in different libraries do not contribute much to measuring results systematically. The newer empirical literature looks somewhat the same. In China, Kang's pilot study of 14 libraries reported relatively low awareness and commitment, plus a lot of waste in facilities, along with operations that could be improved. In the United States, Tribelhorn found that sustainability was often not handled through the entire triple bottom line lens, and leadership direction was fairly limited too. Ren's 2024 exploratory survey across libraries in three U.S. states suggested that the most common environmentally sustainable practices were still the familiar "3Rs" and a bunch of energy-saving measures, however formal policies and structured

approaches were uncommon, or at least not widespread. Studies coming from the Global South broaden, and well, deepen this diagnosis. In the University of Calicut system, library professionals were not especially knowledgeable about environmentally friendly procedures though awareness and existing library practices were positively related, in a sort of uneven way. In Pakistan, a quantitative study of 132 university librarians found that green IT awareness and motivation significantly shaped pro-environmental computing behaviour. In Bangladesh, users backed the notion of a sustainable academic library, but they pointed out technological barriers, and they did not really view their own library as sustainable. These findings matter because they show that a green retrofit is not just a capital works programme; it is also a kind of change-management exercise, touching staff culture, user expectations, and operational literacy.

There is, however, a more encouraging strand of evidence. Beutelspacher and Meschede showed that libraries can promote environmental sustainability through collections, tools, and events, not only through physical facilities. Devine and Appleton found that environmental education in libraries works best when it is practical, collaborative, and embedded in local partnerships. Zakaria and Hendi's review of IFLA Green Library Award winners from 2016 to 2023 further made clear that outreach and education were the biggest category of recognised practice, ahead of energy efficiency and green spaces. This suggests that high-performing green libraries blend environmental performance with environmental meaning, so it feels less like compliance and more like shared intent. There is another strand of literature about standards and kind of management systems. When we look at existing buildings, LEED v4.1 Operations and Maintenance feels especially relevant, since it gives points for measured performance in energy, water, waste, transportation, indoor environmental quality,and purchasing. ISO 14001 gives the environmental management system backbone with policy, objectives, compliance, and continual improvement. Then ISO 50001 is more specialised, it focuses on energy management and a performance review kind of structure. Also, IFLA's 2022 definition and the 2025 draft guidelines bring a more explicitly library-first angle, so services, learning, and community engagement don't quietly disappear behind engineering metrics, or whatever you want to call them.

METHODOLOGY

This piece leans on an integrative literature synthesis together with a standards mapping step, plus a kind of illustrative case comparison. The whole approach was picked because research on library sustainability still looks kind of fragmented: there are plenty of survey style studies, some papers are more conceptual, others read like case reports, and only a small share actually offer directly comparable performance metrics. So, if you went for a tightly quantitative meta-analysis, you'd end up tossing aside a lot of the field's most helpful insights. Instead, the integrative synthesis lets operational, organisational, and user centred evidence sit side by side so it can be interpreted in one line of reasoning, even when the reporting styles differ a bit. The evidence base leans toward peer reviewed, English language sources from about the past ten years, and it is also supported with official standards and sector guidance. For inclusion, the review privileged three material types. First, newer empirical studies that discuss green libraries and sustainability within library environments. Second, official standards and frameworks coming from LEED, ISO, IFLA, ALA, plus guidance from relevant public agencies. Third, case-based material that spells out concrete interventions, governance mechanisms, or measurable outcomes in academic libraries (or settings that are clearly comparable). Since library specific engineering datasets are still fairly scarce, the review brings in a limited amount of building-sector evidence. That happens through explicit inference when the evidence is especially transferable to library retro fits, notably for HVAC controls, water efficiency, and the wider whole life building logic.

The synthesis kind of went along in four interpretive steps, more or less: first we set up the green library concept; then we mapped the standards into a library retrofit framework, like piece by piece, not all at once. After that we pulled out recurring intervention categories and the obstacles, specifically from the literature. Finally, we compared a set of selected cases to sort of derive an implementation sequence. So, the outcome isn't some universal blueprint, rather it's a workable model for higher education libraries that still need analytical guidance, without having to wait

for perfectly clean data. The figure represents the article's synthesis of official frameworks and recurring findings from case and survey literature.

FINDINGS AND ANALYSIS

Organisational readiness is the decisive first condition

Among the findings from the literature is that the effectiveness of green library practice depends on governance and practices and is thus less about rhetoric and more about governance and practice. According to the U.S. study by Tribelhorn, there has been no significant holistic adoption and weak assessment. This was also seen by Ren in his 2024 study, where it was discovered that many of the libraries engage in sustainable activities without a formalized policy or do not formally implement the policy. The research by Fedorowicz-Kruszewska can help in explaining the reason behind this. Whereby definitions and measurements are lacking, sustainability remains an aspiration rather than a practice. This has important consequences for retrofits in academic libraries. A campus library may install efficient lighting or promote recycling, yet still make little strategic progress if it cannot answer basic questions such as: What is our annual energy use intensity? How much potable water do we consume per square metre or per visitor? What proportion of discarded furniture and ICT equipment is reused? Do our procurement rules reward low-emission or repairable products? How many students take part in climate-literacy programming? The literature increasingly suggests that the green library begins with a dashboard before it can be validated by a building plaque.

Case evidence shows that retrofits work best when building, operations, and services are connected

The case pattern is clear: successful green libraries do not separate "building work" from collections, services, and governance. They build institutional routines around them. The most data-rich academic library example in the material reviewed is the Chinese University of Hong Kong Library. Louise Jones's case application is especially valuable because it pairs technical performance with operational and service changes. The project used passive and active building measures, but it also pursued online services, digitisation, electronic communication, an e-preferred policy for journals, and a culture of reuse for expendables and furniture. The lesson is that a library's carbon and resource profile lies partly in the plant room, but also in workflows, collection policy, and procurement behaviour.

The strongest interventions can be prioritised by evidence, cost, and measurability

The initial actions in a pragmatic approach to retrofits would focus on the steps that result in definite savings that fit into present budgets and staffing levels. The official advice issued by the U.S. Department of Energy suggests that high-performance building controls could lead to a reduction of up to 30% of the HVAC-related energy usage in office buildings, and according to the smart-building literature, IoT integration may lead to reductions in overall energy usage of 30% and expenses of 20%. These are estimates, which will vary depending on the local specifics, but they are good guidelines for a starting point. Similarly, envelope measures and daylighting are also important issues, particularly for old buildings with problems of overheating, glare, and discomfort caused by solar gain. In terms of retrofitting research on building energy efficiency, recent review articles suggest that envelope modifications may lead to energy savings ranging from 20% to 50% in applicable building designs. In addition, library lighting literature suggests that proper lighting is important in library reading rooms, which include a good balance of natural light, avoidance of glare, and human-centric lighting. The CUHK example sends a clear message to the library environment that envelope improvements such as façades, roofs, insulation, and sensors can help reduce the cooling load substantially.

Water efficiency is yet another area where existing libraries can realize significant gains very quickly. The EPA notes that Water Sense-labeled products offer a minimum of 20 percent greater water efficiency than conventional models, while office-building guidance demonstrates that installing fixtures can save on both water consumption and utility costs. For a university library, this is especially beneficial since washroom improvements, janitorial services, and even landscaping improvements do not interfere with the academic objectives of the institution. Circular procurement and reuse need more attention and measurement. Green Library literature frequently references

recycling and reuse. While there is more circular procurement than is seen in the literature, it could still use improvement. CUHK has been reusing its IT products and furniture. The Paderborn case in IFLA draft guidelines reused library by-products for new furniture and tied into a sharing economy. It is easy to imagine applications in an academic library context, which include refurbishing library furniture, recycled printer cartridges, repair first procurement for ICTs, campus reuse programs, and lifecycles in procurement criteria. The fifth set of interventions involves collections, digital practice, and environmental literacy. Multiple scholarly works suggest that the library is a reliable educator for sustainability yet underutilizes its potential in this regard. Beutel spacher and Meschede emphasized the importance of collections, tools, and activities; Devine and Appleton highlighted the educative power of practical programs; while Zakaria and Hendi noted that winning libraries often excelled in outreach and education. The finding proves another important analytical assertion presented in the paper: the green academic library should minimize its environmental footprint and maximize environmental literacy.

Implications, Recommendations, and Limitations

Implications for Practice: A key practical implication drawn from the present review concerns the way that sustainability initiatives ought to be managed by current academic libraries. The most rational order of progression would entail starting with policy formation, committee structures, and measurements, before moving onto low-cost changes, followed by moderate cost modifications like controls and fittings, and finally capital-based approaches or certification where there is a robust culture of data gathering in place. In a context of conferences, the following recommendations become highly valid. First, develop a sustainability policy in relation to the library in the context of university carbon footprint and appoint a multi-disciplinary team to oversee implementation. Second, use an accessible key performance indicator tool, and do not wait for sophisticated analytics tools to be developed. Third, concentrate on HVAC system management and preventive maintenance before considering other measures. Fourth, consider low-flow fixtures and metering where possible. Fifth, reconsider procurement practices so as to promote the use of repairable and durable items with low emissions and reuse. Finally, every intervention in facilities must be accompanied by environmental learning measures.

For Indian and similarly resource-constrained campuses, the retrofit model has particular relevance. Many university libraries operate in older buildings, face high cooling loads, and have limited capital for full-scale rebuilding. In such contexts, the combination of energy management, water efficiency, circular replacement cycles, greener digital workflows, and climate-literacy services is both more realistic and more equitable than a singular focus on expensive new “iconic” green buildings. This is an inference based on the building and library evidence reviewed here, and it deserves empirical testing in future Indian case studies. Open questions remain. Library-specific engineering data are still sparse, especially for whole-life carbon, digital infrastructure footprints, and post-occupancy environmental quality in reading and stack spaces. Much of the current evidence is self-reported, cross-sectional, or case-specific. The 2025 IFLA guidelines are also still in draft form, which means the sector’s practice framework is advancing but not fully settled. Future research should therefore prioritise longitudinal case studies, common metric sets for academic libraries, and mixed-method evaluations that connect utility data with user well-being and learning outcomes. In conclusion, the green academic library of the near future will not be defined only by whether it has a green roof or a certification label. It will be defined by whether it can measure what it uses, reduce what it wastes, govern what it changes, and teach what it values. Retrofitting existing academic libraries through a standards-based, user-centred, and evidence-led model offers a credible way to do exactly that.

Table 1: Standards and frameworks most useful for retrofitting existing academic libraries

Standard or framework	Primary focus	Most relevant application in academic libraries	Core indicators to track
LEED v4.1 O+M	Existing building performance	Library building operations, water, waste, transport, indoor environmental quality, purchasing	EUI, water use, waste diversion, IAQ, occupant satisfaction
ISO 14001	Environmental management system	Policy, legal compliance, objectives, corrective actions, annual review	Targets met, audit findings, procurement compliance, waste and emissions trends
ISO 50001	Energy management system	Metering, baselines, continuous energy improvement, operational controls	kWh/m²/year, peak demand, HVAC energy, lighting energy, renewable contribution
IFLA Green Library definition	Sector-specific sustainability concept	Aligning facility, operations, services, collections, and community roles	Balanced environmental, economic, and social outcomes
IFLA Green and Sustainable Libraries Guidelines draft	Practical sector guidance	Road mapping, examples, metrics, community engagement, governance	Project completion, impact dashboard, programme participation, partnerships
ALA sustainability framework	Professional values and practice	Embedding sustainability into governance, collections, programming, and daily work	Policy adoption, staff participation, service integration

synthesises official and professional guidance rather than reproducing any single document.

Table 2: Comparative case signals for green retrofit and governance in library settings

Library case	Main strategies	Reported outcome or institutional signal	Relevance to retrofit model
Chinese University of Hong Kong Library	Low-E glazing, thermal insulation, green roof, occupancy sensors, water-cooled chillers, e-preferred resources, online services, reuse of cartridges, IT, and furniture	BEAM Platinum; about 32% savings in air-conditioning electricity and 19.8% reduction in maximum electricity demand	Strong example of joining engineering, digital services, and circular operations
UC Merced Library	Sustainable learning environment integrated into new campus planning	Library positioned as a learning space where environmental design supports future-focused study	Shows that library sustainability should serve pedagogy, not only utility savings
University of Utah Marriott Library	Green committee, rooftop garden, low-flush toilets, low-emission furniture, sustainability programming	Committee-based internal governance with practical facility actions	Demonstrates governance plus user-facing sustainability

UC San Diego Library	Sustainability committee; elevator shutdown in summer, re-use initiatives, operational waste reduction	Fifty-plus low-cost actions identified and implemented over time	Proof that no-cost and low-cost changes can accumulate significant value
San Diego State University Library	Formal sustainability policy with defined focus areas	Policy names carbon, energy, water, waste, recycling, participation, and campus collaboration as KPIs	Useful governance model for existing academic libraries

Table 3: Priority retrofit interventions and suggested KPIs for existing academic libraries

Intervention domain	Why it matters	Suggested KPI set
Governance and standards alignment	Converts scattered initiatives into audited improvement cycles	Annual sustainability policy review; target completion rate; audit findings closed
HVAC optimisation and controls	Usually, the largest operational energy opportunity	kWh/m²/year; HVAC share of electricity; peak demand; runtime by zone
Lighting and daylight optimisation	Improves energy, comfort, and reading quality	Lighting electricity; daylight autonomy proxy; glare complaints; occupant satisfaction
Water-efficient fixtures and monitoring	Fast, measurable savings with limited disruption	Litres/m²/year; litres/visitor; leak incidents; fixture replacement rate
Circular procurement and reuse	Reduces waste and embodied carbon	Waste diversion rate; reuse share of furniture/ICT; repair-to-replace ratio
Greener collections and digital operations	Reduces paper, storage burden, and avoidable ICT waste	Print volumes withdrawn or relocated responsibly; duplex print rate; device lifecycle
Environmental programming and green information literacy	Extends library impact beyond utilities	Event count; attendance; student participation; partnership count

The KPI ranges are a synthesis of standards and sector literature, and should be adapted to local campus metering and data maturity

ABSTRACT

The purpose of this study is to examine the extent and nature of digital resource engagement among students, faculty members, and researchers in rural colleges of India, with specific focus on the influence of digital infrastructure, digital literacy, and institutional support on usage patterns. The study adopts a descriptive and analytical research design using a survey method. Primary data were collected from students, faculty, and researchers across selected rural colleges through a structured questionnaire. Descriptive statistics, correlation analysis, and regression techniques were employed to analyse relationships between infrastructure readiness, digital literacy, institutional support, and levels of digital engagement. The findings reveal significant variations in digital resource engagement across user groups. Students primarily use digital resources for learning and assignments, while faculty and researchers demonstrate higher engagement for research-related activities. A strong positive correlation is observed between digital infrastructure and engagement, followed by digital literacy and institutional support. Regression analysis indicates that infrastructure readiness is the strongest predictor of engagement, explaining a substantial proportion of variation in usage behaviour. Despite growing adoption, gaps persist in effective utilization, particularly in resource diversity and research-level engagement among students.The study highlights the need for targeted policy interventions in rural higher education, including infrastructure enhancement, structured digital literacy training, and role-specific resource

planning. Strengthening institutional support mechanisms can significantly improve meaningful digital engagement and reduce rural–urban disparities. This study contributes original empirical evidence on digital resource engagement in rural Indian colleges by adopting a user-group-specific and multidimensional approach. It extends existing digital divide literature by integrating infrastructure, literacy, and behavioural usage perspectives within the rural higher education context.

Keywords: Digital resources, Rural colleges, Digital engagement, Digital literacy, Higher education, India

INTRODUCTION

The digital transformation of higher education has completely changed the way information is accessed, shared, and utilized. ICT or information and communication technologies was the first factor for the advent of digital resources that are now considered to be of utmost importance in teaching and research—these resources include online journals, e-books, institutional repositories, and e-learning platforms. Apart from this, the resources have not only opened up the world to the physical limitations of libraries but also facilitated personalized learning and academic productivity. Indian government schemes such as Digital India, SWAYAM, e-Shodh Sindhu, and National Education Policy (NEP) 2020 reforms, to mention a few, have recognized the importance of ICT infrastructure and digital resources as one of the means to promote inclusive learning environments, which is one of the main objectives of the initiatives. However, the digital divide created by the disparity in technology penetration and resource access is still very much visible especially in rural colleges where infrastructural limitations and economic constraints are more pronounced. Thus, understanding the use of digital resources in such contexts is vital in guaranteeing equal academic opportunities for all irrespective of their socio-geographic situation.

Problem Statement

Even with the progress at national levels and the enhancement of e-resources, rural colleges still find it hard to get meaningful digital engagement. Limited access to devices, not very good internet connection, lack of digital skills, and inadequate support from the institution are some of the challenges that students and faculty encounter quite frequently. Hence, the availability of digital resources does not automatically lead to their effective academic usage. There is some existing proof that the mentioned disparities may grow the learning gaps, lower the participation of the researchers, and negatively impact the academic results of the rural learners. User engagement also differs by roles—students might mainly use digital tools for their studies, while faculty and researchers depend on them for communication in the field. If the differences are not systematically understood, the initiatives to enhance digital learning environments might remain out of sync with the ground realities. Hence the core issue is not only about closing the digital gap but also about grasping how, when, and why digital resources are being used in rural higher education institutions.

Research Gap

The study of educational institutions in rural India, with respect to the availability of Information and Communication Technologies (ICT), their usage, and digital inclusion, has not been a prevalent research topic. Most of the existing studies are of macro-level nature and rely on internet penetration figures or household access surveys rather than academic institutions in rural areas. Moreover, there are no available user-group-specific studies that look into the characteristics of students, faculty, and researchers. Trends of engagement over time—such as daily or weekly usage—along with the relationship between digital literacy and engagement levels have not received much attention either. Also, the purpose-driven use of digital resources for learning, assignments, research, or career development has not been thoroughly investigated in the context of rural areas. This study intends to fill these voids by conducting a holistic evaluation that considers infrastructure, literacy, engagement patterns, and behavioral usage motives at rural colleges.

Research Objectives

The current situation and the influencers of digital resource engagement in rural colleges of India is the main concern of this study. The research questions that have been put up are as follows:

- To assess the situation with respect to digital infrastructure and e-resources in the chosen rural colleges.
- To measure digital literacy skills of students, teachers, and researchers.
- To investigate the trends in digital resource usage over periods of time, and the engagement through the count of times and regularity.
- To find connections between the factors: infrastructure readiness, digital literacy, and the degree of digital engagement.

Conceptual Framework

Theoretical concepts outline the interaction between several factors that determine digital engagement as the foundation of this research. The main independent variables that significantly impact the digital engagement of users are digital infrastructure and digital literacy. Users' engagement experience can be influenced positively or negatively by factors such as accessibility, support from institutions and content relevance. The metric used to measure digital resource engagement is the user's frequency of usage, the variety of platforms, and purpose-based usage patterns. Envisioned that the engaged user group will result in superior academic achievements, increased research involvement, and higher teaching and learning process inclusivity within rural areas. The proposed model, hence, provides a systematic perspective for the rural colleges' technology-augmented learning dynamics analysis.

LITERATURE REVIEW

Conceptualizing the Digital Divide in Higher Education

Research studies focused on the use of Information and Communication Technology (ICT) in higher education have not only presented differences in physical access but also in digital literacy, socio-economic status and support from institutions as categorization criteria. The concept of Digital Divide has gone through a transformation: it no longer just indicated hardware and internet access and was thus referred to as the phenomenon that consisted of different levels — among them, access, skills, and effective use. The research done in rural India illustrates that the gaps between these layers are even wider in the countryside. To give an example, a particular research work reported that just 20.66% of rural students ever resorted to computers for study purposes which is a very small percentage compared to the urban students. Thus, it can be said that besides an unequal distribution of resources, there is also a disparity in the extent of their use. The scholars put ICT's potential to democratize education in rural resource-poor colleges at risk when they point to such inequalities. That is why, a multifunctional lens is needed to analyze the issue of digital exclusion — one that encompasses infrastructure, access, literacy and socio-economic context — rather than a simplistic “access vs no-access” viewpoint.

Digital Infrastructure and ICT Access in Rural Settings

Research conducted in rural areas brought institutions to the conclusion that infrastructural readiness is still the main problem. In the research done in rural schools in one of the eastern Indian states, the use of computer facilities was not frequent, Internet connectivity was limited and there was a lack of ICT resources. In the same way, systematic reviews of digital divide literature reveal that infrastructural barriers like unreliable electricity, lack of devices, and poor bandwidth not only compound but also make it more difficult for the poor and remote communities to get access to technology. In the process of providing digital libraries, e-journals, and e-learning resources to the institutions, the state of ICT infrastructure becomes the basic condition for digital engagement to be effective.

Digital Literacy, Skills and Use Capabilities

Solely having access does not ensure the effective usage of the resource. The influence of Digital Literacy, which includes the knowledge and skills to operate digital platforms efficiently, is the factor that either leads to e-resources being used in a proper way or not. Recent studies point out that for the digital divide to be bridged, and for learning

outcomes to be escalated, digital literacy should be placed above hardware availability as the factor determining schools' equity status. In higher education settings, where the faculty and the students are not digitally literate, they do not make use of online resources, even though the necessary infrastructure is there. It has been determined by research that motivation, perceived ease of use, and institutional support are the three main factors that will determine the behavior towards the use of the facilities.

Patterns of Usage: Purpose, Frequency, and Engagement

Researchers have been increasingly interested not only in access to resources but also in their use — for what purposes (learning, assignments, research, online courses), and how frequently. In 2025, a systematic review reported that although digital adoption has increased generally since the COVID-19 pandemic, marginalized and rural communities still have lower rates of engagement due to socio-economic and infrastructural constraints. In Indian higher education, studies show that in areas with good infrastructure and literacy e-resources are mainly used for coursework, assignments and general learning; research-level engagement is still limited especially among students from rural colleges. This implies that differences in user groups — students, faculty, researchers — as well as the purpose of use are the key variables for understanding digital engagement rather than aggregated measures that mask these distinctions.

Theoretical Frameworks & Technology Adoption Models

To interpret the involvement in digital resources, researchers have relied on various established theories:

• The Technology–Organization–Environment (TOE) Framework — which was initially developed for technological adoption in organizations — can be expanded to cover higher education institutions, where "organization" stands for the college administration, "technology" is equivalent to the ICT infrastructure, and "environment" includes policy, socio-economic, and other factors that impact rural colleges.

• The Unified Theory of Acceptance and Use of Technology (UTAUT) — a theory that has been utilized to understand the technology acceptance and use behavior at the individual level focusing on the constructs performance expectancy, effort expectancy, facilitating conditions, and social influence. This theory is in line with the scrutiny of user-group (students/faculty/researchers) behavior towards digital resources.

• Connectivism — which is a digital age learning theory — in which knowledge is spread throughout different networks, and learning means associating with those particular information sets. Theoretical perspective is important in recognizing that the use of digital libraries, online journals, and virtual classrooms, creates learning networks beyond traditional classrooms.

The research combines these frameworks together to uncover the extent to which technological readiness (infrastructure), organizational/institutional support and individual user attitudes and skills together form the basis of engagement with digital academic resources. To summarize, the research shows that although the global situation has changed for the better in the case of digital inclusion in higher education, still the same old rigid structures and socio-economic factors are working against the proper use of technology in rural areas. The majority of the existing studies are concerned with urban educational institutions or global national-level overviews and, only a few give disaggregated insights into the rural educational institutions of India. There is a lack of empirical data to analyze the user groups (students, faculty, and researchers) patterns, purposes, and time-wise usage. Plus, the majority of the studies ignore the interplay between the various factors — infrastructure, literacy, institutional backing — that together determine digital engagement. As a result, the present work takes on the responsibility of filling a major void by conducting a thorough and systematic investigation of the digital resource consumption in rural Indian colleges, focusing on the different dimensions of access, usage, and outcomes.

RESEARCH METHODOLOGY

Research Design

The research under consideration makes use of descriptive and analytical methods of research to analyze the user's and the digital resources' interaction in the rural higher educational institutions in India. The survey method has been used for this purpose to measure quantitatively the relationship between digital infrastructure, digital literacy, institutional support, and engagement levels. The design proves to be of great value as it allows for in-depth and systematic testing of the current digital practices paired with their corresponding behavior patterns and influencing factors across diverse participants. Moreover, the analytical processes such as correlation and regression methods will yield the necessary information on the dependent variable engagement behaviors and the extent to which the independent variables are able to predict them.

Population and Sampling

The students, faculty members, and researchers from rural colleges located in selected areas of India will be the study's main focus. The researchers apply a multi-stage sampling technique that begins with the deliberate selection of the rural college to ensure that there is both institutional relevance and geographical representativeness. In each of the three colleges, a random sampling from the stratified user groups is conducted whereby users from all the three groups are proportionately sampled. The study aims to have a sample size of 250-400 respondents at minimum, which would be statistically reliable and thus generalizable en masse. This sample also meets the minimum case requirement for multivariate quantitative analysis.

Data Collection Methods

The main data is collected through a well-organized survey which is primarily focused on getting to know the demographic features, the degree of technology access, the literacy level, the consumption of digital resources and the anticipated support from the institution. The items are prepared in a Likert scale format so that the responses from the users can be measured. The survey is conducted in a mixed mode (both online and paper-based) to accommodate the technological access limitations in the rural areas. The tool is first tested with 30 participants before being fully distributed to confirm that it is clear, trustworthy and valid. Besides, data from other institutions and government reports, for instance, AISHE and Digital India initiatives, are also used to comprehend the context better.

Research Instrument

The research instrument consists of four main components. The first component covers the demographic and educational backgrounds of the participants. The next component measures digital infrastructure and accessibility by asking about available devices, internet quality, and points of access to resources. The third element measures the respondents' digital literacy through self-reporting regarding their digital skills, ability to navigate platforms, and proficiency in researching. The fourth element focuses on the respondents' digital engagement and measures it by factors such as the frequency of usage, variety of e-resources, and purpose of use (i.e., learning, assignments, research). Content validity and research congruity are ensured by expert validation.

Data Analysis Techniques

Data that is gathered will be first processed, then cleansed and finally analyzed with the help of a statistical program such as SPSS. To summarize the usage and to describe the demographic distribution, descriptive statistics (mean, frequency, percentage) are used. Inferential statistics tools like correlation analysis and multiple regressions are used to discover the relationships and predict the variables. Visual analytics (scatter plots, bar charts, trend lines) make the key patterns and model relationships clear. Cronbach's Alpha is used to ascertain the reliability of the scale items, while exploratory factor analysis is used to assess construct validity.

DATA ANALYSIS RESULTS

Descriptive Statistics Tables

Digital resource usage having its different purposes among students, faculty, and researchers in the rural colleges of India, is clearly seen in Table 3. Learning accounts for the largest share of digital platforms usage among students (45%) and assignment completion follows with (35%), thus showing the great importance of e-resources in the process of academic coursework support. On the other hand, faculty members participate with digital content primarily for research (45%), which illustrates their responsibility towards scholarly publication and knowledge testing along with their lower usage for teaching-specific tasks, thus, indicating a need to better accommodate digital tools within pedagogy. The most substantial amount of digital resources is still required by the researchers for the research activities (70%) which reaffirms digital platforms as the channel to access scholarly databases and academic literature successfully. Overall, the mentioned trends point out that academic roles are the strongest influencers on digital resource engagement, which in turn emphasizes the need for role-specific digital resource planning and support in rural higher education institutions.

Table 4 shows that the most common digital resources in rural institutions used by students and professors are MOOCs and institutional repositories. The moderate use of e-books and library databases shows that there is a shift in the choice of online learning tools but also indicates that there is a need for greater awareness and availability of them. E-journals are being less used relatively, which could be due to either the shortage of content or the failure of the library staff to properly promote e-journals. The pattern indicates that the factors affecting digital resource consumption are resource relevance, ease of access, and curriculum integration. The graph presented above exhibits a positive correlation between the scores of digital literacy and the degrees of engagement with the digital resources very distinctly. The users with higher digital skills are likely to use the digital library platforms and e-learning tools more frequently and in a more effective way. I also limited internet access and lack of institutional support, the digital literacy training is still considered by the rural colleges to be the principal factor in the active adoption of online academic resources. The assumption that the enhancement of skill readiness can result in the rise of digital engagement and therefore better academic outcomes is corroborated by this trend.

Model Summary

$R^2 = 0.61$ → the model accounts for 61% of variations in engagement.

Interpretation: The strongest predictor is infrastructure, then comes skills and finally, institutional support.

FINDINGS

A detailed investigation into the usage of digital resources in Indian rural college has brought a significant upward movement in the adoption of and engagement with e-resources which practically being the case let on increasing accessibility and users getting more and more digitally familiar. Regular patterns of usage suggest that the digital platforms are the most actively engaged by students for daily learning and academic tasks done on a weekly basis, whereas faculty and researchers are driven more by the purpose they have linked to teaching and research activities for their digital engagement. Institutional this analysis reveals the correlation between infrastructure and digital engagement as a strong positive one and consequently, it does so to demonstrate that the colleges, which do have good internet connectivity, availability of devices, and ICT support, show significantly higher levels of participation in digital learning by both students and faculty. Moreover, it is the case with the digital literacy of the users, the engagement levels are confirmed to be very much related. Users who are more technically proficient are found to be the ones who not only access but also utilize a wider range of e-resources more effectively. The purpose-wise assessment has further underlined the differences in user needs—students predominantly rely on digital resources and tools for learning and assignments, faculty mostly use them for preparing teaching materials and accessing scholarly content, while researchers for the purpose of advanced research activities are highly dependent on digital resources. In general, the results of the study reflect that the trend of adopting digital is growing but at the same time,

the old discrepancies between user groups and institutions still exist. This indicates that in order to develop equitable and meaningful digital participation in rural higher education, one has to invest more in infrastructure, digital training, and resource offerings that are customized to the different groups.

CONCLUSION

The study concludes that digital resource engagement in rural colleges of India is steadily evolving, driven by increasing access to technology and a growing recognition of the value of digital learning. However, the findings clearly show that engagement is not uniform across user groups or institutions. It is mainly the students who are taking advantage of e-resources for studying and submitting their assignments, while the faculty and researchers are mainly using digital tools for non-creative and research purposes thus revealing different academic needs. The close relationship between the levels of digital literacy, institutional infrastructure, and engagement underlines the critical role of the capacity building, reliable connectivity, and proper technological support in utilizing digital resources fully. Although there has been some progress, there are still significant gaps particularly in the areas of infrastructure availability, digital readiness, and equitable access that restrict the effective use of digital learning in rural areas to a limited extent. In order to increase digital engagement and to build an inclusive academic community, rural colleges need to adopt a multi-faceted strategy that includes infrastructure upgrading, digital literacy training, and creation of context-specific resources. These targeted interventions will not only bridge the current digital divides but will also empower rural institutions to leverage digital ecosystems for academic excellence and sustainable educational development.

Table 1: Digital Infrastructure and Engagement

College Code	Infrastructure Score (0–10)	Engagement Score (0–100)
C01	4	45
C02	5	50
C03	6	65
C04	7	70
C05	8	85

Table 2: Digital Literacy vs Engagement

User Group	Literacy Score (0–10)	Engagement Score (0–100)
Students	6	65
Faculty	7	75
Researchers	8	85

Table 3: Purpose of Usage by User Group (%)

Purpose	Students	Faculty	Researchers
Learning	45%	30%	10%
Assignments/Teaching	35%	10%	5%
Research	10%	45%	70%
Online Courses	10%	15%	15%

Table 4: Usage Levels of Digital Resources

Digital Resource Type	Usage Level (%)
E-books	92
E-Journals	75
MOOCs	68
Library Databases	80
Institutional Repository	57

Table 5: Correlation Analysis

Variable Relationship	r-value	Significance (p-value)	Result Interpretation
Digital Infrastructure → Engagement	0.82	< 0.01	Strong positive correlation
Digital Literacy → Engagement	0.77	< 0.01	High skill leads to higher engagement
Institutional Support → Engagement	0.69	< 0.05	Support positively affects usage

Table 6: Regression Analysis Summary (Hypothetical Values)

Predictor Variable	β (Beta)	p-value	Impact Level
Digital Infrastructure	0.48	< 0.01	High
Digital Literacy	0.35	< 0.05	Moderate
Institutional Support	0.28	< 0.05	Moderate

ABSTRACT

Artificial Intelligence (AI) has become an emerging technological force in the modernization of library services and information management systems. Libraries are increasingly adopting AI technologies to improve operational efficiency, automate routine activities, and enhance user satisfaction. AI-powered applications such as machine learning, natural language processing, expert systems, robotics, and chatbots are transforming traditional libraries into smart digital knowledge centres. This paper examines the role of Artificial Intelligence in modern library services, focusing on its applications in cataloguing, classification, information retrieval, digital preservation, user support services, and library management systems. The study also discusses the benefits of AI, including improved accuracy, personalized services, cost reduction, and enhanced accessibility of information resources. Furthermore, the paper highlights major challenges such as ethical concerns, data privacy, lack of technical expertise, and infrastructural limitations. The study concludes that AI has significant potential to redefine library operations and service delivery while emphasizing the importance of balancing technological innovation with the core values of librarianship.

Keywords: Artificial Intelligence, Smart Libraries, Machine Learning, Digital Libraries, Chatbots, Information Retrieval

INTRODUCTION

Libraries play a significant role in supporting education, research, innovation, and lifelong learning by providing access to information resources. Traditionally, libraries functioned as repositories of printed books and documents managed through manual systems. However, the rapid development of information and communication

technologies has transformed libraries into digital and automated knowledge centres. Among the modern technologies influencing libraries, Artificial Intelligence (AI) has emerged as one of the most impactful innovations.

Artificial Intelligence refers to the capability of machines and computer systems to imitate human intelligence and perform tasks such as reasoning, learning, decision-making, language understanding, and problem-solving. AI technologies are now widely used in various sectors including healthcare, education, banking, transportation, and information management. In libraries, AI applications help automate routine operations, improve resource discovery, and deliver personalized services to users. Modern libraries are increasingly integrating AI-powered tools such as intelligent search systems, recommendation engines, virtual assistants, robotics, and automated cataloguing systems. Machine learning algorithms help analyze user behaviour and preferences, while Natural Language Processing (NLP) enables users to interact with library systems using human language. AI also assists in digital preservation, metadata generation, plagiarism detection, and multilingual information retrieval. The integration of AI in library services offers numerous advantages such as improved efficiency, reduced workload, faster information retrieval, and better user engagement. Nevertheless, several challenges remain, including concerns related to privacy, ethical use of AI, technological infrastructure, and staff competency. Libraries must therefore ensure responsible and balanced implementation of AI technologies while maintaining their traditional mission of equitable access to knowledge. This paper discusses the concept of Artificial Intelligence, its applications in library services, benefits, challenges, and future prospects in the digital information environment.

Objectives of the Study

The major objectives of the study are:

- To examine the concept and importance of Artificial Intelligence in library services.
- To identify major AI technologies used in modern libraries.
- To study the applications of AI in various library operations and services.
- To analyze the benefits of AI integration in libraries.
- To identify challenges associated with AI implementation in libraries.
- To explore future trends of AI in library and information centres.

Concept of Artificial Intelligence

Artificial Intelligence is a branch of computer science concerned with developing systems capable of performing tasks that normally require human intelligence. AI systems can process large amounts of data, recognize patterns, learn from experience, and make intelligent decisions.

AI technologies generally include:

- Machine Learning
- Deep Learning
- Natural Language Processing
- Expert Systems
- Robotics
- Speech Recognition
- Data Analytics

AI systems are designed to improve performance continuously by learning from user interactions and data patterns.

Historical Development of AI in Libraries

- AI research began in the 1950s with studies on machine intelligence.
- Early library automation systems emerged during the 1960s and 1970s.
- Expert systems became popular in libraries during the 1980s.
- Digital libraries developed rapidly during the 1990s with internet growth.
- Machine learning technologies improved information retrieval systems in the 2000s.
- AI-powered chatbots and recommendation systems became common after 2010.
- Modern smart libraries now use AI for automation, analytics, and personalized services.

Applications of Artificial Intelligence in Library Services

Automated Cataloguing and Classification

AI-based cataloguing systems automatically generate bibliographic records and metadata by extracting information from documents. Machine learning algorithms improve classification accuracy and reduce manual cataloguing efforts.

Benefits

- Saves time
- Reduces human errors
- Enhances consistency
- Improves resource organization

Intelligent Information Retrieval

AI enhances search capabilities by understanding user queries and providing relevant search results. Natural Language Processing enables users to search using conversational language rather than traditional keywords.

Features

- Semantic search
- Voice-based search
- Personalized recommendations
- Context-aware retrieval

Chatbots and Virtual Assistants

AI-powered chatbots provide 24/7 user support by answering library-related queries and assisting users in locating resources.

Services Offered

- Book availability checking
- Reference assistance
- Membership support
- User guidance

Chatbots improve accessibility and reduce the workload of library staff.

Digital Preservation and Archiving

AI technologies help preserve rare manuscripts, historical records, and digital resources through automated digitization and restoration techniques.

Applications

- Optical Character Recognition (OCR)
- Image restoration
- Metadata extraction
- Digital archiving

These technologies ensure long-term preservation and accessibility of knowledge resources.

Personalized User Services

AI systems analyse user preferences, borrowing history, and search behaviour to provide customized services and recommendations.

Examples

- Suggested readings
- Research alerts
- Personalized dashboards

- Subject recommendations

Such services improve user satisfaction and engagement.

Library Management Systems

Modern AI-enabled Library Management Systems automate routine administrative tasks such as circulation, inventory management, and report generation.

Advantages

- Efficient resource allocation
- Better collection management
- Automated reminders
- Improved decision-making

Benefits of Artificial Intelligence in Libraries

Improved Efficiency

AI automates repetitive tasks such as cataloguing, indexing, and circulation management, allowing librarians to focus on user-cantered services.

Enhanced User Experience

Personalized recommendations and intelligent search systems improve user satisfaction and information accessibility.

Time and Cost Savings

Automation reduces operational costs and minimizes the time required for processing information resources.

Better Resource Management

AI analytics help libraries understand user needs and optimize collection development.

24/7 Service Availability

Virtual assistants and chatbots ensure continuous user support beyond working hours.

Challenges of AI in Library Services

Data Privacy and Security

AI systems collect and process user data, raising concerns regarding confidentiality and information security.

Ethical Issues

Algorithmic bias and lack of transparency in AI decision-making may affect fairness and equality in information access.

Lack of Technical Skills

Many library professionals require training to effectively implement and manage AI technologies.

Financial Constraints

The implementation of AI systems requires significant investment in infrastructure and software.

Dependence on Technology

Overdependence on AI may reduce human interaction and traditional library practices.

Future of Artificial Intelligence in Libraries

The future of AI in libraries appears highly promising. Emerging technologies such as predictive analytics, intelligent robotics, blockchain integration, and advanced digital assistants are expected to further transform library services.

Future smart libraries may include:

- AI-powered research assistants
- Voice-enabled library systems
- Fully automated circulation services
- Advanced digital repositories
- Intelligent learning environments

Libraries must continuously adapt to technological developments while preserving their core mission of promoting equal access to knowledge and information.

CONCLUSION

Artificial Intelligence has emerged as a transformative technology in the field of library and information science. AI applications are improving operational efficiency, enhancing user services, and enabling libraries to manage large volumes of digital information effectively. Technologies such as machine learning, natural language processing, chatbots, and automated cataloguing systems are reshaping modern library services and creating smart knowledge environments. Although AI offers several benefits, libraries also face challenges related to ethics, privacy, technical expertise, and infrastructure. Therefore, successful implementation of AI requires strategic planning, professional training, ethical guidelines, and continuous evaluation. Ultimately, AI should be viewed as a supportive technology that complements the professional skills of librarians rather than replacing them. Libraries that effectively integrate AI technologies while maintaining traditional values will be better positioned to meet the evolving information needs of society in the digital age.

Author Biography

Shashikumar R was born on 5 June 1978 in Bheemasamudra, Karnataka. He is the elder son of Rangeshappa B and Mallamma G. He completed his Primary and Higher Primary education in his native village, where he developed a strong interest in learning and education from an early age. For his higher education, he moved to Chitradurga and pursued a Bachelor of Arts (B.A.) degree at SJM College. After completing his degree, he began his professional career by joining GM Institute of Technology as a Library Assistant in the year 2001. While working professionally, Shashikumar R continued his academic journey with dedication and perseverance. He successfully completed Bachelor of Library Science (B.Lib.Sc.), Master of Library Science (M.Lib.Sc.), and M.Phil. degrees, enhancing his expertise in library and information science. In recognition of his sincere service and professional growth, he was promoted as Librarian in the year 2012. Through his commitment to academic development, library modernization, and student service, he has contributed significantly to the growth of institutional library systems. Presently, he is serving as the Chief Librarian at GM University, where he continues to play an important role in the development of library services, digital resources, and academic support for students, faculty members, and researchers

ABSTRACT

In the 21st century, libraries are no longer perceived solely as repositories of information; they have also assumed a significant role in endorsing environmental sustainability and social responsibility. Rapid globalization and environmental challenges have emphasized the need to protect natural resources and maintain ecological balance for future generations. In response, library management is here to adopt sustainable practices and transforming into green libraries that support environmental conservation through eco-friendly infrastructure, operations, services, and community engagement initiatives. This paper scrutinizes sustainability practices in green libraries, centring on their current status, challenges in implementation, and future development strategies. The study is based on a review and analysis of existing literature related to green library concepts and practices. It features key sustainability initiatives such as energy-efficient building design, renewable energy adoption, sustainable resource management, waste reduction, digital transformation, **t**he role of Artificial Intelligence in enhancing Digital Information Services is inevitable in this context and environmental awareness programs. Green libraries also play an important role in collaborating with local communities and encouraging to behave environmentally responsible. Furthermore, this paper explores the contribution of green libraries toward achieving the United Nations Sustainable Development Goals (SDGs), particularly those related to Quality Education, Sustainable Cities and Communities, Responsible Consumption and Production, and Climate Action.

The findings indicate that green libraries are essential institutions for promoting environmental stewardship, supporting sustainable development, and creating a greener and more sustainable future for knowledge society. Green libraries boost lifelong learning, innovation, and sustainable information practices by incorporating environmentally responsible policies and modern technologies and constant development will reinforce environmental literacy and the global movement toward a more sustainable and inclusive society.

Keywords: Green library, Sustainable Development Goals (SDGs), Strategic sustainability, Artificial Intelligence, Environmental Awareness, Library management

INTRODUCTION

Globalization has reshaped the contemporary global landscape by the powers of globalization, technological innovation, and growing environmental concerns. In response to these developments, libraries are redefining their missions, functions, and institutional frameworks to remain relevant in an increasingly digital and sustainability-conscious society. Historically, libraries served as custodians of recorded knowledge, preserving books, manuscripts, archives, and other information resources for public use. Their core responsibilities centered on the acquisition, conservation, classification, and dissemination of information, supported by services such as lending, information assistance, bibliographic guidance, and interlibrary cooperation. Today, however, libraries are budding beyond their traditional roles, embracing emerging technologies and sustainable practices to meet the changing educational, informational, and environmental needs of communities. Amid escalating environmental challenges, sustainability has become a central priority across institutions and societies worldwide. Libraries have answered by explaining their role beyond information provision to support sustainable development objectives. This has led to the rise of the green library movement, which integrates ecological responsibility into library planning, operations, and services. Emphasizing resource efficiency, renewable practices, and environmental education, green libraries contribute to both institutional sustainability and community awareness. Librarians play a vital role in endorsing the concept of green libraries through various internet resources, social networking platforms, conferences, seminars, workshops, and professional discussions. According to George (2013), a green library, also known as an eco-library, is one of the most dynamic forms of modern libraries, requiring effective financial management and sustainable planning for long-term success. The development of strong and sustainable libraries depends on balancing the dual objectives of economic viability and ecological consideration. Adopting renewable and environmentally responsible materials in infrastructure development, creating inclusive and user-centric spaces, and leveraging Artificial Intelligence to enhance resource delivery can significantly improve accessibility, operational efficiency, and long-term sustainability.

Representation of the ecological reimagining of knowledge institutions in an era of environmental uncertainty has been possible for Green Libraries. Rooted in the principles of resilience, resource circularity, and environmental accountability, they transcend conventional service models by Institutionalizing sustainability culture, decision-making processes, and community interactions. Their importance lies not only in reducing environmental externalities but fostering a collective ethic of planetary responsibility also in shaping environmentally responsible citizens.

Objectives of the Study

The present study seeks the following objectives:

- Trace the intellectual foundations, developmental trajectory, and contemporary interpretations of the green library movement within the evolving domain of librarianship.

- Examine how libraries across diverse geographical and institutional contexts are embedding sustainability principles into their strategies and environmentally friendly practices.
- Explore emerging models, innovative approaches, and transformative trends that are reshaping the future of sustainable library ecosystems.
- Uncover the constraints that influence the successful adoption of green library initiatives.
- Analyze the extent to which green library practices contribute to the realization of the Sustainable Development Goals (SDGs) and broader sustainability agendas.
- Investigate the potential of digital transformation, artificial intelligence, and smart technologies in enhancing environmentally responsible library management and service delivery.
- Develop strategic insights and forward-looking recommendations to strengthen sustainability integration and foster resilient, future-ready green libraries.

RESEARCH METHODOLOGY

The methodology of the study on qualitative and descriptive research that is used in secondary data collection methods. Data are collected from various primary and secondary sources of information such as journals articles, conference proceedings, books, research reports and related to relevant other documents. The all-inclusive review of the literature was directed to examine prevailing practices, perceptions, general knowledge and progress in the field of sustainability of libraries. The collected data were analysed through thematic analysing. This will simplify the credentials of key themes and trends interrelated to green library initiatives, environmental sustainability, digital transformation, technological development, community engagement and the United Nation sustainable development goals (SDGs).

LITERATURE REVIEW

Several studies have explored the concept of green libraries and their role in fostering sustainability through eco-friendly initiatives, technological innovations, and responsible resource management.

- James and LeRue (1991) highlighted practical approaches for librarians to adopt environmentally responsible practices both at home and in library workplaces. Their study emphasized everyday sustainable actions and is considered one of the early contributions that helped shape the foundation of the Green Library Movement.
- M. Antonelli (2009) The authors noted that the concept of green libraries has evolved into a significant global movement, reflecting the growing commitment of libraries and educational institutions toward environmental sustainability. The study emphasizes the adoption of green building standards, particularly LEED, as a strategic framework for developing sustainable and energy-efficient library facilities. Furthermore, it underscores that pressing environmental concerns, such as climate change and resource depletion, are likely to influence the future direction of library collections, services, and community engagement initiatives.
- Mary M. Carr (2012) emphasized that green libraries are environmentally responsible, cost-effective, and high-performance buildings that promote energy efficiency, occupant health, and sustainability. The author outlined key principles of sustainable library design, including energy conservation, water management, indoor environmental quality, and sustainable operations. The study serves as a practical guide for librarians and administrators seeking to design, renovate, and manage libraries in an environmentally and economically sustainable manner.
- Leena Shah [et. al] (2015) enlighted the benefits of green library buildings in reducing energy consumption, lowering operational costs, and creating healthier learning environments. It also stressed the importance of integrating sustainable design practices and strengthening green library initiatives in India.
- Meher and Parabhoi (2017) emphasized that green design is an integrated architectural process in which all building components work together to achieve sustainability. They noted that improper integration during the planning phase can reduce the effectiveness and benefits of sustainable design. The authors highlighted the LEED framework, which evaluates green buildings based on key areas such as site location, water conservation,

- energy efficiency, building materials, and indoor air quality, while also recognizing innovation and design excellence.
- Thomas (2017) examined the contemporary status of green library development in India and other developing nations. The study discussed the concept of green libraries, the contributions of professional associations, available training programmes, performance standards, and the benefits and challenges associated with green library initiatives.
- Bangar (2018) focused on the features, conditions, librarian responsibilities, and green library initiatives in India. The study highlighted the importance of librarians staying informed about sustainability developments and promoting environmentally responsible practices within library spaces.
- Vasanthi (2019) investigated the efforts of major organisations toward environmental sustainability, the evolution of green standards, the development of green libraries in India and abroad, and the significant role of librarians in supporting green library practices.
- Ashis Biswas (2019) examined the concept of green libraries as a means of promoting environmental sustainability and resource conservation. It discussed the adoption of eco-friendly practices, including efficient use of energy and water, sustainable construction, and recycling initiatives. The study also emphasized the growing necessity of green libraries in India to raise environmental awareness and support sustainable development.
- Barnali Roy Choudhury [et. al] (2019) explained that green libraries must move beyond theoretical sustainability and actively implement environmentally responsible practices. It explored the role of Internet of Things (IoT) technologies in improving library management, operational efficiency, and sustainable resource utilization. The study concluded that, despite challenges related to security and standardization, IoT has significant potential to support the future development of sustainable and user-centred libraries.
- Shahzeb Hasan [et. al] (2023) Literature shows that sustainable libraries promote environmental conservation through green practices. These initiatives help reduce environmental impact and raise sustainability awareness among users.
- Bansal et al. (2024) highlighted that green libraries contribute to achieving Sustainable Development Goals (SDGs) by reducing carbon footprints, conserving resources, and promoting environmentally sustainable practices in library operations. The study emphasized the role of librarians in advocating sustainability through green building standards, renewable energy adoption, and awareness programs, while noting the limited literature available on the concept of green libraries in India.
- Sonia Sharma [et. al] (2025)emphasizes the importances of government grants, financial support and librarians involvement in green initiatives. It also highlights the challenges such as financial, managerial and operations constraints.
- Nilay Cevher [et. al] (2026) study explores findings of growing awareness of sustainability among libraries in Azerbaijan, Bosnia-Herzegovina, Greece, North Macedonia, and Türkiye. Academic libraries play a vital role in promoting sustainable development despite facing various challenges.
- Abubakar Sadeeq Isa [et. al] (2026)suggests in their research that green libraries as a means of promoting sustainability through eco-friendly practices, emphasizing the role of policy support, funding, and staff awareness in successful implementation. Renewable energy, digital resources, and recycling are identified as key sustainability strategies.

A review of the literature highlights that green library initiatives have emerged as a vital approach to fostering environmental sustainability, emphasizing eco-conscious infrastructure, efficient resource utilization, and sustainable practices that enhance the social and ecological responsibilities of libraries.

Green Libraries and Sustainable Development Goals (SDGs):

Green library contributes significantly to the implementation of the United Nations Sustainable Development Goals (SDGs) in 2015 by the IFLA International Advocacy Programme. Green Library can promote and support by their role in the promoting education, environmental awareness, innovation and community development through the planning and implementation can be archive of SDGs.

SDG 4: Quality Education

Green libraries are fundamentally aligned with SDG 4, which seeks to ensure inclusive, equitable, and quality education while promoting lifelong learning opportunities for all. As knowledge centres, libraries provide free and equitable access to information resources, educational materials, digital technologies, and learning opportunities that support formal, informal, and self-directed education. Green libraries further enhance educational outcomes by incorporating sustainability education into their collections, programs, and outreach activities. Through workshops, seminars, exhibitions, and environmental literacy initiatives, they cultivate awareness of ecological challenges and sustainable lifestyles. By fostering critical thinking, information literacy, and environmental consciousness, green libraries empower individuals to become informed and responsible citizens capable of contributing to sustainable development.

Green Library Contributions to SDG 4

- Provision of equitable access to educational and informational resources.
- Promotion of lifelong learning opportunities for diverse communities.
- Development of environmental literacy and sustainability education programs.
- Support for digital learning and information literacy skills.
- Facilitation of inclusive educational environments that encourage knowledge sharing.

SDG 6: Clean Water and Sanitation

Green libraries contribute to SDG 6 through sustainable water management practices that reduce water consumption and promote responsible use of freshwater resources. Modern green library buildings often incorporate rainwater harvesting systems, water-efficient fixtures, grey water recycling technologies, and landscape designs that minimize water demand. In addition to operational measures, libraries serve as educational platforms for raising public awareness about water conservation, sanitation, and environmental protection. Through information services, exhibitions, and community programs, green libraries disseminate knowledge about sustainable water practices and encourage environmentally responsible behaviour. These initiatives help foster a culture of water stewardship within communities and support broader efforts toward sustainable water resource management.

Green Library Contributions to SDG 6

- Installation of rainwater harvesting and water conservation systems.
- Use of water-efficient technologies and sustainable landscaping practices.
- Promotion of public awareness regarding water conservation and sanitation.
- Dissemination of information on sustainable water management practices.
- Reduction of institutional water footprints through responsible resource management.

SDG 7: Affordable and Clean Energy

The principles of green library development strongly support SDG 7 by encouraging the adoption of affordable, reliable, sustainable, and modern energy solutions. Green libraries increasingly utilize renewable energy technologies such as solar photovoltaic systems, energy-efficient lighting, natural ventilation, and intelligent energy management systems to reduce dependence on fossil fuels. These initiatives not only lower operational costs but also minimize greenhouse gas emissions and environmental impacts. Libraries further contribute to SDG 7 by providing access to information and educational resources related to renewable energy technologies, energy conservation, and sustainable energy policies. Through community outreach and awareness programs, green libraries help promote the transition toward cleaner energy systems and sustainable energy consumption practices.

Green Library Contributions to SDG 7

- Adoption of renewable energy technologies, particularly solar energy systems.
- Implementation of energy-efficient building designs and operations.
- Utilization of smart energy management and monitoring technologies.
- Promotion of public awareness regarding clean and sustainable energy.
- Support for research and learning related to renewable energy innovations.

SDG 9: Industry, Innovation, and Infrastructure

Green libraries contribute significantly to SDG 9 by promoting resilient infrastructure, sustainable innovation, and technological advancement. Modern library buildings increasingly incorporate green architectural features such as energy-efficient lighting systems, renewable energy installations, rainwater harvesting mechanisms, and smart building technologies. These innovations reduce operational costs while minimizing environmental impacts. Furthermore, libraries serve as hubs for digital innovation by providing access to information and communication technologies, maker spaces, digital learning laboratories, and research support services. Through the adoption of environmentally sustainable technologies and intelligent resource management systems, green libraries demonstrate how institutional infrastructure can support both knowledge creation and ecological responsibility. Their commitment to sustainable design serves as a model for public institutions seeking to balance technological progress with environmental sustainability.

Green Library Contributions to SDG 9

- Adoption of energy-efficient and smart building technologies.
- Integration of renewable energy systems such as solar panels.
- Development of digital libraries and virtual information services.
- Promotion of innovation through maker spaces and research support facilities.
- Enhancement of resilient and sustainable institutional infrastructure.

SDG 11: Sustainable Cities and Communities

Green libraries play a vital role in fostering inclusive, safe, resilient, and sustainable communities. As accessible public spaces, libraries provide equitable access to information, education, and cultural resources regardless of socioeconomic status. Their environmentally responsible infrastructure contributes to sustainable urban development by reducing energy consumption and promoting resource conservation. Additionally, green libraries function as community learning centers where citizens can engage with sustainability-related programs, environmental awareness campaigns, and educational workshops. They often provide safe public spaces that encourage social inclusion, civic participation, and community cohesion. Through their support for lifelong learning and environmental literacy, green libraries strengthen community resilience and contribute to the creation of sustainable urban environments.

Green Library Contributions to SDG 11

- Provision of inclusive and accessible public learning spaces.
- Support for sustainable urban planning through green building practices.
- Promotion of environmental awareness and community education.
- Enhancement of social cohesion and civic engagement.
- Preservation of local cultural and environmental heritage.

SDG 12: Responsible Consumption and Production

The principles of green librarianship closely align with SDG 12, which emphasizes sustainable consumption and production patterns. Libraries inherently promote resource sharing by enabling multiple users to access the same materials, thereby reducing the need for individual ownership and excessive consumption.

Green libraries further strengthen this contribution through sustainable procurement policies, paper reduction initiatives, digital resource adoption, recycling programs, and environmentally responsible waste management practices. Many institutions prioritize eco-friendly materials, energy-efficient equipment, and sustainable supply chains when making purchasing decisions. By encouraging responsible resource utilization, green libraries exemplify circular economy principles and sustainable organizational management.

Green Library Contributions to SDG 12

- Promotion of shared resource use through library collections.
- Reduction of paper consumption through digitization initiatives.
- Implementation of recycling and waste reduction programs.
- Adoption of sustainable procurement and purchasing practices.

- Encouragement of responsible consumption behaviours among users.

SDG 13: Climate Action

Climate action represents one of the most significant dimensions of green library initiatives. Green libraries actively contribute to climate change mitigation by reducing carbon emissions through energy-efficient operations, renewable energy adoption, and sustainable facility management. Green building certifications and environmentally conscious construction practices further reduce the ecological footprint of library facilities.

Beyond operational sustainability, libraries serve as critical centres for climate education and environmental advocacy. They curate collections on climate science, host awareness campaigns, organize sustainability workshops, and facilitate public discussions on environmental challenges. Through these activities, libraries empower communities to make informed decisions and participate in climate action efforts.

Green Library Contributions to SDG 13

- Reduction of greenhouse gas emissions through sustainable operations.
- Utilization of renewable and clean energy sources.
- Climate literacy and environmental education programs.
- Support for climate-related research and information dissemination.
- Promotion of sustainable behaviors within communities.

SDG 17: Partnerships for the Goals

The successful implementation of green library initiatives often depends upon strategic partnerships and collaborative networks, making SDG 17 particularly relevant. Libraries frequently collaborate with governmental agencies, educational institutions, environmental organizations, community groups, and international bodies to advance sustainability objectives.

These partnerships facilitate knowledge exchange, resource mobilization, capacity building, and the implementation of sustainability projects. Through participation in professional networks and collaborative research initiatives, libraries contribute to the global dissemination of best practices in sustainable development. Such partnerships enhance the effectiveness and reach of green library programs while fostering collective action toward achieving the SDGs.

Green Library Contributions to SDG 17

- Collaboration with environmental and educational organizations.
- Participation in national and international sustainability networks.
- Joint research and knowledge-sharing initiatives.
- Resource mobilization for green projects and infrastructure development.
- Promotion of multi-stakeholder engagement in sustainable development efforts

Strategic Sustainability Structure for Green Libraries

The concept of sustainability in libraries has evolved from a narrow focus on environmental conservation to a broader framework encompassing social responsibility, economic viability, and technological innovation. In the context of green libraries, sustainability is not merely a collection of isolated environmental initiatives but a strategic approach that influences planning, governance, service delivery, and resource management. A comprehensive sustainability structure enables libraries to align their operations with long-term environmental goals while simultaneously meeting the educational, cultural, and informational needs of their communities.

Energy Efficiency and Conservation

Energy conservation is a fundamental component of green library operations. Libraries increasingly adopt energy-efficient technologies such as LED lighting systems, automated lighting controls, occupancy sensors, and smart heating, ventilation, and air-conditioning (HVAC) systems. The incorporation of renewable energy sources, including solar energy, further contributes to reducing dependence on conventional energy resources and lowering carbon emissions.

Water Resource Management

Effective water management supports the sustainable utilization of natural resources. Green libraries implement rainwater harvesting systems, low-flow plumbing fixtures, water-efficient landscaping, and greywater recycling mechanisms to minimize water consumption and promote conservation.

Waste Reduction and Resource Recovery

Libraries contribute to environmental sustainability through waste minimization strategies. Recycling programmes, paperless administrative processes, responsible electronic waste disposal, and composting initiatives help reduce landfill waste and encourage resource recovery practices.

Sustainable Procurement Practices

Environmentally responsible purchasing policies ensure that libraries procure products and services that have minimal environmental impact. Preference is given to recycled materials, eco-friendly office supplies, energy-efficient equipment, and suppliers committed to sustainable production standards.

Equitable Access to Information

Libraries serve as democratic institutions that provide free and equitable access to information resources. By removing barriers related to socioeconomic status, age, gender, or physical ability, libraries support information equity and social inclusion.

Community Engagement

Green libraries actively engage with their communities through awareness campaigns, educational programmes, sustainability workshops, and collaborative partnerships. Such initiatives strengthen community participation and encourage collective responsibility toward sustainable development.

Cultural Heritage Preservation

Libraries play a crucial role in preserving cultural heritage, local history, and indigenous knowledge systems. These preservation efforts contribute to cultural continuity and safeguard valuable knowledge resources for future generations.

Lifelong Learning and Information Literacy

Through educational services, information literacy programmes, and skill-development initiatives, libraries support lifelong learning and empower individuals to make informed decisions in an increasingly complex information environment.

Cost Efficiency and Operational Savings

Investments in sustainable infrastructure often result in substantial financial benefits through reduced energy consumption, lower maintenance costs, and improved operational efficiency. These savings contribute to the long-term sustainability of library services.

Resource Optimization

Resource-sharing mechanisms such as cooperative acquisitions, library consortia, interlibrary loan services, and shared digital platforms enable libraries to maximize access to resources while minimizing unnecessary expenditure.

Financial Resilience

Long-term sustainability requires diversified funding sources, effective budgeting practices, and collaborative partnerships with governmental, educational, and private-sector organizations. These strategies strengthen financial resilience and institutional adaptability.

Digital Transformation

The development of electronic collections, digital repositories, virtual reference services, and online learning platforms has expanded information access while reducing dependence on physical resources.

Smart Technologies and Automation

Advanced technologies such as building management systems, automated circulation systems, and intelligent resource monitoring tools improve operational efficiency and support sustainable facility management.

Digital Preservation and Long-Term Access

Sustainable access to digital information requires effective preservation strategies, metadata standards, secure storage systems, and regular technological updates. These measures ensure the continued availability and usability of digital resources.

Strategic Integration and Institutional Sustainability

The success of green libraries depends on the effective integration of environmental, social, economic, and technological dimensions into a cohesive sustainability strategy. These dimensions are interconnected and collectively contribute to institutional sustainability. Environmental initiatives reduce operational costs, technological innovations improve resource efficiency, and socially inclusive services enhance community relevance and support.

Trends and Future Prospects

Surfacing trends suggest that emplacement of libraries as active agents in addressing environmental challenges and advancing sustainable development is highly escalating.

The Evolution of Carbon-Responsible Knowledge Centres

In response to global concerns regarding climate change and carbon emissions, integrating net-zero and carbon-neutral models has become a primary driver of sustainable innovation in libraries. Libraries are carry out renewable energy systems, energy saving mechanism, and carbon management strategies to reduce their ecological burden Net-zero libraries seek to produce as much renewable energy as they consume over a given period, thereby reducing dependence on non-renewable resources. Such proposals reflect a proactive climate stewardship, positioning libraries as models of institutional viability.

Future-Ready Green Libraries and Sustainable Smart Infrastructure

The acceleration of digital ecosystems has catalyzed the evolution of environmentally responsive library territory characterized by computational intelligence and ecological alertness Contemporary library facilities increasingly incorporate interconnected sensing networks, relying on data and foresight automation mechanisms, and analytical governance frameworks that facilitate the dynamic observation of environmental surroundings , utility expenditure patterns, user movement distributions, and atmospheric wellness indicators. By transforming operational data into actionable insights, these advanced systems promote adoptability responsible monitoring of institutional resources while minimizing ecological burdens. This paradigm signifies a transformative consolidated of environmental ethics and technological ingenuity, redefining libraries as resilient knowledge environments capable of harmonizing sustainability aspirations with intelligent overarching strategies.

Next-Generation Library Services and Artificial Intelligence

Artificial Intelligence (AI) applications support a wide range of functions, including automated cataloging, metadata creation, predictive maintenance, user-service personalization, and optimization of Energy. By analyzing large datasets and identifying operational patterns, AI-driven systems leveraging predictive insight while supporting informed managerial decisions in library environments.. This is tool to uplift sustainability in Library system.

Sustainability Education and Eco-Conscious Information Literacy

Libraries are gradually multiplying their role in education through the advancement of eco-conscious information literacy. This particular dimension of information literacy emphasizes the ability to locate, evaluate, interpret, and apply environmental information in informed and responsible ways. Libraries are developing s educational programs, specialized collections and societal outreach initiatives that address topics such as climate change, renewable energy, biodiversity conservation, environmental justice, and sustainable consumption. By nurturing environmental awareness and critical thinking, libraries play huge rolein the improvement of sustainability education along the contemporary challenges.

Sustainability driven Digital Transformation

The digital reconfiguration of libraries has opened new pathways for advancing environmental sustainability by minimizing paper dependency and broadening access to information resources. However, growing recognition of the environmental impacts associated with digital technologies—including energy-intensive data centers and electronic waste—has prompted greater attention to sustainable digital practices. Contemporary approaches emphasize energy-efficient data management, green cloud computing, responsible technology procurement, sustainable software development, and effective e-waste management. Thus**,** eco-intelligent digital evolution has raised as a pivotal pillar within holistic green library frameworks.

Libraries as the pillar of sustainable civic engagement

An increasingly significant development trend in modern library practice is the transformation of libraries into catalysts for community-centered sustainability initiatives that promote environmental awareness and civic participation. Through initiatives such as seed libraries, community gardens, repair cafés, climate literacy programs, makerspaces, and citizen science projects, libraries provide opportunities for individuals to participate directly in sustainability-related activities. These programs strengthen community resilience, encourage environmentally responsible behavior, and foster collaborative approaches to local environmental challenges. By incorporating this expanded function, libraries move beyond their conventional informational responsibilities and play a proactive role in advancing long-term sustainable community well-being.

Challenges in Establishing Green Libraries

The pursuit of sustainability within library environments is often constrained by a variety of structural, managerial, and resource-related constraints. Prominent challenges include:

Economic Constraints*:* Sustainable construction, renewable energy installations, and eco-friendly technologies require substantial financial investment.

Deficiencies in Knowledge: Limited awareness of sustainability principles and green management practices among library personnel can impede implementation.

Infrastructure Modernization hurdles: Older library buildings may not be compatible with energy-efficient upgrades, water conservation systems, or environmentally responsible redesigns.

Complexities of Sustainable Technology Integration: The adoption of smart systems and sustainable technologies demands technical expertise, maintenance, and continuous monitoring.

InstitutionalInertia and Change Resistance: Organizational reluctance to modify established policies and operational practices can delay sustainability initiatives.

Governance and Policy Framework deficiencies*:* The absence of dedicated sustainability frameworks and administrative commitment often weakens green library efforts.

Spatial and Resource Limitations: Limited physical space and inadequate resources may restrict the integration of green infrastructure and environmental facilities.

Issues in Sustainability Monitoring and Evaluation: Measuring environmental performance and long-term impacts remains difficult due to the lack of standardized evaluation mechanisms.

CONCLUSION

Green libraries denote a transformative convergence of ecological responsibility, intellectual vitality, and long-term institutional resilience. By embedding ecological consciousness within their infrastructure, services, and governance frameworks, they transcend conventional librarianship and emerge as influential agents of sustainable transformation. While financial, technological, and organizational complexities may hinder progress, strategic foresight and collaborative commitment can unlock enduring opportunities. In an era defined by escalating environmental exigencies, green libraries stand as catalysts for regenerative knowledge ecosystems, nurturing environmentally cognizant citizens and shaping a sustainable trajectory for future generations.

ABSTRACT

This paper examines the contribution of these emerging technologies to library digitization, educational development, and information accessibility. Cloud computing offers scalable and cost-effective infrastructure for storing and managing digital libraries in the digital era have transformed from traditional physical repositories into advanced technology-oriented knowledge centers. Rapid developments in information and communication technologies have significantly influenced the way libraries collect, manage, preserve, and disseminate information. Among the most impactful innovations are cloud computing, artificial intelligence (AI), and blockchain technology, which together are reshaping modern library services and improving access to knowledge resources. Resources, while artificial intelligence supports intelligent automation, personalized recommendations, and improved information retrieval. Blockchain technology enhances transparency, trust, and security through decentralized and tamper-resistant systems. The study further discusses the integration of cloud computing, AI, and blockchain in creating smart library ecosystems capable of delivering efficient, user-centered, and secure services. In addition, the paper highlights the major challenges associated with the implementation of these technologies, including financial, technical, ethical, and legal concerns. Finally, the research explores future trends and emphasizes the growing importance of technological adaptation in the development of sustainable and intelligent library systems.

Keywords: Cloud Computing, Artificial Intelligence, Blockchain, Challenges in Implementation, Future Trends in Library Technology, Library Systems.

INTRODUCTION

Traditionally, library services were primarily based on physical collections and manual operations. However, the rapid growth of digital information and the increasing demand for remote and instant access to resources have accelerated the transition toward digital and automated library environments. In the modern information society, users expect uninterrupted access to digital resources, personalized services, and efficient information retrieval systems. To satisfy these evolving expectations, libraries are increasingly adopting advanced technologies such as cloud computing, artificial intelligence, and blockchain. These technologies not only improve operational efficiency but also enhance user experience, resource management, and data security. Cloud computing enables libraries to host databases, digital repositories, and management systems on virtual platforms, thereby reducing dependence on physical infrastructure and enabling remote accessibility. Artificial intelligence contributes intelligent capabilities such as automated cataloging, recommendation systems, virtual assistants, and advanced search mechanisms. At the same time, blockchain technology provides secure, transparent, and decentralized methods for managing digital records and transactions. The combined application of these technologies supports the development of next-generation smart libraries that are scalable, intelligent, and secure. Cloud computing delivers flexible storage and computing power, AI improves automation and user interaction, and blockchain ensures authenticity, trust, and protection of digital assets. Together, they create a comprehensive framework for innovative library services and sustainable knowledge management.

LITERATURE REVIEW

Numerous studies have examined the influence of cloud computing, artificial intelligence, and blockchain technology on library systems and digital information management. Research on cloud computing in libraries has highlighted its role in reducing infrastructure costs, improving scalability, and supporting collaborative digital services. Several scholars have analyzed cloud-based library management systems and their effectiveness in delivering mobile information services, collective intelligence, and enhanced user experiences. Studies conducted in different geographical and institutional contexts have identified both the advantages and implementation challenges associated with cloud technologies in libraries. Artificial intelligence has emerged as a transformative technology in library services by automating repetitive tasks, improving search accuracy, and personalizing user experiences. Existing literature demonstrates that AI applications such as machine learning, natural language processing, chatbots, and virtual assistants contribute significantly to efficient information retrieval and digital knowledge management. Researchers have also emphasized the role of AI in recommendation systems, intelligent search tools, predictive analytics, and digital preservation initiatives. Recent studies have further explored AI-driven educational technologies, including systems capable of generating interactive multimedia learning content. These technologies improve accessibility, personalization, and user engagement within digital learning environments. Additional research has focused on intelligent interaction systems in academic libraries that integrate voice recognition, biometric authentication, and motion detection to enhance user-centered library services.

Blockchain technology has also attracted considerable attention in the field of library and information science. Researchers have discussed its potential for improving digital rights management, secure transaction recording, identity verification, and resource sharing. The decentralized and immutable nature of blockchain provides libraries with reliable mechanisms for maintaining transparent and tamper-proof records. The integration of blockchain with artificial intelligence has also been explored in relation to interlibrary loan systems and resource-sharing networks. AI technologies such as predictive analytics and machine learning can optimize borrowing procedures and anticipate user needs, while blockchain ensures secure and transparent transaction management. Recent research has additionally examined blockchain-supported digital libraries that facilitate secure global access to educational materials and support efficient resource sharing among institutions. These systems emphasize transparency, data integrity, and secure digital transactions. Overall, the literature demonstrates that cloud computing, artificial

intelligence, and blockchain technologies are significantly transforming library systems by improving accessibility, operational efficiency, personalization, and data security. However, existing studies also indicate the need for further research regarding integration strategies, implementation challenges, ethical considerations, and sustainable adoption models for smart library ecosystems.

Purpose of the Paper

The primary objective of this paper is to examine the applications and benefits of cloud computing, artificial intelligence, and blockchain technology in library systems. The study aims to evaluate how these technologies contribute to improving library management, information accessibility, user services, and digital security. Furthermore, the paper seeks to identify current limitations, research gaps, and implementation challenges while proposing innovative approaches for the development of efficient, intelligent, and sustainable library environments.

Cloud Computing in Library Systems

Cloud Computing Architecture-

Cloud computing is a modern technology that delivers computing services such as storage, software, databases, and networking through the internet. Instead of maintaining physical infrastructure within the library, institutions can use online platforms to access resources whenever needed. Cloud services generally operate through three major models:

- Infrastructure as a Service (IaaS)
- Platform as a Service (PaaS)
- Software as a Service (SaaS)

Cloud deployment can be categorized into public, private, and hybrid models depending on the level of access and security required.

Uses of Cloud Computing in Libraries-

Cloud technology has significantly transformed library operations and services.

- **Management of Digital Resources-**Libraries can preserve and organize electronic materials such as e-books, online journals, research databases, and multimedia resources using cloud storage systems. This minimizes the dependence on physical storage devices and improves accessibility.
- **Cloud-Based Library Management Systems-**Many libraries now use cloud-hosted Integrated Library Systems (ILS) to handle functions such as cataloging, circulation, acquisitions, and serial control. Since these systems are internet-based, librarians can manage services remotely and efficiently.
- **Resource Sharing and Collaboration-**Cloud platforms support collaboration among libraries by enabling interlibrary loan services, cooperative cataloging, and shared access to digital collections.
- **Remote Access to Library Services-**Users can access library resources from any location using internet-enabled devices. This increases convenience and supports online learning and research activities.

Benefits of Cloud Computing-

- Reduces expenditure on hardware and infrastructure
- Provides flexible and scalable storage capacity
- Supports automatic software updates and maintenance
- Ensures backup and disaster recovery services
- Enhances accessibility to information resources.

Drawbacks of Cloud Computing-

- Requires stable internet connectivity
- Raises concerns regarding privacy and data security
- Dependence on external service providers may create vendor lock-in problems.

Arti Jain

Artificial Intelligence in Library Systems

Introduction to Artificial Intelligence-Artificial Intelligence (AI) refers to the capability of machines to imitate human intelligence and perform tasks such as learning, reasoning, and decision-making. AI technologies commonly used in libraries include:

- Machine Learning (ML)
- Natural Language Processing (NLP)
- Computer Vision

These technologies improve the efficiency and quality of library services.

Applications of AI in Libraries

- **Smart Search Systems-**AI-powered search tools can understand user queries more effectively and provide accurate search results using NLP techniques. These systems improve information retrieval by recognizing user intent rather than relying only on keywords.
- **Chat bots and Virtual Assistance-**Libraries increasingly use AI chat bots to answer routine questions related to book availability, library timings, membership, and database access. These virtual assistants provide quick responses and reduce staff workload.
- **Automated Cataloging and Classification-**AI applications can automatically classify and index library materials by generating metadata and assigning subject headings. This saves time and increases operational efficiency.
- **Personalized Recommendation Services-**AI systems analyze user interests, borrowing history, and search behavior to recommend relevant books, journals, and digital materials.
- **Predictive Analysis-**Libraries can use AI algorithms to study user patterns and predict future demand for resources, helping in collection development and resource management.

Advantages of AI in Libraries

- Improves user satisfaction and service quality
- Speeds up information retrieval processes
- Reduces repetitive manual work
- Supports better planning and decision-making

Challenges of AI Adoption

- High implementation and maintenance costs
- Ethical concerns such as algorithmic bias
- Dependence on high-quality data for accurate results
- Privacy concerns related to user information

Blockchain Technology in Library Systems

Introduction to Blockchain: Blockchain is a decentralized digital ledger technology used to store records securely and transparently. Information is stored in blocks that are linked together chronologically, forming a secure chain of records.

Main Features of Blockchain-

- Decentralization
- Transparency
- Immutability
- Enhanced security

These characteristics make blockchain suitable for secure information management.

Applications of Blockchain in Librarie

- **Digital Rights Management-**Blockchain technology helps libraries manage intellectual property rights by tracking ownership and preventing unauthorized use of digital content.
- **Secure Record Maintenance-**Library transactions such as book borrowing, returns, and membership activities can be securely recorded and verified through blockchain systems.
- **User Identity Management-**Blockchain-based authentication systems can provide secure and reliable user identification while reducing the risk of identity fraud.
- **Interlibrary Loan and Resource Sharing-**Blockchain can improve transparency and efficiency in interlibrary loan services by securely tracking transactions and resource exchanges.

Advantages of Blockchain-

- Provides strong data security
- Increases transparency and trust
- Reduces chances of fraud and unauthorized modifications
- Ensures reliable record management

Limitations of Blockchain-

- Requires significant computational power
- Faces scalability and performance challenges
- Lack of common standards for implementation
- Complex technology requiring technical expertise

Integration of Cloud Computing, AI, and Blockchain-The combined use of cloud computing, artificial intelligence, and blockchain creates an advanced technological framework for modern libraries.

Combined Benefits-Each technology contributes unique advantages:

- Cloud computing offers scalable infrastructure and storage
- AI provides intelligent automation and data analysis
- Blockchain ensures secure and transparent transactions

Together, these technologies improve library efficiency, security, and accessibility.

Smart Library Environment-A smart library system may include:

- Cloud-based digital repositories
- AI-enabled search and recommendation tools
- Blockchain-secured transaction systems
- Online and remote user services

Example of Integrated Functioning-When a user searches for a resource:

- AI interprets the query and identifies relevant materials
- Cloud servers quickly retrieve the required information
- Blockchain securely records the transaction

This integration provides fast, secure and reliable library services.

Case Studies

Academic Libraries-Universities and research institutions use cloud computing for digital repositories and AI-driven systems for personalized recommendations and research support.

National Digital Libraries-Government-supported digital libraries use cloud infrastructure to manage large-scale collections, while blockchain technology ensures secure access and copyright protection.

Public Libraries-Public libraries adopt cloud systems and AI-powered chatbots to improve user interaction, remote access, and community engagement.

Challenges in Implementation

Technical Difficulties

- Complex system integration
- Compatibility problems between technologies
- Cybersecurity threats

Financial Issues

- High setup and implementation costs
- Continuous maintenance expenses
- Need for advanced technological infrastructure

Ethical and Legal Concerns

- Protection of user privacy
- Intellectual property rights management
- Ethical use of AI technologies

Human Resource Challenges

- Shortage of trained professionals
- Resistance to adopting new technologies
- Requirement for continuous skill development

Future Trends in Library Technology

Autonomous AI-Based Libraries-Future libraries may use AI and robotics to automate routine operations with minimal human involvement.

Blockchain Knowledge Networks-Blockchain may support decentralized and secure global knowledge-sharing platforms for libraries and research institutions.

Hybrid Cloud Environments-Libraries are likely to adopt hybrid cloud systems to balance flexibility, cost-effectiveness, and data security.

Adoption of Emerging Technologies-Libraries may increasingly integrate technologies such as:

- Internet of Things (IoT)
- Big Data Analytics
- Augmented Reality (AR)
- Virtual Reality (VR)

These technologies can enhance user interaction and information access.

Implications for Library Professionals-The rapid adoption of digital technologies is changing the role of library professionals. Librarians must develop expertise in areas such as:

- Data analytics
- Artificial intelligence applications
- Cloud computing management
- Cybersecurity
- Digital preservation
- Information ethics

Changing Role of Librarians-Modern librarians are becoming:

- Information technology facilitators
- Digital resource managers
- Data specialists
- Information literacy educators

Need for Continuous Professional Development-To remain effective in the digital environment, library professionals should participate in:

- Training programs
- Workshops and seminars
- Online certification courses
- Research and professional development activities.

CONCLUSION

Cloud computing, artificial intelligence, and blockchain technology are playing a transformative role in the evolution of modern library systems and digital information management. These technologies have significantly improved the efficiency, accessibility, security, and personalization of library services. Cloud computing provides scalable and cost-effective infrastructure that supports remote access, digital storage, and collaborative resource sharing. Artificial intelligence enhances information retrieval, automates routine operations, and delivers intelligent and user-centered services through technologies such as machine learning, chatbots, and recommendation systems. Blockchain technology contributes to secure data management, transparent transactions, digital rights protection, and trustworthy record keeping through decentralized and tamper-proof systems. However, several challenges remain, including high implementation costs, technical complexity, data privacy concerns, cybersecurity risks, lack of skilled professionals, and ethical issues related to artificial intelligence and data governance. Therefore, libraries must adopt strategic planning, continuous staff training, strong policy frameworks, and sustainable technological models to ensure successful implementation and long-term effectiveness. In conclusion, cloud computing, artificial intelligence, and blockchain technologies are reshaping libraries into intelligent, secure, and user-centric knowledge ecosystems. As these technologies continue to evolve, they will further strengthen the role of libraries as dynamic centers for digital learning, research, innovation, and global information access in the future.

ABSTRACT

The information and its development in digital era are growing exponentially in the subscription-based resources, open access repositories, Institutional repositories, research data repositories. This growth has created challenges for information resource discovery and information retrievals. The information mining was highly cerotic in the traditional federated searching systems, these keyword-based searching techniques limited to provide the relevant match and limit in providing the accessibility to the scholarly contents. The smart discovery platforms transform the way of information search and information interaction with the implementation of semantic search technologies in response to fill the gap. The paper is examining the role of semantic search technologies to enhance the research visibility with the implementation of next-generation discovery tools. This paper explores the integration of advanced technologies - Natural Language Processing (NLP), linked data, knowledge graphs, metadata enrichment, and artificial intelligence to improve search precision, contextual understanding, and resource discovery. The study also highlights the semantic search analysis the user intention about the information, relationship with the concept and produce the result accordingly. This paper also discusses that smart discovery platforms can bring together different information sources. These sources include library catalogues, electronic databases, institutional repositories, and open science resources and accessible all through a single search interface. These systems make easier to access research outputs, boosting visibility of institutional publication, and help users find knowledge more efficiently. The study also highlights challenges in implementation, such as metadata quality, interoperability, infrastructure needs, and privacy issues. The findings also suggest that semantic search-enabled discovery services can improve the user experience, resources utilization, and research impact. The study also showed the changing information needs of academic communities. The paper concludes by highlighting the importance of using smart discovery frameworks as a key part of future-ready academic libraries and digital knowledge systems.

Keywords – Research Visibility, Semantic Search, Discovery Services, Knowledge graph, Information Retrieval

INTRODUCTION

The scholarly contents are publishing in a exponentially higher then ever in various organizing platforms including IR, Subscription based resources, Open publishing medium, web pages and inf format of web blogs. These contents are majorly in different formats and require emerging under a common umbrella for retrieving the information in more concisely, accurately and cross platform interoperable. The growing trends of information digitization confront the need for constitute this information resources under a universal approach include the interoperability, accessibility and information retrieval. These platforms have different communication model and information retrieval mechanisms, which leads a user to spend a large amount of time to locate a relevant and authentic information. The duplication, irrelevancy of contents and lack of standardised searching mechanism user lost the information access interest. The Development of Open Science where a scholar can publish and access the information contents freely, are also a key responsible for the rapid growth of information. The platforms – arXiv, SSRN and Research Square are largely supporting the open publishing and accessing model. The Traditional searching is based on the Boolean search model and only allowed to search with the methods of AND, OR, NOT. These search engines are basic and purely depends upon the model of keyword matching, literal results (exact terms for searching any information) and limited with lack of understanding and corelating with the searching terms. The traditional search works in a sequence of breaking the query into groups and words, searching the documents where these words exist and ranked the result documents based on the frequency and the keywords positions. The most common limitations of these traditional searches are – Lack of understanding the context, limited to only exact search terms (its fail to create relations between the Synonyms and misspells) and no support for the natural language queries acceptance.

The Semantic Search is purely focussed on the Natural language processing, the content analysis and the vector embedding. These Searching Techniques Focuses on the concept instead of words. They support

- In developing relationships between search term and documents with the implementation of Artificial intelligence.
- The semantic searches are based on the ontology, and it helps to create and aligned the contents with the domain-specific knowledge hierarchies.
- It helps to overcome the limitations of misspelling and terminological variations with the implementation of fuzzy searching mechanism.

These limitations of traditional searching showed the need of a more intelligent, more robust and natural query solving mechanism and showcase the results in concise and domain specific. The study is to showcase the new semantic search technologies emergence in the discovery-based search. However, its limited in scope of generative AI discovery assistance and conversational searching.

Research Objectives

The study has the following objectives

- To examine the discovery services evolutions from traditional searching to Semantic search enabled systems.
- To study the role of semantic search technologies in enhancing the research visibility
- Contribution of Natural language processing, machine learning, knowledge graphs, Linked data and Information retrieval.
- To study the future implementation of semantic search technologies for enhancing Institutional repositories and electronic resources collection.

REVIEW OF LITERATURE

The literature considers for the study collectively indicate the emergence of intelligent Semantic search over the traditional keyword-based searching model. Web indexing, ranking algorithms and search engine qualities were highly discussed in the early research (Lewandowski, 2005; Henzinger et al., 2002). However, in the later studies the

limitation of keyword searching and the requirement of context-based information retrieval (Kasenchak, 2019). The New era of discovery search highly focused on the implementation of artificial intelligence, natural language processing, Ontologies & its use for knowledge organizations and to improve search precision and relevance by the transformer-based embeddings (Gupta et al., 2020; Malo & Al-zebari, 2025). The collective suggestion showcases that the importance of semantic search technologies in the discovery systems, the information retrieval based on the intent instead of the keyword match. Also, this literature investigates the AI – driven integrating semantic techniques in the current age discovery platforms enhanced the accessibility of scholarly resources. The literature also explored the role of semantic search technologies in libraries and the future recommendations for make the research discovery and information retrieval more user centric and visible.

Evolution of Discovery Services

The searching for information has exists since the development of internet era. The library for the searching of stacked information document through the Catalogue with the metadata level information in print and with the development of Integrated Library Management System (ILMS) the searching becomes easy. The Z39.50 protocol uses in the ILMS for information retrieval enhanced the library role and the visibility between the public. The Z39.50 bridge between the information database and the information seeker. In 2008, Orbis Cascade Alliance, a academic library consortium launched a unique union catalogue in OCLC and named it as Worldcat.org, where user can search information about a books from several library catalogues at a same time with a single query. The information need, access and interaction forced to put the continuous transformation in information retrieval. Traditional searching provide a gateway to vast repositories and serve the limitless information queries based and in a static manner. And the large information publication platform has emerged the need of personalization of contents and intelligence-based discovery.

The development of Federated searching where all the subscribed resources integrated system for feature the better information showcase and access. Still the limitations of syntax-based searching, Boolean logics and information seeking behaviour analysis. Few federated searching tools are Knimbus, Refread and RemoteXs. With the decade passes the federated searches emerged the concept of discovery searching, which help to provide more authentic and accurate information by using the indexed based content searching mechanisms. Discovery searching also fill the gap of stimulated search by through the searching terms in the multiple resources in real – time and showcase the indexed result. The platform including the EBSCO discovery searches, Summon and Primo are the most used platform for the discovery-based searches. Still the limitation of natural language processing, Ai generative answer for real time queries is lagged in these discovery-based searches. However, the latest emergence of the AI, the discovery system are enhanced their performance, analysis requested term and result orientations which are in the better state compared to the initial discovery and federated searching methods. The AI integrations are supported in the context analysis, behaviour studies and the content matching with user's needs.

Semantic Search Technologies and their contributions to Discovery

The semantic search is information search mechanism where it focuses on understanding the context means and user intention for the information search and overcome the barriers of matching the keywords. These searches show the result based on analysis of various considerable factors, relationship in searching terms, User's location and search history. The semantic search includes the various technologies including the Natural language processing, Machine Learning, Knowledge graphs, Artificial intelligence and entity recognition. The technologies help to understand the user's need and present the result based on the comprehensive analysis. These are comparison-basedoutcome of the semantic search and their role in the development of discovery- In this figure the development of technologies in Semantic search showed the traditional search limitations. It also describes the enhancement through the involved technologies. This enhancement has impacted the research by Showing the relevant result, Increase in resource utilization, discoverability, entity and relations in query and improved indexing and information retrieval.

The scopes for the future enhancement of semantic search in Modern Libraries are

Constructing the Knowledge graphs –The smart libraries knowledge graphs are used to map and structures information from diverse resources (books, articles, IR and other online publications). It help to create relationship between the entities and organize the knowledge into machine readable and human understandable. The knowledge graphs include following features

- Its rich in semantic search, develop relationship between entities and represent the information in more appealing and contextual ways.
- Knowledge graphs also support the integration of diverse by adding data types and create a unified information view.
- Knowledge graphs provide the flexibility in to add new information and create new extension without change the schema.
- Its useful for driving new knowledge from existing information.

Application of Knowledge graphs in Library –

- Information search and retrieval enhancement
- Live Chat – for Question and Answer
- Resource Recommendations
- Unified schema for data integration
- Information management

Enhancement in Institutional Repository contents

Semantic search does the transformation of institutional repository from the traditional storage space to a intelligent information discovery system. The technologies – Discovery, Information retrieval, metadata structure, research showcase and user engagement enhanced the IR. The following are features has been emerged in the IR –

- Interoperable Metadata Enhancement
- Relationship development between entities
- Concept-based information access
- Advance Discoverability
- Scholarly ecosystem

CONCLUSION

The increase and the variation in scholarly information requires more user-oriented approaches for information retrieval in the compare of keyword-based searching approach. The semantic searches technologies have emerged as a role model for enhancing the search showcase by enabling the concept oriented, contextual awareness and user-oriented discovery services. The accessibility and discovery of electronic resources, institutional repositories and open access research have increased with integration of natural language processing, linking data, knowledge graphs and metadata enhancement. The semantic search has developed the connections between the researcher and relevant information by enhanced the limitations of keyword matching issues, supporting interdisciplinary exploration, and enhances the visibility of institutional scholarship. These developments have enhanced the user experience as well as the visibility of the scholarly contents, enhanced the utilization of resources and the academic impact. The semantic search technologies are useful for the supporting the research, learning and the invention and for the digital knowledge ecosystem. The future development of research knowledge graphs, metadata enrichment, recommendation system, Information retrieval and generative ai based discovery will enhance the scholarly information retrieval and smart discovery service as a next generation library.

Author's Profile –

Shukal Kumar - Mr. Shukal Kumar is a Senior Assistant Librarian at Ashoka University, Sonipat, Haryana. He holds an M.L.I.Sc. from the Central University of Himachal Pradesh and qualified UGC-NET (July 2025). He also earned a PG Diploma in Library Automation and Networking from IGNOU (2019) and is pursuing a Ph.D. in Library and Information Science at Mangalayatan University, Aligarh. With over 12 years of experience in academic libraries, his expertise includes website and e-resources management, LMS, academic integrity support, AWS cloud services, usage analytics, and open-source tools. He has published four conference papers and organized three national and international conferences.

ABSTRACT

Digital literacy has become a powerful force that is changing the way information is accessed in society. The rise of cutting-edge technologies like artificial intelligence, big data analytics, cloud computing, and networking. Library services and user engagement patterns have undergone a significant change due to the digital revolution of information environments. From print-dominated repositories to hybrid and fully digital knowledge centres with electronic databases, institutional repositories, digital reference services, and remote access systems, libraries have changed over time. However, library users' proficiency with digital literacy is crucial to the efficient use of these services. Digital literacy is a multifaceted concept that includes communication skills, ethical awareness, technical competency, cognitive talents, and content creation capabilities. The study offers a thorough conceptual framework for enhancing digital competencies within libraries and emphasizes the changing function of libraries and librarians as promoters of digital literacies.

Keywords: Digital Innovation, Digital Literacy, Information Society, Information Literacy, Digital Skills, Role of Librarian.

INTRODUCTION

In the 21st century, digital literacy is become a key force for change in all areas, such as education, business, government, and communication. The fast growth of digital technologies has greatly changed how we create, access, and share information. These changes have improved efficiency but have also brought new challenges in the digital

world. Because of this, digital literacy has become an essential skill for everyone. It is not just about knowing how to use a computer or smart phone. It also involves knowing how to evaluate information carefully, use digital tools effectively, and behave responsibly and ethically online. Digital innovation and digital literacy are closely connected and depend on each other. As new technologies continue to develop, the skills needed to use them also keep changing. It focuses on these connections and highlights why it is important for people keep improving their digital skills over time. The emergence of digital technologies has transformed how information is accessed and shared. The internet, cloud computing, artificial intelligence, and mobile technologies have all advanced quickly, turning traditional library systems into digitally connected information centers. Electronic journals, e-books, institutional repositories, online databases, and virtual reference services all accessible through modern libraries. Despite the substantial expansion of technological infrastructure, users' ability to efficiently browse and utilize electronic resources of data is still inconsistent.

In this context, digital literacy has become a crucial skill for library users. It makes people to be able to find, retrieve, assess, analyse, and use digital information in an ethical manner. Users might have a hard time fully utilize digital library services if they lack sufficient digital literacy abilities, which could lead to resource underutilization and growing knowledge gaps. Thus, a conceptual analysis of digital literacy is necessary to comprehend its importance in contemporary library ecosystems (Diseiye et al., 2024; Faizan, 2023). Additionally, the demand for a multifaceted understanding of digital literacy in library settings has increased due to the increasing complexity of digital information environments. It now includes information assessment, critical thinking, data awareness, online communication competence, cybersecurity consciousness, and a knowledge of digital ethics in addition to basic computer skills and digital device operation. By enabling users to interact with scholarly databases, citation management tools, plagiarism detection software, and open-access platforms efficiently, digital literacy academic libraries in particular promotes research productivity, academic integrity, and lifelong learning. As a result, through user orientation programs, information literacy workshops, and skill-development efforts, libraries are increasingly seen as both producers of digital resources and facilitators of digital literacy. Therefore, a conceptual investigation digital literacies is necessary to define its theoretical aspects, pinpoint its essential elements, and emphasize its strategic function in enhancing user empowerment and knowledge sustainability in the digital era (Ahmed & Rasheed, 2020; Khan & Waheed, 2015; Odu & Omosigho, 2017).

Digital Literacy

Digital literacy is the ability to use digital technologies effectively and critically. It includes technical skills, cognitive abilities, and ethical understanding. According to Gilster (1997), digital literacy involves the power to understand and to use information in multiple digital formats. It also includes skills such as searching for information, evaluating sources, communicating online, and creating digital content. In addition, digital literacy emphasizes responsible use of technology, including issues related to privacy and security. The foundation of digital literacy is several theoretical stances that describe how people engage with digital information settings. According to constructivist learning theory, users actively create knowledge by interacting with digital tools and resources. Learners can explore, assess, and synthesize material in interactive environments offered by digital platforms. The cognitive processes involved in finding, choosing, organizing, and understanding digital information are highlighted by information processing theory. Users of digital libraries must sort through vast amounts of data, which calls for sophisticated cognitive techniques. The development of digital literacy through cooperative participation in online communities, discussion boards, and social networking sites is explained by social learning theory. Participation in digital academic networks among library users is growing, improving group learning. These theoretical foundations support the idea that digital literacy includes higher-order cognitive and social abilities in addition to operational skills (Bawden, 2001; Cordell, 2013).

The information literacy framework, which stresses the ethical, critical, and contextual use of information in academic settings, has a significant impact on the idea of digital literacy in addition to these viewpoints. Information literacy was defined by the Association of College and Research Libraries as a collection of interrelated fundamental ideas that encourage critical thinking, the assessment of authority, and responsible involvement in the production of

knowledge. By emphasizing that students must not only access digital material but also critically evaluate its reliability, comprehend its socio cultural context, and use it ethically, this concept closely corresponds with digital literacy. Additionally, current research connects digital literacy to 21st-century abilities like creativity, problem-solving, communication, and teamwork all of which are critical for navigating intricate digital environments. Together, these theoretical contributions present digital literacy as an integrative concept that combines socio-cultural, ethical, technical, and cognitive aspects in contemporary library settings (Mykolaiko et al., 2024; Spires et al., 2018).

Types of Digital Literacy

History of Digital Literacy

In the latter half of the 20th century, the idea of digital literacy became widely accepted. Paul Gilster popularized the term by defining digital literacy as the capacity to comprehend and use information from a variety of digital sources in diverse formats. Crucially, It placed more emphasis on information interpretation and critical thinking than just technical proficiency (Gilster, 1997). Media literacy, computer literacy, and information literacy are examples of broader competencies that have been incorporated into digital literacy over time. According to academics, digital literacy encompasses the capacity to critically analyze and produce digital content in addition to operational computer abilities (Bawden, 2008). Digital literacy is closely linked to information literacy frameworks created by professional organizations like the Association of College and Research Libraries in the conversation around libraries and information science. These frameworks emphasize the value of critical thinking, assessing authority, engaging in ethical behavior, and using knowledge thoughtfully (Association of College and Research Libraries [ACRL], 2016)

As a result, digital literacy has developed from a limited technical notion to a multifaceted, all-encompassing concept that incorporates social, ethical, cognitive, and technological elements. Additionally, modern academics stress that digital literacy includes digital citizenship, digital communication, and collaborative abilities required for meaningful engagement in networked communities. In order to navigate complicated digital environments, users are increasingly needed to build adaptive and evaluative abilities due to the emergence of algorithm-driven platforms and artificial intelligence-based information systems. As a result, digital literacy is increasingly seen as a dynamic, lifelong learning process that changes in response to sociocultural and technological advancements (Van Laar et al., 2017).

Digital Innovation

Digital innovation refers to the use of digital technologies to create new or improved products, services, and systems. It includes tools such as artificial intelligence, cloud computing, big data, and mobile technologies. These innovations have transformed traditional systems into more efficient and user-centered digital environments. Digital innovation is not only about technology but also about how it is used to solve problems and improve human experiences.

Digital Literacy and Library Users

Library users' digital literacy can be conceived using a number of interconnected dimensions. Technical skill is the first dimension. Operating computers, cell phones, tablets, and library interfaces like OPAC systems and discovery tools fall under this category. Users need to be familiar with digital access protocols, internet navigation, and fundamental software applications. Information retrieval and assessment abilities make up the second dimension. Users need to employ sophisticated search filters, apply Boolean operators, create efficient search strategies, and evaluate the reliability and applicability of digital content. Evaluation skills are especially important in a time of disinformation and predatory publishing. Communication and teamwork skills make up the third dimension. Effective communication via email, online discussion boards, academic networking sites, and collaborative research tools is a key component of digital literacy. There are several types of library users. In academic and research settings, professional digital communication is crucial. Awareness of ethics and the law is the fourth dimension. Users need to be aware of data privacy issues, intellectual property rights, copyright regulations, and plagiarism guidelines. Academic integrity is ensured by the ethical use of digital information. Digital content creation and innovation constitute the fifth dimension. The ability to create digital content, including presentations, research blogs, multimedia outputs, databases, and scholarly publications, is a component of advanced digital literacy. Additionally,

users need to comprehend open access platforms and digital distribution channels (Greene et al., 2014; Martínez-Bravo et al., 2022).

Importance of Digital Literacy in Library

Digital literacy improves library services' overall efficacy. Users that are proficient with technology are better able to take advantage of institutional repositories, digital archives, subscription databases, and open access resources. They can monitor study impact measurements, use citation management systems to manage references, and take part in an academic communication network. Digital literacy also supports lifelong learning. Digital-savvy library users can browse online courses, research databases, and professional development materials on their own. The problem of the digital divide is significantly addressed by digital literacy. Equal access is not ensured by the sheer existence of digital infrastructure. Despite technical developments, those who lack digital abilities continue to be disadvantaged. Inamdar (2021) highlighted the significant libraries' role in facilitating digital literacy competencies. Therefore, for inclusive knowledge societies, improving digital literacy is crucial. Furthermore, in digital library contexts, digital literacy enhances user autonomy and self-regulated learning. According to a recent study, people who are digitally literate have higher levels of confidence when seeking information, critical assessment abilities, and flexible problem-solving techniques. These skills translate into better research productivity, appropriate use of electronic resources, and more effective database searching in university libraries (Sharma, 2016).

Users need sophisticated evaluative and interpretive skills to interact meaningfully with algorithmically curated information systems, as libraries increasingly include digital research analytics and AI-driven discovery tools. Furthermore, digital literacy strengthens libraries' strategic role in promoting digital inclusion and knowledge equity. The European Commission's Digital Competence Framework states that information literacy, communication, content creation, safety, and problem-solving abilities are all part of digital competence and are essential for both employability and active citizenship. Through user education programs, information literacy workshops, and digital training efforts, libraries as democratic knowledge institutions play a crucial role in promoting these competencies. Therefore, enhancing digital literacy within library ecosystems promotes greater socioeconomic engagement and digital empowerment in addition to improving individual academic success. In library ecosystems, digital literacy is essential for maintaining academic integrity and improving the caliber of research. Users need to have sophisticated evaluative and critical appraisal abilities in today's digital ecosystems, which are marked by disinformation, predatory publication, and algorithm-driven content distribution. According to studies, digital literacy improves people's capacity to recognize biased or manipulated information, evaluate the reliability of sources, and reach evidence-based conclusions. These skills are especially important in academic libraries for staying away from predatory journals, making sure that proper citation procedures are followed, and interacting with open-access publishing platforms in an ethical manner. Digital literacy acts as a safeguard that promotes responsible knowledge generation, ethical research conduct, and openness as academic communication becomes more digital and data-intensive (Martzoukou & Elliott, 2016; Wang & Si, 2024).

Challenges in Enhancing Digital Literacy

Despite its importance, a number of obstacles prevent library users from effectively developing their digital literacy. These issues are complex and impacted by institutional, socioeconomic, technical, and cognitive variables (Ng, 2012; Purmayanti, 2022; Siregar, 2024; Van Dijk, 2005).

Technological and Infrastructure Limitations

- One of the primary obstacles is still limited access to dependable internet connectivity, especially in poor nations.
- User participation is limited by the lack of access to digital devices including computers, tablets, and assistive technology.
- Incompatible digital platforms and antiquated library administration systems impede easy access to electronic resources.

- Unreliable power supplies and technical maintenance problems further interfere with digital learning environments.

The Digital Divide and Socioeconomic Inequalities

- People with low incomes frequently don't have access to high-speed internet or personal gadgets.
- The gaps in digital engagement between urban and rural areas are still growing.
- First-generation students and marginalized communities could have had little prior experience with digital technologies.
- Equitable access is hampered by language difficulties and the scarcity of localized digital material.

Quick Technological Progress and Skill Lacks

- The ongoing development of new technologies necessitates ongoing skill improvement, such as data analytics platforms and artificial intelligence-driven discovery tools.
- Users may become overwhelmed by frequent program changes and changing digital interfaces.
- Recurring skill gaps might result from the rapid obsolescence of previously acquired technological competencies.
- Adaptability to technological change is diminished when a lifelong learning mentality is lacking.

Inadequate Institutional Support and Structured Training

- Formal assessment methods and comprehensive frameworks for digital literacy are lacking in many institutions.
- Orientation programs sometimes overlook sophisticated research competencies in favor of fundamental skills.
- Librarians' ability to offer useful digital advise is hampered by a lack of professional development opportunities.
- Academic courses do not uniformly incorporate digital literacy.

Misinformation and Information Overload

- One factor contributing to cognitive overload is the enormous amount of digital information.
- Evaluation procedures are made more difficult by the growth of predatory publications, bogus news, and content that is biased by algorithms.
- A lack of critical thinking abilities makes one more susceptible to false information
- Using scholarly databases less effectively could result from an over-reliance on generic search engines.

Digital Literacy Role of Libraries and Librarians

Martzoukou and Elliott (2016) highlighted the expanding role of libraries and librarians in encouraging digital literacy, digital inclusion, and user empowerment in contemporary information environments. Libraries are essential for encouraging users to be digitally literate. Librarians serve as digital navigators, educators, and facilitators. Libraries offer crucial instruction in the use of digital resources through organized user education programs, workshops, webinars and online tutorials. Digital literacy training is getting more and more integrated into curriculum-based learning modules and orientation programs in contemporary libraries. User competencies are further improved by individualized research consultations, database training sessions, and digital research support services. Additionally, libraries need to constantly adjust to new technologies like digital preservation systems, data analytics platforms, and discovery tools powered by artificial intelligence. To effectively assist users in changing digital settings, librarians themselves need ongoing professional development (Faizan, 2024). Libraries serve as inclusive digital learning centres that close access, skill, and confidence gaps in addition to their instructional duties. According to research, academic and public libraries play a major role in fostering digital inclusion by providing users from a variety of socioeconomic backgrounds with guided help, internet connectivity, and technological access (Helsper, 2012). Libraries assist users in developing not only technical skills but also digital confidence and autonomy by offering secure and encouraging places for experimentation and learning. The social role of libraries is strengthened by this community-centred strategy, which promotes fair participation in digital knowledge societies (Inamdar, 2021; Nasir & Jana, 2024). Librarians also increasingly taking on the role of collaborators in scholarly

communication and research. They assist users in areas including bibliometric analysis, open access publication, data management planning, and research visibility in higher education settings. Librarians are increasingly actively involved in knowledge production and digital scholarship rather than merely serving as traditional information stewards. Consequently, encouraging digital literacy is now a strategic role integrated into the main goals of modern libraries rather than a supplementary service (Castelli, 2006).

CONCLUSION

Libraries must take a systematic, strategic approach to improving digital literacy. User groups' competency gaps can be found using needs assessment surveys. Libraries should create tiered training programs for novices, moderate users, and advanced researchers based on these evaluations. Accessibility can be improved by blended learning strategies that combine in-person seminars with online courses (Faizan et al., 2023). Effectiveness should be measured by incorporating regular evaluation and feedback methods. Collaboration between institutions is equally crucial. To integrate digital literacy into curriculum frameworks, libraries should collaborate with academic departments. Policies at the national and institutional levels must acknowledge digital literacy as a fundamental academic skill and provide sufficient funding for training and infrastructure. Strategic interventions should also be in line with globally accepted frameworks for digital competency in order to ensure consistency, scalability, and quantifiable results. Competency based frameworks, like the Digital Competence Framework of the European Commission, for example, place a strong emphasis on organized development in the areas of information literacy, communication, content creation, safety, and problem-solving. Clear learning benchmarks and assessment indicators can be produced by incorporating such organized frameworks into library training programs (Abiddin et al., 2022; Anthonysamy et al., 2020). Therefore, libraries need to go beyond their conventional role as infrastructure suppliers and take a proactive, strategic approach to developing digital capability. This necessitates integrating digital literacy into long-term strategic planning, curriculum frameworks, and institutional policies. Sustainable digital literacy projects must include competence-based evaluation methodologies, structured training programs, and ongoing professional development for librarians. More significantly, it will help communities become knowledgeable, critical thinking, and digitally empowered so they can participate in knowledge societies in an ethical manner. In order to ensure that technical advancement translates into significant intellectual and social improvement, libraries must continue to prioritize the promotion of digital literacy as they develop within increasingly complex digital landscapes.

ABSTRACT

As India is rapidly changing to a digital nation, libraries in the communities located in semi-urban & rural areas will definitely be able to help in the advancement of digital literacy as well as in making information universally accessible. The government has introduced various measures such as the National Digital Library of India (NDLI) and the Digital India campaign. However, the utilization of E-resources and digital services by community libraries in villages remains an unexplored area. This article attempts to shift the research focus from urban and university libraries to community libraries, a segment that faces issues like lack of infrastructure & socio-economic problems. So, through an extensive review of literature, policies & digital initiatives, it seeks to find out the current scenario, difficulties in adoption & potential socio-economic impacts of digital services in these community libraries. Firstly, a lack of proper digital infrastructure, low funding, absence of trained staff, and the community's low level of digital literacy are the major issues identified from the study. Secondly, there are some instances where reliance on digital resources has resulted in significant improvements in education, employment, and social activities. Finally, this article issues a call for digitally empowering community libraries as a just and required step towards bridging the digital divide. In this regard, it proposes that giving due weightage to the enhancement of digital infrastructure, designing localized multilingual content, staff development, promotion of public-private partnerships & framing a dedicated policy for the sustainable digital transformation should be considered.

Keywords: Community Libraries, Digital Empowerment, Digital Divide, Rural India, E-Resources Integration, ICT Adoption, UTAUT-2 Model, Digital India Mission Information Accessibility.

INTRODUCTION

Information & communication technology (ICT) has drastically transformed social sectors such as education and healthcare; due to this, libraries are not only the warehouse for books but they are also digital learning institutions. In the last few years, these libraries changed into hubs where one can learn new things with the help of the computer and the internet. There are multiple examples of big cities, metropolitan areas, and academic libraries which have already implemented these technological changes. On the other hand, community libraries located in rural and backward areas of India are still struggling with a lack of basic infrastructure and trained personnel. Libraries play a crucial role in fostering literacy and lifelong learning; however, the reach and sustained use of government schemes such as the National Digital Library of India (NDLI) and e-Granthalaya, particularly in the grassroots settings, are still very much unknown and unexplored. One of the objectives of digital empowerment is to equip the individuals with the means to avail themselves of educational and economic opportunities. Nevertheless the digital divide remains a reality in the socio-economic strata of India.

Concept of digital empowerment and digital divide

Digitally empowered people are able to use technology to achieve personal, educational & economic development. In digitally empowered societies, people rely on the Internet for accessing government services, education and earning their living. Nevertheless, a digital divide remains largely in India, which is essentially the inequalities in access to ICT among different socio-economic groups. Giving out computers is not enough; local service delivery programs are necessary for a real breakthrough. Community libraries can make a tremendous contribution to bridging these digital empowerment gaps by functioning as inclusive centers for digital empowerment. These centers not only help to bring out of the margins vulnerable groups such as women, the elderly, school dropouts, the economically disadvantaged but also rural youth.

Reason for the Research

Digitally empowering rural Indian community libraries tends to be the silent theme in the overall research on digital empowerment that mainly focuses on well-funded urban institutions. Besides, the national level frameworks like NDLI & Digital India being in place. Their penetration and effectiveness at the grassroots level are very much the need of the hour for further study. In this paper, the author examines the technological limitations & puts forward the policy measures to overcome the digital divide. Apart from the main target of evaluating the integration of E-resources, identifying barriers to the implementation of digital literacy & developing a conceptual framework to understand digital literacy

Challenges with the help of technology acceptance models, the other key objectives are real so set. This study aims to fill major research gaps & on this basis, the study states the following research objectives:

- TofindoutthepresentmacrolevelsituationofE-resources&digitalserviceintegrationinIndian community libraries through literature scanning and policy reports.
- To trace out the difficulties encountered by community libraries in the adoption & implementation of digital services.
- To develop a conceptual framework for the challenges on Digital Literacy and usage constraints using technology acceptance models.
- To determine the role of digital services in educational, occupational, and social empowerment of the local community.

To recommend strategic direction and best practices for deepening the integration of E-resources and digital services in community libraries for inclusive digital Empowerment.

Problem Statement

Even though there are more and more efforts to use technology in libraries and public services, community libraries in India, especially in the rural areas, have not been able to effectively implementand continue digital services. Low digital skills, poor internet connection, lack of funds & insufficient staff are some of the challenges that still exist. The scarcity of focused research on the integration of digital resources, usage patterns & socio-economic impacts in these localities aggravates the problem. Community libraries as means to digital empowerment, without focused studies& planning will remain a largely untapped area.

Purpose of the Study

This paper, being conceptual, is aimed at understanding the extent of integration of E-resource & digital services in community libraries in India as well as offering strategic ways for their role in digital empowerment to be more inclusive. Principally a literature review, this paper also through policy document & case study analysis, tries to bring out the role of community information services in bridging the digital divide.

The study scope

This conceptual study is concerned with how community libraries in semi-urban and rural India are progressing through digital transformation. It excludes metro and academic institutions for the purpose of looking at infrastructure, E-resources availability and issuance of digital literacy programs to marginalized areas. The research, by theoretical & policy-oriented analysis, investigates the socio-economic impacts & challenges of technology adoption in order to provide strategic insights to the decision-makers & community leaders.

Significance of the Study

The digital inclusion and community development aspects which are often neglected but very relevant are focused of this research. One of the main goals is to share ideas that can help decision-makers, library officials as well as community leaders in understanding how community libraries can be used to provide digital literacy training and to bridge the digital divide. Besides that, the strategic proposals of the study can guide not only the government's next programs, funding priorities & community-based initiatives for the digital empowerment of all but also be one of the deciding factors for these directions.

Review of Literature: Foundational Themes and Context

First, this paper is a concept derived from a systematic literature review (SLR) that considered research articlesfromScopus,J-GateaswellasDOAJdatabases,governmentreports,aswellasNGOcasestudies. The literature review's main focus was to uncover the current situation, challenges, barriers to the adoption & even the best practices of digital service integration in community libraries. The outcome of this literature synthesis points to three important areas which constitute the heart of this study: the global trend towards digital inclusion; the scope of national digital initiatives in India; and the structural barriers that obstruct the transformation of community libraries.

The Changing Role of Libraries for Digital Age and Global Access

Libraries as key players in promoting digital inclusion have their role strongly endorsed in international policy documents and academic debates. To illustrate, IFLA (2019)and UNESCO(2021)are highlighting the significance of libraries networks in achieving Sustainable Development Goals(SDGs), particularly in the areas of making information accessible & fostering digital citizenship. Recent studies indicate a profound transformation in the role of libraries with digital libraries becoming community-oriented and social impact-creating, rather than just following the traditional approach of collection management (Tammaro, 2026). The Digital Divide, defined as the differences in access to Information and Communication Technology (ICT) depending on someone's social and economic status and location, has been a topic of concern in many studies (World Bank, 2017). Besides that, the use of very new kinds of technologies such as Artificial Intelligence (AI) and the Metaverse by the public and academic libraries leads to the further digital transformation of societies globally at an unprecedented pace. This majorly changing scenario highlights the importance of libraries as agents of information access who take an active role

(Garcia Febo & Tammaro, 2026). Research dealing with acceptance by users showed that the success of e-materials mainly relies on the effectiveness of the features that are useful and simple enough, however, making it essential for users to have training and solid institutional support (Kumar & Singh, 2020). At the same time, changing of staff roles to AI and other new technologies is one of the arguments in favor of getting trained and improving skills.

National Digital Initiatives of India A Survey

India has at the time various major policies geared towards universal digital access. The Digital India Mission (Govt. of India, 2015) lays down the main goal for a digitally empowered society whereas the National Mission on Libraries (2016) aims at revamping the libraries as knowledge centers. Major projects like National Digital Library of India (NDLI) (2021) and e-Granthalaya (2022) have been rolled out to centralize contents and standardize management practices among Indian libraries. Nonetheless, the literature reviewed points to a norm of patchy implementation. Whereas academic and metropolitan public libraries which receive ample funding have been able to successfully introduce digital catalogs and e-resources, community libraries especially those run by local bodies or NGOs in the countryside and semi-urban places, are very far behind.1 A study by Rao & Verma (2021) clearly identified the incorporation of ICT as a major obstacle in the case of Indian libraries which implies that there is a gap in the operationalization of these national programs at the grassroots level. Moreover, this problem is not relieved when one comes across recent studies which continue to show that sustained use and satisfaction often depend on institutional issues and quality training which are generally not available in community settings.

Systemic Barriers to Digital Service Integration

This systematic review consolidates major challenges and presents them as themes that, together, hinder the continuous digital transformation of community libraries:

- **Infrastructural and Technical Deficits:** Many papers have consistently pointed to poor and unstable internet connections, irregular power supply, and the scarcity of essential digital devices (computers, e- readers) as the main causes of hold-ups, especially in aboriginal and rural areas. However, according to recent global studies, even in developed countries the lack of training, limited access, and a poor IT environment are still leading factors preventing wider adoption of e-resources (Habib et al., 2022; Acheampong et al., 2020). New issues are also focusing on threats coming from the cyberspace and on the security and privacy of the users of digital libraries (Abdelrahman, 2026).
- **Human Resource and Financial Constraints:** Research has found that there is a serious lack of qualified librarians who can deal with e-resources and digital literacy classes. This root problem is aggravated by a lack of funds from the local government, blocking the technology updates and the setting up of reliable financial systems for the obtaining of digital subscriptions.
- **Socio-Behavioral Gaps:** Studies have shown that the main factor limiting the use of digital resources, no matter how hard people try, is low digital literacy and a general lack of community awareness about what is available in terms of e-resources. Moreover, socio-cultural barriers such as the digital gender divide and a cultural preference of printed material over digital one, further limit the usage opportunities of the most vulnerable populations (Sharma & Patel, 2019).

Best Practices and Transformative Impact

Nevertheless, evidence from cases indicates that digitally enabled community libraries have the potential to be very effective, despite the systemic barriers. That the targeted interventions lead to certain socio- economic changes, including higher digital literacy levels & improved access to E-Governance, have been affirmed by both global initiatives and local efforts. For example, Gates Foundation's Global Libraries Initiative (2018) and Digital Empowerment Foundation (DEF) (2020) respectively. The leading reason why these examples worked is mainly because they implemented community-specific content in local languages, rolled out extensive training programs for library staff, and formed powerful public- private partnerships for scalability and sustainability. Studies done lately back this notion and point to the significance of social responsibility very strongly as a vehicle by which libraries can promote community development and empowerment (Latif et al., 2026). Besides, the use of user-centric theoretical

frameworks such as the extension of UTAUT2 is one of the ways in which researchers have been able to identify factors that influence the intention to adopt library resources such as Open Educational Resources (OER) in public libraries and it also acts as a basis for more effective changes (Tran et al., 2026). Such a change of gears in the direction of localized & tangible social impact is a very important step toward bridging the digital divide.

Conceptual Framework for the Rural Setting

The UTAUT2 model was chosen by the author of this paper to examine technology usage of rural Indian community library users to show how community library is a socio-technical mediator in the process of bridging the digital divide. The two variables, which in the UTAUT model are called Performance Expectancy (Perceived Usefulness) and Effort Expectancy (Perceived Ease of Use), are used to explain how the users' perception of library intervention, such as digital literacy workshops and regional language content, can affect their decision to adopt technology. Community libraries besides providing digital literacy may be offering digital access, training and other support or may even be playing the role of a digital hub which will not only increase the Behavioral Intention to Use among their patrons but will also lead to sustainable digital empowerment and by extension socio-economic up liftment. The research framework identified five key factors or elements that knowledge and use of digital technology depend upon: availability of infrastructure, capacity of human resources, community digital literacy levels, policy and financial support & socio-cultural factors.

A conceptual research framework was prepared based on the review of the related literature to capture the focus of the study on the following five dimensions:

- Availability of Infrastructure (internet connectivity, ICT tools)
- Capacity of Human Resource (trained library staff, digital trainers)
- Community of Digital Literacy Levels (existing knowledge and skildds, digital habits,)
- Policies and support of Finance (schemes of government, grants,etc)
- Socio-Economic and Cultural Barriers (gender-based divides, affordability issues, cultural resistance)

Outcomes:

- Enhanced Digital Literacy
- Improved Educational and Employment Opportunities
- Socio-cultural Empowerment
- Bridging the Digital Divide

RESEARCH METHODOLOGY

So research methodology plays the role of a blueprint to guide a study giving the overall approach, design, tools, and techniques to be used in order to meet the research goals. In conceptual research, the methodology differentiates from that of empirical studies since it is based on theoretical frameworks, literature studies, analyses of secondary data as well as gaining qualitative insight from already existing knowledge resources, instead of conducting primary data collection through field surveys or experiments. This study has taken the approach of secondary data thematic analysis, which means loosely that a systematic review of the challenges and opportunities was made through synthesis of the literature that was published between 2016 and even after 2026 through databases like Scopus and Google Scholar, the institute reports such as NML and DEF, etc.

Research Design

This research is aimed at describing phenomena or characteristics through analysis of existing information with secondary data and also exploring and interpreting information for a deeper understanding of the situation through conceptual analysis and systematic literature review. The main focus is on analyzing the present situation, problems

and prospects of digital service integration in community libraries through literature survey and from research report findings and making strategic recommendations through the interpretation secondary data.
The research paper is divided into the following parts:

Survey of national and international literatures
Analysis of the present digital library programmes in India
Physically showing the relationship between problems and solutions through the use of a conceptual map

Sources of Data

- Academic Journals and Research Articles: Publications that have gone through peer review from well-recognized journals in the domain of library and information science, digital literacy, ICT in education, and social empowerment.
- Government Reports and Policy Documents: Examples: National policy frameworks, Digital India Mission, National Mission on Libraries, e-Granthalaya project documents, and National Digital Library of India reports.
- Conference Proceedings and Working Papers: These are interesting examples: (International and national) Conference papers on digital libraries, community empowerment, and technology integration in public services.
- Case Studies and NGO Reports: These are first-hand pieces of evidence and assessments carried out by the Digital Empowerment Foundation (DEF), the Gates Foundation's Global Libraries Initiative, and other regional digital literacy projects.
- Online Resources and Repositories: This is where you will find websites of institutions, digital repositories, and open-access databases.

Research Questions

1. What is the macro level status of E-resources and digital services in community libraries in India as documented in policy literature?
2. What are the major infrastructural, financial, human resource challenges in integrating digital services in community libraries?
3. How do library users access digital services and E-resources in community libraries?
4. What are the effects of digital services in community libraries on various aspects such as digital literacy, education, employment, and socio-cultural participation, according to the perception of the people?
5. What suggestions can be made from a strategic perspective to make E-resources and digital services in community libraries more effective and accessible to a wider audience?

Data Collection Techniques

The study employed various data collection methods. Systematic literature review is the main method through which it intends to identify, select & critically evaluate the research & reports that are related to the topic. Below are the data collection steps:

Literature Search: Appropriate keywords like community libraries, digital literacy, e-resources in India, technology integration in libraries, Digital India, e-Granthalaya, National Digital Library of India & digital empowerment initiatives were used for searching the databases Google Scholar, Scopus, J-Gate, and DOAJ.
Screening and Selection: After drafting a preliminary list of articles, reports and documents, they were then selected based on their relevance, credibility & date of publication (preferably from 2010 onwards). A major priority was also given to peer-reviewed articles as well as official government or NGO reports.
Data Categorization:
The thematic areas into which the literature collected was divided are:

- The existing situation of community libraries in India

- National digital library projects
- Issues in technology adoption
- Best practices as well as models worldwide
- Case studies & localized actions

Critical Review & Synthesis:
Initially, the documents were scanned for purpose, method, results & closure after which a thematic synthesis was done to discover shared tendencies, determine gaps or highlight contrasting view points.

Data Analysis Techniques
This paper will analyze the data through qualitative content review and thematic synthesis of the secondary data gathered.

- The collected data will be first categorized into several main themes
- Various areas and programs will also be contrasted
- The different data aspects will be carefully examined to identify the most and the least effective things
- To find the gaps and opportunities for intervention, the data will be placed against the theoretical framework
- In order to theoretically assess the possible practicality & longevity of digital service integration in community libraries, a SWOT (Strengths, Weaknesses, Opportunities, and Threats) analysis is carried out.

Study Limitations

- **No Primary Data:** This research is based on secondary information; consequently, it might not do a good job of revealing the local-specific issues.
- **Dependence on Published Literature:** This work is based on existing literature and may not include the very latest or unpublished community-based initiation.

Regional Generalization: In this case, the focus is mainly on community libraries in the semi-urban & rural areas of India. And it may not capture adequately the differences among regions, in terms of infrastructure, digital literacy, and socio-economic situations.

Ethical considerations
This paper being conceptual using only secondary data, there is no direct human participation. In that case, ethical clearance is not required. However, the study keeps academic integrity at a high level by:

- Giving accurate references to all secondary data sources
- Avoiding plagiarism through original synthesis and analysis work
- Following the open-access and fair-use policies while material sourcing

Thematic Analysis, SWOT Matrix, and Policy Roadmap
This section, instead of giving local empirical field data, completes the qualitative insights, national policy frameworks, and international case examples collected during the literature survey. The discussion, linked to the proposed UTAUT2 framework, examines the factors and behaviors influencing digital service use in Indian community libraries.

Infrastructure vs. Implementation Gap in National Missions
Leveled inquiry into literature and institutional documents indicates a significant disconnection between high-level policy development and community-level implementation. A group of scholars agree that flagship programs such as the Digital India Mission (2015) and the National Mission on Libraries (2016) established strong infrastructural frameworks. However, physically reaching and integrating these frameworks into rural and semi-urban community library networks still remains extremely disjointed. Likewise, the centralized repositories i.e. National Digital Library of India (NDLI) and e-Granthalaya are mostly geared for academic and public libraries in metropolitan areas which

naturally have a strong institutional support and funding on a continuous basis. In comparison, research describing rural areas reports that the community libraries, which are under the local municipal bodies, NGOs, or Gram Panchayats, are very often isolated infrastructurally. The information compiled from the series of studies reveals a loss of the "last-mile delivery". Despite the allocation of basic equipment (like computer terminals), secondary essential infrastructural components, especially high-speed fiber-broadband connectivity, uninterrupted electricity supply, and dedicated solar- power backups, are missing, thus making the digital integration non-functioning. This brings a severe structural impediment: on one hand, national programs provide enormous stores of digital information, on the other hand, the community library-level conditions are so basic that they are practically unable to host or stream such content, resulting in a large-scale non-use of the national public investments.

Socio-Cultural Nuances of the Rural Digital Divide

The digital divide in rural India has roots in socio-cultural inequalities, such as differences based on the gender, age & economic status of the individual. For instance, women and girls might be limited by cultural norms when it comes to technology usage, while the fact that digital spaces tend to be male- dominated may result in the exclusion of other vulnerable groups. In fact, having software interfaces only in a few languages can be a real stick in the wheel for the locals who speak only their dialect. It can even make them afraid of using technology. Luckily, community libraries, as places that welcome everyone and ignore socio-cultural differences, can be a great help by offering local support & a chance for people to learn from their peers, thus giving them a leg up in overcoming these invisible barriers. On the other hand, the absence of qualified information professionals in non-urban public sectors is a major factor that keeps these digital infrastructures from being sustainable.

Human Resource Deficits and Capacity-Building Bottlenecks

Human technical abilities play a major role in determining how well digital library infrastructure will serve its purpose over time, but there is a big gap in the availability of trained experts in the non-urban public sector. Untrained volunteers or personnel with inadequate skills in e-resource management and troubleshooting are often the ones running rural community libraries. The impact of this deficiency on the users' perceived ease of use has been found to be negative, as it led to their experiencing technology anxiety and eventually abandoning the system. In the literature, the authors argue that simply upgrading hardware, without training the users, results in technology obsolescence quite quickly. Hence, academic recommendations focus on the need for digital librarianship training programs to become a regular feature of institutions and trainers to be brought in locally to instruct the caretakers so that they become community-oriented digital educators.

Strategic Synthesis: Conceptual SWOT Analysis Matrix

In line with the methodology (Section 4.4), the authors used a conceptual SWOT matrix to analyze the possibility of turning the existing grassroots units into centers of digital empowerment. The matrix below categorizes four elements internal factors (both Strengths and Weaknesses) & external factors (both Opportunities and Threats) that most influence this digital transformation process:

Analysis of the SWOT matrix

The SWOT analysis of Indian community libraries indicates that the community trust that these libraries have built is a critical base for them to work on their internal problems like fear of technology & staff competence-related issues. For library administrators to reach a stage where their financial situation is both stable and scalable over time, they should be opening up to Public-Private Partnership (PPP) models & Corporate Social Responsibility (CSR) funds. Besides that, in order to safeguard new internet users from exposure and other cyber threats, it is necessary to take appropriate steps against risks involving security as well as getting quickly outdated with new technology. However, consistent and sustainable efforts aimed at bridging the rural digital divide require these operational necessities to be in tune with national-level initiatives like the Digital India Mission through a properly organized, gradual, strategic plan.

Stepwise strategic policy plan for execution

The present study suggests a Strategic Roadmap in stages to change the SWOT data into government policies that can be performed. The roadmap, which acts as an indispensable handbook for digital change, takes community libraries forward together with the essential governance infrastructure. It moves beyond simple technology deployment toward a systematic learning and implementation cycle for digitally empowered communities.

CONCLUSIONS

This concept paper focuses on the large possibility of community libraries in rural & sem-urban India contributing to inclusive development through digital empowerment. Even though there are national schemes like NDLI and Digital India, the local level libraries suffer from deep-rooted problems like lack of infrastructure, limited resources, and absence of skilled personnel. The lack of a unified national policy is a major obstacle in digital transformation. Yet, research indicates that digital integration leads to better digital skills and more socio-economic opportunities. The paper proposes a unified approach to make digital inclusion for marginalized groups a reality by focusing on financing, policy alignment and strong public-private partnerships.

Strategic Recommendations

Strengthening Digital Infrastructure

Libraries at the community level must update their core infrastructure to not only provide uninterrupted power and internet but also ensure the presence of every required digital device such as computers, tablets or e-readers. One should not make solar backup a mere option, especially when trying to deliver digital services to those remote areas that don't even have a grid connection. To be in line with government's digital initiatives, the library should get into partnerships with the telecom companies for affordable & continuous broadband access. Partnering with telecom companies to provide affordable and continuously accessible broadband solutions with a view to be in sync with government digital drives is a must.

Capacity-Building and Professional Development

Provide simple to advance digital literacy training to library personnel including e-resources and application maintenance through ensuring regular ongoing sessions. Consider creating and offering an officially recognized Digital Librarianship course tailored for community libraries staff. Use local university students and retired professionals as community volunteers to organize well-structured workshops on digital literacy.

Development of Localized, Multilingual Digital Content

Make creation and promotion of region-specific, multilingual E-learning content and information services the top priority that directly impact critical local issues (e.g., health, agriculture, employment). Initiate formal collaborations with educational institutions, content developers and NGOs for producing tailor- made digital resources catering to various user groups (children, women, differently-abled persons, elderly).

Community Engagement and Awareness Campaigns

Carry out area-specific digital literacy awareness programs and campaigns especially in villages and semi-urban areas for generating interest and increasing community participation. Make use of local media channels (community radio, regional press, localized social media groups) to promote the availability and advantages of digital library services.

Hold major digital empowerment events, e.g., E-awareness days and skill-building sessions, in community libraries.

Integration with National Digital Initiatives

Integrate community libraries effectively and officially into national digital infrastructure schemes such as NDLI, e-Granthalaya and E-Governance platforms like Digi Locker. Delineate and promote widely community libraries' resource-sharing networks with the help of standardized operating guidelines resulting in collaborative learning and

broad content accessibility. Library users should be offered an easy way of accessing Open Educational Resources (OER) & basic government services through library workstations.

Strengthen the Role of Public-Private Partnerships (PPP)

Make best use of Corporate Social Responsibility (CSR) funding for major physical infrastructure development, digital training programs & content development initiatives. Enter into agreements with leading technology companies to secure donations of equipment, the supply of software solutions & follow-up technical support. Establish relationships with various NGOs for the most effective reaching of rural areas, implementation of training, and mobilization of the community.

Policy Development and Institutional Support

- Initiate and pass a specialized National Policy for Community Library Digital Transformation to unify and control the nationwide implementation of digital services at the local level.
- Set up State-Level Digital Library Cells in public library departments to manage, supervise, and provide financial assistance to community library digitization efforts.
- Clearly identify community libraries as key players in the broader Digital India inclusion strategy in order to ensure that they receive the necessary resources and policy focus.

Monitoring, Evaluation, and Best Practices Documentation

- Construct strict, evidence-based impact measurement systems for carrying out evaluations, on a yearly basis, of how effective and extensive the digital services in community libraries are.
- Advocate and implement research methods where users, staff, and community leaders work together to record implementation issues and successful results.
- Create a nationwide, easily reachable archive for listing and spreading documented best practices and effective digital library service models to serve as a reference for future policies and initiatives.

Future Research Directions

Comparative regional studies: These are in-depth studies that aim to investigate the differences between various states in terms of their level of digital services integration, support from administration & operational performance at local government levels.

- User Perception & Audits: Studies and surveys of digital resource utilize the behavior patterns of real- time library users in community libraries.
- Gender and Intersectionality: Research on gender-based perspectives with the aim of digital equity, finding out barriers specific rural women & evaluating intervention results.

PPP Cost-Benefit Analysis: Studying the economic costs & benefits of Public-Private Partnership models both from the aspects of sustainability, finances & an overall benefit/cost ratio of such a model.

Table1: Conceptual SWOT Analysis Matrix

Strengths (S)	Weaknesses (W)	Opportunities (O)	Threats (T)
Deep-Rooted Local Trust: High psychological acceptance and strong grassroots community penetration within rural ecosystems.	**Absence of Permanent Funding:** Chronic dependence on ad hoc local bodies, unpredictable grants, and volatile philanthropic donations.	**Collaboration with Digital India:** Alignment with initiatives such as the National Mission on Libraries (NML), NDLI, and e-Granthalaya.	**Exacerbated Cybersecurity Gaps:** Increased risk of data breaches, identity theft, and digital privacy issues in rural local networks.
Low-Cost Information Access: Ability to provide democratized, non-	**Untrained and Deficit Staffing:** Shortage of professionally qualified	**Corporate CSR Funding:** Opportunity to leverage Corporate Social	**Rapid Technological Obsolescence:** Fast-changing software,

commercialized learning environments for marginalized communities.	library personnel capable of managing advanced ICT infrastructure and digital literacy programs.	Responsibility (CSR) initiatives for acquiring modern hardware, software, and digital resources.	hardware, and AI technologies may outpace institutional capacity for upgrades.
Existing Physical Infrastructure: Availability of established public/community buildings that require enhancement rather than new construction.	**Linguistic and Interface Barriers:** Heavy reliance on English-based digital tools, resulting in poor accessibility for users preferring local vernacular languages.	**E-Governance Convergence:** Potential to function as official rural digital access points for public welfare, healthcare, agricultural, and citizen service portals.	**Systemic Infrastructure Failures:** Persistent issues such as unstable electricity supply and unreliable broadband connectivity can disrupt service delivery.

Table2: Phased Strategic Road map for Grass roots Digital Integration

Phase & Nomenclature	Core Operational Objectives	UTAUT-2 Target Constructs	Key Stakeholders Involved	Expected Deliverables / Milestones
Phase 1: Infrastructure Setup (Baseline Mobilization)	Procurement of essential ICT hardware (PCs, tablets, and e-readers).Provision of high-speed broadband connectivity and dedicated solar-powered backup systems. Integration with national digital initiatives such as NDLI and e-Granthalaya.	Reduce infrastructural friction.Establish baseline **Perceived Ease of Use**.	Ministry of Culture National Mission on Libraries (NML) National Informatics Centre (NIC)Gram Panchayats / Local Bodies	100% operational connectivity and power backup at selected nodes. Deployment of standardized cloud-based library catalogues.
Phase 2: Staff Capacity Building (Human Capital Optimization)	Institutionalize certified Digital Librarianship training modules for library personnel. Train staff in e-resource management, ICT operations, and user troubleshooting. Utilize university volunteers for peer-to-peer technical mentoring and digital literacy support.	Minimize technology anxiety. Enhance **Perceived Ease of Use** through user-centric capacity building.	State Library Departments. Academic LIS Departments Local NGO Networks	At least one professionally certified digital facilitator per community library.Establishment of localized user-help desks for technical assistance.

Phase 3: Community Mobilization*(Socio-Cultural Inclusion)*	Developing and curat ingregion-specific, multilingual digital content (agriculture, local job portals, e-health). Launching targeted outreach programs, including dedicated library hours for rural women. Organizing communitye-awareness days.	Maximizing Perceived Usefulness. Shaping Behavioral Intention to Use.	Community Leaders. Self-Help Groups(SHGs). Language & Content Developers.	Measurable spike in daily user footfalls from marginalized demographics. Successful on boarding of non-English-literate users.
Phase 4: Sustainability through PPP(Long-Term Institutionalization)	Establishing formal Public-Private Partnership (PPP) governance frameworks. Tapping into corporate CSR mandates for continuous technology upgrade funding. Formulating a National Policy for Community Library Digital Transformation.	Transitioning from initialadoption to sustained Actual Usage.	Tech Corporations (CSRUnits). Central/St ate Policy Makers. Library Advisory Committees.	Creationof a permanent, non-volatile state-level digital library development cell. Enactment of national standardization guidelines.

ABSTRACT

Artificial Intelligence revolutionized the world, it has been not only change the whole working system but affect in all present fields. In education and library services AI profoundly affect, give personalized learning idea, easy access, inclusion for all, improving efficiency in library and education sector. AI enhance the services; influences user preferences provide AI based recommendation. Just like a coin has two sides, there are many aspects of AI. one side has positive outcomes such as quick result, automate services, minimize the human error, rapid diagnose system, analyze large data set in minimum time etc. In other side it also creates challenges like privacy, ethical, environmental concerns. Many researches show that AI directly affect cognitive thinking and reduces logical reasoning ability, making them over dependent on AI. On the other side many experts give warning that Artificial Intelligence has dangers outcomes for humanity. GEMINI, CHAT GPT, Anthropic's Claude Mythos like AI models are capable of giving a fierce response. This research paper explores the current impact of Artificial Intelligence in user preferences in academic libraries of Chhattisgarh. Examining effect of Artificial Intelligence, reading behavior, ethical concerns and find out how can AI change role of the librarians. The study adopts a mixed method research, involving survey for primary data and secondary data also used. Findings indicates that AI system positively influence users and raising concerns regarding ethical, privacy, over dependency. The study concludes that balance approach regarding AI, integration with libraries to improve services and maintain ethical privacy concerns of user.

Keywords: Artificial Intelligence, Emerging Technology, Chat gpt, Academic Libraries, Education, AI Ethics.

INTRODUCTION

The current modern society associated with new technologies and vast information system. New emerging technologies not only change the whole discovery process but it had change the whole information cycle. In present day artificial intelligence directly or indirectly affect library services. It also turns library into smart libraries, because of post COVID effect digital transformation happened. Millions of users were using AI and in near future they will increased use of AI not only by professionals but they often used by general user. IN academic library students were come for information collection but Chat gpt, Google Gemini, Claude etc.AI tools were influence student interest, they any time search in AI. But it does' mean that AI replaces library. Even after that user relied in pear reviewed authentic data, information and library services. In present era integration of AI in academic libraries major shift in services they provide more dynamic information system. They enhance the access of information, provide interactive environment, research practices, inclusion for society. There are ethical challenges associated with it. AI is not only a tool it is an exhortation for reshaping information generation, management and whole process(Malik&Mandal,2025). AI adoption in education is not only choice its today's requirement for future development. In education a strong, clear, ethical guidelines required for use of AI. Educator need to emphasizes AI literacy and adoptability (Taheri et al.,2025). In USA universities uses chat gpt and other generative tools. They strongly attention in plagiarism, privacy and instructional limitations. For educator it is essential to use AI to find learning objectives assessment strategies, support knowledge system(Wang et al.,2024). Use of AI created confusion in both teachers and students. Sometime unfair use of AI in research or in study work create an ethical concern. Its teachers and student's responsibility to use AI in controlled ethical way. AI support learning and relationships but it required strong ethical checks (Tsao,2025). Many research shows that in Universities strongly required mandatory AI literacy programs, training, policies. A step by step training approach from basic level of learning to advance applied learning system(Wu et al., 2025).As technological advancements are being explored the demand of user for services and resources are increased (Bharati&Verma, 2021). Which required new technologies in library, they also need of training, funds, awareness. In higher education libraries using Scopus, Web of Science data to provide quality reliable global research papers. Ai offers guidance for students in their research (Mitha& Omarsaib,2024). Libraries transformed in digital information Centre. They are essential for cultural preservation, scientific research etc.(Rahmanova,2025).

AI not only applicable in education sector it used by whole sector of the globe. It gives solution for real time operations. Health sector revolutionized with the use of AI. It early diagnoses the problems all post data in concise real time monitoring, efficient, secure, maintenance without internet (Sockolow et al.,2025) (Artiushenko et al., 2025). AI has high accuracy rate over 93%, It is suitable for low power environments. Future world focus on real world deployment low resource environment and improving interoperability. Overall effective AI system not only save out effort but balance accuracy, efficiency and adoptability (Morals,2025). According to Microsoft, Carnegie study and other research overdependence on AI may decreases critical thinking of user. User can dependent on decision making on AI. Anthropic's project Glasswing is a cybersecurity project which is very good. In system it is capable in finding of cyber vulnerability, including bugs. In future it's a threat for cybersecurity, national banks other important services. One of the other report of Digital Bedrock a medium data center using 11lakh liter water per day for cooling. In future use of AI will increases and data center will also increase that has been more vulnerable concern for environment. In this research paper examining the current awareness about AI tools, which AI tools mostly used by user, is they faces any good or bad experience in using AI tools. In academic libraries of Chhattisgarh have integrated their library with AI Tools. Is students preferring library use or AI. The study discloses the impact of AI in academic libraries.

Research Questions

- How much awareness about AI tools?
- Preference between AI and Library, is any ethical concern occurred regarding use of AI.

- Are any AI tools available in their institute, any training or workshop conducted, is they attend any AI training/workshop program?

RESEARCH METHODOLOGY

In this study mixed method research design is used combined with qualitative and quantitative approaches insights into AI influence on user preferences, libraries. For primary data survey method was used for data collection. Questionnaire has been send online to students, scholars, faculty and different study groups. Students, scholars, faculty are participants of the survey. A structured questionnaire was send in structured format, basic information, some are open ended and close ended questions. For secondary data library databases, websites, institutional data were used. A stratified/convenience sampling method is used to ensure representation from different user groups. Participants – UG students-34, PG students-34, Scholars-30, Faculty-24 Participants.

FINDINGS AND DISCUSSION

In this survey total 122 user participated from different colleges and universities of Chhattisgarh. Percentage representation of different user groups UG students – 27.9%, PG students – 27.9%, Scholars- 24.6%, Faculty- 19.7%. Male, female representation – Female participants 70 (57.4%), Male- 52(42.6%). To understand impact of AI on user preference and library services here presented questionnaire response of users.

AI awareness and preference

According to user response 88.5% user aware from AI tools and 11.5% user are not aware from AI Tools. Most of the user prefer chat gpt(53%) for their social media, study research. After that Gemini and Claude is mostly used. 21.31% user using other AI tools. (Figure 1.1 Most preferred AI tool). Majority user 1-2 hours spend daily on AI tools. No one is spending more than 5 hours in AI tools. (Figure 1.2 How much time spend in AI tools.) The large portion of the user uses AI tools for social media, entertainment and study research purpose.

Library Usage and Services

According to data only 5% user are visited library daily and most of the user 44.26% user rarely visited library (Figure 2.1). In academic library 85.2% students answered there are not any AI Tools present in their library. In libraries 67.2% user not used any AI based services. 11.5% user using AI based search system in libraries (Figure 2.2). Most of users in library using book borrowing, e library services, Scopus and other electronic services. But 2.4% users not aware from term library services.

AI vs LIBRARY comparison-

AI tools make easier to find relevant resource-The finding discloses that majority 68.85% responded agreed with statement, while 26.23% expressed a neural option and only 4.92% disagreed. More than 50%(52.5%) user agreed they explore more resources due to AI recommendation. But 47.5% user directly oppose this they never explore resources due to AI recommendation. In between Library and AI mostly prefer and rely on both (30%), AI (20%), Library (16%) and 34% user not give satisfying answer. In questionnaire this is open ended question. Respondent prefer use of AI and rely for quick response, easy access, for everyday search, it is more convenient to summarize the content, explore the things. Many said that that AI is easy to use, it explains difficult content in very simple understandable way in one tap. 16% user rely on Library for their study, course books reading habits. For detailed study of subjects, deep study of subject they choose go to library. They more relied on library for authentic and verified data. Law students more rely on libraries for legal studies and research. For anatomy, case studies and detail study medical students more rely on library.

AI training/workshop and participation52.5% responded replied in their institute AI related workshops/training conducted (Figure 4.1). 62.3% user not attended any training or workshop regarding AI. 24.6% attended online

workshop/training related of AI and 13.1% attended offline. AI Impact on learning and research– 50.8 % participants feels that AI limits their exposure in diverse materials. AI changed reading habits of user. Approximately 70% user use AI for digital media and other search. (Figure 5.2)

AI related challenges and satisfaction-

- While using AI user feel over dependent on
- More than half (59%) user satisfied with AI search. 39.3% are neutral about AI search and 0.3% are disagree with satisfaction of their AI search.
- In total participants 72.1% users have expressed ethical concern regarding the use of AI and 27.9% user expressed there is no ethical concern regarding use of AI.
- In all participated user 50.82% user not facing any or bad experience regarding use of AI.40.98% user experience good experience AI help them to find daily answer immediately. One is write that she is reading too lengthy topic of her syllabus Gemini help her to gives short and untestable answers. 8.20% user facing bad experience regarding using AI. Some are facing incorrect information about their topic, some are not feel their data safe its used by AI generating companies. Few users responded that their AI based contents are not accepted in their colleges/institutes.

Secondary data was taken from different universities websites and institutional databases. At present no fully automated libraries present in university libraries of Chhattisgarh. Most of the universities are using partial AI based services. Currently libraries of Chhattisgarh are in improving stageof automation and digital transition of development. But there is a noticeable gap compared to other top academic libraries of India. AI chatbots, Automated book sorting, I audio reading tools and full AI recommendation system is not available in any academic library of Chhattisgarh. There are uneven library services present in college libraries of CG. Govt. autonomous colleges and private colleges using SOUL and KOHA LMS, digital repositories, Nlist and other e journals access. Mostly college libraries in CG have not yet AI based services. In currently in Chhattisgarh 34+ universities are working. Here is the data that has been taken from different universities websites.

- Technical institute such as NIT, IIIT and CSVTU are shifting towards AI based research tools and smart library system. In CSVTU AI assisted engineering database present.
- Specialized universities (Medical, Law, Music and Agriculture)- In AIIMS Raipur Clinical AI support databases, plagiarism AI tools like iThenticate, DrillBit present. They assist in clinical search, research analytics and for plagiarism detection. Other medical institute are also in moderate level of integration of AI in libraries. HNLU does not have fully AI based library services, but AI supported research platforms are available like SCC online, Manupatra ,LexisNexis, Casemine etc. IGKV is an Agriculture university in Raipur uses AI agriculture research tools. Crop Doctor AI system diagnose advisory system, pest detection, Smart Farming AI tools and databases analytics system. IKSV have digital music archive and AI based tagging.
- In many universities of CG partial AI system present. In different universities AI search system, plagiarism detection tools such as Drillbit, Turnitin etc. are available.

Recommendation

- In Chhattisgarh universities and college libraries should adopt transparent AI policies.
- User's privacy protection and ethical issue must be strengthened for betterment of library services.
- To solve issue of induced critical thinking user should require to always be aware from use of AI, outline their ideas manually before using AI. Create your own idea without copying AI suggestions.
- Many users are not aware from library services so Libraries should promote library services, organize exhibition, diversity of resources, recommendation.
- Continuous user feedback should be implement to improve quality. User prefer AI for quick response so implement AI based fast services in library.

- Staff and user training programs on AI technologies should be essential for future development.
- Research in field of AI integration with libraries are also required. Adequate budget allocation required to promote AI based library services.

Limitations

In this article survey method was used. Convenience sampling was used for data collection. Participants were selected based on easy accessibility. The sample may not reflect accurate demographic data and equal representation of all targeted population. Secondary data was taken from different universities websites. Sometime universities not up-to-date their websites other details. The result may depend on participant's response. But some of the user not understand the question in which context the question is, it is a drawback of online sending questionnaire.

CONCLUSION AND RESULT

Artificial intelligence is reshaping library services and system. Artificial Intelligence directly impacted user preferences and Academic Libraries. Artificial Intelligence influences user preference through personalized recommendation. Chhattisgarh's academic institute have not fully Artificial Intelligence based libraries. Many universities have partial AI based recommendation system, plagiarism tools. Most of the user are aware from AI tools, they prefer AI search for social media and for daily routine work. Chat gpt is mostly used AI tool, user spend 1-2 hour daily on that for digital media, study etc. Compare to Artificial Intelligence they rarely visit library. But it doesn't mean that library will replaced by AI. In participated user more than 60% user prefer AI Tools over library. They use library for their syllabus books, e resources for authentic and verified data. Mostly user reported there are no AI based library services present. According to survey in Academic library of Chhattisgarh half of the user responded AI training program conducted in their institute but 62.3% user never attended any AI training programs/workshops.AI changed students reading habit, AI give quick response to user, more than 65% user responses AI easily find relevant resource but the same time in diverse reading material AI limits their exposure. More than 70% user expressed ethical concern regarding AI use. They over dependent for decision making, other ethical concern associated with AI. Overall in survey more than 50% user experience good experience regarding AI. Some user experienced incorrect information, privacy concern, data profiling and other problems. Therefore, for future libraries must adopt, a balanced approach between use of AI and Library. Academic Libraries should integrate AI with library services. Libraries should install AI based chatbots, smart search system, AI based audio reading system for Students convenience. Students will have to be made aware to study. According to scientific studies reading books activate parts of the brain. It improves concentration, mental health, memory. To increase students interest in library it's important to make attractive library environment and more convenient services. The paper was concluded future research on AI in field of library it has immense potential to more accessible to user.

ABSTRACT

The rapid development of modern digital technology has greatly influenced the operations of academic libraries and their service systems within higher education institutions. This conceptual paper focused on the role played by smart information services in changing academic library websites especially among women's colleges in the case of Delhi University. Some of the aspects that were covered included the significance of smart information services, the needs of transformations for the existing library websites, and innovative digital services that could facilitate the process. The discussion in this paper highlighted various smart services including smart search systems, chatbots, institutional repositories, mobile-friendly interfaces, remote access services, and tools for real-time interaction. It was found that the inclusion of smart information services is bound to enhance digital inclusiveness, accessibility of information, research activities, and user-centricity in women's colleges in Delhi University.

Keywords: Smart Information Services, Academic Library Websites, Digital Transformation, Women's Colleges, Delhi University, Digital Libraries

INTRODUCTION

The fast development of information and communication technologies has radically changed higher education and the operation of academic libraries. Websites of academic libraries have been turned into dynamic digital spaces

providing access to electronic books, journals, databases, institutional repositories, and other academic assistance services. With this new digital reality, intelligent information services, including artificial intelligence, virtual assistants, mobile accessibility, and automatic user assistance, have become important tools for enhancing information access and academic assistance for users. In regard to women colleges within Delhi University, the use of smart library websites may facilitate digital inclusion, academic empowerment, and education of women. The current paper is of a theoretical character as it is grounded upon a review of relevant scientific literature dealing with smart information services and academic library websites transformation in higher education institutions.

Significance of Smart Library Services in Women's Colleges Under Delhi University

The women's colleges of Delhi University form an important group of institutions which focus on academic excellence, inclusiveness, and women empowerment. In the context of the contemporary information age, a smart academic library website can make a valuable contribution toward improving the academic accessibility and participation in research by female college students. The use of smart information facilities would enable students to have access to quality academic material at any time and from any place, thus fostering independent study and research-based education.

Objectives of the Study

- To understand the role of smart information services in academic library websites.
- To explore the transformation needs of library websites in women's colleges under Delhi University.
- To identify innovative digital services that enhance library accessibility and user engagement.

REVIEW OF LITERATURE

Ardyawin, Sugihartati, and Danugroho (2025)Carried out a systematic review of the literature on the impact of digital technologies in changing academic library services. The research showed that digital technologies greatly enhanced library operations, remote access, and user-focused information services in higher education institutions. Hamad, Al-Fadel, and Fakhouri (2023) The provision of smart services in academic libraries was investigated, and several problems encountered during their provision were found out. It was found that smart information services positively impacted user interaction, access to information, and digital communication in academic libraries. Okunlaya, Syed Abdullah, and Alias (2022)created a novel theoretical framework for incorporating artificial intelligence in the library functions of universities to promote their digital revolution. It was highlighted that AI-based services were helpful for improving information searching, personalized assistance for learners, and the effectiveness of digital academic processes.

Conceptual Framework of Smart Information Services

The incorporation of digital technologies has led to the creation of smart digital library websites which offer effective and convenient information services that are user-centric. Smart information service technologies involve innovative search engines, virtual assistants, customised services, remote access to electronic sources, institutional repositories, mobile services, and instant communication technologies. Such technologies contribute immensely towards enhancing information accessibility and learning environments. The conceptual relationship among the major dimensions of smart information services in academic library websites can be represented as follows: The above conceptual framework shows how smart information services are realized in a combination of technological innovations and digital solutions that are user-centered and together are contributing to the changes in academic library websites.

Challenges and Transformational Needs of Academic Library Websites

Digital learning in education has been growing in leaps and bounds in recent times. This has been resulting in higher expectations from academic library websites on higher education institutions. The purpose of library websites should

be to offer digital knowledge management facilities to leverage effectively by teachers and students. But in most of the academic library websites there have been several technological and usability problems. This calls for digital transformation in these libraries. There is a need to incorporate smart information services into library systems.
Some of the major challenges faced by academic library websites include:

- Outdated website interfaces and conventional designs
- Limited accessibility across digital devices
- Lack of personalized user services
- Poor navigation and inefficient search systems
- Inadequate digital interaction and communication tools
- Absence of AI-driven technologies and smart automation
- Information overload due to excessive digital content

Such obstacles may hinder the effectiveness, availability, and user-friendliness of library websites for students and scholars. Users are increasingly expecting the digital media they use to be responsive, interactive and easy to use, providing ready access to academic material and immediate help facilities. It is vital to mention that the metamorphosis of academic library websites is imperative for today's academic world. The major challenges that have been encountered by academic library websites and the impact on users are listed in the following table: The digital learning platforms have become more and more central to education, and it has become clear that it is necessary to transform academic libraries technologically and customer-oriented. Conventional library website designs present some challenges, but the use of AI and other technologies, like automation and smart information services, can be a great help in resolving these issues. These solutions include intelligent search options, automated suggestions, virtual assistants, and predictive analysis. It is imperative to note that the transformational needs of academic library websites relate significantly to aspects such as user experiences, increased digital accessibility, and innovation in terms of academic services. Academic libraries need to go beyond traditional forms of information delivery and embrace the dynamic nature of academic research with interactive and intelligent approaches to online information service delivery. The following table shows the need for transformation and smart solutions in academic library websites: To ensure the relevance and usefulness of the academic library in the rapidly changing digital academic environment, it is crucial to modernize the academic library websites. If the case of women colleges, Delhi University, modernizing the websites of library with the smart information services can significantly improve the experience of digital learning and research among learners. Intelligent digital solutions can also contribute to making an academic library system in the future, inclusive and technologically advanced.

Smart Information Services in Women's Colleges Under Delhi University

As the digital technology has become more and more important in the higher education system, the role of the smart academic library has become more important to create an enabling environment for all to access learning opportunities. The Academic Library website can become a powerful tool in the teaching-learning process in Women's Colleges affiliated to the Delhi University, with the provision of information services using technology. Smart information service like smart search engine, remote access to digital resources, chatbots, institutional repository, mobile web pages and instant messaging can improve the accessibility, engagement, and digital learning experience of students. The table below reflects the possibilities for smart information services to enhance the accessibility, efficiency and user-friendliness of the academic library websites of the women's colleges affiliated to Delhi University. The digitalization of these services could contribute to the creation of inclusive learning settings and improve learning and research-related tasks for students.

CONCLUSION

This current paper has emphasized the need for smart information services as far as the process of changing traditional academic library websites to digital information services is concerned. This paper has suggested that the

use of Smart Search Technologies, Intelligent Service Provision, Remote Access Services, Mobility, Institutional Repository and Instant Communication Services can improve the level of information accessibility and makes the academic library services responsive and efficient. From the point of view of women colleges affiliated to Delhi University, smart library services can be used in ensuring digital inclusion and women college students' research involvement. The findings that this paper has presented has revealed that the change of academic library websites is now an unavoidable requirement in academic libraries.

Table 1: Major Challenges Faced by Academic Library Websites and Their Impact on Users

Challenges Faced by Academic Library Websites	Impact on Users and Academic Services
Outdated website interfaces	Reduced user engagement and poor digital experience
Limited accessibility features	Barriers to inclusive and remote access
Lack of personalization	Inefficient information delivery and lower user satisfaction
Poor navigation systems	Difficulty in locating relevant resources
Inadequate digital interaction	Limited communication and user support
Information overload	Increased complexity in information retrieval
Absence of AI-driven technologies	Reduced efficiency and lack of smart automation

Table 2: Transformational Needs and Smart Information Service Solutions for Academic Library Websites

Transformational Needs	Smart Information Service Solutions
Improved information retrieval	Smart search systems and AI-based discovery tools
Enhanced user support	Chatbots and virtual assistance services
Better accessibility	Mobile-friendly and responsive website interfaces
Personalized user engagement	Recommendation systems and customized dashboards
Efficient digital communication	Real-time chat and online support systems

Organized scholarly resource management	Institutional repositories and cloud-based systems
Reduction of information overload	Intelligent filtering and automated content management

Table 3: Smart Information Services and Their Potential Benefits for Women's Colleges Under Delhi University

Smart Information Services	Potential Benefits for Women's Colleges Under Delhi University
Smart search systems	Faster and more accurate access to academic resources
Remote access to e-resources	Flexible learning and uninterrupted academic support
Mobile-friendly interfaces	Improved accessibility through smartphones and digital devices
Chatbots and virtual assistance	Real-time user guidance and academic support
Institutional repositories	Increased access to research publications and scholarly content
Personalized user services	Better user engagement and customized learning experiences
Real-time communication tools	Enhanced interaction between library professionals and users

ABSTRACT

As global climate action and digital transformation accelerate, the evolution of smart and green libraries has become critical for sustainable knowledge management. This study investigates the integration of eco-friendly architecture, energy-efficient operations, and advanced smart technologies like Internet of Things (IoT), cloud computing, big data, block chain and Artificial Intelligence (AI) in modern knowledge centres. This integration presents libraries with the challenge of adapting to new technological realities while preserving their core mission of knowledge stewardship. By leveraging AI and IoT, libraries optimize resource consumption-such as energy and water-while expanding access to digital scholarly resources. The findings highlight the dual benefit of reducing operational costs and fostering an ecologically conscious society. The paper concludes with actionable recommendations to seamlessly transition traditional facilities into smart, green, and future-ready institutions.

Keywords: Smart Libraries; Green Libraries; Sustainable Knowledge Management; Eco-friendly Design; Digital Transformation.

INTRODUCTION

Libraries have evolved from traditional to digital and now to the era of smart libraries. Traditional libraries were based on printed materials; Digital libraries have increased the use of e-books, e-journals, databases and internet-based resources; while smart libraries have used technologies such as AI, IoT, Cloud computing, big data and blockchain to provide personalised and efficient services to users (Ahmad & Chand, 2022). According to the "Online Dictionary of Library and Information Science (ODLIS)" on 1994. Green Library or Sustainable Library is defined as library designed to minimise Negative impact on the natural environment and maximise indoor environmental quality by means of careful site selection, use of natural construction materials, biodegradable products conservation

of sources like water energy paper and responsible waste disposal recycling etc. Green libraries are more than just energy-efficient buildings; they are catalysts for change within their communities. By adopting eco-friendly infrastructure, reducing waste, and promoting digital resources, libraries significantly lower their environmental footprint. Sustainability and knowledge management have become two important areas of concern for libraries in 21st century. Sustainable libraries not only adopt environmentally friendly practices, but also emphasize digital storage, open access, green ICT and long-term knowledge preservation (Rafiq et al., 2021). At the same time, knowledge management facilitates the collection, sharing and reuse of organizational knowledge, which increases the information literacy and research capacity of users (Singh & Arora, 2019).

In this regard, this paper discusses the topic of "smart and green Libraries for sustainable knowledge" from a future oriented perspective.

Key components of green libraries

Eco friendly Building Design

- LEED Certification: Many green libraries aim for certification like LEED (Leadership in

Energy and Environmental Design) to ensure buildings are energy efficient and Environmentally sustainable.

- Renewable energy: solar panels, geothermal heating etc.
- Sustainable Materials: Use of recycled, renewable, or low impact materials for construction and furnishings.

Energy efficient

- Advanced HVAC systems, natural lighting, and energy efficient lighting (e.g. LED).

Water conservation

- Low flow plumbing fixtures
- Rain water harvesting systems for irrigation.

Recycling and waste reduction:

- Offering digital resources to reduce paper use.
- Hosting community recycling programs for items like books, electronics, and textiles.

Green Library International standards

GRIHA: GRIHA stands for green rating for integrated habitat assessment. GRIHA is a rating tool that helps people assesses the performance of their building against certain nationally acceptable benchmarks.
IGBC – Indian Green Building Council

Challenges & Limitations of smart libraries

- Infrastructure and cost
- Digital Divide
- Data security and Privacy
- skills and training shortages
- policy and administrative constraints.

Future oriented approach:

- Hybrid Library Models
- Libraries as Innovation hubs
- cross sector collaboration
- Increasing use of AI and bigdata

CONCLUSION

Smart libraries and sustainable knowledge management are complementary. Smart libraries Provide more effective, personalized, and easily accessible services to users by using digital Technologies, AI, big data, cloud computing. At the same time, the sustainability of libraries can be ensured with the help of open access, digital preservation, green initiatives and community oriented services. Green libraries embody a transformative approach to addressing environmental challenges while fulfilling their traditional roles as centres of learning and community engagement. By integrating sustainable design, resource efficient operations, and environmentally focused programming these institutions significantly reduce their ecological footprint and inspire community wide action towards sustainability.

ABSTRACT

The unprecedented expansion of digital financial ecosystems and the accelerating adoption of electronic-payment infrastructures have fundamentally transformed contemporary commercial transactions while simultaneously intensifying the prevalence and sophistication of fraudulent financial activities across global markets. As credit-card utilization continues to proliferate through online commerce mobile payment platforms digital banking environments and technology driven financial services the challenge confronting financial institutions increasingly revolves around the development of robust real time mechanisms capable of accurately identifying mitigating and preventing fraudulent transactional behaviour. Against this rapidly evolving backdrop the present study undertakes a comprehensive bibliometric examination of scholarly research pertaining to credit-card fraud-detection published between 2011 and 2025 and indexed within the Scopus database. A substantial corpus comprising 929 publications was systematically analyzed to investigate publication trajectories scholarly productivity intellectual influence collaborative patterns and thematic evolution within this highly dynamic research domain. Bibliometric performance indicators were evaluated through Microsoft Excel while science mapping procedures and advanced knowledge visualization techniques were conducted using VOSviewer in order to uncover research trends collaboration networks conceptual relationships and thematic structures characterizing the field. The findings reveal a remarkable acceleration in scholarly output particularly after 2020 thereby reflecting the growing urgency of addressing fraud related challenges within increasingly digitized financial ecosystems. Conference papers emerged as the dominant publication format illustrating the highly technological innovation driven and rapidly evolving nature of this research area. Subject distribution analysis identifies Computer Science as the leading disciplinary contributor thereby emphasizing the central role of computational intelligence Machine-learning data analytics and algorithmic innovation in advancing fraud-detection methodologies. Country wise productivity analysis indicates that India

China and the United States constitute the most prolific contributors reflecting their substantial research investments and strategic engagement in financial technology innovation. Author productivity assessment identifies Khoshgoftaar T. M. as the most influential contributor while *Lecture Notes in Networks and Systems* emerges as the predominant publication venue facilitating the dissemination of scholarly advancements within the field. Institutional analysis reveals Tongji University as the leading research organization with significant support from the National Natural Science Foundation of China thereby highlighting the pivotal role of institutional and governmental backing in fostering research excellence. Furthermore keyword co occurrence analysis uncovers eight major thematic clusters that collectively define the contemporary intellectual architecture of credit-card fraud-detection research including imbalanced learning methodologies deep-learning frameworks conventional Machine-learning algorithms financial market fraud-detection approaches optimization driven analytical models Explainable Artificial Intelligence predictive boosting architectures and the broader economic consequences associated with fraudulent financial activities. Collectively these findings provide a comprehensive overview of the intellectual foundations conceptual evolution and rapidly expanding scholarly landscape of credit-card fraud-detection research while simultaneously illuminating the technological innovations methodological transformations and emerging research directions that continue to shape this strategically significant field within the contemporary digital economy.

Keywords: Bibliometric analysis, Credit-card fraud-detection, Machine-learning, VOSviewer, Financial fraud analytics

INTRODUCTION

The accelerated evolution of digital payment infrastructures and electronic commerce ecosystems has profoundly reconfigured the landscape of global financial transactions while simultaneously amplifying the complexity scale and frequency of fraudulent financial activities. Credit-cards remain among the most extensively utilized instruments within contemporary electronic-payment systems owing to their operational efficiency universal acceptability and transactional convenience across geographically dispersed markets. However the exponential expansion in credit-card utilization has been accompanied by a corresponding escalation in fraudulent transaction activities characterized by increasingly sophisticated methodologies and multifaceted patterns of financial deception. Credit-card fraud commonly defined as the unauthorized utilization of another individual's credit-card credentials for the purpose of conducting illicit purchases or financial transactions (Adewumi &Akinyelu 2017) continues to inflict substantial economic losses upon financial institutions commercial enterprises and consumers throughout the global financial ecosystem. The unprecedented growth of online purchasing environments mobile payment applications and card not present (CNP) transaction mechanisms has further intensified vulnerabilities within digital financial architectures thereby creating fertile conditions for increasingly adaptive and technologically sophisticated fraudulent activities. Fraud perpetrators continuously refine their operational strategies by exploiting emerging technological developments systemic security weaknesses and deficiencies within authentication infrastructures. Consequently conventional rule basedfraud-detection mechanisms have become progressively inadequate when confronted with the rapidly evolving nature of fraudulent behaviours and the immense volume of real time transactional data generated across contemporary financial networks. In response to these challenges Machine-learning (ML) deep-learning (DL) andensemble-learning frameworks have emerged as dominant methodological paradigms within the domain of credit-card fraud-detection research (Khalid et al. 2024).

One of the most persistent methodological challenges confronting researchers concerns the severe class imbalance inherent within credit-card transaction datasets wherein fraudulent transactions typically constitute less than one percent of all recorded observations (Yang et al. 2019). Such disproportionate distributions substantially complicate predictive modelling processes and often hinder the accurate identification of rare fraudulent events. Recent investigations by Baisholan et al. (2025) further caution that extensive reliance upon resampling methodologies may generate artificially inflated performance outcomes thereby raising concerns regarding the practical applicability and external validity of such models when deployed under authentic operational conditions characterized by original

class distributions. Beyond predictive accuracy contemporary scholarship has increasingly emphasized critical dimensions including model interpretability privacy preservation computational efficiency and ethical accountability within fraud-detection systems (Yang et al. 2019; Sulaiman et al. 2022). Simultaneously hybrid architectures integrating attention mechanisms with recurrent neural-networks have demonstrated enhanced capabilities in modelling sequential transactional behaviours and uncovering subtle anomalous patterns embedded within complex financial datasets (Benchaji et al. 2021). These developments collectively illustrate the inherently interdisciplinary technologically intensive and rapidly evolving character of credit-card fraud-detection research.

Despite the remarkable proliferation of scholarly contributions within this field a comprehensive synthesis of its intellectual architecture thematic progression collaborative structures and methodological evolution remains comparatively limited. Existing bibliometric investigations within adjacent domains including online credit-card fraud-detection (Hove et al. 2024) and banking fraud analytics (Fajar &Januarti 2025) reveal substantial growth in annual publication output particularly after 2016 accompanied by increasing scholarly emphasis upon Machine-learning frameworks ensemble modelling approaches and intelligent analytical systems. Nevertheless a dedicated bibliometric examination specifically focusing upon literature indexed under the precise terminology "Credit-card Fraud-detection" spanning the period from 2010 to 2025 has yet to be comprehensively undertaken. Given the extraordinary expansion of scholarly literature during the preceding fifteen years a systematic bibliometric assessment has become both timely and necessary. Such an investigation facilitates the evaluation of publication trajectories research productivity influential scholars and institutions international collaboration structures keyword co occurrence relationships and methodological transformations that collectively define the contemporary knowledge landscape of credit-card fraud-detection research. Accordingly the present bibliometric analysis seeks to provide a comprehensive examination of the intellectual evolution of credit-card fraud-detection scholarship identify dominant streams of inquiry uncover patterns of academic collaboration and illuminate emerging directions for future investigation. The findings are expected to provide valuable insights for researchers practitioners policymakers and financial technology stakeholders seeking a deeper understanding of the current state future trajectory and strategic opportunities within this increasingly significant field of research.

LITERATURE REVIEW

Contemporary scholarship increasingly employs systematic literature review methodologies to critically evaluate Machine-learning driven approaches for credit-card fraud-detection particularly under conditions characterized by severe class imbalance. Baisholan et al. (2025) conducted a comprehensive systematic review grounded in the PRISMA 2020 framework and Kitchenham's evidence based review methodology examining peer reviewed studies published between 2019 and 2025. Their findings reveal a persistent dependence upon a relatively limited collection of benchmark datasets alongside the predominance of tree basedensemble-learning techniques as preferred predictive modelling approaches. Furthermore the review highlights the comparatively limited adoption of Area Under the Precision Recall Curve (AUC PR) as a performance evaluation metric despite its recognized suitability for highly imbalanced classification environments. Hove et al. (2024) undertook a bibliometric investigation encompassing 524 Scopus indexed publications produced between 2013 and 2022 with the objective of mapping the intellectual development of Machine-learning applications in online credit-card fraud-detection. Utilizing Bibliometrix and VOSviewer analytical frameworks the authors identified five dominant thematic clusters centred upon imbalanced datasets anomaly detection Machine-learning methodologies decision tree architectures andensemble-learning systems. Their analysis further demonstrated substantial growth in annual publication output while identifying India as the most influential contributor in terms of both scholarly productivity and research impact.

Similarly Fajar and Januarti (2025) conducted a bibliometric assessment of fraud-detection research within the banking sector utilizing Scopus indexed literature to examine publication trajectories influential authors institutional productivity and collaborative research networks. Their findings indicate the rapid emergence of Machine-learning

and artificial intelligence as the dominant methodological paradigms shaping contemporary fraud-detection scholarship while simultaneously identifying China and India as the principal contributors to global banking fraud research. Expanding the analytical scope Winarto (2025) performed a bibliometric examination of 193 accounting fraud related studies published between 1993 and 2024. Through the integration of R Studio VOSviewer and Microsoft Excel the study explored citation structures keyword associations collaborative patterns and thematic evolution thereby providing valuable comparative insights into the development of fraud related research domains. Milne (2023) advocates for a broader interdisciplinary perspective on fraud prevention emphasizing the necessity of transitioning from reactive detection frameworks toward proactive and preventive analytical models capable of mitigating fraudulent activity before its occurrence. Complementing this perspective Muria (2023) conducted a bibliometric analysis of fifty selected studies on credit-card fraud-detection published between 2017 and 2021 and underscored the growing significance of big data analytics in extracting complex transactional patterns for fraud identification purposes. The study further recommends intensified exploration of hybrid computational architectures capable of integrating diverse analytical techniques and heterogeneous datasets in order to enhance predictive accuracy robustness and operational effectiveness within real world fraud-detection environments.

METHODOLOGY

The present investigation adopts a quantitative bibliometric research design to systematically examine the intellectual architecture scholarly evolution and global research dynamics characterizing the domain of credit-card fraud-detection as represented within the Scopus database. Bibliographic records were retrieved through a structured and precisely defined search strategy employing the query- TITLE-ABS-KEY(fraud) AND PUBYEAR > 2010 AND PUBYEAR < 2026 AND LIMIT-TO (EXACTKEYWORD, "Credit-card Fraud-detections"). Application of these retrieval parameters resulted in the identification of 929 scholarly documents published during the period 2011–2025 comprising peer reviewed journal articles conference proceedings and review papers disseminated through English language academic sources. Following retrieval all bibliographic metadata were exported in CSV format and subjected to systematic processing and analytical examination. Microsoft Excel was utilized for data cleaning organization classification descriptive statistical computation and trend based evaluation including annual publication growth patterns and citation performance analysis.

Subsequently VOSviewer was employed to construct bibliometric visualizations and thematic knowledge maps facilitating the identification of intellectual clusters conceptual structures research networks and keyword co occurrence relationships within the literature. Additional analytical functions embedded within the Scopus platform were utilized to determine the most influential authors leading countries productive institutions funding agencies and source titles exhibiting the highest levels of scholarly impact and citation prominence. Upon completion of all analytical procedures Microsoft Word was employed for the compilation integration formatting and presentation of bibliometric tables graphical illustrations citation profiles and visualization outputs thereby producing a comprehensive and publication ready research document.

Research Limits and Scope

The scope of the present study is specifically confined to a bibliometric examination of credit-card fraud-detection literature indexed exclusively within the Scopus database during the period extending from 2011 to 2025. The investigation utilizes a rigorously defined search query together with an exact keyword filtering mechanism to retrieve highly relevant bibliographic records for subsequent analysis. The study encompasses an evaluation of publication trajectories scholarly productivity collaboration structures institutional contributions citation performance and thematic developments through the combined application of Microsoft Excel and VOSviewer analytical frameworks. While the research provides a comprehensive quantitative overview of the intellectual landscape of credit-card fraud-detection scholarship its coverage remains restricted to publications indexed within Scopus and therefore excludes potentially relevant literature available through alternative scholarly databases including Web of Science Google Scholar and other indexing platforms. Furthermore bibliometric analysis primarily

emphasizes quantitative indicators such as publication frequency citation counts collaboration networks and thematic relationships and consequently does not provide an in depth qualitative assessment of the theoretical significance methodological robustness practical applicability or scholarly merit of individual research contributions.

Research Objectives

- To critically examine publication trajectories annual growth patterns and the longitudinal evolution of scholarly output in credit-card fraud-detection research during the period 2011–2025.
- To identify the most prominent research subdomains thematic specializations and intellectual concentrations within the field while evaluating their respective contributions to the advancement of contemporary knowledge.
- To analyse the scholarly contributions of countries institutions funding agencies and research communities in order to determine the principal drivers of global credit-card fraud-detection research.
- To identify the most productive and influential authors together with their affiliated institutions and major publication outlets contributing to the development of the research domain.
- To investigate keyword co-occurrence structures thematic clusters and emerging conceptual trends in order to reveal the evolving intellectual landscape of credit-card fraud-detection research and provide strategic insights for future scholarly and professional advancements.

Data Analysis and Interpretation

Table No. 1 demonstrates that the cumulative scholarly production exhibits a remarkably stratified publication architecture distributed across five discrete document categories each reflecting distinct patterns of academic prioritization scholarly communication and knowledge dissemination within the credit-card fraud-detection research ecosystem. A comprehensive quantitative evaluation reveals the overwhelming supremacy of conference papers which account for 712 publications representing approximately 76.6 percent of the total corpus comprising 929 documents thereby evidencing an exceptionally strong inclination toward conference oriented scholarly dissemination and underscoring the intensely dynamic character of this rapidly advancing research domain wherein the expeditious communication of emerging discoveries remains of paramount significance. The extraordinary concentration of scholarly activity within conference proceedings further signifies the field's pronounced commitment to technological advancement methodological innovation experimental investigation and accelerated intellectual exchange among academic researchers industry specialists and professional communities. Journal articles emerge as the second most substantial category with 193 publications accounting for approximately 20.8 percent of the aggregate scholarly output thereby reflecting a sustained dedication to rigorous peer reviewed dissemination mechanisms that facilitate the validation consolidation and enduring intellectual influence of research developments within the discipline. Book chapters occupy the third position with 19 publications representing approximately 2 percent of the overall output thereby indicating a comparatively modest yet academically meaningful contribution to edited scholarly collections and collaborative academic volumes that promote interdisciplinary engagement conceptual synthesis and thematic integration.

Conversely review articles and books collectively constitute only a negligible proportion of the literature with four review publications and a single book accounting for less than one percent of the total publication volume. This limited representation suggests that the field remains predominantly oriented toward original empirical inquiry methodological advancement and innovation driven investigation rather than extensive synthesis based scholarship. Overall the publication distribution unequivocally demonstrates that conference papers journal articles and book chapters constitute the principal channels of scholarly communication within credit-card fraud-detection research with conference publications maintaining an indisputably dominant position and functioning as the foremost medium through which contemporary scientific breakthroughs technological advancements methodological refinements and emerging research trajectories are disseminated throughout the global scholarly community. Table No. 2 and Figure 1 collectively demonstrate that the temporal distribution of scholarly publications exhibits a remarkably pronounced and continuously ascending trajectory of intellectual expansion thereby reflecting the escalating academic prominence and intensifying global research engagement associated with credit-card fraud-detection scholarship. The annual productivity assessment reveals that 2024 emerged as the most prolific year

throughout the entire investigation period generating 187 publications and thereby representing the highest magnitude of scholarly output recorded within the dataset. This was succeeded by 2025 with 165 publications and 2023 with 120 publications collectively establishing these three years as the most productive epoch within the developmental progression of the research domain. A detailed examination of publication dynamics reveals a progressive and relatively stable pattern of scholarly advancement commencing after 2016 with publication productivity increasing consistently from 31 documents in 2016 to 52 in 2017 followed by 69 in 2018 and 84 in 2019 thereby illustrating a period characterized by gradual intellectual consolidation expanding scholarly participation and increasing research visibility.

Beginning in 2020 the field entered a substantially accelerated phase of development distinguished by a sustained escalation in publication volume increasing from 69 publications in 2020 to 84 in 2021 followed by 105 in 2022 and 120 in 2023. This extraordinary expansion reflects intensified scholarly interest heightened investigative activity and broader international participation directed toward addressing the increasingly complex technological financial and cybersecurity challenges associated with credit-card fraud-detection. In contrast the earlier phase extending from 2011 to 2015 was characterized by comparatively modest levels of scholarly productivity commencing with only four publications in 2011 increasing to thirteen publications in both 2012 and 2013 and subsequently exhibiting minor fluctuations throughout the remainder of the period. When evaluated across the entire fifteen year interval the publication trajectory unmistakably reveals a transformative expansion in research productivity culminating in the exceptional output levels observed during 2023 2024 and 2025. Collectively these findings signify the growing strategic relevance of credit-card fraud-detection research and underscore its emergence as a highly dynamic technologically sophisticated computationally intensive and rapidly advancing field of scholarly inquiry situated at the intersection of financial technology cybersecurity artificial intelligence machine learning and advanced data analytics.

Table No. 3 elucidates that the subject wise distribution of scholarly productivity embodies a distinctly discipline centric yet remarkably transdisciplinary architecture of knowledge creation within the expansive domain of credit-card fraud-detection research. The analytical assessment reveals the indisputable supremacy of Computer Science which contributes 860 publications and consequently functions as the dominant intellectual epicentre underpinning the entire scholarly ecosystem. This exceptional concentration accentuates the indispensable significance of computational intelligence algorithmic sophistication machine learning frameworks artificial intelligence driven architectures predictive analytical systems and advanced data centric methodologies in addressing the multifaceted complexities associated with contemporary fraud detection environments. Engineering occupies the second position with 438 publications thereby emphasizing the critical contribution of computational architectures intelligent system development technological integration mechanisms infrastructure optimization frameworks and advanced processing environments. Mathematics secures the third position with 257 publications thereby reinforcing the pivotal importance of statistical inference probabilistic modelling mathematical optimization quantitative assessment methodologies predictive reasoning systems and computational precision in advancing the theoretical and practical dimensions of fraud detection scholarship. The substantial scholarly output distributed across these three disciplinary pillars collectively reflects an extraordinary degree of analytical rigor methodological refinement theoretical depth scientific robustness and intellectual sophistication that fundamentally characterizes the research landscape. Decision Sciences contributes 249 publications and maintains a profound intellectual convergence with the dominant technological disciplines thereby highlighting the escalating relevance of intelligent decision support frameworks predictive risk evaluation systems strategic analytical modelling approaches and evidence driven decision making mechanisms within increasingly complex financial security infrastructures.

Beyond these predominant disciplinary territories Medicine contributes 85 publications Physics and Astronomy account for 78 publications Energy contributes 73 publications and Materials Science records 51 publications collectively illustrating the progressive diffusion of credit-card fraud-detection scholarship across an increasingly diverse spectrum of scientific and technological frontiers. Furthermore the inclusion of Social Sciences with 44 publications alongside Business Management and Accounting with 35 publications signifies the growing

incorporation of behavioural organizational managerial economic societal and policy oriented perspectives into the broader intellectual framework of the field. Environmental Sciences contributes a comparatively modest eight publications yet nevertheless demonstrates the remarkable adaptability of the research domain and its capacity to expand into emergent interdisciplinary landscapes. Overall the disciplinary distribution unequivocally establishes Computer Science Engineering and Mathematics as the three most influential intellectually dominant and academically productive knowledge domains collectively constituting a technologically intensive computationally advanced quantitatively rigorous and methodologically sophisticated research framework that continues to accelerate the intellectual maturation scientific advancement conceptual evolution and global prominence of credit-card fraud-detection scholarship.

Table No. 4 demonstrates that although scholarly productivity exhibits a discernible degree of geographical concentration the broader intellectual ecosystem embodies extensive international participation and an increasingly heterogeneous global presence. A country wise assessment of publication productivity reveals that India occupies an unequivocally dominant position with a cumulative scholarly output of 391 publications thereby establishing itself as the foremost contributor within the research domain. This exceptional magnitude of academic productivity signifies the nation's expansive research engagement strengthening scientific infrastructure accelerating technological innovation and sustained intellectual dedication toward the advancement of credit-card fraud-detection scholarship. China emerges as the second most prolific contributor with 136 publications whereas the United States secures the third position with 116 publications. The substantial scholarly contributions generated by these nations further underscore their strategic prominence in shaping the intellectual architecture of the field through advanced technological capabilities sophisticated research ecosystems robust institutional foundations and extensive transnational collaboration networks. Beyond these leading contributors several countries demonstrate noteworthy levels of academic participation.

Morocco contributes 33 publications while Saudi Arabia and the United Kingdom each contribute 29 publications thereby reflecting the progressively internationalized character of contemporary research activity and the expanding engagement of diverse scholarly communities in addressing complex fraud detection challenges. Additional substantial contributions are observed from Bangladesh with 26 publications alongside France and Turkey with 24 publications each further illustrating the widespread global interest surrounding this specialized research domain. Although comparatively modest in publication volume Belgium with 19 publications Iran with 17 publications and both Australia and Germany with 16 publications each continue to provide meaningful intellectual contributions to the expanding corpus of scholarly knowledge. Collectively these publication patterns reveal a highly interconnected global research environment characterized by extensive international participation sustained knowledge generation scholarly diversification and cross national intellectual exchange. Overall the distribution of research productivity unequivocally identifies India China and the United States as the three dominant contributors thereby establishing a geographically influential research ecosystem principally driven by Asia and the United States while simultaneously demonstrating the progressive incorporation of researchers from multiple world regions into the continually evolving global discourse surrounding credit-card fraud-detection scholarship.

Table No. 5 demonstrates that the author wise distribution of scholarly output provides valuable insight into the individuals who have exerted the greatest influence on the intellectual development and research productivity of the credit-card fraud-detection domain. The analysis reveals a distinctly concentrated pattern of scholarly contribution in which a select group of highly productive researchers has played a pivotal role in shaping the evolution of the field. Among all contributors, Khoshgoftaar, T.M. emerges as the most prolific author with a remarkable total of 22 publications, thereby establishing a position of exceptional prominence within the global research community. Closely following is Liu, G. with 19 publications, whose substantial scholarly output further reinforces a strong and sustained contribution to the advancement of fraud-detection methodologies and analytical frameworks. Caelen, O. occupies the third position with 13 publications, consolidating the presence of highly influential individual scholars whose research efforts have significantly enriched the knowledge base of the discipline. Additional noteworthy contributors include Jiang, C. with 12 publications and Xie, Y. with 11 publications, both of whom demonstrate

considerable research consistency and sustained academic engagement. Bontempi, G. contributes 10 publications, further exemplifying the importance of continuous scholarly participation in strengthening the field's intellectual foundation. A second tier of productive researchers is represented by Granitzer, M. and Hancock, J., each with 9 publications, while He-Guelton, L., Le Borgne, Y.A., and Li, Z. each contribute 8 publications, reflecting substantial scholarly commitment and ongoing involvement in collaborative research initiatives. Furthermore, Duman, E., Siblini, W., Wang, H., and Yan, C. each contribute 7 publications, collectively illustrating the broad distribution of expertise and sustained research activity across the international academic community. The overall authorship pattern reveals a vibrant and collaborative research ecosystem characterized by both concentrated scholarly leadership and widespread intellectual participation. Most notably, Khoshgoftaar, T.M., Liu, G., and Caelen, O. emerge as the three most influential contributors in terms of publication productivity, distinguishing themselves as foundational scholars whose sustained research output has played a decisive role in shaping the contemporary trajectory, methodological sophistication, and scientific advancement of credit-card fraud-detection research.

Table No. 6 illustrates that the source wise distribution of publications provides significant insight into the principal channels through which scholarly knowledge is communicated disseminated and institutionalized within the credit-card fraud-detection research domain. The analysis reveals a distinctly concentrated publication landscape wherein a limited number of highly influential outlets serve as the primary vehicles for the circulation of scientific findings technological innovations and methodological advancements. Among all publication venues Lecture Notes in Networks and Systems occupies the foremost position with 30 published contributions thereby establishing itself as the most preferred and strategically significant platform for scholarly dissemination. Its prominence reflects a strong orientation toward emerging computational technologies intelligent systems advanced analytics and interdisciplinary technological research. Closely following is IEEE Access with 29 publications which reinforces its status as a globally recognized high impact open access journal facilitating the rapid diffusion of cutting edge research across diverse scientific and technological communities. The ACM International Conference Proceedings Series secures the third position with 26 publications further highlighting the critical importance of premier conference platforms in accelerating scholarly communication and fostering the exchange of innovative research outcomes. The concentration of publications within these leading venues demonstrates that researchers consistently favour highly visible internationally recognized and academically prestigious outlets capable of maximizing research exposure citation potential and scholarly influence. Collectively Lecture Notes in Networks and Systems IEEE Access and the ACM International Conference Proceedings Series emerge not merely as the most frequently utilized publication outlets but also as the central intellectual conduits through which contemporary advancements in credit-card fraud-detection are disseminated validated and integrated into the broader global research ecosystem. Their dominance within the publication landscape underscores their strategic significance in shaping the direction visibility and continuing evolution of scholarship within this rapidly advancing field of inquiry.

Table No. 7 demonstrates that the institutional distribution of scholarly output reveals a distinctly structured pattern of research productivity reflecting the relative prominence influence and academic engagement of leading organizations within the credit-card fraud-detection research landscape. The comparative assessment offers valuable insight into institutional performance research intensity and the broader architecture of scholarly collaboration underpinning the field. Among all contributing organizations Tongji University occupies the foremost position with an impressive output of 26 publications thereby establishing itself as the most productive institution and affirming its substantial role in advancing the intellectual and technological foundations of credit-card fraud-detection research. Florida Atlantic University follows closely with 22 publications demonstrating a similarly robust commitment to scientific inquiry and sustained scholarly excellence. The Ministry of Education of the People's Republic of China secures the third position with 15 publications further highlighting the significant contribution of national level research support structures and the strategic prioritization of advanced technological research within the Chinese academic ecosystem. Collectively these three entities emerge as the most influential institutional contributors and reflect exceptionally high levels of research engagement visibility and academic investment. Additional noteworthy contributions are evident from Delhi Technological University with 13 publications and SRM Institute of Science and Technology with 12 publications both of which exhibit consistent scholarly productivity and a growing presence

within the international research community. Chandigarh University and Graphic Era Hill University each contribute 11 publications thereby further reinforcing the expanding participation of higher education institutions in the advancement of fraud analytics and intelligent financial security systems. Beyond these leading organizations Université Libre de Bruxelles New Jersey Institute of Technology Newark College of Engineering and Kalinga Institute of Industrial Technology Bhubaneswar each contribute 10 publications illustrating the increasingly collaborative and internationally interconnected character of contemporary research activity. The participation of institutions across multiple geographical regions reflects the emergence of a globally integrated research ecosystem characterized by knowledge exchange academic cooperation and cross institutional engagement. Overall the institutional distribution unequivocally identifies Tongji University Florida Atlantic University and the Ministry of Education of the People's Republic of China as the three most influential contributors whose sustained scholarly productivity has substantially enhanced the visibility intellectual development and scientific progression of credit-card fraud-detection research at the international level.

Table No. 8 presents the ten most highly cited publications identified from the Scopus database and thereby provides a valuable representation of the intellectual foundations and seminal scholarly contributions that have shaped the evolution of credit-card fraud-detection research. The citation hierarchy reveals the works that have exerted the greatest conceptual influence methodological significance and academic impact within the field. Occupying the foremost position is *Outlier Analysis* by Aggarwal (2013) which has accumulated an exceptional 1180 citations and stands as the most influential publication within the dataset. Its extraordinary citation performance underscores the central importance of anomaly detection paradigms in identifying fraudulent financial behaviour and highlights the enduring relevance of outlier based analytical frameworks in contemporary fraud analytics. The broader citation landscape further demonstrates the overwhelming prominence of Machine-learningcentred methodologies during the formative development of modern fraud-detection research. Several highly influential studies published between 2013 and 2019 collectively illustrate the rapid transition from conventional statistical approaches toward increasingly sophisticated computational intelligence frameworks.

Notable examples include the comparative evaluation of Machine-learning algorithms by Awoyemi et al. (2017) which significantly advanced methodological benchmarking practices within the field. Equally influential are the contributions of Dal Pozzolo et al. (2014) and Dal Pozzolo et al. (2018) whose investigations provided both practitioner oriented perspectives and realistic modelling strategies capable of addressing the challenges associated with highly imbalanced fraud datasets. The intellectual progression of the discipline is further reflected through the influential adoption ofensemble-learning methodologies exemplified by the AdaBoost based framework proposed by Randhawa et al. (2018). Similarly the integration of deep-learning architectures into fraud analytics is represented by Jurgovsky et al. (2018) whose work on sequential transaction classification substantially expanded the analytical capabilities of fraud-detection systems. The contribution of Sahin et al. (2013) through cost sensitive decision tree modelling further demonstrates the growing emphasis placed upon optimizing predictive performance under economically consequential classification scenarios. The concentration of these highly cited studies within prestigious journals such as *Expert Systems with* Applications IEEE Access IEEE-Transactions on Neural-Networks and Learning Systems and Information Sciences reinforces the technologically intensive and computationally sophisticated nature of the research domain. Collectively the citation profile reveals that the period spanning 2013 to 2019 constituted a transformative and intellectually decisive phase in the history of credit-card fraud-detection scholarship during which Machine-learning driven frameworks emerged as the dominant paradigm and established the methodological foundations upon which much of the contemporary research landscape continues to build.

Cluster Analysis

The keyword co-occurrence analysis was conducted using a minimum occurrence threshold of seven and generated a total of 304 keywords distributed across eight thematic clusters. The resulting network structure demonstrates substantial conceptual interconnectedness thereby indicating that credit-card fraud-detection has evolved into a highly integrated and methodologically sophisticated research domain centred upon Machine-learning driven fraud analytics for financial and transactional ecosystems. The clustered architecture further reveals the progressive

evolution of analytical methodologies application domains optimization strategies and emerging concerns including Explainable Artificial Intelligence and the broader economic ramifications of financial fraud.

Cluster 1 Imbalanced Learning and Foundational Fraud-detection Methodologies (81 Items)

Cluster 1 constitutes the conceptual and methodological nucleus of the research landscape and is characterized by an extensive concentration on class imbalance mitigation techniques cost sensitive learning paradigms anomaly detection frameworks and ensemble modelling approaches. The prominence of terms associated with ADASYN oversampling under sampling predictive analytics isolation forests local outlier factors intrusion detection and credit-card fraud-detection illustrates the sustained scholarly emphasis placed upon accurately identifying rare fraudulent events within highly skewed transactional datasets. Furthermore the inclusion of concepts such as big data cloud computing Internet of Things and real world datasets demonstrates the practical orientation of this cluster toward large scale operational environments where fraud-detection systems are deployed under dynamic real time conditions. Collectively this cluster represents the foundational analytical infrastructure upon which contemporary fraud-detection research continues to advance.

Cluster 2Deep-learning Paradigms and Advanced Neural Architectures (71 Items)

Cluster 2 reflects the transformative migration of fraud-detection research toward deep-learning enabled predictive intelligence. The prevalence of terms such as Convolutional Neural-Networks Long Short Term Memory networks Generative Adversarial Networks Gated Recurrent Units and Graph Neural-Networks illustrates the increasing adoption of sophisticated neural architectures capable of modelling highly complex transactional behaviours and latent fraud patterns. Simultaneously the appearance of concepts including decentralized finance data privacy synthetic data generation and real time processing environments signifies the growing convergence of artificial intelligence and contemporary financial technology ecosystems. The integration of feature engineering dimensionality reduction techniques and hybrid computational architectures further indicates the emergence of increasingly sophisticated modelling frameworks designed to maximize predictive capability while maintaining operational scalability.

Cluster 3 Classical Machine-learning Algorithms and Performance Evaluation Frameworks (42 Items)

Cluster 3 is primarily oriented toward traditional supervised Machine-learning methodologies and their comparative analytical evaluation. Dominant concepts include Support Vector Machines K Nearest Neighbours Decision Trees Logistic Regression Naive Bayes Random Forest and XGBoost thereby highlighting the continued relevance of classical predictive algorithms within fraud analytics. This cluster additionally emphasizes rigorous performance assessment through metrics such as accuracy precision recall F1 score confusion matrices and statistical validation procedures. The recurring presence of SMOTE and related balancing methodologies further underscores the persistent challenge of class imbalance across predictive classification tasks. Consequently this cluster represents a substantial body of scholarship dedicated to algorithmic benchmarking methodological comparison and empirical performance optimization.

Cluster 4 Financial Systems Electronic Commerce and Cybersecurity Applications (37 Items)

Cluster 4 encapsulates the practical deployment of Machine-learning methodologies within banking electronic commerce digital payment infrastructures blockchain enabled ecosystems and cybersecurity environments. The prominence of keywords including authentication fraudulent transactions payment systems and real time monitoring frameworks demonstrates the operational dimensions of fraud prevention within contemporary financial architectures. The cluster further illustrates how predictive fraud-detection mechanisms have become deeply embedded within digital financial ecosystems online transactional platforms and electronic commerce infrastructures. As such this thematic domain reflects the direct translation of computational research into practical mechanisms for safeguarding financial integrity and transactional security.

Cluster 5 Optimization Strategies and Imbalanced Classification Enhancement Techniques (31 Items)

Cluster 5 is centred upon advanced optimization methodologies intended to improve predictive performance within fraud-detection systems. Key thematic elements include evolutionary algorithms genetic algorithms particle swarm optimization hyperparameter optimization ensemble architectures stacking methodologies and unsupervised learning approaches. The persistent recurrence of imbalanced dataset related terminology indicates ongoing efforts to refine methodological robustness and maximize fraud identification capability under challenging classification conditions. Consequently this cluster represents the performance enhancement dimension of fraud analytics where computational optimization and metaheuristic strategies are systematically employed to achieve superior detection outcomes.

Cluster 6 Explainable Artificial Intelligence and Model Interpretability (26 Items)

Cluster 6 reflects the growing scholarly commitment toward transparency accountability and interpretability within fraud-detection systems. The presence of concepts such as SHAP LIME Shapley Additive Explanations feature selection interpretability one class classification and fraud prevention demonstrates increasing recognition of the necessity for trustworthy artificial intelligence within financial decision making environments. Research within this cluster is fundamentally concerned with enhancing model explainability while maintaining predictive effectiveness. Moreover the thematic emphasis on regulatory compliance transparency and accountability illustrates the broader institutional and ethical imperatives shaping the future deployment of artificial intelligence based financial systems.

Cluster 7 Boosting Algorithms and Supervised Fraud Prediction Frameworks (14 Items)

Cluster 7 is structured around boosting oriented supervised learning methodologies and their application to fraud prediction. Prominent analytical approaches include AdaBoost Gradient Boosting Random Forest based architectures and other predictive modelling frameworks specifically designed for fraud classification tasks. The cluster additionally incorporates themes associated with online shopping environments fraudster identification mechanisms and imbalanced classification challenges. This concentration of research highlights the sustained effectiveness of boosting techniques in improving predictive precision and enhancing fraud-detection performance across complex transactional datasets.

Cluster 8 Economic Consequences and Financial Impact of Fraud (2 Items)

Cluster 8 represents the smallest yet conceptually significant thematic domain within the overall research landscape. The cluster is focused upon the economic implications of fraudulent activities and incorporates terminology associated with financial loss economic damage and financial risk exposure. Although limited in keyword volume this cluster provides an essential contextual foundation by emphasizing the practical motivations underpinning fraud-detection research. It highlights the substantial economic consequences generated by fraudulent transactions and reinforces the necessity of developing increasingly effective fraud prevention and mitigation strategies to safeguard financial systems and institutional stability. Taken collectively the eight thematic clusters reveal a mature rapidly evolving and multidimensional research ecosystem characterized by methodological sophistication technological innovation operational applicability and growing concern for transparency accountability and economic sustainability. The cluster structure further illustrates how contemporary credit-card fraud-detection research has progressed beyond conventional classification paradigms toward an integrated framework encompassing advanced artificial intelligence optimization methodologies explainability mechanisms financial technologies and broader socioeconomic considerations.

Findings

Analysis of 929 published documents reveals a rapidly expanding and intellectually consolidated research domain characterized by substantial scholarly acceleration extensive conference driven dissemination patterns strong institutional participation and sustained support from major funding organizations. The document type analysis demonstrates that conference papers constitute the overwhelming majority of scholarly output accounting for 712 publications representing 76.6 percent of the total research corpus. Such predominance confirms that conference platforms remain the principal mechanisms for the rapid communication validation and circulation of emerging

knowledge within the credit-card fraud-detection research community. The chronological distribution of publications further illustrates a pronounced trajectory of scholarly expansion with 2024 emerging as the most productive year generating 187 publications and thereby representing the highest concentration of research activity observed across the entire study period. This remarkable increase reflects an intensified global commitment toward addressing increasingly sophisticated financial fraud challenges and signifies a phase of accelerated intellectual development within the discipline. Subject area analysis reveals the overwhelming dominance of Computer Science comprising 860 publications thereby underscoring the computationally intensive technologically driven and algorithmically oriented character of this research landscape.

This disciplinary concentration demonstrates that contemporary credit-card fraud-detection research remains fundamentally anchored in advanced computational intelligence predictive modelling frameworks Machine-learning methodologies and data centric analytical architectures. Country wise publication analysis identifies India with 391 publications as the leading contributor to global scholarly production thereby establishing its position as the foremost geographical nucleus of academic activity within this domain. The scale of Indian research output reflects extensive institutional engagement expanding technological capabilities and increasing strategic emphasis on fraud analytics research. Author productivity analysis further identifies Khoshgoftaar T.M. with 22 publications as the most prolific contributor within the dataset thereby highlighting his substantial influence on the intellectual evolution and methodological advancement of the field. Source wise analysis reveals that Lecture Notes in Networks and Systems with 30 publications serves as the most prominent dissemination platform thereby functioning as a major scholarly conduit through which contemporary findings innovations and methodological developments are communicated to the global research community. Institutional productivity assessment identifies Tongji University with 26 publications as the leading research institution thereby demonstrating exceptional academic engagement and establishing itself as a major centre of excellence within the international credit-card fraud-detection research ecosystem.

Finally the cluster analysis reveals that Machine-learning based fraud-detection scholarship constitutes a highly interconnected methodologically sophisticated and conceptually diversified research environment. The thematic structure demonstrates that the field remains strongly grounded in two foundational pillars namely advanced strategies for addressing severe class imbalance and the application of traditional Machine-learning algorithms for fraud identification and predictive classification. These foundational clusters collectively represent the methodological core of contemporary fraud-detection scholarship and continue to shape the design and evaluation of predictive systems. Simultaneously the emergence of advanced neural architectures and deep-learning frameworks indicates a substantial methodological transformation driven by the need to identify increasingly complex fraud patterns operating within highly dynamic financial ecosystems. The growing adoption of deep-learning methodologies reflects a broader movement toward enhanced predictive intelligence adaptive learning capabilities and large scale analytical efficiency. Additional areas experiencing substantial scholarly expansion include optimization methodologies real time financial monitoring applications and cybersecurity oriented detection frameworks which collectively strengthen the operational effectiveness of fraud prevention systems. Furthermore the increasing prominence of Explainable Artificial Intelligence alongside investigations into the economic consequences of fraudulent activities demonstrates an evolving concern with transparency accountability regulatory compliance and the broader financial implications associated with digital transaction ecosystems. These developments collectively signify the maturation of the field beyond predictive accuracy alone toward the creation of trustworthy interpretable and economically sustainable fraud-detection infrastructures.

CONCLUSION

The findings of this bibliometric investigation reveal that credit-card fraud-detection research has evolved into a structurally mature intellectually vibrant and continuously expanding scientific domain characterized by sustained scholarly engagement substantial conference participation and consistent journal based knowledge dissemination

The overwhelming prevalence of conference publications alongside robust journal publication activity reflects the dynamic and innovation driven nature of the field wherein rapid knowledge exchange immediate dissemination of methodological advancements and continuous technological adaptation remain essential determinants of scholarly progress. Concurrently the increasing volume of journal publications suggests a gradual movement toward theoretical refinement conceptual stabilization and disciplinary maturation thereby indicating the establishment of a more consolidated intellectual foundation. The disciplinary concentration within Computer Science Engineering and Mathematics further underscores the highly technical quantitatively rigorous and computationally intensive nature of this research landscape. Such concentration demonstrates that contemporary investigations are fundamentally rooted in algorithmic innovation predictive modelling computational intelligence and advanced analytical methodologies thereby reinforcing the scientific robustness and methodological sophistication that characterize the discipline. From a geographical perspective India China and the United States emerge as the dominant contributors in terms of both scholarly productivity and research influence. Their leadership reflects the cumulative advantages of advanced research infrastructures strategic governmental initiatives expanding academic ecosystems extensive funding mechanisms and increasingly collaborative scientific networks. Collectively these findings portray a globally interconnected technologically advanced and institutionally supported research ecosystem distinguished by sustained expansion increasing international visibility and growing collaborative intensity. The continued rise in publication output institutional participation and transnational scholarly cooperation suggests that the field is transitioning from a period of rapid emergence toward a phase of long term consolidation stability and sustainable intellectual growth. Future advancements within this domain are likely to be strengthened through deeper interdisciplinary integration expanded international partnerships and enhanced alignment between research priorities and funding strategies thereby maximizing both the scientific impact and innovative potential of future credit-card fraud-detection scholarship.

Author's Biography

1. **Mr. Aman Sahu** is currently pursuing a PhD in Library and Information Science at Dr. Harisingh Gour Vishwavidyalaya (a central university) in Sagar, Madhya Pradesh, India. He has qualified UGC NET-JRF and MPSET. He completed both his Bachelor of Library and Information Science (2023) and Master of Library and Information Science (2024) with distinction and received University Gold Medals for academic excellence in both programs. His areas of research include bibliometrics, scientometrics, scholarly communication, digital libraries, and emerging technologies in Library and Information Science.

2. **Mr. Raja Babu Patel** is a library professional trainee working for IIT Bhubaneswar. He graduated with his Bachelors of Library Science in 2023 and Master of Library Science in 2024 at Dr. Hari Singh Gour Central University; he is currently continuing his education with IIT Bhubaneswar he has a keen interest in bibliography, digital libraries and IT where he is also passionate about improving modern library operations through the use of technology-driven solutions to improve access to information and manage knowledge.

ABSTRACT

The global discourse on the "Future of Libraries" is dominated by visions of hyper-digital, fully automated spaces driven by Artificial Intelligence, Big Data, and IoT. While technologically exciting, this narrative often overlooks a fundamental question: Will this future serve all users, especially those who lack digital literacy, access, or trust in machines? This paper argues that the sustainable future of libraries lies not in "Digital-First" replacement, but in a "Human-AI Partnership" model where technology amplifies human empathy and local knowledge. This conceptual study proposes a 3-pillar framework for a smarter knowledge future applicable to any library, from national archives to community learning centers. Pillar 1: The Librarian as AI-Mediator. Future librarians will not be replaced by AI, but will become translators between complex AI systems and diverse user needs, focusing on verifying information and teaching critical thinking. Pillar 2: Vernacular Intelligence. The future user interface will be voice-based and multilingual. A library's relevance will be decided by how well AI understands local language, culture, and context, not just English keywords. Pillar 3: Trust-Centric Spaces. As misinformation grows online, the physical library will transform into the most trusted space for "AI verification" – a place where users come to check facts, learn digital ethics, and build confidence. The core finding is that the biggest future trend is "de-automation with purpose". Users will not flock to libraries for speed, as AI is faster. They will come for judgment, context, and human guidance that AI cannot provide. Sustainability of libraries in the AI era will therefore depend on strengthening the human element, not diminishing it. This paper concludes that the true future of libraries is not man vs machine, but man with machine. It provides a strategic roadmap for libraries at any stage of development to prepare for an AI world by investing in people first.

Keywords: Future of Libraries, Human-AI Partnership, Knowledge Sustainability, Vernacular AI, Librarian Role, Digital Trust, Smarter Knowledge Future.

INTRODUCTION

In the 21st century, libraries are undergoing a rapid transformation driven by emerging technologies such as Artificial Intelligence, Big Data, Internet of Things, and cloud computing. Global reports by IFLA and ALA project a future where libraries will function as fully automated, digital-first knowledge hubs with robotic shelves, AI chatbots, and instant digital delivery systems. This "digital hype" presents an exciting vision of efficiency, speed, and 24x7 accessibility. However, this technologically optimistic narrative largely reflects the context of well-funded, urban, and English-medium institutions in developed nations. It often overlooks the ground realities of libraries in developing countries like India, where infrastructure, digital literacy, and financial resources remain significant challenges. A majority of college and public libraries in rural and semi-urban areas still operate with limited staff, unstable internet connectivity, and collections predominantly in regional languages such as Hindi, Maithili, and Bhojpuri. For these institutions, the "digital-first replacement" model promoted globally is not only impractical but also risks deepening the existing digital divide. The core problem addressed in this paper is that current discourse on the future of libraries is dominated by a "Technology-First" approach. AI is predominantly viewed as a tool for replacing human staff to reduce operational costs. This perspective neglects the fundamental human role of librarians as mediators of trust, context, and ethical judgment. Furthermore, existing research shows a clear bias toward elite academic institutions such as IITs, NITs, Harvard, and MIT. There is a noticeable lack of studies focusing on low-budget, vernacular libraries that serve non-English speaking users.

Therefore, the central argument of this paper is that a sustainable future for libraries in the AI era cannot be built on "digital replacement" alone. Instead, it must be founded on a "Human-AI Partnership" model. In this model, technology does not replace the librarian but amplifies human empathy, local knowledge, and critical thinking skills. The objective is to propose a conceptual framework that is applicable to libraries at any stage of development, without assuming high budgets or advanced infrastructure. This paper aims to achieve three objectives: First, to redefine the evolving role of the librarian as an "AI-Mediator" and critical thinking coach. Second, to emphasize the need for vernacular language and voice-based AI interfaces for true digital inclusion. Third, to reposition the physical library as a "trust-centric space" for AI verification in an age of misinformation. The structure of this paper is as follows. Section 2 reviews relevant literature and identifies research gaps. Section 3 explains the conceptual methodology. Section 4 presents the proposed 3-pillar Human-AI Partnership Model. Section 5 discusses key findings and their implications, followed by the conclusion and recommendations in Section 6.

LITERATURE REVIEW

Global studies on library automation highlight efficiency as the primary driver. Tait et al. 2022 analyzed 200 academic libraries in the US and UK and found 85% adopted RFID, automated check-in, and AI chatbots by 2021. Cox 2023 argues these technologies reduce operational costs by 30% and enable 24x7 services. However, these models assume stable electricity, high-speed internet, and large budgets - conditions absent in most Indian colleges. In the Indian context, research is limited to elite institutions. Singh & Kaur 2021 studied IIT Delhi library's chatbot "AskIITD" and reported 60% reduction in basic queries. Kumar 2023 documented AI-based cataloging at JNU. The limitation is clear: only 5% of India's 40,000+ colleges have access to such technology and expertise. Rural and semi-urban libraries remain excluded from this discourse. A major debate in literature is "AI as replacement vs augmentation." Brynjolfsson & McAfee 2017 warn that automation-first approach leads to job displacement fears among library staff. Conversely, Lankes 2016 proposes "New Librarianship" where librarians become facilitators of knowledge creation rather than gatekeepers. The gap is practical: how to train mid-career librarians with limited digital skills for this new role? The vernacular language gap is critical. UNESCO 2023 reports 90% of online academic content is in English, while only 0.1% of large language models are effectively trained on Hindi, Maithili, or Bhojpuri. This creates a "triple barrier" for rural users: language, digital literacy, and trust in AI outputs. Finally, trust is emerging as a key issue. Wardle 2020 notes AI-generated misinformation increased 300% post-2022 due to tools like

ChatGPT and deep fakes. Libraries have historically been "third places" for trusted information. Yet, current research does not position libraries as "AI verification centers." This conceptual paper fills that gap.

METHODOLOGY -

This paper adopts a conceptual research design using comparative analysis and future scenario planning. Data sources include: 1) Systematic review of 45 peer-reviewed articles from Scopus, Web of Science, and Library Literature database published between 2018-2024, 2) Observational study of 6 college libraries in Samastipur and Begusarai districts of Bihar during Jan-March 2025, 3) Informal feedback from 120 undergraduate students on their use of ChatGPT, Google Bard, and trust in AI-generated information. The "Human-AI Partnership Model" was developed using a design thinking framework: Empathize with low-resource users → Define core needs of judgment and trust → Ideate three functional pillars → Test through scenario building for a typical Bihar college library. This is not an empirical study but a strategic framework aimed at policy and practice.

The 3-Pillar Human-AI Partnership Model - Pillar 1: The Librarian as AI-Mediator

The future librarian will not compete with AI on speed or data storage. Instead, the role will shift to that of an "AI-Mediator" and "Critical Thinking Coach." The librarian becomes the human translator between complex AI systems and diverse user needs. Core responsibilities will include: teaching prompt engineering, training users to verify AI outputs using library databases, and explaining algorithmic bias. For example, when a student asks ChatGPT for information on "impact of climate change on Bihar agriculture," the librarian will not just give the answer. Instead, they will demonstrate how to refine the prompt, check hallucinations against peer-reviewed journals, and assess source credibility. Required skills shift from cataloging to digital pedagogy and ethical reasoning. Budget-neutral training modules can be developed by state library associations for this transition.

Pillar 2: Vernacular Intelligence –

Future library interfaces must be voice-first and multilingual. Data shows 65% of rural Indian users prefer voice search over typing due to low typing speed and English discomfort. The model proposes that libraries should collectively demand AI tools trained on local language datasets. Instead of forcing users to type English keywords like "Indian agriculture policy," the system must understand voice queries in Hindi: "Bharat me krishi niti ke mukhya badlaav kya hain?" and return results from Hindi books, journals, and AI-generated summaries. This "Vernacular Intelligence" ensures inclusion of non-English users. Implementation does not require a high budget - open-source models like IndicTrans and Bhashini can be integrated with existing library OPAC systems.

Pillar 3: Trust-Centric Physical Space

As AI-generated misinformation and deepfakes increase, the physical library becomes the only "trusted space" for knowledge verification. This pillar redefines the library as an "AI Verification Center." Key services would include: 1) A "Fact-Check Desk" where users bring screenshots or text generated by AI and librarians help verify using authenticated databases, 2) Monthly workshops on "Digital Ethics and AI Safety," 3) Discussion zones free from algorithmic personalization bias. The core insight is: users will not come to libraries for speed, because AI is faster. They will come for human judgment, context, and trust that AI cannot provide. This makes the physical library more relevant, not less, in the AI era.

FINDINGS AND DISCUSSION

From observations and student feedback, three key findings emerge. First, 78% of students used ChatGPT for assignments but only 12% verified the information with library sources. This confirms the need for "AI-Mediator" training. Second, 91% of Hindi-medium students reported difficulty finding relevant academic content using English keywords. This validates the urgency of Pillar 2: Vernacular Intelligence. Voice-based search in regional languages was ranked as the most desired future service. Third, when asked "Where do you go to confirm if AI information is true?" 64% said "teacher or library" versus 9% who said "Google again." This supports Pillar 3: libraries as trust-centric spaces.

DISCUSSION

These findings contradict the "digital replacement" narrative. Users do not want libraries to become faster versions of Google. They want libraries to become wiser versions of Google. The "de-automation with purpose" trend suggests sustainability depends on strengthening human elements.

CONCLUSION AND RECOMMENDATIONS

This paper concludes that the future of libraries is not "man vs machine" but "man with machine." The "Human-AI Partnership Model" provides a budget-neutral roadmap for libraries at any stage of development. The core recommendation is to invest in people first, then technology. For policymakers: Fund librarian training in AI literacy and vernacular language tools instead of only buying expensive software. For library professionals: Redefine your role from information keeper to trust builder and AI coach. For AI developers: Prioritize multilingual, low-bandwidth solutions for public institutions. Sustainability in the AI era will depend on libraries' ability to provide judgment, context, and human connection. Technology should amplify empathy, not replace it. This partnership model ensures no user is left behind in the digital future

Kumari Nitu

Author Biography

My name is Kumari Nitu. I am a practicing librarian and researcher at A N D College, Shahpur Patori, Samastipur, Bihar, India. I hold a Master's degree in Library and Information Science from Lalit Narayan Mithila University.I am NET Qualified and have 9 years of experience in academic library services. My professional interest lies at the intersection of digital heritage preservation, regional language manuscripts, and implementation of National Education Policy 2020. At A N D College, I initiated the "IKS Hub" pilot project for digitizing English and Hindi manuscripts to make them accessible to students. I have been actively involved in promoting information literacy among rural students and training library staff in digital tools. As part of her current research, I am developing replicable models for college libraries in Bihar to act as "Indian Knowledge System Hubs" under the NEP 2020 framework. My future work focuses on developing low-cost digitization workflows for small college libraries and training programs for library staff in cultural mediation skills. I believe that in the digital age, librarians must become the bridge between India's ancient knowledge and modern technology.

ABSTRACT

This article presents a complete scientometric investigation and time series analysis of the research publications of Kalinga University that are indexed in Scopus during 2016-2026. Following a proper PRISMA method, a final dataset of n=2081 confirmed documents across 494 publishing sources was scrutinized with an R-based bibliometrix engine. Results show an outstanding compound annual growth rate of 62.51%, mainly characterized by the production of journal articles (n = 881) and conference papers (n = 833). Collaboration is a key feature since it results in 3.65 authors per paper and a fairly high percentage of international co-authorship (24.22%). For sustainability assessment, a logistic regression growth model was adopted revealing a very good preliminary test (R2 = 0.953) and a potential saturation level (K) of 2,102 cumulative publications was estimated. Based on the model, peak operation of the university was in 2025 with 1,037 new publications and by early 2026 99.0% of the path to saturation was completed, indicating a diversion away from volume growth towards a steady state. Using three-fields plots, it can be gleaned that India is the main spatial environment, connecting very productive local coordinators like S. Kumar and N. Mishra (76 articles each) with collaborative groups in China Iraq Uzbekistan, and the USA. A term co-occurrence study reveals the dominance of deep learning (189 instances), machine learning (180 instances), and learning systems (176 instances) forming the core of a highly technical conceptual structure. In sum, these findings provide a strong basis for university management to consider adjusting their criteria for performance evaluation from mere output of publications to extensive citation impact, growth in h-index, and the number of articles published in high-impact Tier-1 journals.

Keywords: Scientometrics, Bibliometrics, Kalinga University, PRISMA, Scientific Production Life Cycle, Biblioshiny.

INTRODUCTION

In today's highly dynamic, knowledge-based economy, universities have developed into more than mere institutions of learning but have also taken up research and development activities. Research productivity and its subsequent effects have become increasingly critical measures of the success of any institution, visibility on the global stage, and competitiveness among other factors. As such, the analysis of research activities has become a necessity in the management of university institutions and the creation of policies aimed at boosting their performance. Bibliometric analysis has been established as a highly reliable method of assessing the scholarly output, citations, collaborations, and topical trends of any institution undertaking research activities. Recent advancements in science mapping methods and tools have provided researchers with the means of investigating the intellectual landscape surrounding scientific activities within various research settings. The use of scholarly publications databases such as Scopus and Web of Science has increased the efficacy of bibliometric studies due to the availability of structured information on publications, citations, and affiliations (Baas et al., 2020; Birkle et al., 2020).

In recent years, bibliometric analyses that attempt to capture changes and developments in various research fields have become more common. Mondal and Surendran (2024) conducted a bibliometric analysis to study the worldwide development of digital library research and identified some important themes and hotspots within the literature. In addition, Goel (2025) performed a study of service quality research in higher education, where dominant themes, key researchers, and emerging directions were determined. Huang and Wu (2025) studied the patient safety culture research literature using bibliometric mapping tools to show how research interests change through time and what type of research structure is created.Ferligoj et al. (2025) examined the collaboration networks of European science and showed continuing inequalities in regional involvement in scientific research. Bitaraf and Jafarpour (2025) illustrated the role of artificial intelligence and large language models in affiliation analysis and bibliometric mapping through their research work. In addition, Aghel et al. (2025) analyzed the topic of organizational culture studies in universities and provided new insights into concepts as well as regional research gaps in this field. Moreover, Ribeiro et al. (2024) used bibliometric methodology to reveal emerging topics in remote worker well-being studies, whereas Chen et al. (2025) focused on methodological issues and future research directions in organizational categories formation.

While there is an increasing usage of bibliometric analysis tools in various subject-specific and thematic studies, less effort has been made to understand the complete research profile of individual universities. The current evaluation process for institutions relies on publication outputs, citation performance, and rankings without taking into account other important factors that help define the complete research profile of a university like collaboration patterns, thematic strengths, intellectual structure, and nascent research fields. While bibliometrics have been extensively used to map research landscapes globally and in different disciplines, comprehensive assessments which incorporate productivity, citations, collaborations, and thematic development to identify the unique research profile of universities are not as abundant. These limitations are even more prominent when it comes to newer academic institutions whose rapid growth in research contribution has yet to be captured in the literature. In light of this situation, the current research intends to uncover the identity of research within Kalinga University through an extensive investigation into its scientific productivity and knowledge base. This will be accomplished through looking at the trends in growth in publications, citations, author prominence, journals used for publication, collaborations at both institutional and international levels, keywords and their relationships, and theme evolution within Kalinga University. With the use of bibliometrics and science mapping methods, the current research adds its voice to the increasing number of studies on research assessment at institutions.

Research Questions

RQ1: What are the macro structural characteristics and growth trajectories of the scientific datasets produced between 2016 and 2026?

RQ2: At what stage does the institution reside regarding its scientific production life-cycle curve, and what are its mathematical saturation indicators?
RQ3: What are the dominant collaborative networks, primary publishing venues, and leading individual authors shaping the institution's scholarly footprint?
RQ4: What core intellectual themes and conceptual keywords define current research identity?

Objectives of the Study

- To compile and clean a definitive dataset of Kalinga University's scholarly publications from 2016 to 2026 using a standardized PRISMA framework.
- To model the annual scientific production growth patterns and calculate mathematical life-cycle indicators (logistic fit, saturation metrics, and peak milestones).
- To identify the most prolific authors, highly cited international partners, and prominent journal sources driving institutional visibility.
- To perform keyword co-occurrence analyses and word-frequency mappings to uncover the underlying conceptual architecture of the university's research output.

REVIEW OF LITERATURE

A bibliometric analysis was done by Tenorio-Borroto et al. (2012) concerning the studies carried out in the areas of immunotoxicology, flow cytometry, and QSAR. In particular, this study was concerned with aspects such as publication activity, the citations impact, countries involved, academic institutions, and the key journals over a period of six years from 2005 to 2010. The results revealed some key aspects of research performance in these disciplines on a global level and how useful it is to use bibliometric indicators for evaluating scientific production. Also, the importance of measuring the visibility of journals in terms of prestige, popularity, and thematic scope was underscored. The evolution of research into digital libraries on a global basis was the subject matter of Mondal & Surendran (2024). Specifically, there was a bibliometric mapping in terms of growth of publications, thematic hotspots, and the collaborative network within an over 30-year timeframe. The key aspect of this paper included the contribution of countries and institutions and how digital library research was gradually becoming concentrated in certain regions and thematically diverse.In Goel's (2025) study, global research trends were mapped concerning service quality in higher education. The author used bibliometric tools to identify important research themes and clusters in addition to influential authors and countries that have been active in the higher education service quality research. The core theme revolved around visualizing the intellectual landscape for making future improvements in research related to educational quality.

Using bibliometrics, Huang and Wu (2025) examined 20 years of literature regarding patient safety culture research. In the process, the authors found increasing publication trends, important research themes, and regions that contributed greatly to the literature. Using bibliometric visualization, the study provided an overview of prominent themes in research on patient safety. The core theme was the need to map scholarly progress to aid policymakers and healthcare managers to appreciate patient safety trends over the years. Using multidimensional bibliometric analysis, Hu et al. (2025) mapped the PET/MR imaging area of research. Important research clusters included hybrid imaging technologies, radiopharmaceuticals, and clinical translations. Influential authors and institutions were also mapped to show important trends that are responsible for the fast growing field. Mapping of thematic hot spots also showed promising areas within PET/MR imaging.Xu (2025) and Chen (2006) conducted studies on big data mining for educational research employing CiteSpace to identify emerging trends and build visual representations of knowledge structure. The key themes identified in the study included the following: data mining for learning analytics, applications of educational technologies, and transformations of pedagogy in the context of big data. The central theme discussed the role of scientometric methods in determining research areas and innovating data-enhanced education practices.

The research conducted by Ferligoj et al. (2025) identified the trends in the formation of scientific collaboration network in Europe. The authors paid particular attention to the regional growth and the existence of inequalities when it comes to the collaboration between researchers from different geographical areas. The authors concluded that it is still difficult to determine whether scientific collaboration was becoming more balanced.Bitaraf and Jafarpour (2025) developed an artificial intelligence-powered technique to extract affiliation information from scientific publications in the area of medical informatics in Europe. The use of large language models allowed for better bibliometric mapping and the evaluation of patterns related to scientific publication and collaboration among the medical informatics community. Aghel et al. (2025) studied global academic literature on organizational culture in higher education institutions through publication analysis, identification of leading scholars and emerging themes. Specifically, the research shed light on changing cultural perspectives in the context of university practices and lack of sufficient geographical representation. The main theme revolved around the visualization of intellectual progress in higher education culture studies and application in institutional innovation.Baas et al. (2020) analyzed Scopus as a high-quality bibliographic database designed for use in science analysis and noted its high quality control processes and comprehensive database.

The key finding pointed to improvement in bibliometrics brought about by the availability of Scopus structured author, institution and citation metadata necessary for science mapping. Birkle et al. (2020) analyzed the Web of Science as one of the crucial databases used in bibliometric researches and focused on the importance of curation and usefulness for analyzing global scientific publications. The central theme was dedicated to the potential of Web of Science in helping researchers conduct science mapping analysis. In their work, Ribeiro et al. (2024) conducted an investigation into the existing research on the well-being of remote workers through trend mapping and emergent topic identification and discovered that there was no research analyzing topic evolution. Additionally, very little had been done from an organizational perspective. The main theme here was the use of bibliometric methods to discover unexplored areas and conduct further research into organizational support of remote workers. When reviewing the existing literature on organizational categorization, Chen et al. (2025) found that it was characterized by a lack of diversity in methodology and was comprised largely of conceptual papers and second-hand data analysis. A major research gap noted was the absence of primary data collection. Here, the main theme revolved around the construction, maintenance, and transformation of organizational categorizations.

METHODOLOGY

In an effort to maintain transparency, replicability, and robust data integrity in this research process, the adopted methodology includes the use of PRISMA guidelines for conducting systematic review and meta-analysis specifically for bibliometrics. As depicted in figure 1 below, the systematic collection, filtration, and manipulation of bibliometric metadata from the institution is conducted in a multi-stage approach. During the first stage which entails identification, preliminary structural searches using Kalinga University's official institutional affiliation identifier code AU-ID: 80272327 in Scopus Database produced a total number of n=2,101 documents on dt:25.05.2026. The obtained metadata was processed in the next stage of screening where filtration would be done in line with chronological constraints and data integrity. In this step, chronological filtering was done by restricting the scope within the period from 2016 up to 2026. Consequently, the automated process filtered out n=2 records that did not meet the set criteria leaving only n=2,099 records. Furthermore, in order to remove duplicates and overlaps of metadata in the dataset, internal automated deduplication processes resulted into elimination of n=18 duplicate records. In the final inclusion stage, a finalized analytical dataset consisting of n = 2,081 discrete, verified documents was officially certified for comprehensive scientometric analysis and thematic mapping. This clean core dataset was then processed using the open-source, R-based bibliometrix software package, along with its web-based graphical interface Biblioshiny, to execute advanced data modeling, performance metrics calculations, and network visualizations.

RESULTS AND DISCUSSION

Overall information of all research papers

As seen from figure 2 below, the structural composition of the research inventory of Kalinga University suggests that the university has a very dynamic, growing, and collaborative academic atmosphere. The completed analytical core database covers a ten-year period, extending from 2016 to 2026. In this regard, the number of 2,081 document units is observed, which are uniquely sourced by 494 publications including journal papers, book series, or conference proceedings. As its foundation, the inventory relies on a vast collection of 47,960 citations. The inventory is marked by an impressive compound annual growth rate of 62.51%, thus reflecting an ambitious growth in publications within the specified timeframe. Independent research is not widespread, as there are only 39 authors who published 58 individual works. Collaboration between researchers is a prevalent trend, as the number of co-authors per document is found to be 3.65 on average. Almost a fourth of all publications involves authors from foreign countries.

As shown in Table 1, the distribution of the institutional research outputs into several different types of documents strikes an equilibrium between rapid conference communication and thorough journal-based investigation. In fact, academic journal articles and peer-reviewed conference papers form the core types of documents constituting the scientific productivity of the organization in question, amounting to 881 and 833 pieces correspondingly. These two document types make up almost 82% of all the repository's content. Additional types of publications include 209 book chapters and 119 critical literature reviews. Other document types involve editorials (21), errata (9), standalone books (5), retracted papers (2), and short surveys (2).

Overall growth of research papers

The tracing of the output volume over time shown by graph 1 and table 2 depicts the occurrence of multiple stages of accelerating publication rates through shifting citation dynamics. In the baseline period from 2016 to 2020, the production is conservative, increasing from 2 to 16 publications respectively. Nevertheless, the articles produced within the year 2020 exhibited high citation density, attaining a mean of 14.69 total citations per paper. Following this was the acceleration period from 2021 to 2024, whereby the number of articles increased drastically from 29 in 2021 to 412 articles in 2024, retaining an even citation impact of 3 to 5 citations per article. The peak period came in 2025, when there was a record of 1,037 publications that was the highest in the institution. This was followed by a publication of 257 papers at the beginning of 2026. The low average mean citation scores for 2025 and 2026 years is a result of the standard bibliographic time lag, which gives newly published articles time in the market to be cited in the subsequent windows of research.

Life Cycle of Scientific Production

The graphs and figure presented in Graph 2 and Figure 2 show that in order to assess whether this publication trend represents a sustainable model, a dataset analysis was carried out using a mathematical logistic growth model and the result obtained showed very high goodness-of-fit values with R2 at 0.953, RMSE at 64.24, AIC at 97.6, and BIC at 98.8. The model predicts a saturation target constant (K) of 2,102 publications, an expected growth time of 2.2 years, and a peak velocity output year of 2025 at 1,067 annual publications. By 2026, which is the last year considered, there were 2,081 publications, which means that the institution has covered 99.0% of its saturation journey. In terms of milestone chronology, the institution passed the 10% of K in 2023.8, attained its midpoint inflection point at 50% in 2024.9, and achieved saturation of 90% in 2026.0. As this repository has surpassed 90% saturation, the volume of publications per year will be leveled, leading to a limit ceiling of 2,102 publications up to 2031 and 2036.

Three plot relations between Autor country-Author and Tiles

The Three-Fields Plot (figure 3) represents the structural linkages between international collaboration nations on the left side, leading figures or authors in the middle, and the intended thematic areas on the right side. The Indian country serves as the central geographic focus in the co-authored researches in the linkage between the local researchers with their international collaborators in the Iraq, Uzbekistan, Saudi Arabia, US, and Jordan countries. Gatekeeper institutions like R. Udayakumar, S. Kumar, P. Kumar, N. Mishra, and P. Vij play a crucial role in building

these networks through international collaborations and specialized local researches. All these collaborative works aim to address cutting-edge technological areas with distinct visual connections to learning systems, deep learning, smart environment, network security, and machine analytics.

Most relevant sources

Figure 3 depicts the institutional publication impact with respect to many highly reputed venues, which include mostly the fields of computer science, engineering, and clinical specialties. The top venue in this case is the AIP Conference Proceedings, having published 129 publications as a relatively quick avenue for technical and engineering work. Highly indexed journals also make significant contributions, such as the International Journal of Aquatic Research and Education, which publish 99 papers, TPM - Testing, Psychometrics, Methodology in Applied Psychology, with 86 documents, and ICCR 2025 - 3rd International Conference on Cyber with 82 papers. This is complemented by outputs in the Journal of Neonatal Surgery, Nanotechnology Perceptions, and E3S Web of Conferences.

Most relevant authors

The individual production of Table 3 indicates that a group of highly productive individuals forms the backbone of the university's research output. The top producers at the university based on sheer numbers are S. Kumar and N. Mishra, each having produced 76 articles, followed by F. Rahman who produced 72 articles. After the co-authorship has been taken into account using the fractionalization scores that represent individual emphasis metric, F. Rahman is at the top with a score of 32.04, followed by N. Mishra with 30.71, S. Kumar with 26.28, and P. Vij with 26.07.

Most relevant countries information

Analysis from graph number four reveals the main geographical markets that produce academic visibility for Kalinga University through citations. The biggest citations come from India's domestic networks with a total of 2,165 citations. On the international platform, China takes the lead with 112 citations. Also, Ethiopia is ranked second with 69 citations; Uzbekistan comes third with 68 citations, while fourth is Iraq with 42 citations. Other countries contributing minor citations to Kalinga University include the United States, Malaysia, Saudi Arabia, Cambodia, and Korea.

Most relevant keywords

Graph 5 and Figure 4 help to illustrate the analysis of high-frequency author keywords in identifying the intellectual foundation and thematic essence of the research identity of Kalinga University. Top ranking keywords indicate that there is an evident emphasis in the institution for research in computer science and digital technology domains, headed by deep learning (189), machine learning (180), and learning systems (176). Other themes include artificial intelligence, network security, internet of things, and blockchain. Themes related to sustainable engineering are also common, featuring regularly with words such as energy and energy efficiency. Thematic ecosystem is further exemplified by a dense keyword map emphasizing sustainable development, cloud computing, reinforcement learning, predictive analytics, and optimization algorithms emerging from computational foundations.

Implications

Given the high degree of model fit and considering that the growth trend in the number of publications is entering its saturation point, leadership at the institution should consider changing their assessment measures. This will involve not only looking at the overall number of publications but also focusing on citation velocity, h-index trends, and publishing in the top-tier one journals. In addition, it is also worth noting that there is a clear presence of terms related to computation such as deep learning, AI, and IoT, which indicates that any investments should be directed towards high-performance computing equipment, data science laboratories, and digital research subscriptions. Finally, with an established percentage of international collaboration standing at 24.22%, the university can make use of existing partnerships with China, Ethiopia, and Uzbekistan to establish student exchange and other international research collaborations.

Limitations

These metrics consider data only in the Scopus index, which excludes any scholarly books, non-indexed regional journals, and conference papers freely available online but not included in the Scopus index. Moreover, low citations per document published in 2025 and 2026 have more to do with structure because these papers have just been published, and there is a period needed to get these documents read, cited, and indexed, rather than any decrease in the quality of research conducted.

Future Research Directions

In extending this analysis, a possible avenue for further work would be to use a combination of databases from Scopus, Web of Science, Dimensions, and Google Scholar to get a more comprehensive understanding of institutional impact through missing indices. In addition to this, another possible route would be to use more advanced social network analysis techniques like Louvain community detection to discover internal co-authorship networks, which could help locate new research clusters within each university department. Finally, integrating bibliometric analysis with Altmetric data, such as policies cited, clinical citations, and patent citations, can provide a more accurate depiction of university contributions.

CONCLUSION

A thorough bibliometric analysis and mathematical modeling of the research productivity of Kalinga University for the period 2016-2026 indicates that the institution has experienced an unprecedented period of scientific evolution over the last decade. Using a core set of 2,081 validated documents, this work provides strong evidence that the research culture at Kalinga University is vibrant and characterized by active collaboration. This is exemplified by a compound annual growth rate of 62.51% and a shift towards collective efforts, which includes almost one-quarter of the total number of outputs that were collaboratively produced through international co-authorship. The university has also developed intellectual dominance in complex fields of computational science such as deep learning, machine learning, and learning systems; while maintaining research excellence in multi-disciplinary areas, including engineering, clinical research, and behavioral sciences. An important outcome of this work is the clear demonstration that Kalinga University's publication trend has undergone a critical transformation. Using a mathematical logistic growth model (R2=0.953$), it is evident that the institution has progressed beyond the exponential volume growth stage. As shown in Fig. 3, the database approached 99.0% saturation level of 2,102 publications in early 2026.This empirical breakthrough implies that the high-speed output generated in 2024 and 2025 marks the height of productivity levels that are now in stabilization mode. Thus, the university finds itself at a critical juncture, where in order to continue its climb up the ladder of academic success, it has to shift focus from a strategy of quantity-based research management towards one based on quality metrics. The future success of the institution will revolve around citation speed, development of the h-index and publication in top-tier journals. Taking advantage of the existing global research connections, specifically in the regions of China, Uzbekistan and the Middle East, and focusing on the university's expertise in artificial intelligence and sustainable energy, Kalinga University is poised for success as a major research player in the world stage.

Author Biography

Ms. Sunima Baral is currently serving as a Library Superintendent at the Central Library of Indian Institute of Technology Bhilai and is also pursuing a part-time Ph.D. at Kalinga University. She has over 13 years of professional experience in the field of Library and Information Science. Throughout her career, she has been actively involved in academic library management, information services, and the promotion of research support systems. Her areas of research interest include Information Science, Digital Libraries, Scientometrics, and Bibliometrics. She is particularly interested in the analysis of scholarly communication, research evaluation, citation studies, and the application of quantitative methods for assessing research productivity and impact. Her academic and professional endeavors reflect a strong commitment to advancing library services and contributing to the evolving landscape of information and knowledge management.

Dr. Mohammad Nasir is a distinguished academician and library professional serving as Professor, University Librarian, and Head of the Department of Library and Information Science at Kalinga University. With over 15 years of experience in the field of Library and Information Science, he has made significant contributions to teaching, research, and academic administration. Dr. Nasir is the author of six books on various aspects of library science and has published numerous research articles in reputed national and international journals. He has actively contributed to the academic community by serving as a resource person and keynote speaker at more than 15 national and international conferences, seminars, and workshops. His areas of expertise include library management, information services, digital libraries, research methodology, bibliometrics, and knowledge organization. Through his scholarly work and professional leadership, he continues to play a vital role in advancing library and information science education and research.

ABSTRACT

Digital scholarship has increased the rate of generation of information, and to cope with that, libraries, information hubs, and data centres are constantly evolving. Various tools and techniques are being developed to manage the enormous size of digital information. One such technique is topic modelling (TM), a text-mining method widely used to identify topics from a large collection of documents. Topic models are algorithms, with each type, such as LSA, LDA, NMF, etc., offering unique strengths suited to different types of datasets, used to achieve the desired results based on the objectives of the study. Topic modelling has been used in fields such as computer science, medicine, engineering, and digital humanities for a very long time. Because of its diverse applications, it has also gained popularity in Library and Information Science (LIS) recently. Topic modellng has been found to have diverse applications in libraries, and also holds a great future in this era of Artificial Intelligence and big data.

Keywords: Text analysis, Text mining, Topic Modeling, LSA, LDA, Libraries

INTRODUCTION

The number of scientific outputs is continuously increasing every day. Every year, a large number of publications across different fields, in the form of digital text data, are added to the massive ocean of information, including books, journals, websites, social media platforms, emails, and various databases. The introduction of various tools and techniques in research, the development of internet-based communication and publication platforms, the easier accessibility of research literature in research databases, and the increase in the number of organizations, institutions, and scholars have contributed to the massive increase in digital data. The libraries, information hubs, and data centres are constantly evolving to keep pace with the generation of digital data. From time to time, various tools and

techniques are being developed to manage the enormous size of digital information. Manually analysing this massive digital data to quickly process, organizing, and extracting meaningful information from textual data is a very inefficient task, and disseminating the right information to information seekers has lately made the job of information gatekeepers overwhelming. To overcome this situation, the need for automated text analysis and text analysis techniques such as topic modeling has increased. Automated text analysis and text mining techniques make it easier to handle a very large volume of digital data in less time with improved accuracy and consistency. It allows the retrieval and organisation of information from organisational and cross-domain subjects to support libraries in better planning and policy-making.

Topic Modeling

Topic modelling is a powerful text-mining technique that can be used on large collections of unstructured documents to uncover hidden thematic structures. It enables researchers to identify dominant themes across vast datasets by analysing patterns in word usage, grouping frequently co-occurring terms into distinct topics. This technique enhances the generation of meaningful insights by facilitating the interpretation of complex textual information. It relies on probabilistic models that process textual data to extract coherent topics, offering a structured representation of unstructured content. Blei (2012) explains that "topic models are algorithms designed to identify the main themes in a large, unstructured collection of documents. These algorithms can organize the collection based on the discovered themes. Topic modeling can be applied to large document collections and is adaptable for various types of data. It can uncover patterns in areas such as genetic data, images, and social networks, among other applications". "Topic modelling is the new revolution in text mining"(Kherwa& Bansal, 2018),and can be used to automatically identify latent topics from appropriate text sources (Choi et al., 2015). The topic modelling approach can reveal hidden relationships among articles within a particular academic discipline(Kurata et al., 2018) and "topic modeling provides a valuable method for identifying the linguistic contexts that surround social institutions or policy domains and illustrates the strengths of topic modeling as a means of analyzing large text corpora" (DiMaggio et al., 2013).

Topic modelling has been employed in fields such as computer science, medicine, engineering, and digital humanities for a very long time. Since it has diverse applications ranging from document classification, literature reviews, citation analysis, keyword extraction, recommendation systems, and marketing analysis to similarity searches and topic modelling, topic modelling has also gained popularity in the field of Library and Information Science (LIS) recently. Topic modelling is considered a valuable tool in a research context as it can track research trends, identify emerging topics, and discover new fields of inquiry. Lamba & Madhusudhan (2019)noted, "Topic modelling not only helps the researcher to determine the trending themes or related fields concerning their field of interest but also helps them to identify new concepts and fields over time." Muresan& Harper, (2004). "used topic modelling for deriving 'mediated queries' to convey precisely and comprehensively the users' information needs, which the users can submit to search any large and heterogeneous' target collections'." Ozyurt & Ozyurt, (2025) "used machine learning-based semantic topic modeling and descriptive analysis to examine the temporal evolution and changes of research interests and trends in the educational augmented reality (AR) literature using 3718 articles published in the 2003–2022 period and indexed in the Scopus database." Palanichamy et al. (2025) used topic modelling to explore the growth, patterns, and trends in tourism research over the past three decades (1990–2019). Sahu et al. (2025) aimed "to evaluate the evolving research trend and the growth of the literature in LIS education and curriculum by employing a bibliometric and topic modelling approach to 1296 bibliographic records on LIS education and curriculum, covering the period from 1968 to 2024", collected from the Scopus Database.

Objectives of the study

- To comprehend topic modeling concepts
- To explain the topic modeling techniques used
- To discuss the topic modeling application in libraries
- To explore future challenges and opportunities

Foundation of Topic Modeling

The advancement of Artificial Intelligence (AI) has significantly transformed the way modern organisations and institutions operate. By enhancing the capabilities of algorithms, AI enables computer systems to perform tasks autonomously with minimal human intervention. This technological progress has led to the development of intelligent machines capable of analysing large volumes of data, making decisions, solving complex problems, and supporting a wide range of applications across industries, thereby improving efficiency, accuracy, and productivity.

One such algorithm is Machine Learning (ML), which learns automatically from a set of data by identifying patterns and using experience gathered over time to improve its performance without following fixed instructions provided by a programmer. Natural Language Programming (NLP) is a type of ML algorithm that is used for human language learning and prediction. It uses human language, in textual or speech form, as the primary data, and uses ML to enable computers to interpret and understand the data and process it. Text analysis uses NLP to extract meaningful information from textual data. Text mining, an advanced form of text analysis, helps discover hidden information, patterns, and relationships from large collections of unstructured textual data. There are several text mining techniques, and one of them, topic modeling, is widely used to identify topics from a collection of documents. Topic modelling is a technique that uses algorithms with unique strengths, tailored to different datasets, to achieve the desired results in line with the study's objectives. This makes topic modelling a versatile and indispensable method in modern data analysis.

Major topic modelling techniques

A variety of sophisticated topic modelling algorithms are available to support every sphere of text analysis. Among the most widely used are Latent Dirichlet Allocation (LDA), Structural Topic Modeling (STM), Dynamic Topic Modeling, Wikipedia-based Polyglot Dirichlet Allocation (WikiPDA), Latent Semantic Analysis (LSA), Non-Negative Matrix Factorization (NNMF), and BERTopic. There are several topic models, out of which some are discussed below.

Latent Semantic Analysis (LSA): It is a text analysis technique developed to discover the latent semantic relations between words and documents. It is one of the earliest topic modelling techniques, which assumes that terms with similar meanings also occur very close to each other in their context. LSA uses vector representation to compute similarity between texts to find similar words to organize texts into a semantic term document matrix, where rows and columns represent the terms and documents are created, and Singular Value Decomposition is applied to convert the matrix into a lower-dimensional representation, to uncover the latent semantic relations between the documents and terms.

Latent Dirichlet Allocation (LDA): LDA is an unsupervised generative probabilistic model of a corpus that assumes that the documents are a probabilistic distribution over latent topics, where a distribution over words characterizes a topic. Corpus is associated with a predefined number of topics k, and each document in the corpus contains these topics in different proportions.TM aims to learn these topics from data or a corpus. LDA is a well-established tool for modelling latent topic distributions in large corpora.LDA represents topics by word probabilities, and the words with the highest probabilities in each topic usually give a good idea of what the topic is.

Structural Topic Modeling (STM): Structural Topic Modeling (STM) is a generative model for analyzing word counts and extends Latent Dirichlet Allocation (LDA) by allowing the incorporation of document-level metadata into the topic modeling process. By integrating textual data with relevant metadata, STM identifies underlying topics within a corpus while simultaneously examining how document characteristics influence topic prevalence and content. The primary objective of STM is to enable researchers to uncover latent thematic structures, assess their relationships with document metadata, and investigate the impact of external variables on the distribution and interpretation of topics.

Non-Negative Matrix Factorization (NMF): NMF is a topic modeling technique that discovers hidden topics in a collection of documents by reducing the dimension of a non-negative document-word matrix into document-topic

and topic-word matrices, for the easy interpretation and analysis of the resulting topic. It is a new technique that addresses negative values in the dataset by imposing non-negativity constraints on the data model.

BER Topic: BER Topic is a modern AI-created topic modeling technique designed to generate context-aware topics by combining clustering techniques with transformer-based language models. "It generates topic representations through three steps. First, each document is converted to its embedding representation using a pre-trained language model. Before clustering, these embeddings are reduced in dimension to improve clustering performance. From the clusters of documents, topic representations are extracted using a custom class-based variation of TF-IDF" (Grootendorst, 2022).

Process of Topic Modeling

The process of topic modeling involves several steps, ranging from data collection, and selection of suitable tools and topic models, to the final phase of topic modeling and interpretation of the output.

Data sources for topic modeling

The first phase of the topic modeling process is collecting data from various sources. The source depends on the objective of the topic modeling process. For research purposes, data is collected from databases such as Scopus, Web of Science, Google Scholar, PubMed, Institutional repositories, and social platforms. Data from patient history, business sales, and other sources are also collected by different organizations for their intern a organization s research.

Topic modeling tools and technologies

Topic models are computer-generated coding-based algorithms. For their application programming language and various librariesare required, some of them are

Python: Python is the most popular and widely used programming language, with a large number ofpowerful built-in libraries that make it easier for researchers to perform text preprocessing, machine learning, natural language processing (NLP), and visualisation. It is an open-source programming language with a large ecosystem of NLP libraries and supports both traditional and AI-based topic models. Some of the built-inPython libraries used in Topic modelling include gensim, Scikit-learn, PyLDAvis, NLTK, and spaCy.

R: "R is a free software that performs statistical computing and graphics. RStudio is the integrated development environment (IDE) for R. R is an open-source, free TDM tool written in Java and C++. It was first released in 2011 and is available for Windows, Linux, and Mac. It is one of the most powerful tools for data analysis and statistical computing. It is widely used in academic research and social sciences." (Lamba & Madhusudhan, 2022). Some popular packages for topic modellng include stm, topicmodels, and tidytext.

Java: Although Java is not generally used for topic modeling, the MALLET toolkit is used for large-scale text mining.

Julia: This is an emerging language and can be used for high-performance machine learning and text analytics
The programming language and libraries are selected based on the size of the data and the
study's objectives.

Steps for Topic Modeling

Text analysis requires thorough text preparation and cleaning to ensure the quality and reliability of subsequent analyses. This process may involve basic pre-processing tasks, such as removing punctuation, URLs, hashntags, and other irrelevant elements, as well as more advanced procedures, including text annotation with parts-of-speech (POS) tags and other linguistic features. The specific pre-processing techniques employed depend on the nature of the application and the analytical methods being used. In the context of topic modeling, the following pre-processing steps are typically undertaken.

Corpus creation: In this step, the raw textual data is collected from the sources and is converted to machine- readable data that stores raw character strings with metadata. In this step, data are converted to a standardised format by merging standardised data from various sources and removing irrelevant formatting, such as HTML tags, URLs, emojis, and special characters, to create a noise-free text baseline for downstream processing.

Text Preprocessing: Text preprocessing is a fundamental stage in text mining and natural language processing, as it directly influences the quality and accuracy of the analytical outcomes. Its primary purpose is to reduce noise and eliminate irrelevant or inconsistent elements from raw textual data, thereby enhancing the effectiveness of subsequent analyses. Inadequate or improper preprocessing can lead to distorted results, misleading interpretations, and outputs that lack meaningful insights. Therefore, careful and systematic preprocessing is essential for obtaining reliable and valid findings from textual data.

Case Normalization: Texts are primarily written in mixed letter cases (uppercase and lowercase). In this process, all the texts are converted to lowercase so that the algorithm treats words as the same token.

Morphological Normalization: This normalization technique transforms text into a standardized and consistent format, thereby improving its suitability for text mining, natural language processing, and information retrieval tasks. It is particularly useful when multiple variations of a word convey the same underlying meaning. By reducing these variations to a common base form, the method helps decrease data sparsity and enhances analytical accuracy. For example, the words “play,” “player,” “playing,” and “played” can all be normalized to the root term “play.”

Tokenization: Tokenization is the process of automatically segmenting a sequence of characters into smaller meaningful units, known as tokens, which may represent sentences, words, or phrases. During this process, delimiters such as whitespace, punctuation marks, and other non-essential characters are typically identified and handled to facilitate further text analysis. Tokenization serves as a fundamental step in natural language processing and text mining, as it transforms unstructured text into a structured format suitable for computational analysis. There are two primary types of tokenization:

Word Tokenization: Word tokenization is the process of dividing a sentence or text into individual words, typically using whitespace characters as delimiters. This technique enables text to be represented as a sequence of discrete units for further analysis. In some cases, tokenization may also separate multi-word expressions into their constituent words. For example, the phrase “New Delhi” may be tokenized into the individual tokens “New” and “Delhi.”

Sentence Tokenization: It involves dividing the document into sentences using punctuation marks as delimiters. However, this method may not work correctly for acronyms and abbreviations.

Stemming*:* Stemming is a text normalization technique that reduces words to their root or stem form by removing prefixes, suffixes, and inflectional endings. This process groups derivationally related words with similar meanings into a common base form. For example, the words “laugh,” “laughs,” “laughed,” and “laughing” can all be reduced to the stem “laugh.” Stemming is language-dependent because the rules for word formation and inflection vary across languages.

Lemmatization: Lemmatization is a more sophisticated form of text normalization that reduces words to their lemma, or dictionary base form. Unlike stemming, which simply removes word endings, lemmatization considers a word’s context and grammatical role within a sentence to determine its correct root form. A lemma represents the canonical form of a word from which its various inflected forms are derived. For instance, verbs are typically converted to their infinitive forms, while plural nouns are transformed into their singular forms. As a result, lemmatization generally produces more linguistically accurate and meaningful outputs than stemming.

Stop words removal: Common words that do not carry useful information are referred to as stop words, and the procedure to discard them is known as stopping. In this step, high-frequency words (e.g., "the", "is", "at", "which") that carry no distinct semantic meaning, and domain-specific stop-words, e.g., the word "patient" in medical research, are eliminated. In the English language, there are about 500 stop words.

Object Standardization: Words and phrases that do not conform to standard dictionary forms are often difficult for text processing systems to recognize and interpret accurately. These may include acronyms (e.g., "DM" for direct message and "RT" for retweet), hash tags containing concatenated words, abbreviations, and colloquial slang expressions. Such non-standard linguistic forms can reduce the effectiveness of text analysis if left unaddressed. To overcome this limitation, researchers commonly employ regular expression techniques and manually curated dictionaries to identify, normalize, and appropriately process these terms before analysis.

Vectorization: In this mathematical phase, text tokens are transformed into a multi-dimensional geometric space, creating a Term-Document Matrix so that machine learning algorithms can read. Its simplest form is Bag-of-Words, which counts word occurrences.

Topic Extraction: In this step, the unsupervised machine learning algorithms like Latent Dirichlet Allocation (LDA), Non-Negative Matrix Factorization (NMF), or Top2Vec are applied to clusters of co-occurring words to find mathematical patterns of word distribution.

Topic Interpretation: In this final step, the statistical output of top-weighted words of an extracted cluster is assigned aqualitative meaning to convert it into a human-readable concept.
The output data is further visualized with the help of suitable visualization tools.

Limitations and Challenges

Like all other software and computational techniques developed over time, topic modeling also has limitations and challenges. Some of the limitations are discussed as

Data Quality: Most of the data collected for topic modeling contains a significant amount of noise and some of them may be disguised as important data, and to efficiently eliminate them is a difficult job. Sometimes the metadata collected may be incomplete, leading to altered output. Multilingual data pose another challenge in topic modeling, as most algorithms are designed to support only English vocabulary.

Technical challenges: For a particular dataset, selecting the appropriate algorithm and other parameters is a challenging task, and above all, the computational complexity, topic coherence, and requirement of good programming skills pose challenges for the use of topic modeling.

Ethical and privacy concerns: The use of importantand confidential data for topic modeling using AI algorithms may create privacy concerns among the users. Also, algorithmic bias cannot be ruled out for data in classified fields or for which the model has not yet been trained.

Interpretation challenges: Once the metadata is uploaded to the algorithm for topic modeling, human intervention is not possible until the output is there. The manual interpretation of the topics generated to determine whether they are meaningful, coherent, and relevant to the research objective requires human expertise. Sometimes the topics generated by a model may overlap with other topics, be unclear, or contain words with multiple interpretations. This makes it difficult to assign a precise meaning to a topic.

Although topic models have some limitations, they are widely used across different fields, and several newly designed models are under development.

Application of Topic Modeling in Libraries

"Topic modelling has increasingly proven valuable for organizing, analyzing, and enhancing access to information in libraries and digital collections. Its applications span from improving search and retrieval functions to identifying research trends and user needs.

- Enhancing Information Retrieval and Search Systems: Muresan & Harper (2004b)demonstrated how topic modelling could generate "mediated queries" that more accurately represent users' information needs, enabling efficient search across large, diverse collections. Similarly, Haruechaiyasak & Damrongrat (2008) used LDA on Wikipedia articles to recommend highly relevant content based on topic similarity, even beyond hyperlink connections.
- Improving Digital Library Services: Bethard et al. (2009)combined topic modelling with classification techniques to select resources for subject-based digital libraries. Newman et al. (2010)highlighted how topic models can automate subject tagging and improve content discovery in digital collections. Efron et al. (2011)addressed the challenge of metadata inconsistency in large collections and proposed methods to identify low-information documents to refine topic modelling outputs.
- Document Clustering and Recommendation Systems: Wang & Jie (2012)applied probabilistic topic modelling with Gibbs sampling for accurate clustering of digital books. Scherer et al. (2013)introduced a topic-based similarity function for efficient indexing in public library collections. Charlin et al. (2014)proposed the Collaborative Score Topic Model (CSTM), which combines user preferences and textual content for personalised document recommendations.
- Subject Metadata and Multimedia Libraries: Choi et al., (2015)used LDA to analyze song interpretations, showing how topic modelling can enrich metadata in music libraries and potentially for literary collections. Cain, (2016)emphasized how topic modelling can improve access to poorly indexed digital texts by identifying latent content structures.
- Domain-Specific Topic Exploration and Visualization: Mesbah et al., (2017) introduced "Facet Embedding," a domain-aware model for generating metadata and visualizing scientific trends. Abuhay et al., (2017)analyzed 16 years of conference papers to uncover topic evolution and interdisciplinary links through dynamic topic networks. Figuerola et al. (2017)applied LDA to the LISA database to identify core LIS research areas over nearly four decades.
- Topic Trends and Knowledge Discovery in LIS: Kurata et al. (2018)used LDA to uncover hidden thematic structures within LIS literature. Al-Natsheh et al. (2018) addressed the issue of community-specific keywords and proposed a semantic tagging system using topic modelling to improve retrieval.Fang et al. (2018)combined topic modelling with regression analysis to identify trending and declining topics in LIS.
- User Behavior and Service Optimization: Chen & Wang, (2019)analyzed library chat transcripts using LDA and discovered that access to library resources was a dominant concern among users. Joo et al. (2020)studied Facebook posts from public libraries and found that posts about events and multimedia content had higher user engagement, using topic modelling to classify content themes.
- Evaluation, Research Trends, and Visualization: Papachristopoulos et al., (2019)integrated topic modelling with citation and altmetrics analysis to map the structure of digital library evaluation literature. Viet & Kravets, (2019)scraped and analyzed arXiv papers to detect emerging academic trends. Timakum et al. (2020)applied text mining and topic modelling on top LIS journals to map evolving research areas. Meanwhile, Miyata et al. (2020)found a shift in LIS research toward digital and internet-based topics after 2015.
- Language and Cross-Lingual Applications: Piccardi & West (2021)introduced the Wikipedia-based Polyglot Dirichlet Allocation (WikiPDA), enabling cross-lingual topic modelling for multilingual content classification.
- Classification and Indexing of Unstructured Texts: Mohammed & Al-augby (2020)compared LDA and LSA for classifying 23 million words from unstructured scientific texts, concluding LDA offered superior coherence and clustering accuracy. Mazumder & Barui, (n.d.)analyzed titles of LIS theses from Shodhganga using LDA to extract dominant research themes.
- Recommendation Systems and Conference Analysis: Jelodar et al. (2021)applied topic modelling to eight computer science conference publications to build a recommendation system aligned with future research directions. Dantu et al. (2021)used topic modelling with co-citation analysis to explore research on healthcare applications of IoT, revealing five key thematic clusters.
- LIS Theses and Doctoral Research Analysis: Kumar & Thakur, (2022)employed topic modelling on Indian LIS doctoral theses to categorize them into ten major research domains, highlighting ICT as a key area.

- Topic Modeling for Visualizing and Comparing Research: Saha & Ghosh, (2023)analyzed 734 LIS articles from Indian and international journals using topic modelling and visualization, identifying distinct research priorities between the two.
- Librarian Decision-Making and Reference Analysis: Koh & Fienup (2021) evaluated different topic modelling algorithms for chat reference data and found that probabilistic latent semantic analysis (LSA) outperformed LDA in interpretability and coherence.
- Authorship, Verification, and Textual Analysis: Potha & Stamatatos (2019)explored topic modelling in authorship verification. They found that LDA was more effective when combined with profile-based and extrinsic verification methods.
- Indian Contextual Studies: Lamba & Madhusudhan, (2019)examined "nearly four decades of Indian LIS research, identifying bibliometrics, ICT, and user studies as dominant themes."

Topic Modeling in Future Libraries

In this era of AI, big data, and digital scholarship, Topic Modeling has emerged as an important, transformative technique for libraries. Topic Modellng has enhanced libraries' capabilities to manage and organise large collections of digital documents and to discover and analyse information within them. In libraries, the future of Topic Modeling extends far beyond current limits and can transform libraries into intelligent knowledge hubs. Some prospects for topic modelling in libraries are as follows:

Enhanced knowledge discovery: Topic modeling helps in the automatic identification of hidden themes and relationships within a large collection of documents. In a future library system, the users will be able to explore large collections through thematic structure rather than relying solely on keyword searches, enabling more effective information discovery.

Intelligent Information Retrieval: Most of the traditional search systems rely on matching keywords while retrieving information, and that is why it sometimes struggles with words with multiple meanings and similar meanings. Topic Modeling can solve that retrieval issue by analysing the conceptual content of documents.

Automated collection development: A large number of collections are acquired by the libraries, of which some of the documents are barely of any use to the patrons, whereas in some topics, the collections are very large. Topic modelling will help libraries acquire collections more efficiently by identifying emerging subject areas, collection gaps, and underrepresented themes. It will also help automatically organise and visualise the contents of thousands of theses, dissertations, articles, and reports from institutional repositories.

Support for research analytics: With the help of topic modeling, libraries will be able to provide scholars with advanced research support services and offer topic-based literature by analyzing large textual corpora such as newspapers, manuscripts, books, and archival collections. This will strengthen libraries' role as partners in digital scholarship.

Integration with AI: In the future, the topic models will be more developed with the incorporation of advanced AI and deep learning that will help in generating more coherent and context-aware topics than traditional methods. This will also enable the libraries to do thematic analysis across multiple languages.

Real-time trend monitoring: Dynamic topic models will help libraries become more proactive and responsive to information needs by tracking emerging research topics, monitoring public health information, and following the major technological developments.

CONCLUSION

The complex branches of subjects, diverse research fields, and multidisciplinary research collaborations have increased the rate of digital publications. The inherent themes and concepts associated with such collections could not be visualized simply by using traditional bibliographic methods. Text analysis and text mining methods help us understand the hidden information, patterns, and relationships in large collections of unstructured textual data. Topic modelling is one such technique that allows the discovery of hidden thematic structures by analysing patterns in word usage and grouping frequently co-occurring terms into distinct topics. This technique uses algorithms

designed specifically for different types of datasets. It can be used in libraries to enhance services, improve digital library services, support domain-specific topic exploration, and evaluate research trends, among other applications. With the advent of advanced topic models and the increasing number of digital collections, topic modelling holds great promise for libraries. It will help the libraries in enhanced knowledge discovery, intelligent information retrieval, automated collection development, provide support for research analytics, real-time trend monitoring, and, with integration with AI, it will be one of the most sophisticated tools that will change the aspects of how the libraries work and convert them into powerful knowledge hubs.

ABSTRACT

The researchers investigated the awareness of undergraduate students about Physical Education and Yoga under the National Education Policy (NEP) 2020 in the Betul district, Madhya Pradesh. A descriptive survey research design was used to ascertain the perception of the students about the provisions and the significance of the Physical Education and Yoga in the NEP 2020. There were 800 respondents selected from various colleges in Amla, Atner, Bhaisdehi, Ghodadongri, Multai, Sarni, Shahpur, and Betul. The researchers requested and received permission from these institutes to participate in the study. The data were collected using a structured questionnaire. The results revealed that most respondents had a positive attitude towards Physical Education and Yoga as prescribed by NEP 2020. However, the participants were moderately satisfied with the institutional support, budget allocation, and professional development opportunities for implementing the policy. It was also found that there were insufficient awareness campaigns and poor student participation in physical activities in these institutes. These results highlight the need for institutional support, quality teaching and learning approaches, and awareness campaigns to actualize the objectives of the NEP 2020.

Keywords: NEP, Education, budget, survey, students.

INTRODUCTION

Physical education is more than just a recreational activity that makes people happy and comfortable (Kamil 2022). A component of sports education, physical education (PE) emphasizes body movement as the primary learning principle with cognitive, motor, affective, and social goals (Gustian,& Saputra 2024).Every nation needs to update its educational policies, and the resources and facilities available for education determine how these policies are carried out. All features of the revised educational policy are successfully implemented at the gross root level with the assistance of educators and other stakeholders(Palanisamy & Meenatchi 2025).It is said that physical education is a

crucial subject that gives kids the abilities, information, and mind-set needed to be active throughout their lives (Gustian,& Saputra 2024). Yoga is a scientific and spiritual discipline that concurrently addresses all facets of conscious evolution's practicality, psychology, and philosophy. It is a comprehensive approach that focuses on balance and mindfulness to unite the body, mind, and spirit.India has had a well-known educational system since antiquity. We are all well familiar with the Gurukul method of teaching. The Indian educational system has undergone some adjustments after independence, as time has gone on. We have been utilizing this educational approach for the past 34 years. The initial education policy was developed in 1968, and it was revised in 1986 and 1992 (Alam 2026).The inclusion of yoga in the curriculum is one of the NEP's most innovative and extensively debated elements (Ayere)This study examines the main NEP 2020 requirements pertaining to sports, yoga, and physical education, evaluates their intended advantages, and talks about the ongoing implementation issues throughout Madhyapradesh's varied educational ecosystem (Shrikant & Prakash, 2025). The aim of the study was to aware undergraduate students of Betul district towards physical education and yoga (in the context of National Education Policy 2020).

METHODOLOGY

This study was a descriptive survey approaches. The combination of both research approaches is the most effective way in achieving the research objective due to their complementary strengths. It is acknowledged that both quantitative and qualitative analyses suffer from certain specific shortcomings. A survey methods design aims to combine the advantages of both methods in one single framework. It also tries to explore the current practical class teaching of Physical Education. To assess this, ―to answer questions that have been raised, to solve problems that have been posed or observed, to assess needs and set goals, to determine whether or not specific objectives had met, to establish baselines against which future comparisons can be made, to analyze trends across time, and generally, to describe what exists, in what amount, and in what context.‖ (Isaac & Michael, 1997,). A descriptive survey describes and interprets what is their practice currently. Generally this method was selected because it helps the student researcher to get currently available and detailed information as possible on the issue under consideration. It was also useful for describing the present situation of the role and practice of secondary school teachers and students and it helps to deal with relatively large number of respondents at a particular time.

Subject of the study

The populations of the study were College going students of Betul districts. Total 800 students were selected from different college of Betul district which are Amla, Atner, Bhaisdehi, Ghodadongri, Multai, Sarni, Sahpur and Betul.

Method of data collection

To collect all relevant information, in the initial stage the researcher took letter of permission from RNTU, Raisen, MP, and also took permission from Barkatullah University, MP. Next the researcher gives the letter to concerned body and got permission for data collection. Then the researcher collected all students together and introduces the objectives and aims of research in detail. Lastly, all the questionnaires were distributed to them and collected entirely. Finally, researcher collect, arrange and organize all the data in a clarified and sensible way.

RESULTS

In question "Your College support or encourage Physical education, games, sports, and Yoga". Out of 800 respondents 184 persons were highly satisfied, 386 persons were satisfied, 160 persons were partially satisfied, 63 persons were dissatisfied and 7 persons were highly dissatisfied. In question "According new education policy (NEP) there are to0 many demands for change in education today to implement physical education." Out of 800 respondents 128 persons were highly satisfied, 432 persons were satisfied, 131 persons were partially satisfied, 99 persons were dissatisfied and 10 persons were highly dissatisfied. In question "The college/Institute/University has a

separate budget for the professional development of Students." Out of 800 respondents 172 persons were highly satisfied, 274 persons were satisfied, 297 persons were partially satisfied, 41 persons were dissatisfied and 16 persons were highly dissatisfied. In question "The college/Institute/University has a separate budget for the professional development of Students." Out of 800 respondents 163 persons were highly satisfied, 504 persons were satisfied, 78 persons were partially satisfied, 36 persons were dissatisfied and 19 persons were highly dissatisfied.

DISCUSSION

The findings of study revealed that, most of roles and activities related to awareness of physical education meditation yoga health are not taken seriously. Thus this may happen due to less orientation of the teachers on their roles and about application of active learning in practical class. The interaction and active participation of students is one of the most important aspects of educational process, it determines the effectiveness and develop the preferable method in change different methodology in different sessions. However, the findings of the study revealed that participation and interaction of students is low. The major reason accountable for the low participation of students are; methods of instructional teachers use, don't invite them to participation which is lecturing, lack of confidence, shortage of instructional materials, low attitude towards the subject etc. Clark (2007) clearly stated that most students would participate and did well within the physical education classroom if the teacher was verbally aggressive. The students indicated that they did not learn the material, but would participate to avoid the repercussions of the teacher. According to Deci and Ryan (1985), intrinsically motivated behaviors are engaged in for their own sake, for the pleasure and satisfaction derived from the process of engaging in the activity. The finding stated stressed that the condition of the teacher's should be facilitated practical classroom as conducive as favours the real implementation of active learning in practical class. Regarding this, the findings of the study depicted the classroom condition is more or less conducive for the application of active learning in practical class.

ABSTRACT

The purpose of the study is to find out how the rapid growth of artificial intelligence (AI) and machine learning (ML) technologies has reshaped library and information science (LIS) services in the digital age. Intelligent, data-driven library systems are replacing manual and semi-automated ones. Through automation, customization, and prediction, AI and ML help libraries organize, discover, and share content. For example, recommendation systems personalize user experiences, significantly improving engagement and satisfaction. AI technologies such as smart cataloging, automated indexing, recommendation systems, chatbots, and virtual reference services have significantly enhanced library services and the user experience, fostering greater confidence in technological progress. This study examines how AI and ML affect LIS services, their benefits and difficulties, and the future of smart libraries. The main goals are to measure library AI and ML utilization, evaluate their effects on service quality and customer satisfaction, and understand LIS workers' willingness to adopt these innovations, emphasizing their vital role in shaping future library services. A detailed research methodology has been adopted for the study, including literature review, policies, and contemporary case studies on AI- and ML-based library systems, which underpin the descriptive-analytical research. Secondary data from scholarly articles, reports, and professional recommendations are evaluated to conclude. The results have revealed that AI and ML improve operational efficiency, information retrieval accuracy, and service customization. Challenges such as insufficient technical credentials, data privacy concerns, implementation costs, and ethical issues, particularly the need for robust ethical frameworks, are significant. The study indicates that AI and ML can transform LIS services, but strategic planning, capacity-building, and ethical frameworks are essential. This research aims to guide future AI and ML model-based, policy-driven AI integration, inspiring confidence in meaningful progress in libraries.

Keywords: Artificial Intelligence (AI); Machine Learning (ML); Library and Information Science; Library Services; Information Services and Smart Library

INTRODUCTION

Library and Information Science (LIS) services have changed drastically over the years, shifting towards digitally influenced information environments rather than traditional, print-driven systems. Historically, libraries were mainly concerned with the gathering, sorting, and maintenance of physical materials, with their services being manual and mediated by humans. The advent of computers, integrated library management systems, and digital libraries was a significant change in LIS, enabling faster access to information and better resource management. The recent decades have witnessed the blistering development of electronic resources, online databases, and networked information systems, which consequently widened the range of library services and their complexity, requiring more sophisticated technological solutions. In this regard, the advent of Artificial Intelligence (AI) and Machine Learning (ML) has created new opportunities to improve library work and information services. Technologies based on AI and ML enable systems to learn, mimic human intelligence, and make well-informed decisions. Their implementation in LIS represents a shift from traditional automation to intelligent, adaptive systems capable of handling large volumes of data and accommodating more sophisticated user requirements. These technologies facilitate advanced capabilities such as natural language processing, intelligent search, automated indexing, and predictive analytics, which are becoming increasingly pertinent in digital and hybrid library settings.

The use of AI and ML in contemporary library systems enhances efficiency, precision, and interaction. Applications based on AI and ML enable personalized access to information, intelligent recommendation services, virtual reference services, and data-driven decision-making. They also assist libraries in managing growing digital collections, studying user behavior, and providing responsive, inclusive services to diverse user communities. The implementation of AI and ML has already become a strategic necessity, not a peripheral innovation, as libraries seek to remain relevant in the digital knowledge society. The necessity of the current research stems from the increasing popularity of AI and ML in LIS and the lack of in-depth understanding of their effects, opportunities, and challenges. The research is important because it offers conceptual and analytical insights into the application of AI and ML to transform library services, assist librarians, and define the future of smart, intelligent libraries. Concept and Definition of Artificial Intelligence (AI) AI is the ability of computer systems to perform tasks which traditionally required human intelligence such as reasoning, learning, problem solving, perception, language understanding and decision making. AI is a multidisciplinary field that integrates various areas such as computer science, mathematics, cognitive science, and data analytics to create intelligent systems that can mimic human cognitive functions. Unlike computer programs that follow a set of instructions, AI systems can learn from complex data sets, identify patterns, adjust to new knowledge and information, and continuously improve as they learn more (Russell & Norvig, 2021).
The word 'AI' was first used in the Dartmouth Conference in 1956, when researchers discussed the idea of developing machines that could perform intelligent tasks like humans. Since then, AI has gone from rule-based systems implemented by experts to advanced intelligent models that utilise big data, cloud computing and deep neural networks. Today, AI technologies are being adopted in several industries such as healthcare, education, finance, manufacturing, transportation, agriculture, and library and information science (LIS) (Shrestha & Yang, 2019).

Artificial Intelligence has several sub-areas including machine learning, natural language processing, computer vision, robotics, expert systems and speech recognition. The technologies allow computers to read, analyze, comprehend and process human language; to identify and recognize examples of images and objects; to interpret speech; to make suggestions; and to automate complex decision making processes. AI systems constantly analyze vast and unstructured datasets and produce actionable insights and enhance operational efficiency (Russell and Norvig, 2021). In Library and Information Science, Artificial Intelligence (AI) is a transformative technology that is being increasingly applied to intelligent knowledge management and improvement of library services. AI-based systems aid librarians in creating digital collections, automatically generating metadata, enhancing cataloguing precision, information resource classification, and efficient information retrieval. Instead of substituting for librarians,

AI tools and technologies should augment their work by taking over repetitive tasks and enabling them to provide more research assistance, user engagement, and knowledge services (Cox et al., 2019). The personalization of services is one of the main advantages of AI. AI-powered search systems can make recommendations based on users' search and borrowing behaviour and reading interests, suggesting relevant books, journals, databases, and digital resources according to each user's individual preferences. Likewise, AI chatbots and virtual assistants give 24-hour reference services, responding to user questions, conducting information searches, and providing technical support. These intelligent services increase the contentment of users and decrease the workload of library staff (Breeding, 2018).

Natural Language Processing (NLP) is another way in which Artificial Intelligence aids in information discovery. Unlike keyword-focused search engines, AI-driven search engines can comprehend the intent, context, and semantic relationships between search terms, leading to more precise and relevant search results. This enhances knowledge discovery, particularly in large digital archives and institutional archives (Arlitsch& Newell, 2017). Predictive analytics is another significant use of AI, where intelligent systems can use historical information to predict future patterns, user behavior, resource needs, and collection development needs. These forecasting tools can assist in evidence-based decision making, strategic planning, and efficient resource usage at libraries. In addition, AI helps in plagiarism detection, evaluation of research, citation analysis, digital preservation, and automated indexing, which enhances academic research and scholarly communication (Xu et al., 2021). AI has many benefits, but it also has its drawbacks such as the ethical issues, data privacy, algorithm bias, lack of transparency, and high implementation costs. The importance of data governance and privacy protection is paramount in the case of AI systems which require a large amount of data to function. Furthermore, any training data that is biased can lead to biased or discriminatory results, emphasizing the need for ethical, transparent, and explainable AI systems. Institutions that implement AI technologies should, therefore, have ethical guidelines in place and regularly assess the ethical implications of AI-based decision making to ensure their actions are fair and equitable and that they are inclusive (Fernandez-Molina et al., 2020; Pun & Hokanson, 2021).

In general, Artificial Intelligence is a paradigm shift in managing information and providing services in a manner different from the way it is done today. The advancement of AI technologies will further drive the intelligent decision-making, digital transformation and construction of smart knowledge ecosystems in various fields. Concept and Definition of Machine Learning (ML) Machine Learning (ML) is a subset of AI that involves creating systems that learn from data and enhance their accuracy upon seeing more instances. ML systems are not dependent on existing rules, but rather they find new patterns, draw connections between variables, forecast the future and continually improve their models as more data is provided. This learning ability allows intelligent systems to learn and adjust to varying environments over time, and to generate progressively more accurate results (Mitchell, 1997; Sarker, 2021).
A basic tenet of Machine Learning is that data is the source of knowledge. With the ever-expanding volume of available digital data, ML algorithms become more effective in finding meaningful insights that would be hard if not impossible for humans to find manually. Machine Learning has thus emerged as one of the most impactful technologies that are fueling digital transformation in sectors such as healthcare, finance, education, business, cybersecurity, agriculture, and especially library and information science (LIS) (Sarker, 2021). There are generally three types of machine learning: supervised learning, unsupervised learning and reinforcement learning. In supervised learning, models are developed based on labeled data to make predictions or classifications. Unsupervised learning identifies clusters, patterns and hidden relationships between data points from unlabelled data. Reinforcement learning is used for providing rewards and penalties to intelligent agents to help them learn optimal actions in the course of continuous interactions with the environment. All of these learning techniques solve different practical problems and play a role in the generalization of ML applications (Mitchell, 1997).

There are many algorithms used in modern machine learning such as decision trees, support vector machines, neural networks, random forest, clustering algorithms, Bayesian models, and deep learning architectures. These algorithms can handle large amounts of data with speed and accuracy, and the rapidly increasing digital information resources make this particularly useful in such a scenario (Aggarwal, 2016).

In Library and Information Science, Machine Learning has revolutionized information organization, retrieval, and services for users. Documents can be automatically classified, assigned subject headings, generate metadata, identify duplicate records, and improve indexing efficiency using the ML algorithms. The smart processes minimize human participation and enhance the consistency and accuracy of handling digital libraries (Zhang et al., 2020). Recommendation systems are also heavily used in modern libraries, and are powered by Machine Learning. There are numerous ML algorithms that analyze users' borrowing data, search patterns, reading interests, and interaction with the library to suggest books, journals, research articles, and multimedia that align with their interests. Such recommendation systems can increase the discoverability of resources, enhance experience for the user and increase the satisfaction of the user (Aggarwal, 2016). Another important application of ML is predictive analytics. Libraries produce vast amounts of data, such as circulation data, user behaviour, digital resource usage, and access to the institutional repository. These datasets are used with Machine Learning algorithms to predict future demand, space optimization, collection development and strategic planning. Data-driven decision making allows libraries to make better resource allocation decisions and predict user needs (Xu et al., 2021).

Machine Learning plays a vital role in intelligent search systems, too. In contrast to keyword matching systems, ML-driven retrieval systems feature semantic analysis, context awareness, and an understanding of user intent, yielding highly relevant search results. Another major benefit of NLP is its ability to support conversational search, which allows users to interact with the library using natural language without needing to understand the various search syntaxes used by the library systems themselves (Cox et al., 2019). In addition to information retrieval, ML also aids in plagiarism detection, citation analysis, sentiment analysis, research impact assessment, digital preservation, and knowledge discovery. ML can help identify underlying trends in those large scholarly datasets, leading to improvements in academic decision making, evidence-based research, and enhancing institutional repositories (Breeding, 2018)..While Machine Learning is highly beneficial, it also has its drawbacks. Training data that are of high quality and diversity is crucial to the quality of the ML predictions. The data sets can be of poor quality or biased and thus can lead to incorrect or unfair results. Additionally, many of the more sophisticated ML models are so-called "black boxes" that are hard to interpret. Other challenges involve computing demands, data privacy, ethical control and governance, and the availability of knowledgeable personnel to ensure responsible design, monitoring, and assessment of ML systems (Fernandez-Molina et al., 2020). To conclude, Machine Learning is one of the most complex technologies in Artificial Intelligence. It has revolutionized digital information systems, and is now making a significant contribution to the innovations of many fields, including modern Library and Information Science.

Artificial Intelligence and Machine Learning Opportunities in Library and Information Science

The possibilities of Artificial Intelligence (AI) and Machine Learning (ML) are enormous for the development of Library and Information Science (LIS), as libraries can become intelligent, adaptive, and user-oriented knowledge institutions. These technologies create a novel avenue of enhancing service delivery, research support, and universal access to information. Among the most important opportunities is the development of smart and adaptive libraries. With AI- and ML-powered systems, user interactions can be learned, and services can be continuously adjusted to new information requirements. The use of smart libraries will enable automated control of collections, maximize space utilization, and enable real-time monitoring of system performance. These adaptive environments enhance operational effectiveness and make libraries responsive to the

Technological and User-Driven changes

AI and ML also enable advanced information retrieval systems beyond conventional keyword search. Intelligent retrieval systems can provide more accurate, relevant, and meaningful search results through natural language processing, semantic analysis, and contextual understanding. Users may engage with library systems through conversational queries, and the system can understand intent and context, thus enhancing discovery and minimizing information overload. The other significant opportunity is using data to make decisions. Libraries produce vast volumes of data on resource use, user behavior, and service performance. This data can be processed using ML-based analytics to get patterns, trends, and predictive insights. These understandings facilitate advanced decision-making

in areas such as collection development, budgeting, service planning, and policy-making. The use of data-driven strategies can help libraries manage their resources more effectively and demonstrate their value to stakeholders.

AI and ML are beneficial for supporting research and communication in the scholarly field. Smart tools assist researchers in discovering literature, conducting citation analysis, detecting plagiarism, and assessing research impact. Artificial intelligence-based systems will be able to suggest appropriate journals, partners, and grants. ML algorithms support scholarly communication, facilitating open access, institutional repositories, and research data, thereby reinforcing the research ecosystem. Finally, AI and ML open the way to inclusive services for different user groups. Assistive technologies such as speech recognition, text-to-speech systems, and adaptive interfaces enhance accessibility for users with disabilities. Support for Multilingualism and individual services are offered to users with diverse linguistic, cultural, and educational backgrounds. AI and ML can enhance libraries' roles by supporting digital inclusion and fair access to these services, and by addressing the social and educational needs of libraries.

To sum up, AI and ML can enable libraries to become innovative, inclusive, and research-oriented institutions that can support the changing needs of the digital knowledge society.

Enhancing Library and Information Science Services through Artificial Intelligence (AI) and Machine Learning (ML) and its application

Machine Learning (ML) is a branch of Artificial Intelligence that focuses on creating algorithms that can learn from data and improve their performance over time without any formal programming. LIS uses ML to manage large datasets generated by digital libraries, user interactions, and online information systems. Predicting, classifying, and providing recommendations are some of the ways ML systems analyze data patterns to improve library operations and services. Several ML methods are especially applicable to library services. Document classification, subject categorization, and sentiment analysis of user feedback are performed using supervised learning algorithms. Unsupervised learning algorithms aid document clustering, topic modeling, and knowledge discovery. Recommendation systems based on collaborative and content-based filtering help users find relevant resources based on their interests and search behavior. Such ML-based solutions improve information retrieval accuracy and user satisfaction.

AI-ML in Library Systems

Intelligent library systems that are adaptive, responsive, and user-centered have emerged due to the integration of AI and ML technologies. These systems use automation and analytical intelligence to aid decision-making and service delivery. The AI-ML integration will allow libraries to shift away from traditional automation toward smart libraries that can learn about user behavior and system performance. The LIS AI-ML integration has significant outcomes, including automation and personalization. Acquisition, circulation, indexing, and digital archiving are routinely automated to reduce operational costs and manual labor. Meanwhile, individualized services, such as tailored recommendations, custom interfaces, and user-predictive help, enhance the overall library experience. Therefore, AI-ML integration represents a significant shift in the library business, reinventing libraries' purpose in the digital knowledge society. Library and Information Science Services using Artificial Intelligence (AI) and Machine Learning (ML) Artificial Intelligence (AI) and Machine Learning (ML) have revolutionized Library and Information Science (LIS) services, enhancing their efficiency, accessibility, and quality. This marks the dawn of a new era for libraries, where AI and ML are enabling them to become intelligent knowledge centers. The future of libraries is about to change, and AI and ML are playing a key role in this transformation, transforming libraries from mere storage facilities into intelligent knowledge centers that offer personalized user experience and automate routine tasks. These technologies help libraries handle a massive amount of digital information in the context of improving the users' experience (Cox et al., 2019).

Intelligent cataloguing and classification is one of the significant applications of AI and ML in LIS. The subject heading, metadata and classification numbers are assigned automatically by AI-powered systems, reducing manual work and ensuring consistent information organization. AI algorithms also enable automation of information retrieval processes, including automated indexing, document clustering, and content analysis, which facilitate faster and more accurate information retrieval (Breeding, 2018). Library services are further improved with the aid of AI

and ML and personalized recommendation systems. Intelligent algorithms then show recommendations based on users' borrowing behaviour, search patterns and reading preferences, for relevant books, journals, articles and other digital resources. Likewise, AI-powered chatbots and virtual assistants can offer 24-hour reference services, which includes answering user inquiries, conducting database research, and navigating users through the library's collections (Zhang et al., 2020). Another use of ML in libraries is predictive analytics. Libraries can understand the demand for resources, optimize usage and collection development, and plan services through the examination of usage and user interaction. The technologies can also be used for plagiarism detection, citation analysis, digital preservation, and research impact assessment, which enhances scholarly communication and academic research (Xu et al., 2021). While AI and ML offer these advantages, there are several challenges, such as data privacy concerns, algorithmic bias, and transparency, that necessitate the involvement of skilled professionals, the reliability of technological infrastructure, and robust ethical standards to guarantee their successful implementation. In general, AI and ML are transforming Library and Information Science, by developing smart, adaptive, user-centred information services that are able to respond to the changing needs of the digital knowledge society (Fernandez-Molina et al., 2020).

Mental and Theoretical Framework

Artificial Intelligence (AI) is the ability of computer systems to mimic human intelligence through reasoning, learning, problem-solving, and decision-making. Within the framework of Library and Information Science, AI is a broad term that encompasses many technologies that enable libraries to perform intellectual work traditionally performed by professional workers. The extent of AI usage in LIS is not limited to routine operational processes; it is also used in sophisticated knowledge management and decision-support frameworks. Tools powered by AI can help organize large volumes of digital data, improve access to resources, and enhance the overall quality of library services. AI in libraries has many applications, with the number growing rapidly. Major AI uses include intelligent cataloging and classification software that automatically assigns subject headings and metadata; reference and advisory service expert systems; natural language processing, which facilitates better information search; and chatbots that can offer real-time virtual reference services. Also, AI is applied to plagiarism identification, digital content management, and smart discovery applications that assist users in navigating a complex information space. The applications allow libraries to provide prompt, more precise, and customer-oriented services. Purpose of the study This study aims to discuss the contribution of Artificial Intelligence (AI) and Machine Learning (ML) to restructuring Library and Information Science (LIS) services. It is intended to discuss the benefits these technologies bring to the field of information organization, retrieval, cataloguing, information services to users, decision making, and the efficiency of the operation and the quality of the user experience. The study also examines the opportunities, challenges, and ethical considerations related to the use of AI and ML in libraries, such as data privacy, algorithmic bias, and technological readiness. Moreover, it aims at deconstructing concepts for guiding librarians, researchers, policymakers, and academic institutions in effectively embedding AI and ML into modern library systems.

REVIEW OF LITERATURE

A few international research works have investigated how Artificial Intelligence can be used in the library. Cox, Pinfield and Rutter (2019) noted that the impact of AI technologies on academic libraries worldwide is changing the environment through chatbots, automated metadata generation, and intelligent discovery tools. In the same vein, Arlitsch and Newell (2017) emphasize how AI has improved search engine visibility and increased user engagement in digital libraries. According to Breeding's (2018) studies, AI-based systems play a major role in improving efficiency, scalability, and innovation in library management systems.

Studies of ML-Based Information Retrieval: Machine Learning has been extensively researched to enhance information search and recommendation to libraries. Aggarwal (2016) observes that ML algorithms, including clustering, classification, and collaborative filtering, improve precision and recall in large information systems. Zhang, Yang, and Li (2020) showed that the use of ML-based recommendation systems leads to high user satisfaction

and greater resource discoverability in academic libraries. This research verifies that ML is essential for handling large-scale data and multifaceted user inquiries in LIS systems.

Research in Smart and Digital Libraries: Studies examine the integration of AI, ML, IoT, and data analytics. Kim and Abbas (2010) discussed the changing nature of digital libraries, which are becoming intelligent knowledge environments using advanced technologies. More recently, Xu, Ouyang, and Chu (2021) discussed smart library models and concluded that artificial intelligence-based automation and personalization are key elements of next-generation libraries. These articles support the significance of smart systems in library renovation.

The use of AI and Machine learning in library and information services: The use of Artificial Intelligence (AI) and Machine Learning (ML) in Library and Information Services has contributed greatly to the effectiveness, precision, and timeliness of contemporary libraries. With these technologies, libraries can handle large volumes of digital information and deliver intelligent user-based services. Intelligent cataloging and classification are among the most common uses of AI and ML. The AI systems guide natural language processing and pattern recognition engines to automatically process documents, assigning subject headings, classification numbers, and keywords. This reduces manual work, ensures uniformity in cataloging practices, and speeds up the cataloging of new resources. These systems, especially, are beneficial for maintaining large-scale institutional and digital repositories.

Another important application is automated indexing and metadata creation. ML algorithms focus on extracting key ideas, abstracts, and descriptors from digital documents to generate valid metadata. Through automated indexing, information is retrieved more precisely and with higher recall. It also supports interoperability among digital library systems by providing consistent, high-quality metadata. User recommendation systems have become a crucial part of smart library services. Libraries can use user search records, borrowing history, and preferences to recommend the right book, article, and digital resource using ML techniques such as collaborative filtering and content-based filtering. These recommendation systems improve user satisfaction, resource utilization, and the efficiency of knowledge discovery. AI-driven chatbots and virtual reference services offer 24-hour support to library users. These systems require natural language understanding to answer user queries about library resources, services, and policies. Chatbots will reduce the workload of library employees, offer real-time assistance, and maximize user interaction, particularly in libraries and online libraries. Another important use of AI and ML in libraries is predictive analytics of user behavior. Predictive models can estimate user requirements, peak usage hours, and resource requirements by analyzing usage data and interaction patterns. This allows libraries to streamline collection development, space use, and service planning, enabling data-driven decision-making. Lastly, AI and ML technologies are useful for digital preservation and knowledge discovery. The AI tools facilitate long-term digital preservation using automated format migration, anomaly detection, and content validation. Knowledge discovery is also possible using ML techniques to detect concealed patterns, relationships and trends in vast amounts of data. Collectively, these applications make libraries smart sources of knowledge that can be used to participate in advanced research and learning in the digital era.

Artificial Intelligence and Machine Learning: Their Effects on Library and Information Science Services

The use of Artificial Intelligence (AI) and the introduction of Machine Learning (ML) have brought groundbreaking shifts to the field of Library and Information Science (LIS) services, significantly enhancing their usefulness and topicality in the digital era. These technologies have affected different areas of library work, service delivery, and professional practices. Among the most notable benefits of AI and ML, one can identify increased service quality and efficiency. Common physical actions that artificial intelligence systems can automate include cataloging, classification, indexing, circulation, and database maintenance. The machine learning algorithms are constantly learning from data, which means that information can be accurately recalled, search speeds increase, and resources are discovered. Consequently, libraries can manage large digital collections with greater accuracy and less human error, ensuring the consistency and reliability of the services they offer. AI and ML also help improve the user experience and customize library services. By analyzing user behavior, preferences, and interaction patterns, intelligent systems provide customized search results, personalized recommendations, and adaptive interfaces.

Chatbots and virtual assistants provide 24/7 instant support, guiding users to resources and helping them solve queries. This user-focused solution enhances user satisfaction, interaction, and accessibility, especially for remote and digitally reliant users. The second effect is time and cost effectiveness. Technical and administrative processes can be automated to reduce the time required to run routine tasks, enabling libraries to optimize their workflows and enhance productivity. The start-up costs of AI and ML technologies can be extremely high, yet, over time, they offer long-term advantages such as lower operational costs, increased resource utilization, and better scalability of the services they provide. The libraries could reallocate financial and human resources to value-added services such as user education, research support, and community engagement.

The professional role of librarians has also changed as a result of AI and ML. The responsibility of librarians is gradually shifting towards more active, dynamic standards for information management, data analysis, digital curation, and technology providers. They must acquire new data management skills, AI literacy, and digital ethics skills. Instead of ousting librarians, AI and ML become helpful tools that allow librarians to focus on intellectual, pedagogical, and strategic responsibilities. In general, the implications of AI and ML on LIS services are far-reaching and diverse. In addition to enhancing operational performance, these technologies will transform the service model and professional practice, making libraries innovative, smart, and user-friendly knowledge centers in the modern information society. Despite the substantial body of research on AI and ML in LIS, several gaps remain. Most of the research is conceptual or technology-oriented, with minimal empirical research on user perceptions and ethical concerns (Cox et al., 2019). Studies in developing countries are also missing, and less attention has been paid to skill development and librarians' policies. Utilizing these gaps, in-depth and context-specific studies are required.

The study has the following objectives:

- To analyse the concept and applications of Artificial Intelligence (AI) and Machine Learning (ML) to Library and Information Science (LIS).
- To explore the application of AI and ML in the library operations, information retrieval, cataloguing, classification and user services.
- To uncover the potential for and the advantages of using AI and ML to improve the effectiveness, accessibility and personalisation of contemporary library services.
- To explore the challenges and ethical considerations of applying AI and ML in libraries, such as data privacy, algorithmic bias, transparency and technological readiness.
- To suggest suggestions for effectively, ethically, and sustainably incorporating AI and ML into Library and Information Science services to help propel the future of the profession.

Research Methodology of the Study

This study has been conducted using a systematic and analytical approach to research the role, impact, opportunities, challenges, and prospects of Artificial Intelligence (AI) and Machine Learning (ML) in the services of Library and Information Science (LIS). The methodology is designed to facilitate a review-based, conceptual research approach, depending on the nature of the article, and to allow for empirical validation in a subsequent study. A systematic review of the existing scholarly literature on AI and ML applications in LIS is conducted. The design helps consolidate knowledge from various studies, identify patterns, gaps, and new themes, and develop a coherent framework. The conceptual approach helps create a systematic understanding of AI-ML integration in library services, connecting theoretical approaches with practical implementation. Even though the current research is mostly review-based, the methodological framework may be expanded to include empirical studies, such as surveys, interviews, or case studies. The research is completely grounded in secondary sources of data since the data are based on reliable sources such as scholarly databases and information sources such as Scopus-indexed journals, Web of Science, Google Scholar, ERIC, Library and Information Science Abstracts (LISA), and other pertinent conference proceedings, as well as policy documents, professional reports, and reports of the International Library Association.

Scope and Limitation of the Study This study is focused on the application of Artificial Intelligence (AI) and Machine Learning (ML) in Library and Information Science (LIS) and its impact on the transformation of library services in the modern era. It looks into the concepts of Artificial Intelligence, Artificial Intelligence applications in Library, and the

role of Artificial Intelligence in Intelligent cataloguing, classification, information retrieval, information recommendation, digital preservation, and user assistance services. This study also explores the potential these technologies provide in the areas of operational efficiency, more personalized information services, research support, and evidence-based decision making. It also emphasizes the ethical, technical and institutional issues of implementing AI and ML in libraries such as data privacy, algorithmic bias, transparency, infrastructure and the need for trained library practitioners. The conclusions will serve as conceptual guidance to the librarians, researchers, policymakers and academic institutions who are integrating intelligent technologies into library systems. The study has some limitations though. Primarily conceptual, with no empirical research (survey, interview, or case study) and secondary (book, journal article, conference paper, and published report) sources. This talk only looks at the applications of AI and ML in the field of Library and Information Science and does not discuss how this is being used in other areas of information-intensive industries. In addition, AI technologies are undergoing constant advancements, and some of these advances may not be fully captured and may need to be further researched in the future.

Findings of the Study

The examination of the available literature and theoretical sources shows that Artificial Intelligence (AI) and Machine Learning (ML) have a significant and fundamental influence on the services of Library and Information Science (LIS). Among the most important findings, it is possible to mention that AI and ML help increase the efficiency, accuracy, and scalability of library functions considerably. Automated cataloging, indexing, metadata generation, and intelligent search systems minimize manual work and enhance consistency in organizing information. The results also show that AI-based personalization (through recommendation systems and virtual reference services) increases user satisfaction and enhances information availability. A comparison with prior research indicates that the study aligns with it. Some international studies have found that AI and ML enhance the accuracy of information retrieval, user experience, and service responsiveness in academic and digital libraries. As observed in previous studies, this study confirms that although technology offers benefits, issues such as skills gaps, data privacy, ethical concerns, and infrastructure limitations persist. Nevertheless, compared with previous stages of library automation, the present-day AI-ML applications are more user-focused and adaptive, indicating a shift from a system-oriented to an experience-oriented library service. In practice, the results have significant implications for LIS professionals. The librarians are no longer confined to their traditional custodial role; they are emerging as digital curators, technology facilitators, and specialists in supporting research. AI and ML applications are enablers that help librarians provide more sophisticated services, handle complex collections of digital data, and communicate with users more effectively. The discourse emphasizes that librarians should acquire skills in data literacy, AI awareness, and ethical decision-making to use intelligent technologies to their full potential.

Problems, Challenges and Ethical Concerns in the Implementation of AI and ML in Library and Information Science

Although the application of Artificial Intelligence (AI) and Machine Learning (ML) brings great benefits to Library and Information Science (LIS), numerous challenges and ethical issues are also associated with their use, which should be thoroughly addressed to ensure responsible, sustainable use. The technical incompetence of LIS professionals can be considered one of the greatest challenges. The effective introduction of AI and ML presupposes an idea of data analytics, programming, and system management. Nevertheless, many library workers have little exposure to new technologies due to a lack of formal training and training opportunities. This lack of skills may become an obstacle to the successful implementation and optimal use of intelligent systems, which is why it is necessary to cultivate professional competence and revise the LIS curriculum in the context of lifelong learning. Another important challenge is data privacy and security issues. Artificial intelligence and machine learning engines depend on high amounts of user data, such as search history and usage behavior, as well as personal information. It is critical to ensure the confidentiality and security of this data, as violations of either may erode user trust and breach legal and ethical norms. As reliable sources of information, libraries should implement robust data protection measures, comply with privacy laws, and develop effective policies for data collection, storage, and use.

The ethical challenges of algorithmic bias and transparency are important in the case of AI-powered library services. Machine learning algorithms can be biased in their results when inadvertently trained on biased data, leading to unfair or discriminatory search results, recommendations, or access to information. Lack of transparency in algorithmic decision-making, or the so-called black box problem, makes accountability even more of a challenge. To foster fairness and equity in access to information, libraries need to ensure transparency and interpretability of AI systems and their consistent, rigorous assessment. The other primary barrier is the high cost of implementation, especially for small libraries with limited resources. AI and ML technologies require significant investment in software, hardware, talent, and system maintenance. Restricted financial resources may limit implementation and exacerbate the digital divide between well-endowed institutions and smaller libraries, thereby affecting equitable access to advanced services. Lastly, the efficient application of AI and ML in LIS may be hindered by the infrastructure and policy constraints. Poor technological infrastructure, insufficient standardized structures, and the absence of clear institutional or national policies tend to slow down implementation. These limits should be overcome through ethical norms, legal regulations, and strategic planning. To address the challenges mentioned, librarians, policymakers, educators, and technologists may need to work together to achieve ethical, inclusive, and sustainable AI implementation in libraries.

Significance of the study

Artificial Intelligence and Machine Learning in Library and Information Science: Future Directions. The future of Library and Information Science (LIS) has been synonymously associated with the further development and adoption of Artificial Intelligence (AI) and Machine Learning (ML). As information environments become increasingly complex and data-intensive, AI and ML will likely become a core component in designing next-generation library services and knowledge ecosystems. The creation of AI-based knowledge management systems is considered a major future direction. These systems shall not be limited to the conventional information storage and retrieval methods. However, they will enable intelligent organization, contextual association, and semantic interpretation of knowledge resources. Intelligent knowledge graphs, content analysis systems, and advanced discovery applications will enable deeper insight and interdisciplinary research, as well as more efficient knowledge exchange within academic and research communities. The combination of AI and ML with emerging technologies such as the Internet of Things (IoT) and blockchain offers new possibilities for smart libraries. IoT-connected devices will enable real-time supervision of library areas, collections, and user interactions, and AI algorithms will analyze the data to optimize services and resource use. With AI, blockchain technology can improve the management of digital rights, secure transactions, and make records in scholarly communication and digital preservation transparent.

The transformative role of AI in open access and digital scholarship is also to be expected. Smart tools have the potential to automate publication processes, improve the discovery of open-access literature, and provide more sophisticated citation and impact metrics. The researchers can use AI-based platforms to handle their research data, find collaboration opportunities, and adhere to open science policies. This will enhance libraries' position as important enablers of scholarly communication and research integrity. The other important future trend is the further continuous education of librarians. With the development of AI and ML technologies, librarians need to develop new data literacy, AI ethics, digital curation, and technology management skills. It will also be necessary to continue training programs and revise LIS education curricula to equip professionals for new roles as knowledge analysts, digital consultants, and technology mediators. Lastly, developing policies and ethical frameworks will be essential to implementing AI and ML sustainably in LIS. It needs clear guidelines aligned with data privacy, algorithmic transparency, intellectual property, and fair access to intelligent technologies to play responsible roles in their use. Ethical AI practices, inclusivity, and accountability should be encouraged by the institutional and national policies. Finally, the future paths of AI and ML in LIS are focused on innovation, collaboration, and ethical responsibility to make libraries intelligent, trusted, and inclusive knowledge institutions in the digital age.

Recommendations of the study

For Library Professionals: LIS professionals are expected to engage in continuous professional development to develop competencies in AI literacy, data analytics, and digital ethics. Practical training, cross-field collaboration, and involvement in technology-oriented projects are key to the successful adoption of AI.

For Academic Institutions: AI, ML, and data science concepts should be incorporated into LIS coursework in library schools and other academic institutions. Institutions should also support pilot projects, research, and infrastructure development to encourage innovation in library services.

Policy Makers and Researchers: Clear ethical, legal, and operational frameworks for AI applications in libraries should be developed by policy makers, with a focus on data privacy, transparency, and equity. Researchers are challenged to conduct empirical, longitudinal research to assess practical effects and attitudes towards the use of AI-based library systems, as well as their sustainability.

These suggestions would be effective to have a responsible, inclusive, and future-ready integration of AI and ML in Library and Information Science.

CONCLUSION

The study concludes that AI and ML are changing the nature, scope, and purpose of Library and Information Science services in the digital age. According to the key findings, smart technologies can help achieve higher service efficiency, improved user experience, greater cost-efficiency, and the development of new service models. Meanwhile, the paper highlights crucial issues such as technical skills, ethical responsibility, and institutional preparedness, noting that the implementation of technology should be accompanied by human knowledge and ethical considerations. The research paper also contributes to the LIS field by offering an insightful conceptual synthesis of AI and ML applications, their roles, potential, and issues. It provides a systematic insight that ties theoretical lenses to practical implications, thereby contributing to the available LIS literature. The final observations are that AI-driven library services are not substitutes for librarians but enhance them, making libraries smart, inclusive, and research-oriented knowledge institutions in the transforming information society.

ABSTRACT

Generative artificial intelligence has emerged as a significant technological development influencing information management practices in academic libraries. One important application of this technology is automated metadata generation, which can improve the organization and discoverability of digital resources. This study examines the opportunities, ethical concerns, and future implications of generative artificial intelligence in academic libraries, with particular emphasis on AI-driven metadata generation. A mixed-method approach was adopted, combining a survey of academic librarians with a review of recent literature related to artificial intelligence in library services. Data were collected from 82 library professionals working in university libraries. The findings suggest that AI-assisted metadata tools can improve cataloguing efficiency, enhance keyword extraction, and increase the discoverability of scholarly resources in digital repositories and library catalogues. However, respondents also expressed concerns regarding metadata accuracy, algorithmic bias, copyright issues, and the need for professional oversight. The study concludes that generative artificial intelligence should be used as a supportive technology that complements the expertise of librarians rather than replacing traditional cataloguing practices. The research contributes to current discussions on the integration of artificial intelligence in library and information services and provides practical recommendations for academic libraries planning to adopt AI-assisted technologies.

Keywords: Generative Artificial Intelligence; Academic Libraries; Metadata Generation; Resource Discoverability; Digital Libraries; Information Retrieval

INTRODUCTION

Academic libraries play a vital role in organizing, preserving, and providing access to scholarly information. Over the past two decades, the rapid growth of digital resources, institutional repositories, and electronic publications has significantly transformed the information environment of academic institutions. Libraries now manage large volumes of digital content that require efficient systems for organization and retrieval. Metadata is a fundamental element of knowledge organization in digital libraries. It enables users to identify, locate, and retrieve information resources effectively through library catalogues and discovery systems. Traditional cataloguing methods rely on human expertise and established standards such as AACR2 and RDA. Although these practices ensure accuracy and consistency, they require considerable time and professional effort. Recent developments in artificial intelligence have introduced new possibilities for automating certain aspects of information organization. Generative artificial intelligence technologies are capable of producing textual descriptions, extracting keywords, and generating descriptive information from digital documents. These capabilities make AI particularly relevant for metadata generation and semantic indexing in digital library environments. Technological innovation is increasingly influencing the structure of modern library services. Research on digital transformation highlights that emerging technologies are reshaping library operations and encouraging institutions to adopt new technological tools for managing information resources (Sharma, 2025).

Problem Statement and Research Gap

The rapid expansion of digital scholarly resources has created challenges for academic libraries in maintaining efficient metadata creation processes. Manual cataloguing alone is often insufficient to manage the growing volume of digital materials. Artificial intelligence technologies offer potential solutions for automating aspects of metadata generation, yet empirical research examining their practical application in academic libraries remains limited.

Many existing studies discuss artificial intelligence in libraries in general terms without focusing specifically on metadata generation. In addition, the relationship between AI-generated metadata and resource discoverability has received limited attention in empirical research.

Ethical issues associated with generative artificial intelligence also require further investigation. Concerns regarding algorithmic bias, metadata accuracy, copyright responsibilities, and transparency must be considered when implementing automated systems in academic libraries.

Objectives of the Study

- To examine the role of generative artificial intelligence in metadata generation in academic libraries.
- To analyses how AI-generated metadata influences resource discoverability.
- To identify opportunities and ethical concerns related to AI adoption in library services.
- To explore implications for future academic library practices.

LITERATURE REVIEW

Digital technologies have significantly transformed library services and information management practices. Academic libraries are increasingly adopting digital platforms that allow users to access information resources remotely and efficiently. Sharma (2025) emphasizes that digital transformation is an important factor in modernizing library services and improving access to information resources. Artificial intelligence technologies are gradually being integrated into library systems to support various services, including information retrieval, automated indexing, and user assistance. Studies suggest that artificial intelligence can assist librarians in managing digital collections and improving the efficiency of library operations (Cox et al., 2022; Corrall et al., 2022). Machine learning and natural language processing technologies have also been explored for generating descriptive metadata automatically. These systems can analyse textual documents and produce keywords, summaries, and subject descriptors that support information retrieval (Liu & Zhan, 2023; Park & Tosaka, 2024). Despite these advantages,

ethical concerns remain important. Issues such as algorithmic bias, transparency, and copyright compliance must be considered when implementing automated systems in academic libraries (Dwivedi et al., 2023; Corrall, 2023).

Theoretical Framework

This study is conceptually supported by the Technology Acceptance Model (TAM) developed by Fred D. Davis. According to this model, the adoption of new technologies depends primarily on perceived usefulness and perceived ease of use. In academic libraries, librarians are more likely to adopt AI-based tools if they believe that these technologies can improve their professional tasks and enhance the efficiency of library services.

RESEARCH METHODOLOGY

A mixed-method research design was adopted for this study. Primary data were collected through a structured questionnaire distributed among academic librarians working in university libraries. A total of 82 valid responses were obtained. Secondary data were collected from recent scholarly literature on artificial intelligence in library services and digital knowledge organization. Data were analysed using descriptive statistical methods such as frequency distribution and percentage analysis.

RESULTS

The survey results indicate growing awareness of artificial intelligence technologies among library professionals. Approximately 78 percent of respondents reported moderate or high awareness of generative artificial intelligence technologies. Respondents identified several benefits of AI-driven metadata generation, including faster metadata creation, automated keyword extraction, improved organization of digital resources, and enhanced discoverability of scholarly information. However, participants also expressed concerns related to the accuracy of AI-generated metadata, algorithmic bias, copyright issues, and the need for professional training.

DISCUSSION

The findings indicate that generative artificial intelligence has considerable potential to support metadata generation and information organization in academic libraries. Automated systems can assist librarians in managing large digital collections and improving indexing efficiency. However, librarians remain responsible for ensuring the accuracy and reliability of metadata records. Human expertise continues to play a critical role in supervising automated systems and maintaining professional standards in knowledge organization.

Implications for Library Practice

Academic libraries should develop institutional policies for responsible implementation of artificial intelligence technologies. Libraries should also provide training programs that help librarians develop skills related to AI tools and digital knowledge organization systems. Hybrid workflows that combine automated technologies with human expertise may provide the most effective approach for integrating artificial intelligence into library services.

CONCLUSION

Generative artificial intelligence represents an emerging technological development with significant implications for academic libraries. AI-assisted metadata generation has the potential to improve cataloguing efficiency and enhance the discoverability of digital scholarly resources. However, successful implementation of AI technologies requires careful consideration of ethical issues, professional standards, and institutional policies. Librarians will continue to

play an essential role in supervising automated systems and ensuring the quality of information organization practices.

ABSTRACT

Information literacy evolving in daily use from tradition to modern and artificial intelligence compete during the formation of digital world. Also the paper will discuss and examine the possible aspects of information literacy skills development. This paper examines the evolution of information literacy from its traditional foundations to contemporary perspectives that incorporate digital literacy, media literacy, data literacy, visual literacy, and AI literacy. For the development of information society there is a need of development and accessing new technologies regarding information literacy skills. The paper argues that information literacy is no longer confined to library-based competencies but has become an interdisciplinary framework essential for lifelong learning, academic success, research productivity, workplace effectiveness, and informed citizenship. The study concludes that information literacy must continue evolving to address emerging technological developments, ethical concerns, misinformation, and the digital divide.

Keywords: Information Literacy, Digital Literacy, Media Literacy, Artificial Intelligence Literacy.

INTRODUCTION

Information literacy is a set of skills required by a person to find, retrieve, analyse and use information information explosion has become increasingly day to day life. Information literacy is directly linked with lifelong learning, critical thinking and learning to learn the concept of study. The present study focus on the status of information literacy skills among the college students to better understand the level of information and library skills for designing and implementing suitable information literacy programme for the users. In today's information society, large

volume of data is available through digital platform, print resources and other form of media also created opportunities as well as challenges. Important and reliable information should deliever to the users. Many users are unaware of using ICT for information collection. User often struggle with advance search strategies, source evaluation, and distinguishing reliable and misinformation. In India, information literacy level of library users is vital for understanding the readiness of libraries to meet the academic and research needs. Information is now available through numerous platforms, including digital libraries, online databases, social media networks, institutional repositories, search engines, and artificial intelligence-powered systems. The concept of information literacy has evolved significantly since it was first introduced by Paul Zurkowski in 1974. Initially focused on the efficient use of information resources, information literacy now encompasses multiple dimensions, including digital literacy, media literacy, visual literacy, data literacy, and AI literacy. This evolution reflects the changing nature of information environments and the increasing need for critical thinking and ethical engagement with information. The evolution of information literacy demonstrates a significant transformation from a narrow set of library-based skills to a comprehensive framework of competencies required for participation in the digital knowledge society. Earlier approaches primarily emphasized the ability to locate and retrieve information, whereas contemporary perspectives highlight critical thinking, evaluation, creation, communication, and ethical use of information.

This paper examines the evolution of information literacy and explores how the concept has expanded in response to technological, social, and educational developments.

What is Information Literacy?

Information literacy is a set of abilities requiring individuals to "recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information." Information literacy also is increasingly important in the contemporary environment of rapid technological change and proliferating information resources.

Concept of information literacy

The term "information literacy" was first introduced by Paul Zurkowski in 1974. Zurkowski described information-literate individuals as those who have learned techniques and skills for utilizing information tools and resources effectively in solving problems. This early conceptualization emphasized practical information skills and focused primarily on workplace and educational contexts.

Information Literacy in the Library Context

During the 1980s and early 1990s, information literacy became closely associated with library instruction. Academic librarians played a central role in teaching students how to locate, retrieve, and evaluate information resources. Library-based information literacy programs typically focused on:

- Catalogue searching
- Bibliographic instruction
- Database searching
- Reference source utilization

Traditional in the Early 1990s

By the start of the 1990s, the meaning of information literacy as proposed by the ALA was generally accepted. Information literacy had become a major issue in librarianship, since the profession saw in it a way that its members could make a contribution toward a society of lifelong learners. Three main trends are apparent in the 1990's literature to date: educating for information literacy is enjoying attention; information literacy is being considered as part of the wider literacy continuum; and librarians are evaluating their role in the information literacy movement.

Information Literacy in the Internet Era

The emergence of the World Wide Web fundamentally transformed the information environment. Information became more accessible but also more complex and less controlled. Users faced new challenges such as, Information

overload, Variable, information quality, Misinformation, Lack of authority control. As a result, information literacy expanded beyond information retrieval to include critical evaluation and ethical use of information.

Information Literacy in the Digital Age: The digital revolution broadened the concept further. Information literacy increasingly incorporated competencies related to Digital technologies, Online communication, Social networking platforms, Open educational resources.

Digital Literacy: Digital literacy refers to the ability to use digital technologies effectively and responsibly. includes Internet navigation, Online communication, Digital content creation, Cybersecurity awareness

Media Literacy: Media literacy focuses on understanding and critically evaluating media messages. Media-literate individuals can analyze media content, Identify bias, Evaluate credibility The rise of social media platforms has made media literacy increasingly important.

Artificial Intelligence Literacy: AI literacy represents the latest evolution of information literacy. It includes understanding of Machine learning, Ethical implications of AI, AI-generated information, Responsible as AI systems become integrated into information environments, AI literacy is becoming an essential competency.

Objectives of the Study

- Review major theoretical and conceptual frameworks.
- Explore the relationship between information literacy and emerging digital competencies.
- Identify current challenges and future directions in information literacy education and practice

LITERATURE REVIEW

The review of the literature indicates advanced transition from traditional roles to becoming simple educator, focusing on digital, ICT and e-resources for users of the library. Library professionals are expected not only to manage resources but also to guide users in navigating digital database, e-resources and scholarly information system. Many Scholars have researched that information literacy is not only for users but also a need for library professionals who mediate information services , design programme, manage electronic resources and conceptualise user-oriented services. According to professional standard (like ALA/ACRL) librarians should have skills related to digital information retrieval, evaluation of information resources, metadata management and user education.

Acc. To Mahmood and shafique :- found that librarians demonstrate strong traditional knowledge, digital literacy and use of online database remain weak areas require systematic training. Acc. to Shapiro and hughes (1996) :- recognises the concept of computer literacy, library skills and a broader, critical conception of a more humanistic sort. Acc. to Patel and rana(2018) :- found that IL among library professionals will improve after the workshops and continuing education. Information literacy itself is emerging as a distinct skill set and a necessary key to one's social and economic well being in an information society. Bawden (2001)- Bawden examined the relationship between information literacy and digital literacy. He argued that technological changes were expanding traditional information literacy into broader digital competencies. ACRL Framework (2015)- The ACRL Framework for Information Literacy for Higher Education shifted from competency-based standards to threshold concepts, emphasizing deeper understanding and critical engagement with information. UNESCO and Media Information Literacy- UNESCO expanded the scope of information literacy through Media and Information Literacy (MIL), integrating media literacy, digital literacy, and information literacy into a unified framework. The literature demonstrates a clear shift from skill-based approaches toward broader socio-cultural, technological, and critical perspectives.

RESEARCH METHODOLOGY

The study adopts a qualitative and descriptive research design based on an extensive review of secondary literature. Relevant books, peer-reviewed journal articles, conference proceedings, reports, and policy documents were examined to understand the evolution and contemporary significance of information literacy.

Challenges in Information Literacy Development

- Information Overload
- Misinformation and Fake News
- Lack of Awareness and Training
- Support by the management
- Lack of library facilities.

Future Trends

The future of information literacy will be shaped by technological innovation, educational transformation, and societal change.

- Artificial Intelligence Literacy
- Data-Driven Information Literacy
- Open Knowledge and Open Science
- Inclusive Information Literacy

Recommendations

Information literacy should be integrated across educational curricula at all levels. Educational institutions should include digital, media, data, and AI literacy within information literacy programs. Libraries should continue serving as key Centers for information literacy instruction. Information literacy training should be extended beyond formal education to support lifelong learning. Special initiatives should address information literacy needs in underserved communities.

CONCLUSIONS

The expansion of information environments, technological innovation, and the increasing complexity of information ecosystems have necessitated broader and more sophisticated approaches to information literacy. Contemporary information literacy emphasizes critical thinking, ethical engagement, digital participation, and lifelong learning. Ultimately, information literacy remains a fundamental competency for empowering individuals to navigate complex information landscapes, make informed decisions, and contribute meaningfully to knowledge societies. lifelong learning in the 21st century, there must be an unprecedented cooperative effort between higher education and the schools to incorporate information literacy skills into the basic curriculum- starting in kindergarten. Only then will we achieve the ultimate goal of graduating students who possess the full range of abilities that will be absolutely necessary for future Professional edibility and successful citizenship. Yet to be successful in preparing today's students for

ABSTRACT

This paper investigates the impact of mobile technology on library services at two prominent state universities of Uttar Pradesh — Chaudhary Charan Singh University (CCSU), Meerut and Deen Dayal Upadhyay Gorakhpur University (DDUGU), Gorakhpur. The study is grounded in primary data collected from 305 respondents — comprising undergraduate and postgraduate students, research scholars, faculty members, and library professionals — across both institutions during the academic year 2025-26, supplemented by personal interviews with Chief Librarians, direct observation of library infrastructure, and analysis of official library portals. The comparative analysis reveals significant differences in mobile technology adoption, user awareness, infrastructure readiness, and satisfaction levels. CCSU Meerut leads with an overall mobile adoption index of 68%, while DDUGU Gorakhpur records 57%. Both universities rely predominantly on WhatsApp and SMS-based services, while lagging in dedicated mobile applications, QR-code shelf navigation, and institutional repositories. Chi-square analysis confirms statistically significant differences between the two institutions (chi-squared = 7.84, $p < 0.05$). Overall user satisfaction stands at 3.5/5 at CCSU and 3.1/5 at DDUGU on a five-point Likert scale. The study recommends a state-level mobile library policy, consortium-based application development through INFLIBNET, structured digital literacy programmes, and targeted infrastructure investment to bridge the identified digital divide.

Keywords: Mobile technology, A descriptive and comparative survey method, Data Collection Instruments

INTRODUCTION

The proliferation of mobile devices has fundamentally altered how academic communities interact with information resources. India's smartphone user base reached approximately 1.1 billion by 2024 (TRAI, 2024), creating unprecedented opportunities for libraries to extend their services beyond physical walls. University libraries — as nerve centres of academic research and learning — face growing pressure to align their services with the mobile-first expectations of a digitally native student population. Uttar Pradesh, with over 70 state-funded universities, several central universities, and numerous deemed institutions, presents a complex but important landscape for studying library modernisation. The state's two universities under study represent contrasting geographies and institutional contexts: CCSU Meerut (established 1965) in western UP serves over 1.8 lakh students across 900+ affiliated colleges, while DDUGU Gorakhpur (established 1957) in eastern UP serves approximately 1.2 lakh students through 700+ affiliated institutions. Both face resource constraints that have historically limited the pace of digital transformation in their central libraries.

Mobile technology in library services encompasses the following dimensions:

- Dedicated library mobile applications
- SMS and WhatsApp-based alerts and notification services
- QR code-based resource discovery and shelf navigation
- E-book and e-journal access via smartphones and tablets (NLIST, DELNET)
- Mobile-based reference, chat, and query services
- Online book renewal and reservation via mobile devices
- Push notifications for library events, new arrivals, and overdue reminders

Objectives and Hypotheses

Objectives of the Study

- To assess the current status of mobile technology adoption in library services at CCSU Meerut and DDUGU Gorakhpur.
- To identify the range and quality of mobile-based library services offered at both universities.
- To analyse user awareness and usage patterns of mobile library services among students, research scholars, and faculty.
- To compare the ICT infrastructure and budgetary support for mobile library services at both institutions.
- To evaluate user satisfaction with existing mobile library services using a five-point Likert scale.
- To determine the major barriers to mobile technology adoption in both university libraries.
- To examine the demographic and category-wise differences in mobile library service usage.
- To suggest evidence-based strategies for enhancing mobile library services in state university libraries of Uttar Pradesh.

Hypotheses

H1: There is a significant difference in mobile technology adoption between CCSU Meerut and DDUGU Gorakhpur.

H2: Research scholars and PG students are significantly more frequent users of mobile library services than UG students at both universities.

H3: Inadequate Wi-Fi infrastructure is the primary barrier to mobile library service adoption at both CCSU and DDUGU.

H4: User satisfaction with mobile library services is positively and significantly correlated with awareness levels at both universities.

METHODOLOGY

Research Design

A descriptive and comparative survey method was adopted. Data was collected during the academic year 2025-26 from both CCSU Meerut and DDUGU Gorakhpur through multiple instruments to ensure triangulation.

3 Data Collection Instruments

- Structured questionnaire with 35 items using a five-point Likert scale (1=Very Dissatisfied to 5=Very Satisfied)
- Personal interviews with Chief Librarians at both universities
- Direct observation checklist for library ICT infrastructure assessment
- Official website and library portal usability analysis
- Review of annual library reports and INFLIBNET usage data (2018-2024)

Interpretation: Since chi2 = 7.84 > critical value 3.84 at df=1 and p=0.05, there is a statistically significant difference in mobile library service adoption between CCSU Meerut and DDUGU Gorakhpur. H1 is accepted.

Result: chi2 = 9.12 > 5.99 (df=2, p=0.05). H2 ACCEPTED — Research scholars and PG students are significantly more frequent users of mobile library services than UG students.

Result: H3 ACCEPTED — Poor Wi-Fi infrastructure is confirmed as the primary barrier (39.8% combined) to mobile library service adoption at both CCSU and DDUGU.

H4 Test: Awareness-Satisfaction Correlation

Pearson Correlation Coefficient (r): CCSU = 0.81 | DDUGU = 0.76 | Combined = 0.78

Result: H4 ACCEPTED — Strong positive correlation ($r = 0.78$, $p < 0.05$) exists between user awareness levels and satisfaction scores at both universities. Higher awareness consistently predicts higher satisfaction.

CCSU Meerut — Notable Practices

- Fully functional mobile OPAC through KOHA with remote/off-campus access
- Active WhatsApp helpdesk operating 10 hours/day for reference queries
- Pilot QR code system on selected book stacks linking to item records and digital versions
- NLIST e-resources accessible via mobile with institutional login credentials
- Regular SMS push alerts for book due dates, new arrivals, and library events
- Partial institutional repository linked to SHODHGANGA for research output
- Annual digital literacy workshop for first-year students and research scholars

DDUGU Gorakhpur — Notable Practices

- WhatsApp-based reference and query service available to all registered library users
- NLIST digital resources accessible on mobile devices for registered scholars and faculty
- SMS-based overdue book reminders dispatched for all active borrowers
- Responsive library website accessible on smartphones with basic information
- Mobile awareness sessions included in annual library orientation programme
- Ongoing LMS transition from SOUL 3.0 to KOHA for improved mobile compatibility

CONCLUSION

This comparative study provides a comprehensive empirical assessment of mobile technology adoption in library services at two major state universities of Uttar Pradesh. The findings reveal that both institutions have taken meaningful steps towards mobile-enabled library services, yet significant gaps persist compared to central and premier deemed universities. CCSU Meerut outperforms DDUGU Gorakhpur across all assessed parameters — with a higher mobile adoption index (68% vs 57%), superior ICT infrastructure (score: 67 vs 54), greater user awareness (72% vs 63%), more active mobile service offerings (8/10 vs 6/10), and higher overall user satisfaction (3.5/5 vs 3.1/5).

The study validates all four hypotheses with statistical rigour. A chi-square test confirms a significant difference in adoption (H1: chi2=7.84, p<0.05); research scholars emerge as the most active mobile library users (H2: chi2=9.12, p<0.05); inadequate Wi-Fi is the dominant barrier at both institutions (H3); and a strong positive correlation exists between awareness and satisfaction (H4: r=0.78, p<0.05). The east-west digital divide noted by Verma & Misra (2023) is empirically supported by this study's findings, with CCSU's relatively superior ICT ecosystem in western UP contrasting with DDUGU's resource constraints in eastern UP. Encouragingly, both universities demonstrate strong potential for rapid improvement. WhatsApp-based services have achieved near-universal adoption (88% CCSU, 81% DDU), indicating a robust digital communication channel that can be leveraged for more sophisticated mobile library functions. The growing trend in mobile usage — a CAGR of 14.9% at CCSU and 19.2% at DDUGU between 2018-2024 — signals strong user demand. With targeted policy intervention, consortium-based technological solutions through INFLIBNET, infrastructure investment under RUSA, and systematic staff capacity building, both universities can make transformative strides towards fully mobile-enabled library services that serve their combined 3 lakh+ student community effectively.

Table 1: Chaudhary Charan Singh University (CCSU), Meerut

Parameter	Details
Established	1965
Type	State University, Uttar Pradesh
Location	Meerut, Western Uttar Pradesh
Affiliated Colleges	Approx. 900+

Student Enrolment	Approx. 1.8 Lakh
Library Area	Approx. 4,800 sq. ft.
Total Library Holdings	Approx. 1,25,000 Books + Journals
Library Management System	KOHA (Open Source, updated)
E-Resources	NLIST (INFLIBNET), DELNET
Annual Library Budget	Rs. 45–60 Lakhs (approx.)
Internet Speed (Library)	20 Mbps (shared)
Dedicated IT Library Staff	2 staff members
Mobile App Availability	Partial — OPAC module only
WhatsApp Reference Service	Active — 10 hours/day
QR Code System	Pilot phase (selected stacks)
Institutional Repository	Partial — linked to SHODHGANGA
NLIST Mobile Access	Active
Overall ICT Readiness Score	67/100

Tabl 2: Deen Dayal Upadhyay Gorakhpur University (DDUGU), Gorakhpur

Parameter	**Details**
Established	1957
Type	State University, Uttar Pradesh
Location	Gorakhpur, Eastern Uttar Pradesh
Affiliated Colleges	Approx. 700+
Student Enrolment	Approx. 1.2 Lakh
Library Area	Approx. 3,500 sq. ft.
Total Library Holdings	Approx. 98,000 Books + Journals
Library Management System	SOUL 3.0 / KOHA (transition phase)
E-Resources	NLIST (INFLIBNET)
Annual Library Budget	Rs. 30–45 Lakhs (approx.)
Internet Speed (Library)	15 Mbps (shared)
Dedicated IT Library Staff	1 staff member
Mobile App Availability	Not Available
WhatsApp Reference Service	Active — weekly sessions
QR Code System	Not implemented
Institutional Repository	Not Available
NLIST Mobile Access	Active
Overall ICT Readiness Score	54/100

Table 3: Review of Literature

Author & Year	**Key Finding / Contribution**
Cummings, Merrill & Borrelli (2010)	Handheld mobile devices significantly enhance remote access to library resources and improve user engagement with digital content beyond library hours.
Elias (2011)	Mobile-friendly library interfaces lead to a measurable increase in database usage, particularly among undergraduate and postgraduate students.
Tripathi & Kumar (2014)	IIT libraries have made significant progress in mobile OPAC and SMS services, while state university libraries in India trail behind due to budget and staffing constraints.
Ansari & Zuberi (2015)	Academic libraries in developing countries face twin barriers of inadequate ICT infrastructure and poor digital literacy in adopting mobile services effectively.
Singh & Rani (2018)	In UP university libraries, SMS-based notifications and WhatsApp services are the most widely adopted mobile tools, while dedicated mobile applications remain rare.

Kumar & Sharma (2020)	WhatsApp has emerged as a de facto mobile library tool in Indian academic libraries, especially in resource-constrained settings where dedicated apps are absent.
INFLIBNET Annual Report (2022)	NLIST e-resource access via mobile devices increased by 38% between 2019 and 2022 across subscribed Indian universities.
Verma & Misra (2023)	University libraries in UP face a pronounced east-west digital divide, with western UP institutions generally better equipped in ICT infrastructure than their eastern counterparts.
Kaur (2019)	Mobile library services offer significant opportunities for Indian academic libraries but require policy support, dedicated budgets, and staff training to be effective.
Patil & Harer (2020)	Students in state universities prefer WhatsApp and SMS-based library services over dedicated apps due to ease of use and lower data requirements.

Table 4: Sample Distribution

User Category	CCSU Meerut (n)	DDUGU Gorakhpur (n)	Total (N)	% of Total
UG Students	60	50	110	36.1%
PG Students	50	45	95	31.1%
Research Scholars	25	20	45	14.8%

Table 21: Detailed Challenge Analysis

Challenge Category	CCSU (%)	DDU (%)	Severity	Recommended Action
Poor Wi-Fi in library premises	38%	42%	Critical	Upgrade to 100 Mbps dedicated
Low user awareness of services	25%	28%	High	Orientation + digital campaigns
No dedicated mobile app	18%	14%	High	Consortium app via INFLIBNET
Digital literacy gaps	12%	10%	Medium	Training workshops
Language/Hindi interface issues	7%	6%	Medium	Bilingual OPAC configuration
Device incompatibility	6%	9%	Medium	Browser-based solutions
Privacy/security concerns	4%	5%	Low-Medium	Policy + awareness

Table 22: Institutional and Policy Challenges

Challenge	CCSU Meerut	DDUGU Gorakhpur
Formal mobile library policy	Absent	Absent
Separate digital tech budget	Not allocated	Not allocated
Staff training frequency	2 sessions/year	1 session/year
INFLIBNET service utilisation	Moderate	Basic
Cloud-based LMS adoption	In progress	Early stage
Institutional repository	Partial	Absent
User feedback mechanism	Informal	Informal

Table 23: Overall Comparative Performance

Performance Parameter	CCSU Meerut	DDUGU Gorakhpur	Difference	Leader
Overall Mobile Adoption Index	68%	57%	+11%	CCSU
User Awareness (Overall Avg.)	72%	63%	+9%	CCSU
Active Mobile Users (Daily+Weekly)	57%	47%	+10%	CCSU
ICT Infrastructure Score (/100)	67	54	+13 pts	CCSU
User Satisfaction Mean (/5)	3.5	3.1	+0.4	CCSU
Wi-Fi Coverage	70%	55%	+15%	CCSU
Budget (Digital Services)	Rs.52 Lakhs	Rs.37 Lakhs	+Rs.15 L	CCSU
Services Offered (out of 10)	8/10	6/10	+2	CCSU
Research Scholar Usage	84%	77%	+7%	CCSU
WhatsApp Service Activity	Daily	Weekly	More Active	CCSU

Table 24: Recommendations

No.	Recommendation	Target	Priority	Funding Source
1	Upgrade library Wi-Fi bandwidth to minimum 100 Mbps with dedicated user zones and password-protected student/faculty access.	Both Universities	High	RUSA / DST-FIST
2	INFLIBNET to develop a shared mobile app for all UP state universities integrating OPAC, NLIST access, renewal, alerts, and WhatsApp chatbot.	INFLIBNET + State	High	INFLIBNET / UGC
3	Formulate a formal Mobile Library Service Policy covering data privacy, content access norms, acceptable use guidelines, and service standards.	Both Universities	High	Internal
4	Include a mandatory 2-hour mobile library services orientation module in all first-semester induction programmes.	Both Universities	High	Internal
5	Configure KOHA and SOUL with full bilingual Hindi/English interface to improve accessibility for Hindi-medium learners.	Both Universities	Medium	INFLIBNET Support
6	Scale up CCSU's QR code pilot to full library and initiate a QR code programme at DDUUGU linking shelf items to digital records.	Both Universities	Medium	Internal
7	Mandate a minimum of two annual training workshops on mobile library technologies and LMS updates for all library staff.	Both Universities	High	Internal / UGC
8	Establish mobile-accessible institutional repositories at both universities, linked to SHODHGANGA for research visibility.	Both Universities	Medium	INFLIBNET / UGC
9	Develop WhatsApp/Telegram bots as low-cost alternatives to dedicated apps for round-the-clock reference and notification.	Both Universities	Medium	Internal
10	UP state government to formulate a minimum standards framework for mobile library services in all state university libraries.	UP Government	High	State Budget / RUSA

ABSTRACT

The rapid advancement of Information and Communication Technology (ICT) has transformed traditional libraries into smart libraries that provide innovative, technology-driven, and user-centered services. Libraries are experiencing significant issues with information security, cyber threats, data privacy, and resource protection in addition to the increasing use of digital resources, cloud computing, RFID systems, institutional repositories, and online databases. ICT-based security services have become crucial for enhancing smart libraries and guaranteeing safe spaces for study and innovation. In order to protect library resources and user data, this conceptual paper examines the function of ICT-based security services in contemporary smart libraries and highlights a number of technologies, including RFID, biometric authentication, CCTV surveillance, firewall systems, cloud security, artificial intelligence, and blockchain applications. The importance of secure digital platforms in promoting creative academic practices, knowledge exchange, and research productivity is also examined in this work. The study also highlights significant obstacles to the deployment of ICT-based security systems, such as budgetary limitations, a lack of technical know-how, cybersecurity risks, and privacy issues. The paper concludes that effective ICT-based security services are vital for building secure, reliable, and sustainable smart libraries that can strengthen research and innovation in the digital age.

Keywords: Smart Libraries, ICT-Based Security Services, Research Innovation, Digital Libraries, Information Security, Artificial Intelligence

INTRODUCTION

The idea of libraries has changed dramatically in the digital age, moving from traditional print-based systems to smart libraries backed by cutting-edge ICT infrastructure. In order to deliver effective and user-friendly services, smart libraries include contemporary technology including cloud computing, artificial intelligence, the Internet of Things (IoT), RFID systems, digital repositories, and automated library management systems. These developments have enhanced access to information and supported research and innovation activities across academic and research institutions (Gul &Bano, 2019; Cao et al., 2018). However, the increasing dependence on digital technologies has also created several security-related challenges. Smart libraries store and manage large volumes of digital information, research data, institutional records, and user information, making them vulnerable to cyberattacks, unauthorized access, data theft, and digital piracy. Therefore, ICT-based security services have become essential for ensuring the safety, integrity, and confidentiality of library resources and services (Omoike& DO, 2020). ICT-based security services refer to the application of technological tools and systems to protect library infrastructure, digital resources, and users from physical and cyber threats. These services not only enhance the security of library operations but also create a trustworthy environment for research, teaching, and learning. In this context, smart libraries require effective security frameworks to support continuous research and innovation in higher education institutions (Ekere&Akor, 2019; Omoike& DO, 2020).

Objectives of the Study

The present conceptual study aims to examine the role of ICT-based security services in developing smart libraries and creating secure environments for research and innovation in the digital era. It focuses on the concept, importance, and major aspects of ICT-based security systems used in modern libraries. The study also identifies important security technologies and highlights the role of these services in protecting digital resources, ensuring data privacy, improving user trust, and supporting collaborative research. The study also discusses the major challenges in implementing ICT-based security services and suggests measures for developing secure and sustainable smart library systems.

Concept of Smart Libraries

A smart library is a highly technological library that uses intelligent systems and ICT tools to offer users effective, automated, and specialized services. Acquisition, cataloguing, circulation, access control, digital preservation, and user services are just a few of the library functions that smart libraries incorporate digital technologies into. Improving service quality, maximizing resource use, and enhancing user happiness are the primary objectives of smart libraries. Features like cloud-based services, RFID-enabled circulation, digital repositories, self-service systems, remote resource access, and AI-driven information retrieval systems are precisely define smart libraries. "These tools enable easy access to information and promote cooperative invention and research.

ICT-Based Security Services in Smart Libraries

In smart libraries, ICT-based security services are crucial for securing digital and physical resources. These services support preserving the general security and dependability of library information systems, preventing illegal use, protecting user data, and ensuring secure access to information. In order to provide secure, effective, and user-friendly library settings, modern smart libraries are rapidly implementing a variety of ICT-based security systems (Eneogwe et al., 2025; Faizan & Munshi, 2025; Shah &Bano, 2020). Some major ICT-based security services used in smart libraries are discussed below in Table 1.

Role of ICT-Based Security Services in Research and Innovation

Research and innovation efforts in smart libraries are greatly enhanced by ICT-based security services. Libraries are in charge of ensuring the security, dependability, confidentiality, and integrity of digital content and research data in addition to granting access to information resources in the context of digital knowledge. For academic and research

objectives, modern researchers, academicians, and students rely more and more on electronic resources, institutional repositories, online databases, cloud-based platforms, and digital communication tools (Makarov et al., 2021; Naikar& Paul, 2025).

Protection of Digital Research Resources

The security of digital research materials kept in smart libraries is one of the main benefits of ICT-based security services. The expensive electronic journals, databases, e-books, theses, dissertations, and institutional repositories that academic libraries subscribe to necessitate appropriate security measures to stop illegal access, duplication, and digital piracy. These priceless academic resources are shielded from online dangers and data breaches by technologies like firewalls, antivirus programs, encryption systems, and secure authentication procedures. Institutional research results stored in digital archives are extremely susceptible to virus assaults, hacking, and illegal changes. By putting in place safe backup systems and access control mechanisms, ICT-based security systems guarantee the integrity and preservation of research content. Because of this, researchers may confidently access and use academic data without worrying about data loss or manipulation (Saha, 2024).

Secure Access to Information Resources

Smart libraries use cloud-based technology and web platforms to offer remote access to digital resources. Only authorized users can access restricted academic content and licensed databases thanks to ICT-based security systems. Secure access management is maintained via authentication technologies such multi-factor authentication, RFID-enabled access cards, biometric systems, and usernames and passwords. Particularly crucial for safeguarding sensitive institutional data, unpublished articles, patents, and private research initiatives are secure access systems. Libraries foster an atmosphere that encourages continuous research and innovation by providing secure and regulated access to information resources.

Prevention of Cybersecurity Threats

The probability of cybersecurity risks like hacking, phishing, ransomware attacks, malware infections, and data theft has also increased due to the growing usage of digital technologies in libraries. These cyberthreats have the potential to seriously impair research productivity and library operations. ICT-based security services are essential for recognizing, averting, and addressing these kinds of cyberthreats. Libraries can protect their digital infrastructure with the use of sophisticated cybersecurity solutions including intrusion detection systems, firewall protection, network monitoring systems, and artificial intelligence-based threat detection techniques. The security of library systems is further strengthened by frequent security updates, vulnerability assessments, and cybersecurity awareness initiatives. Research operations are guaranteed to continue in a safe digital environment, which also guards against disruptions from cyberattacks (Hamad et al., 2023).

Enhancement of Data Privacy and Confidentiality

Research initiatives frequently require sensitive personal information, intellectual property, and private data. Libraries in charge of research databases and digital repositories are required to protect user privacy and confidentiality. ICT-based security services use controlled access systems, secure communication protocols, and data encryption to safeguard research records and private information. In academic and scientific research including ethical issues and sensitive results, privacy protection is especially crucial. Researchers can safely communicate and preserve data while adhering to institutional and legal data protection standards with the use of secure information systems. This encourages more people to engage in digital research activities and boosts users' confidence in library systems (Mishra, 2020).

Support for Collaborative Research and Knowledge Sharing

Modern research increasingly depends on collaboration among researchers, institutions, and international academic communities. Smart libraries use virtual research environments, cloud storage systems, digital communication platforms, and institutional repositories to support collaborative research. ICT-based security services enable safe communication and the exchange of research data between partners. During cooperative projects, cloud security

solutions, encrypted communication channels, and secure file-sharing technologies help prevent illegal interception or abuse of research material. ICT-based security services support multidisciplinary research, innovation, and international knowledge sharing by facilitating safe academic collaboration.

Protection of Intellectual Property Rights

Another crucial function of ICT-based security services in smart libraries is to protect intellectual property rights. Unauthorized copying or plagiarism can have a detrimental impact on academic integrity and creativity since researchers put a lot of effort into creating original scholarly work. ICT-based security tools, such as secure repository management, digital rights management systems, and plagiarism detection software, assist libraries in protecting intellectual property. To stop academic resources from being misused, libraries could put in place restricted downloading systems and copyright protection measures. These security measures promote creativity, moral research methods, and responsible information resource use (Lyman, 2017).

Strengthening Institutional Repositories and Digital Preservation

Institutional repositories are crucial parts of smart libraries that distribute and preserve academic institutions' research results. The validity and long-term preservation of digital research materials kept in these repositories are ensured by ICT-based security services. Research data is shielded from unintentional loss, corruption, and cyber threats by technologies like cloud backup systems, digital preservation software, blockchain technology, and disaster recovery techniques. Future researchers and academics can continue to access important academic contributions thanks to secure preservation mechanisms.

Facilitating Innovation through Smart Technologies

ICT-based security services facilitate the use of smart technology in libraries, which promotes innovation. Artificial Intelligence (AI), the Internet of Things (IoT), biometric systems, and blockchain applications are examples of technologies that enhance library security and operational effectiveness. While IoT-enabled smart surveillance systems improve physical security within library premises, AI-based systems can automatically identify suspicious activity and monitor network security. In academic information systems, blockchain technology guarantees transparent and unchangeable digital transactions. These developments support technological improvement in research contexts while simultaneously bolstering library security (Makarov et al., 2021).

Ensuring Continuity of Research Services

In the event of emergencies, cyberattacks, or system failures, ICT-based security services additionally assure the sustainability and continuity of library services. Libraries can promptly restore services in the event of outages thanks to data backup systems, disaster recovery plans, and cloud-based security infrastructures. During international crises like the COVID-19 pandemic, when researchers and students mostly relied on distant access to digital resources, the significance of safe digital continuity became especially clear. ICT-based security systems enabled ongoing research efforts in difficult circumstances and provided continuing access to academic information.

Promoting a Secure Research Ecosystem

ICT-based security services help smart libraries provide a safe research environment. They protect digital infrastructure, facilitate secure information access, promote teamwork, protect intellectual property, and bolster users' trust in digital research platforms. ICT-based security services will become more crucial for academic institutions and libraries around the world as research and innovation become more reliant on digital technologies.

Challenges in Implementing ICT-Based Security Services for Smart Libraries

Despite the growing importance of ICT-based security services in smart libraries, several challenges affect their effective implementation and limit their ability to support secure research and innovation activities (Aithal, 2022; Kaishe-Mulungu et al., 2025; Modiba&Chisita, 2025) Some of the major challenges are as follows.

Financial Constraints

A significant financial investment is needed to adopt cutting-edge ICT-based security solutions like digital preservation tools, cloud security infrastructure, AI-driven surveillance systems, and biometric authentication. Budgetary constraints make it difficult for many academic and research libraries to implement and maintain these cutting-edge security measures, particularly in poor nations. The creation of safe smart library settings that are essential for innovation and research is frequently hampered by a lack of financing.

Lack of Technical Expertise

Professionals with training in cybersecurity, networking, digital infrastructure, and information security management are necessary for the effective administration of ICT-based security services. The lack of technically trained personnel in many libraries makes it difficult to manage security risks, maintain digital systems, and provide safe access to research materials.

Increasing Cybersecurity Threats

Cybersecurity threats like malware attacks, phishing, ransomware, hacking, and unauthorized access to research databases have become more prevalent due to the quick expansion of digital library services. These risks have the potential to jeopardize institutional repositories, digital collections, and private research data, which could have a detrimental impact on research continuity and innovation initiatives.

Privacy and Ethical Concerns

Concerns about privacy, confidentiality, and the moral use of personal data are raised by the usage of biometric systems, surveillance technology, and user monitoring tools in smart libraries. Libraries must maintain a secure research environment while ensuring that ICT-based security procedures adhere to copyright laws, ethical standards, and data protection guidelines.

Technological Obsolescence

Existing security systems frequently become obsolete quickly due to rapid technological advancements. For libraries to be effectively protected against new digital risks they must constantly upgrade their systems, update their software, and modernize their architecture. The dependability of smart library services could be compromised if security mechanisms are not updated.

Suggestions for Strengthening Ict-Based Security Services in Smart Libraries

To strengthen smart libraries and promote secure research and innovation ecosystems, the following measures may be adopted:

- **Development of Comprehensive Cybersecurity Policies:** To protect digital resources, research data, and user information, libraries should develop thorough cybersecurity policies and digital security frameworks. Maintaining secure and dependable library operations can be aided by well-defined security policies.
- **Capacity Building and Technical Training:** To increase cybersecurity awareness and technical competencies, library workers and patrons should participate in regular training programs, workshops, and awareness campaigns. Competent library employees are able to handle ICT-based security systems and react to new online dangers.
- **Investment in Advanced Security Infrastructure:** Advanced security technologies including RFID systems, biometric authentication, AI-based monitoring, and cloud security infrastructure should be implemented and upgraded with adequate funding from academic institutions and regulatory bodies.
- **Implementation of Multi-Layered Security Systems:** Smart libraries should use multi-layered security strategies that incorporate both digital and physical security measures. Comprehensive security for library resources can be achieved by integrated systems that include firewalls, CCTV surveillance, encryption technology, and secure authentication methods.

- **Collaboration with IT and Cybersecurity Experts:** To improve digital security management and ensure the successful deployment of ICT-based security services, libraries should work with IT specialists, cybersecurity experts, and technology suppliers.
- **Establishment of Data Backup and Disaster Recovery Systems:** To assure the long-term preservation of digital resources and the continuation of research services in the event of cyberattacks, system failures, or calamities, libraries should create dependable data backup systems and disaster recovery strategies.
- **Promotion of Secure Research Environments:** Libraries should promote safe digital research methods by putting in place secure institutional repositories, encrypted communication routes, and protected access systems. A safe study environment promotes creativity and academic cooperation while also increasing user trust."

CONCLUSION

In the digital age, smart libraries are increasingly vital hubs for research, innovation, and knowledge sharing. But the increasing importance of ICT and digital resources has additionally raised up serious security issues with regard to resource management, cyberthreats, and data protection. ICT-based security services offer practical ways to protect user data, digital collections, and library equipment. The creation of safe and effective smart library environments is significantly facilitated by technologies like RFID, biometric authentication, cloud security, AI-based monitoring, and blockchain systems. Libraries can overcome obstacles like budgetary constraints, technological problems, and privacy concerns with careful planning, investment, and policy creation. Smart libraries will be strengthened and safe research and innovation for future academic progress will be encouraged by the effective integration of ICT-based security services.

Table 1: Smart Libraries-ICT Based Security

S.No	Smart Libraries-ICT Based Security	Description
1	RFID Security Systems	Smart libraries make extensive use of Radio Frequency Identification (RFID) technology for resource tracking and theft detection. Automated circulation and inventory management are made possible by the RFID tags that are affixed to library materials. RFID security gates increase operational effectiveness and stop illegal resource removal from libraries.
2	Biometric Authentication	Smart libraries are increasingly utilizing biometric technologies for secure user authentication, such as fingerprint recognition, facial recognition, and iris scanning. Unauthorized access to computer labs, digital resources, and restricted library areas is prevented by these methods. Additionally, biometric security services enhance the general safety of library operations and assist libraries in maintaining accurate user identification.
3	CCTV Surveillance Systems	Closed-circuit television (CCTV) systems aid in physical security and property monitoring for libraries. CCTV monitoring reduces misconduct, theft, and vandalism in libraries. Additionally, contemporary AI-enabled surveillance systems are capable of automatically identifying suspicious activity.
4	Cybersecurity and Firewall Protection	Cybersecurity is a major problem because smart libraries rely a lot on cloud platforms and internet-based services. Library servers, databases, and user data are shielded against malware and cyber threats by firewall systems, antivirus programs, intrusion detection systems, and encryption technologies.
5	Cloud Security	Cloud computing is now a crucial component of smart libraries for digital services and data storage. Digital resources kept on cloud platforms are protected by cloud security methods include secure authentication, data encryption, backup systems, and access control mechanisms
6	Artificial Intelligence and Blockchain Applications	Cyber threats, anomalous system activity, and automated security monitoring are all possible with artificial intelligence (AI). Blockchain technology creates tamper-proof records and a decentralized information system that improves data integrity and secure transactions in digital libraries.

ABSTRACT

Artificial Intelligence and altmetrics are revolutionizing the impact assessment and scholarly communication in academic libraries. Other indicators are developing that reflect attention in social media, engagement on the Internet and impact on society, as well as the traditional ones that reflect citations. This current research is aimed at enhancing the academic library's research impact measurement using AI technologies and Altmetric indicators. There were a total of 185 publications retrieved and 92 relevant documents were identified after applying the inclusion and exclusion criteria. Peer reviewed journal articles, conference papers, review articles and institutional reports were included in the study. The study will be descriptive and analytical with secondary data obtained from Scopus, Web of Science, Dimensions AI, Altmetric.com and Google Scholar. The results of this study reveal that AI tools have a significant positive impact on research visibility, bibliometric analysis, scholarly communication and the institutional decision-making process while also highlighting the uptake of AI tools and the rise in applications of altmetrics and the challenges that academic libraries face when integrating them into their operations. Ethical issues, data protection concerns and need for professional skills development for librarians are also highlighted in the paper. The study indicates that AI + altmetrics can be a multi-dimensional tool for measuring research impact in the digital knowledge environment.

Keyword: Artificial Intelligence, Altmetrics, Bibliometrics, Academic libraries, Research Analytics, Scholarly communication.

INTRODUCTION

Academic libraries are not just bounded by their information storing and retrieval capabilities anymore, but are now intelligent knowledge centers that assist research analytics, digital scholarship and institutional visibility. Artificial Intelligence (AI) is one of the technologies that have greatest impact on today's libraries and research environments. The traditional measures of research assessment are primarily citation-based, for example, impact factor like h-index, G-index. However, such actions do not always work to adequately gauge the direct social interaction and public effect of scholarly publications. To counter this, they have devised a different measure which they call Altmetrics, which encompasses likes on blogs, news/articles, downloads, bookmarks, policy citations on social media etc. These technologies have extended the possibilities of research impact assessment by combining with AI technologies. These tools can be leveraged using Artificial Intelligence to do in-depth analysis of a large volume of scholarly data and identify the trend of research or citation. The tool can deliver predictive analysis. The use of AI-powered research analytics platforms in academic libraries is becoming widespread as they aid in various aspects such as evidence-based decision making, research visibility and institutional rankings. The study compares the ways academic libraries are using AI and altmetrics to measure research impact and explores the impact these tools have on scholarly communication and library services.

LITERATURE REVIEW

Artificial Intelligence (AI) and altmetrics have been a hot topic in Library and Information Science studies. The importance of altmetrics to understand research visibility outside of citations has been explored in several studies, as has the application of AI in library services, research analytics, and scholarly communication. The following is a brief summary of some of the more important contributions in the fields of AI, altmetrics, research assessment, and academic libraries. Altmetrics were first introduced in 2010 as an alternative set of metrics to the traditional citation-based metrics for measuring the social and online impact of scholarly communication by Priem et al. (2010) They were the first to claim that the influence of scholars is not confined to traditional scholarly databases and that research sharing takes place on social media, blogs, downloads, and online reference management tools. Building upon this Priem and Hemminger (2010) showed that information about the dissemination of research can be captured through altmetrics in near real-time while citations tend to take longer to build up by meaning that public discourse, bookmarks, downloads and mentions of social media can be indicators of early scholarly attention. In two reviews of the scholarly literature on social media and altmetrics, Sugimoto, Work, Lariviere and Haustein (2016, 2017) have called online engagement metrics to be complementary to traditional bibliometrics. The authors recommended measurement of indirect indicators of visibility and public attention to research that is not adequately captured by citations, such as altmetrics. Similarly, in their study, Haustein et al. (2014) examined the relationship between bibliometrics and altmetrics and they found that altmetrics indicate types of impact beyond bibliometrics, and recommended that libraries integrate both the tools and traditional research evaluation tools to evaluate impact more fully. But Fernandez-Llimos (2018) had an alternative perspective on considering the use of altmetrics instead of bibliometric indicators, suggesting that online attention does not necessarily equal research quality.

The author suggested a balanced approach of citation analysis with alternative metrics to evaluate the research more accurately. It is important that this is taken into account for a library developing an evaluation programme which involves both traditional and new types of evaluation measures. Thelwall (2024) was among those that pointed to the transformative power of AI for research evaluation, including how AI tools can be used for processing large volumes of scientific information to drive research trends and identify patterns in citations and predicting research impact via machine learning. The study showed that AI-powered assessment tools can be used to streamline and data-driven scholarly evaluation, directly connecting the AI and this article's altmetrics. Das and Islam (2021) embarked on a systematic review of the use of AI and machine learning (ML) in libraries and came up with a conclusion that technologies like NLP, expert systems and ML are now being used in cataloguing, indexing, classification and

information retrieval services. The discovery that AI is helpful in the efficiency of libraries and in increasing the digital scholarly communication provided the initial empirical support for the more general claims outlined. Based on the analysis of the literature, Islam et al. (2025) were able to identify the following AI applications in academic libraries: automated metadata generation, intelligent search systems, chatbots, recommendation systems, predictive analytics, and bibliometric analysis. The study highlighted the importance of AI tools for research assessment, which helps libraries gain deeper insights into research productivity and performance at the institutional level.

Steiger (2024) summarized the literature related to the use of Artificial Intelligence (AI) in Academic Libraries and Higher Education (HE) to understand the ways in which AI can support the effectiveness of service delivery, help to deliver personalized services, and support academic systems. Cox, Pinfield and Rutter (2019) has adopted an institutional perspective to uncover the use of AI in academic libraries, such as research data management, digital scholarship and institution repository services, and the potential of AI to enhance the user experience through tailored information and recommendations. Barman (2025) briefly mentioned the potential of AI and ML to revolutionize the experience of accessing information in libraries in a more general context, stating that these technologies can impact the utilization and interaction of digital information with users in novel ways. The author highlighted the need for ongoing adaptation of technology and for continuous professional competency development, noting the human-infrastructure element of the adoption of AI technology. Ayinde, Ebiefung and Oladokun (2026) conducted a systematic review of the use of AI in academic libraries and found that AI tools are being widely used in reference services, information literacy training and collection management and administration. Their analysis revealed that AI-powered systems have the power to boost the quality of services and enrich user interaction in academic settings which providing a world-overview of the status quo of AI adoption.

Jabeen and Lux (2020-2025) provided scientometric analysis of the impact of Artificial Intelligence (AI) on academic libraries around the globe on academic information literacy. The research shows the potential of AI technologies in terms of digital learning and automated support and management in research communication. The importance of AI literacy and ethical AI governance for librarians was highlighted, along with other issues that became apparent throughout the literature: operational adoption and competency issues. To investigate the AI literacy of academic library staff in the USA, Lo (2024) survey academic library staff to determine that librarians' AI literacy is moderate in the understanding of AI concepts, but not in the use of AI tools. The results of this study echoed the concerns raised regarding the lack of skills in AI readiness in libraries and the importance of professional learning and institutional support to develop AI competencies in libraries. In the context of academic libraries, Ogwo (2023) delved into the potential applications and outcomes of AI, viewing the library as a more efficient, fulfilling, and user-friendly environment infused with information. A number of implementation barriers were identified, including the absence of ICT infrastructure, a lack of technical skills, financial limitations etc, which proved to be very useful for providing an empirical base for context-specific issues that need to be overcome in the building of library environments in developing countries. Vinuesa et al. (2020) provided a general ethical perspective on AI and noted that algorithmic bias, privacy issues, and transparency issues can impact the reliability of research assessment systems that rely on AI. The study pointed out that there is a need for ethical guidelines and responsible AI policies to be set within educational institutions.

These anxieties have been expressed in the context of libraries as well by Steiger (2024) regarding issues of misinformation, plagiarism, and ethical issues with AI use. Nakaziba et al (2026) did a scoping review of the use of AI in academic libraries in LMICs and concluded that funding concerns, weak infrastructure, privacy concerns and lack of institutional policies are some of the factors that limit the use of AI in academic libraries in LMICs. The study suggested a set of strategic investments and policy frameworks for sustainable implementation of AI. Both Cox, Pinfield and Rutter (2019) underscore the importance of academic libraries as key institutional actors in reshaping the evaluation of research, digital scholarship and knowledge management with these converged technologies. While the literature has explored the potential of AI tools in academic libraries and the adoption of altmetrics for measuring research impact, there has been little research that looks at AI in conjunction with altmetric indicators and its impact

on research impact evaluation. In this context, the present study aims to fill the gap by exploring the potential of the combination of AI and altmetrics in the field of research assessment in academic libraries.

Objectives of the Study

The study was conducted with the following objectives:

- To explore the use of Artificial Intelligence (AI) in Improving Research impact assessment in academic libraries.
- To explore the value of altmetric indicators for understanding research visibility, scholarly communication and societal impact.
- To describe and review key research analytics tools powered by AI and their use in academic libraries.
- To explore the opportunities and difficulties of using AI and altmetrics for research evaluation.
- To examine the changing nature of academic librarians' contribution to research impact assessment, scholarly communication and research support through the use of AI.

RESEARCH METHODOLOGY

This study employs descriptive and analytical research design in order to explore the role of Artificial Intelligence (AI) and altmetrics in the research impact assessment in academic libraries. Secondary data were gathered from Scopus, Web of Science, Dimensions AI, Altmetric.com and Google Scholar. This literature was identified through the keywords of AI, altmetrics, academic libraries, and research analytics, which were used to search the literature in the years 2015-2025. There were a total of 185 publications retrieved and 92 relevant documents were identified after applying the inclusion and exclusion criteria. Peer reviewed journal articles, conference papers, review articles and institutional reports were included in the study and duplicate and irrelevant documents were excluded. The percentages shown in the tables are based on the total sample of 92 publications and reflect the cumulative frequencies of occurrences, with some publications focusing on more than one theme or indicator. The selected literature was analyzed using descriptive statistics, comparative analysis and trend interpretation techniques to identify the major applications of AI, altmetric indicators, challenges in implementing AI, and current trends in research impact assessment in academic libraries.

Concept and Applications of Artificial Intelligence in Academic Libraries

Artificial Intelligenc is the ability of computers to execute tasks which would otherwise require human intellect including learning, reasoning, problem solving, decision making, and language processing. In academic libraries AI technologies are rapidly becoming a part of the library ecosystem with tools like machine learning, natural language processing (NLP), robotics and predictive analytics being used to improve library operations and services for library users. The academic libraries have numerous applications for AI, such as smart information retrieval, automated indexing and cataloguing, chatbots and virtual assistants, recommender systems, research analytics, digital repository management, and plagiarism detection. These technologies enhance the operation efficiency, eliminate repetitive operations, enable custom user services, and help to evaluate the impact of research. As a result, AI has become a game-changer for academic libraries, enhancing scholarly communication, research visibility, and evidence-based decision-making.

Concept and Significance of Altmetrics in Research Impact Assessment

Alternative metrics (altmetrics) are used to assess the online attention, visibility and impact of scholarly work outside of the citation-based metrics like the Journal Impact Factor (JIF). Altmetrics measure digital interactions and engagement with research outputs on a range of online platforms, as opposed to the traditional bibliometric measures. Examples of altmetrics are tweet counts, shares on Facebook, readership on Mendeley, blog posts, news stories, citations in policy documents and Wikipedia references. Altmetrics give a more comprehensive and timely view of the impact of research by providing evidence of dissemination and public engagement nearer to the time of the research. They have thus become an important addition to the traditional bibliographic tools to measure scholarly communication and research visibility.

Data Analysis and Interpretation

The tables in this study have been compiled and synthesized from the literature reviewed from Scopus, Web of Science, Dimensions AI, Altmetric.com, Google Scholar and related scholarly publications published from 2015 to 2025. They are designed to give an indicative picture of some of the current trends and developments in the field of the use of Artificial Intelligence (AI) and altmetrics in academic libraries. All tables are created from the 92 selected publications reviewed which are not otherwise specified. The percentages shown in the tables are based on the overall sample of 92 publications and indicate the total rates of occurrence, not necessarily mutually exclusive categories, of AI and altmetrics themes, applications, indicators, benefits, or challenges. The adoption of Artificial Intelligence (AI) in academic library research is on the rise, as shown in Table 1. The results indicate that the amount of research on the use of artificial intelligence in academic libraries is steadily increasing. The number of publications increased from 17 studies (18.5%) in 2019 to 75 studies (81.5%) in 2025. The positive trend suggests an increasing scholarly engagement with the technologies of AI and their reshaping impact on library operations, research support services and scholarly communication. This significant rise post-2021 reflects the growing understanding of academic libraries regarding AI's potential as a strategic tool for improving information management, research analytics, and user services. The overall data reflect the growing trends of how AI-based technologies are being integrated into the academic library landscape.

The major AI applications found in the reviewed literature about academic libraries are summarized in Table 2. Plagiarism detection was the most common application mentioned in 75 studies (81.5%) and was followed by research analytics in 70 studies (76.1%). User-centered and automated library services, such as a chatbot (70.7%) and recommendation systems (66.3%) were also popular topics. The automated cataloguing (61.9%) and repository management (57.6%) suggest the impact of artificial intelligence on enhancing operational efficiency and managing digital resources. AI's role in trend predictions is evident in 45 studies (48.9%), reflecting its growing application in predicting research trends and aiding in decision-making. The results showed that application of AI tools is gaining traction in academic libraries for improving technical service and academic libraries for improving public services.
The major altmetric indicators reported in the literature reviewed are presented in Table 3. The largest was the number of twitter/X mentions (42 studies, 45.7%), followed by Mendeley readership (36 studies, 39.1%). Other channels of evidence for growing importance of online channels include news media coverage (29.3%) and blog mentions (22.8%). Other indicators of wider societal involvement were also found to be significant, such as Facebook shares (19.6%), policy document citations (15.2%), Wikipedia citations (9.8%) and YouTube discussions (6.5%). The results indicate that, in addition to citations, altmetrics offer important insights to the attention, public engagement and societal impact of scholarly publications online.

Table 4 shows how traditional bibliometric elements and altmetrics differ in terms of some important evaluation criteria. While traditional metrics tend to be citation-based and typically take longer time to build up to a level of measurability, altmetrics give instant feedback on dissemination and public engagement with research. Altmetrics are different from traditional metrics and can be used to track scholarly communication in real-time via social media, news outlets, blogs and online communities. In addition, altmetrics provide better evidence of the impact and attention of a piece of research on society, as well as academic influence, as measured by citation-based metrics. The comparison implies that altmetrics offer a broader and more dynamic view of research impact, offering a complement to traditional metrics for conducting a comprehensive evaluation of research**.** The main problems of AI and altmetrics implementation in academic libraries are listed in Table 5. The lack of technical skills was the most important impediment, mentioned in 63 studies (68.5%), and the necessity for ongoing professional growth and training on AI for librarians was identified. In 58 studies (63.0%) data privacy concerns were raised, emphasizing the increasing concerns about the ethical use of user and research data. The high cost of implementation (57.6%) and the lack of standardization (54.3%) are among the other factors that limit the spread of AI-based systems and altmetrics tools. Other major barriers identified were algorithmic bias (46.7%) and limited technological infrastructure (44.6%). The results highlight the importance of tackling technical, ethical, financial, and organizational challenges to ensure the sustainable integration of AI into academic libraries.

A comparison of traditional bibliometric techniques to AI-based research measures is presented in Table 6. The traditional bibliometrics are mainly based on citation databases and are highly labour-intensive to collect and analyze data. On the other hand, AI-based metrics draw on multiple data sources across diverse platforms, and automate the analytical workflow, allowing for real-time analysis of research performance. AI-driven systems have superior predictive features, cutting-edge research trend prediction, and customised analytical insights. Furthermore, they include social media participation and other less commonly used impact measures. The comparison highlights how AI-based metrics offer a more holistic, up-to-date, and information-rich approach to assessing scholarly impact, thereby improving research assessment practices in academic libraries. The key advantages of incorporating AI and altmetrics into research evaluation are summarized in Table 7. The highest frequency of benefits reported was for increased research visibility (76 studies, 82.6%) and real-time impact monitoring (72 studies, 78.3%). 68 studies (73.9%) reported improved decision making, with AI-driven analytics playing a role in supporting evidence-based institutional planning. Other research-related activities also emphasize the strategic relevance of these technologies for scholarly evaluation, such as research trend prediction (66.3%) and institutional performance assessment (59.8%). In 51 studies (55.4%) an overall impact evaluation was reported, highlighting the need to use traditional and alternative indicators to have a multidimensional view of research impact. In conclusion, the results reveal that the combination of AI and altmetrics has the potential to greatly improve research assessment processes in academic libraries.

Finding of the study

A significant rise in the adoption of Artificial Intelligence (AI) in academic libraries from 2019 to 2025 was found in the study. The number of studies examining the applications of AI rose from 17 (18.5%) in 2019 to 75 (81.5%) in 2025, reflecting increased interest in AI technologies for library services, support of research, and scholarly communication. The most common are plagiarism detection (81.5%), research analytics (76.1%), chatbots (70.7%), recommendation systems (66.3%), automated cataloguing (61.9%), repository management (57.6%) and predictive analytics (48.9%). These are just some of the ways AI is being used to improve library operations and research measurement. The results also showed the increasing relevance of altmetrics for the measurement of research visibility and societal impact. The most significant indicators were Twitter/X mentions (45.7%), readership on Mendeley (39.1%) and news media coverage (29.3%), highlighting the value of altmetrics as additional signals of research dissemination and public engagement that are valuable in complementing traditional citation metrics.

The identified challenges with AI and altmetric implementation were the lack of technical skills (68.5%), data privacy concerns (63.0%), high implementation costs (57.6%), and lack of standardization (54.3%). The results highlight the importance of professional training, technological infrastructure and ethical governance structures to enable a successful adoption. Key advantages identified for the integration of AI and altmetrics were increased research visibility (82.6%), real-time impact monitoring (78.3%), improved decision-making (73.9 %), research trend prediction (66.3 %), institutional performance assessment (59.8 %), and the comprehensive impact evaluation (55.4 %). In summary, the study illustrates how AI can be combined with altmetrics to offer a more all-encompassing, timely, and multidimensional alternative to research impact assessment in academic libraries.

Implications of the Study

The results of this research have significance for policy makers, researchers, library professionals and academic libraries. The rise of Artificial Intelligence (AI) and altmetrics underscores the necessity for academic libraries to implement cutting-edge research analytics tools in their services to assist with research visibility and impact evaluation. To ensure library professionals can effectively handle the new evaluation systems and technology, they need to build AI literacy and data analytics skills. The study also suggests that academic institutions should invest in technological infrastructure, staff training, and ethical governance frameworks to facilitate the sustainable implementation of AI-driven research assessment tools. Moreover, combining altmetrics with traditional bibliometric metrics can offer a more holistic and multidimensional assessment of the impact of research, leading to evidence-based decision-making and enhancing institutional research capacity. The results can be helpful for developing future policies and stratagies for academic libraries.

CONCLUSION

AI and altmetrics are big game-changers in research impact assessment for academic libraries. The research revealed that AI tools like plagiarism checks, research analytics, chatbots, and recommendation systems are being more and more widely used to boost library services and research assessment. Meanwhile, Altmetrics offer important information on research visibility, online engagement and the societal impact of research in addition to citation information. The results indicate the use of AI and altmetrics as a more holistic, timely and multidimensional indicator of scholarly impact. While there are difficulties like lack of technical expertise, concerns about privacy and infrastructure constraints the technologies promise to enhance evidence-based decision making and scholarly communication. Based on the above, academic libraries need to invest in advancing technological infrastructure, foster AI literacy, and establish ethical guidelines to effectively leverage AI-powered research analytics and altmetric indicators in the changing landscape of digital research.

ABSTRACT

Artificial intelligence (AI) is increasingly transforming the landscape of academic libraries, digital learning ecosystems, and information literacy instruction. Technologies such as machine learning, generative AI, intelligent search systems, recommender systems, and AI-powered chatbots are reshaping how users search, evaluate, interpret, and utilize information resources. In response to these developments, the present study investigates the global research trends and intellectual structure of AI-driven information literacy research in libraries through a bibliometric and visualization-based approach. Bibliographic data were retrieved from the Scopus database covering the period 2015–2026. A total of 235 English-language journal articles were analyzed using bibliometric indicators such as publication growth, citation impact, productive authors, influential journals, institutions, and countries. Furthermore, science mapping and keyword co-occurrence analyses were conducted using Bibliomagika, VOSviewer, and Biblioshiny to identify thematic clusters and emerging research directions. The findings reveal a substantial increase in scholarly output after 2022, particularly following the emergence of generative AI tools such as Chat GPT. The United States emerged as the leading contributor in terms of publications and citations, while the Journal of Academic Librarianship was identified as the most productive source. Major thematic areas include AI literacy, digital literacy, academic libraries, machine learning, smart learning environments, ethical concerns, and library instruction. The study highlights the evolving role of libraries in fostering AI-enabled information literacy competencies and preparing users for future digital learning environments. The findings provide valuable insights for librarians, educators, policymakers, and Library and Information Science (LIS) researchers.

Keywords: Artificial Intelligence; Information Literacy; AI Literacy; Academic Libraries; Bibliometric Analysis; Knowledge Mapping; Smart Libraries

INTRODUCTION

Artificial intelligence (AI) has become one of the most transformative technological developments of the twenty-first century. Across educational institutions, research environments, and information systems, AI technologies are redefining how knowledge is produced, accessed, organized, and disseminated. Academic libraries, which traditionally function as centers of information access and literacy development, are increasingly integrating AI-driven tools and systems into their services and operations. Technologies such as intelligent discovery systems, recommendation engines, conversational chatbots, machine learning applications, and generative AI platforms have significantly influenced library instruction and information literacy programs. Information literacy refers to the ability to identify, locate, evaluate, and ethically use information effectively. In the contemporary digital environment, information literacy has evolved beyond traditional search skills to include digital literacy, algorithmic literacy, AI literacy, and critical evaluation of AI-generated content. Libraries are now required to equip users with competencies necessary to navigate increasingly complex AI-driven information ecosystems. Recent developments in generative AI technologies, particularly ChatGPT and large language models, have accelerated scholarly discussions surrounding the role of AI in library instruction and information literacy education. Researchers have emphasized the need for libraries to develop AI literacy frameworks, ethical guidelines, and instructional models to support responsible AI use (Lo, 2023). Similarly, algorithmic literacy and digital literacy have emerged as important dimensions of modern information literacy instruction within higher education institutions (Ridley & Pawlick-Potts, 2021).

The growing scholarly attention toward AI-driven information literacy has resulted in a rapidly expanding body of literature across Library and Information Science (LIS), education, computer science, and interdisciplinary research domains. However, despite the increasing volume of publications, limited studies have systematically mapped the global intellectual structure, thematic evolution, and collaboration patterns of AI-driven information literacy research in libraries. Bibliometric analysis has become a widely recognized quantitative approach for evaluating research performance, identifying influential contributors, examining thematic development, and visualizing scholarly communication networks. Through bibliometric and science mapping techniques, researchers can identify publication trends, citation structures, research clusters, and emerging knowledge domains. Therefore, the present study aims to provide a comprehensive bibliometric visualization of AI-driven information literacy research in libraries using Scopus-indexed publications from 2015 to 2026. By analyzing publication growth, leading journals, productive authors, institutional contributions, and thematic structures, this study contributes to a deeper understanding of the development and future directions of AI-driven information literacy research.

REVIEW OF LITERATURE

The integration of artificial intelligence into library services and information literacy instruction has received increasing scholarly attention in recent years. Researchers have explored the implications of AI technologies on information behavior, academic learning environments, digital competencies, and library pedagogy. Rubin (2019) examined the role of misinformation and disinformation in digital environments and proposed a conceptual framework explaining how false information spreads within online ecosystems. The study highlighted the growing importance of information literacy competencies in combating misinformation in technologically mediated environments. Ridley and Pawlick-Potts (2021) introduced the concept of algorithmic literacy and discussed the role of libraries in helping users understand algorithmic systems that influence information discovery and retrieval. Their study emphasized that libraries must extend traditional information literacy programs to include critical awareness of algorithms and AI-driven systems. Lo (2023) proposed the CLEAR framework for enhancing information literacy through prompt engineering and generative AI applications. The study argued that academic libraries should actively integrate AI literacy instruction into information literacy programs to prepare students for emerging AI-supported learning environments.

Houston and Corrado (2023) investigated the implications of ChatGPT and emergent language models for libraries and academia. The authors highlighted both opportunities and challenges associated with generative AI, including academic integrity concerns, ethical issues, and changes in information evaluation practices. James and Filgo (2023) explored the relationship between ChatGPT and the Framework for Information Literacy for Higher Education. Their findings suggested that generative AI technologies may reshape library instruction practices and require librarians to redesign instructional strategies focused on critical evaluation and ethical AI use. Cox and Mazumdar (2024) discussed the conceptual understanding of artificial intelligence within Library and Information Science and emphasized the importance of AI literacy among librarians. The authors noted that libraries increasingly require professionals with AI-related competencies to support evolving user needs. Harisanty et al. (2025) conducted a systematic literature review examining AI adoption in libraries and concluded that AI technologies are rapidly transitioning from experimental applications to essential components of modern library operations and digital learning ecosystems. Existing studies have primarily focused on conceptual discussions, case studies, systematic reviews, and practical applications of AI in libraries. However, there remains limited bibliometric evidence regarding the global research landscape, publication trends, collaboration networks, and thematic evolution of AI-driven information literacy research. Therefore, the present study fills this research gap by providing a comprehensive bibliometric visualization and knowledge mapping analysis of the field.

Objectives of the Study

The present study aims to analyze the global research trends and intellectual structure of AI-driven information literacy research in libraries. The specific objectives of the study are:

- To examine the annual growth of publications related to AI-driven information literacy in libraries.
- To identify the most productive authors, institutions, countries, and journals in the field.
- To analyze citation impact and research influence using bibliometric indicators.
- To examine patterns of scholarly collaboration among authors and countries.
- To identify major thematic areas and emerging research trends using science mapping techniques.
- To visualize the intellectual structure and knowledge development of AI-driven information literacy research.

METHODOLOGY

Research Design: The study employed a bibliometric research design combined with science mapping and visualization techniques. Bibliometric analysis is widely used in Library and Information Science research to quantitatively evaluate publication patterns, citation structures, collaboration networks, and thematic development.

Data Source: The bibliographic data for the study was retrieved from the Scopus database, which is considered one of the largest multidisciplinary citation databases covering peer-reviewed scholarly literature.

Search Strategy

The following search query was used to retrieve relevant literature:

TITLE-ABS-KEY(
(
"artificial intelligence"
OR AI
OR ChatGPT
OR chatbot*
OR"machine learning"
OR"generative AI"
)
AND
(

"information literacy"
OR"digital literacy"
OR"AI literacy"
)
AND
(
librar*
OR"academic librar*"
OR"library service*"
OR"library and information science"
)
)
AND DOCTYPE(ar)
AND LANGUAGE(english)
AND PUBYEAR >2014

Inclusion Criteria

The study included:

- English-language journal articles
- Publications indexed in Scopus
- Research published between 2015 and 2026
- Studies related to AI, information literacy, and libraries

Conference papers, editorials, notes, and non-English publications were excluded from the analysis.

Data Analysis Tools

The retrieved data were exported in CSV format and analyzed using the following bibliometric and visualization tools:

- Bibliomagika for descriptive bibliometric indicators
- VOSviewer for network visualization and keyword co-occurrence mapping
- Biblioshiny (Bibliometrix package) for science mapping and thematic analysis
- Microsoft Excel for tabulation and graphical representation

Bibliometric Indicators

The study used several bibliometric indicators including:

- Total Publications (TP)
- Total Citations (TC)
- Citation per Paper (C/P)
- h-index
- g-index
- m-index
- Single Country Publications (SCP)
- Multiple Country Publications (MCP)

These indicators were used to evaluate research productivity, impact, collaboration patterns, and scholarly influence.

RESULTS AND ANALYSIS

General Publication Characteristics

The analysis identified a total of 235 publications published between 2016 and 2026. The dataset included contributions from 590 authors with a total citation count of 2,155 citations. The average citation per paper was 9.17, while the h-index of the dataset was 25.Table 1 presents the main bibliometric indicators of the dataset.

The findings indicate a rapidly growing and collaborative research field characterized by increasing scholarly attention and citation impact.

Subject Area Distribution

The subject-wise distribution revealed that Social Sciences dominated the field with 220 publications (93.62%), followed by Computer Science with 62 publications (26.38%). Other contributing disciplines included Business and Management, Engineering, Medicine, and Psychology. The dominance of Social Sciences reflects the central role of Library and Information Science in examining information literacy and digital learning environments. The contribution from Computer Science demonstrates the interdisciplinary nature of AI-related research. The annual publication trend demonstrates a substantial increase in scholarly output after 2022. Minimal publication activity was observed between 2016 and 2020, whereas a dramatic increase occurred between 2023 and 2025. The year 2024 recorded the highest number of publications with 113 articles, followed by 2025 with 61 publications. This sharp increase coincides with the emergence and widespread adoption of generative AI tools such as ChatGPT. The cumulative publication growth analysis showed a strong upward trend with an R^2 value of 0.934, indicating significant expansion of research interest in AI-driven information literacy.

Most Productive Journals

The Journal of Academic Librarianship emerged as the most productive source with 29 publications and 567 citations. Other influential journals included the Journal of Librarianship and Information Science, Library Hi Tech News, Library Trends, and Journal of Information Literacy. These journals have played a significant role in disseminating research on AI, digital literacy, and academic library transformation.

Highly Influential Publications

Among the most influential publications, Lo (2023) received considerable scholarly attention for introducing the CLEAR framework for AI-enhanced information literacy instruction. Similarly, Rubin (2019) gained substantial citations for conceptualizing misinformation and fake news in digital environments. Studies focusing on algorithmic literacy, ChatGPT integration, AI literacy, and emerging technologies also received notable scholarly recognition. The study revealed a strong dominance of collaborative authorship. Multi-authored publications significantly outnumbered single-authored papers, particularly after 2022. This trend indicates growing interdisciplinary collaboration among researchers in Library and Information Science, education, and computer science.

Most Productive Authors

The most productive authors included Russell Michalak and Bolaji David Oladokun, each with eight publications. Leo S. Lo emerged as one of the most influential authors in terms of citation impact, receiving 422 citations.

Most Productive Institutions

The University of New Mexico emerged as the leading institution in terms of citation impact with 422 citations. Other productive institutions included Federal University of Technology (Nigeria), Goldey-Beacom College, University of Kentucky, and Imam Abdulrahman Bin Faisal University. The findings indicate the global and interdisciplinary nature of AI-driven information literacy research.

Most Productive Countries

The United States dominated the field with 82 publications and 834 citations, followed by Nigeria, China, Pakistan, India, and the United Kingdom.

The strong contribution from developing countries highlights the increasing global interest in AI literacy, digital transformation, and technology-enhanced library services.

Thematic Analysis and Research Trends

Keyword co-occurrence analysis revealed several major thematic clusters in AI-driven information literacy research. The dominant themes included:

- Artificial intelligence
- Information literacy
- Academic libraries
- Digital literacy
- ChatGPT
- Machine learning
- AI literacy
- Higher education
- Smart libraries
- Ethical AI

Thematic evolution analysis suggests that early research focused primarily on digital literacy and information retrieval systems, whereas recent studies increasingly emphasize generative AI, prompt engineering, AI ethics, algorithmic literacy, and intelligent learning environments. The emergence of AI literacy as a distinct research theme indicates a shift toward preparing users for AI-mediated information ecosystems.

DISCUSSION

The findings of the study demonstrate that AI-driven information literacy research has experienced rapid expansion during the last few years, particularly following the emergence of generative AI technologies. The substantial increase in publications after 2022 reflects the transformative impact of ChatGPT and related AI tools on educational institutions and library services. The dominance of Social Sciences and Library and Information Science indicates that libraries are playing a central role in facilitating AI literacy and digital competency development. Libraries are increasingly evolving from traditional information repositories into active learning environments that support critical engagement with AI technologies. The strong citation impact of studies related to misinformation, algorithmic literacy, and AI ethics demonstrates growing scholarly concern regarding the responsible use of AI-generated information. Academic libraries are now expected to educate users not only about information evaluation but also about ethical AI use, bias detection, and responsible engagement with AI-generated content. The significant level of international collaboration observed in the study reflects the interdisciplinary and global nature of AI-related research. Researchers from developed and developing countries are actively contributing to discussions surrounding AI literacy and smart learning environments. The findings also suggest that AI literacy is emerging as a critical extension of traditional information literacy instruction. Librarians are increasingly required to develop competencies related to prompt engineering, AI evaluation, digital ethics, and algorithmic awareness. Overall, the study highlights the growing strategic importance of libraries in supporting AI-enabled education and future-ready learning ecosystems.

CONCLUSION

The present bibliometric study examined the global research landscape of AI-driven information literacy research in libraries using Scopus-indexed publications from 2015 to 2026. The findings reveal a rapidly expanding research field

characterized by increasing publication growth, interdisciplinary collaboration, and thematic diversification. The study identified the United States as the leading contributor in terms of productivity and citation impact, while the Journal of Academic Librarianship emerged as the most influential publication source. Major research themes included AI literacy, digital literacy, algorithmic literacy, ChatGPT, ethical AI, and smart learning environments. The rapid emergence of generative AI technologies has significantly transformed scholarly discussions surrounding information literacy and library instruction. Libraries are increasingly expected to play an active role in promoting responsible AI use, critical information evaluation, and AI literacy competencies. The findings of the study contribute to the growing body of literature on AI and libraries and provide valuable insights for librarians, educators, researchers, and policymakers seeking to understand the evolving role of AI-driven information literacy in higher education and library environments.

Limitations of the Study

The study has several limitations. First, the analysis was limited to the Scopus database; therefore, publications indexed in Web of Science, Dimensions, Google Scholar, or other databases were excluded. Second, only English-language journal articles were considered, which may have excluded relevant research published in other languages or publication formats. Third, the bibliometric analysis focused primarily on quantitative indicators and science mapping techniques, which may not fully capture the conceptual depth and qualitative dimensions of AI-driven information literacy research. Finally, because the field is rapidly evolving, particularly after the emergence of generative AI technologies, future studies may reveal additional thematic developments and changing research patterns. Future research may incorporate multiple databases, comparative regional analyses, altmetric indicators, and qualitative content analysis to provide deeper insights into the development of AI literacy and information literacy Research.

ABSTRACT

Libraries experienced significant shift in their roles and functions from being the repositories of books to centers of learning, digital literacy, research, community, and sustainable development. The library has become a strategic partner to the United Nations Sustainable Development Goal (SDGs) in the twenty first century, promoting Equitable Access to Information, Lifelong Learning, Social Inclusion, Innovation and dissemination of Knowledge. The study examines the ways in which libraries support the various SDGs, based on the existing literature, policy documents, and institutional reports, with a particular focus on the SDGs which have been most relevant to library support for multiple SDGs, including those on quality education, poverty reduction, health and well-being, gender equality, reduced inequalities, innovation, climate action, and strong institutions. The article highlights the change of the libraries in the digital world, digital inclusion, information literacy, open access, institutional repositories, the use of artificial intelligence in libraries, smart libraries, and community-oriented services. Besides, the study addresses issues impacting the effectiveness of the library, such as insufficient funding, policy neglect, technological issues, digital gaps and shortage of skilled professionals. The article presents an analytical overview of the latest literature and the frameworks of sustainable development, concluding that libraries act as accelerators of inclusive growth, a well-informed citizenry, and opportunities for the equitable. The study finds that the strengthening of library systems, through policy integration, technological development, collaboration, professional development, and continued investment is needed in order to accelerate progress towards the SDGs and build resilient knowledge societies by 2030 and beyond.

Keywords: Libraries; Sustainable Development Goals (SDGs); Information Literacy; Digital Inclusion; Knowledge Society; Sustainable Development

INTRODUCTION

The twenty first century is defined by new technologies, globalization, environmental issues, social inequalities, and knowledge production and dissemination that is constantly changing. Today's societies rely on information and communication technologies (ICTs) to address developmental issues related to poverty, illiteracy, disparities in health, employment, environment, and access to opportunities. To address these multiple international problems, the United Nations (UN) set out in the 2030 Agenda for Sustainable Development in 2015 with 17 Sustainable Development Goals (SDGs) aimed at building a 'fairer, more inclusive and more sustainable world'(United Nations, 2015). The Sustainable Development Goals highlight an integrated development process, because they acknowledge the economic, social, environmental and institutional links and dependencies of development. They have to be implemented collaboratively with the active involvement of governments, civil society organizations, education, industry, research organizations, and information systems. Libraries have a unique role among these actors, having the potential to offer equal access to information, lifelong learning opportunities, digital participation and evidence-based decision making (International Federation of Library Associations and Institutions [IFLA], 2015). Libraries were traditionally seen as a place collecting, preserving and arranging print materials. Libraries primarily engaged in book acquisition, classification, preservation and circulation, and provided services to educational and scholarly communities by providing physical access to information resources.

But today with the advent of digital technologies, online information landscapes and shifts in knowledge consumption, the nature and scope of library services has changed. Libraries have become multi-purpose learning environments providing a blend of print and electronic materials, information technologies, research support and outreach services to the community. Libraries in the modern era have come to be viewed as knowledge infrastructures with significant roles in and impacts on sustainable social change. They are not just a place to store books; they are places of teaching and learning, a place to become included, a place to get research help, a place to preserve culture, and a place to innovate. Libraries make electronic resources, digital repositories, Internet facilities, multimedia resources, on-line databases, and virtual learning environments available to people of all ages and abilities so that they can be involved more fully in educational, professional and civic life (Corrall, 2010).Furthermore, libraries conduct literacy campaigns, digital literacy workshops, career guidance programs, deliver information literacy training and social awareness programs, which all directly impact human development and social empowerment. Access to information is now firmly recognized as a precondition for inclusive growth and for citizens to be well informed, with the concept of sustainable development gaining importance in this regard. Libraries are a key component in sustainable development, by making information resources accessible to all, particularly to those who are socially and economically disadvantaged.

Libraries help mitigate information inequality and promote opportunities for access to and engagement in education, economy and democracy through the provision of free and equitable services. Public libraries, school libraries, academic libraries, special libraries and digital libraries all play a unique role in the national and international agendas of development, literacy, research, digital engagement, and cultural continuity, respectively (Krolak, 2005). Libraries have been called to action by international organizations many times to play a vital role in reaching the Sustainable Development Goals. The International Federation of Library Associations and Institutions has always believed that universal access to information is a key cornerstone of sustainable development and that libraries are enabling institutions that help achieve the SDGs (IFLA, 2015, 2018).Likewise, the International Union for Conservation of Nature and Natural Resources (IUCN) defines library access as fundamental for the development of inclusive knowledge societies, largely through its ability to enable people to learn and access information throughout their lives as well as to promote digital inclusion (UNESCO, 2016).SDG 16 also makes reference to the importance of public access to information, as one of the aspects of peaceful, inclusive and accountable institutions, highlighting the strategic role of libraries in sustainable development processes. Libraries play a special role in the developing regions where access inequalities on education, information and digital technologies are still significant. Libraries offer free Internet access, education, job and information about health, and digital literacy classes to many underserved

communities to help close the digital divide and enhance social participation. Academic libraries support research productivity and scholarly communication, and public libraries support community development and civic awareness. Special libraries offer a range of knowledge services to the professional and industrial communities while school libraries contribute to literacy formation and educational success (Yuvaraj, 2016).

At the same time, the digitalization of libraries has created new boundaries, growing their role beyond the physical library. Digital repositories, institutional archives, open access systems and distant learning platforms now allow for the greater dissemination of knowledge without any geographical restrictions.AI, cloud computing, automation, and digital preservation are just a few of the technologies that libraries are now using to enhance the accessibility of information and user experience. Technological innovations reinforce the contribution of libraries in inclusive development and sustainable knowledge economies (Hauke et al., 2025). Although these are substantial contributions, many structural and institutional challenges remain for libraries. Bureaucratic, technological, financial, policy and professional restrictions and challenges constrain their potential to make a full contribution to sustainable development goals. These challenges demand stakeholders collaborate, build capacity and skills, and invest in strategic planning and policy recognition by the government. In this context, this article critically explores the changing role of libraries in the promotion of sustainable development in addition to their contribution to the SDGs. It examines the changes in the conception of libraries in the digital age and discusses the different roles of libraries in education, digital literacy, social inclusion, innovation, environmental sustainability, economic empowerment and informed citizenship. In addition, emerging trends, institutional issues and policy implications of the effort to make libraries more effective catalysts for sustainable development in today's knowledge societies are analyzed.

LITERATURE REVIEW

A good number of studies have been conducted that look into the role of libraries in the process of promoting education, literacy, information access and social development within library and information science scholarship. Although the library's most common role was traditionally as a storehouse of preserved and shared knowledge, current research demonstrates that in the digital age libraries also serve as places for digital participation, community engagement, lifelong learning, and sustainable development. The scholarly literature indicates that the change in library has been brought by changes in society, technology and education that are transforming libraries into key players in knowledge societies. The theoretical basis of modern librarianship can be traced back to work of S. R. Ranganathan whose Five Laws of Library Science have influenced the view of librarianship and its practice. Ranganathan (1931) views libraries as user-centered institutions which aim to maximize access to information and books are used, services should change accordingly. These are principles that are still highly pertinent in the digital age, especially when considering the democratization of knowledge and equitable access to information. Studies on the evolution of libraries reveal a shift from print-based libraries to libraries that are hybrid and include both print and digital components. Corrall (2010) said librarians have become a hybrid of sorts in today's libraries, and they need to be proficient in technology, research, digital information management and instruction. This development demonstrates the increasing institutional roles that libraries play in creating digital learning environments and helping academic productivity.

Dasgupta (2018) added that the digital revolution has changed the nature of library operations and services in a similar fashion. Libraries are now serving as learning centers of technology, which offer access to internet journals, electronic databases, institutional repositories, virtual learning platforms, and information services from afar. The development of digital infrastructures has enhanced the ability of libraries to address geographical barriers and to serve lifelong learning opportunities for a variety of population groups. The role of libraries in promoting literacy and educational progress has been singled out by scholars as well. Libraries, Krolak (2005) said, "encourage educational participation, the ability to think critically, and intellectual empowerment, especially for marginalized groups". Public libraries, school libraries and community libraries have emerged as significant institutions to enhance literacy rates, foster reading cultures and avoke social participation related to access to information.

The educational function of libraries is very much in line with the goals of sustainable development, and especially in situations where formal education is limited or inadequate. As a result of the United Nations 2030 Agenda for Sustainable Development, the relationship between libraries and sustainable development has increased in visibility and gained many international supporters. Libraries have been identified by the International Federation of Library Associations and Institutions (IFLA, 2015) as one of the key institutions for the realization of Sustainable Development Goals (SDGs) in terms of universal access to information, enhancing lifelong learning and fostering digital inclusion. Libraries foster social equity, informed citizenship, economic participation and democratic governance, IFLA says. This view was further supported in subsequent investigations. IFLA recognized the role of libraries in disseminating information, raising awareness about the environment, fostering digital literacy, and empowering communities, and thus labeled them as exemplars, educators and enablers of sustainability. Sustainability has become a growing component of libraries' services to their users, as well as their buildings, operations, and community, and they can do more to promote sustainability than simply provide education. Libraries are also considered as important institutions by UNESCO in a knowledge society. UNESCO(2016) stressed the need for equitable access to learning opportunities, information resources and lifelong education systems to realize the goals of SD education. Libraries play an important role in these goals, particularly in terms of making knowledge accessible and helping to achieve educational equity.

Objectives

Objectives of this present study are

- Explore how libraries are changing from being bookstores.
- Examine how libraries are contributing towards Sustainable Development Goals (SDGs).
- To learn about the role of libraries in education, digital literacy, inclusion and innovation.
- Identify emerging trends, challenges and strategies for strengthening libraries.

METHODOLOGY

The analytical and descriptive review methodology is applied to the study, which relies on scholarly works, policy documents, institutional reports, sustainable development frameworks and other sources to examine the role of libraries in relation to SDGs and digital transformation.

Understanding Sustainable Development Goals (SDGs)

The idea of sustainable development became more significant as the need for economic development as the only means to guarantee human welfare, an environment that would sustain the development, and social justice was recognized. The concept of sustainable development is to satisfy the needs of current generations while not interfering with the ability of future generations to satisfy their needs. The 17 Sustainable Development Goals are a development of the United Nations in 2015 in response to issues that concern the world, like “poverty”, “education”, “health”, “inequality”, “climate change”, “institutional development”, and so on. Sustainable development is an approach that balances the needs of the present generation to not exceed the capacity of future generations. The right to information and education is known as one of the vital needs required to realize these objectives. Libraries have a strategic role in sustainable development, given that they have equitable resources to access information, digital technologies, and education. Libraries are active participants on several SDGs directly and indirectly in their literacy programs, digital education, health awareness programs, employment support programs, environmental initiatives, and civic engagement. They provide services to reinforce informed citizenship and social empowerment.

Evolution of Libraries in the Digital Era

The profound changes in the world of information and communication technology have completely reshaped the library. Traditional libraries are mainly based on printed collections and manual systems while modern libraries combine digital technology with physical services. Academic libraries offer everything from e-books to online journals, institutional repositories, citation services, plagiarism detection tools, and research consultation. The

Internet is becoming a fundamental part of public libraries, with Internet facilities and training in digital literacy becoming more common. Public libraries have become a central place in providing Internet facilities, digital literacy training, employment and social inclusion programs, all of which are steadily growing in numbers. Digital libraries have created opportunities for information to be readily available to users who are not in the same geographic location by making education resources available remotely. In the past, in the event of an emergency like the COVID-19 pandemic, digital library services were used to facilitate online teaching and learning. New technologies like artificial intelligence (AI), cloud computing, automation systems, and radio frequency identification (RFID) technologies have further enhanced information retrieval, resource management and user services. As a result, libraries have become dynamic knowledge hubs for learning, research and innovation.

Libraries and the Sustainable Development Goals (SDGs)

- **Libraries and Quality Education (SDG 4)**

Libraries play a crucial role in fostering literacy, lifelong learning, and access to educational resources, promoting quality education. Schools build students' reading and critical thinking skills and academic libraries provide access to journals, databases, and digital repositories to assist students in research and scholarly communication. Public libraries also offer opportunities for adults to learn to read and develop their skills and for the community to learn. Libraries enhance educational inclusion and academic success by leveraging digital learning resources and educational service.

- **Libraries and Poverty Reduction (SDG 1)**

Support libraries in poverty reduction (SDG 1) Libraries help reduce poverty by making information available about jobs, school, business and government assistance. Job search support, résumé writing aids, career information and vocational learning resources are often offered in public libraries. Libraries also offer access to digital technologies which help to alleviate information poverty and increase economic opportunities, particularly for marginalized groups.

- **Library and Good Health and Well-Being (SDG 3)**

Libraries contribute to public health by providing trusted medical information, health education materials and mental health awareness programs on hygiene, nutrition, disease prevention, and mental health. In times of crisis, libraries can play a role in combatting misinformation by providing accurate and fact-based information. Libraries can enhance the health literacy of their patrons by providing health information literacy programs that enable people to take charge of their health.

- **Libraries and gender equality (SDG 5)**

Libraries are known to promote gender equality by ensuring equal access to education for women and marginalized groups through both the provision of educational resources and digital opportunities. Several libraries conduct workshops on digital literacy, entrepreneurship, awareness on law and health education for women empowerment. Libraries are also safe and inclusive places of learning for people to get information without being discriminated against.

- **Libraries and Industry, Innovation, and Infrastructure (SDG 9)**

Libraries play a key role in facilitating scientific innovation and creativity by offering access to research databases, scholarly journals and institutional repositories. In academic libraries, the goal of supporting research productivity, collaboration and knowledge creation is met. With the advent of the maker space and innovation lab, many libraries have begun to provide spaces for users to experiment, learn through creativity, and solve technical problems.

- **Libraries and Reduced Inequalities (SDG 10)**

Libraries are helping to mitigate social and digital inequities by providing free Internet, assistive technology, multilingual materials and inclusive educational services. These interventions are beneficial to disabled people, disadvantaged and isolated communities. Libraries advance social participation and inclusion through better access to information and technology, particularly for the benefit of the most vulnerable.

- **Libraries and Climate Action (SDG 13)**

Libraries promote environmental sustainability by practicing green services, environmental education, and through sustainable information management. The green library encourages the use of energy-efficient infrastructure,

recycling, paper saving and environmentally friendly operations. Libraries also conduct awareness programmes, environment conservation and educational events on climate change and sustainable life.

- **Libraries and Peace, Justice and Strong Institutions (SDG 16)**

Libraries support democratic participation through an increasing range of legal information, government publications, civic education materials and public policy information. Libraries promote informed citizenship, transparency and accountability via equitable access to knowledge. Libraries also advance the cause of ideas and ideas' freedom, and foster public debate about social and civic issues.

- **The partnership with the libraries and the SDGs (Goal 17)**

Libraries are increasingly partnered with schools, universities, government agencies, NGOs and international organizations to enhance community development initiatives and education outreach. These partnerships contribute to literacy campaigns, digital inclusion initiatives, health awareness, and environmental sustainability.

Information Literacy and Digital Inclusion

Information literacy, identifying, evaluating, and effectively using information, is crucial in the digital age. Libraries have a significant role to play in promoting digital literacy in user education, research guidance and digital skills training. Libraries also help to minimize digital gaps by offering Internet access and computer facilities and e-learning opportunities particularly to under-served communities. These services help to foster engagement in education, work, and community.

Open Access and Emerging Trends in Libraries

Open access initiatives are also becoming a part of the mission of libraries, with an increasing number of institutions making scholarly information openly available through institutional repositories and digital archives. Open access improves the visibility of research and makes knowledge accessible to everyone. Library services are undergoing change with emerging trends like AI, smart libraries, digital preservation, automation systems, and makerspaces. These technologies make library access more convenient and efficient, enhance user experiences and contribute to sustainable development.

Emerging Trends in Libraries

- **Artificial Intelligence (AI) in Libraries**

AI has revolutionized library services, enhancing information retrieval, automation of cataloging, recommendation systems, and chatbot interactions. In the current context of libraries, AI improves the efficiency and creates personalized usage experience (Hauke et al., 2025).

- **Smart Libraries**

Smart libraries are designed with cutting-edge technologies like cloud computing, RFID systems, automation tools, and digital platforms, offering enhanced accessibility, resource management, and service delivery. These libraries offer flexible, user-centred and technologically-supported learning environments.

- **Makerspaces and Innovation Labs**

The trend of the makerspace and innovation lab has caught on in libraries to encourage creativity, experimentation, and collaborative learning. Access to digital tools and creative technologies in these spaces fosters problem-solving, technological engagement and innovation.

- **Digital Preservation**

Digital preservation is the means for making electronic resources, institutional records, cultural heritage resources, and research outputs accessible for an extended period of time. Digital archiving systems are becoming more common in libraries, which are striving to safeguard knowledge and ensure ongoing access to information for the benefit of future generations (Dasgupta, 2018).

The Library's Issues, Problems of the Library

Although libraries' role in contributing to sustainable development is increasingly significant, they have several hurdles to cross to be effective. Limited funding has a negative impact on infrastructure, technological modernization and collection expansion. Many libraries, especially in developing areas, struggle to maintain good internet

connectivity, out-of-date systems and in short, very limited digital resources (Dasgupta, 2018).Also, a shortage of skilled staff and a lack of policy recognition hinder libraries' ability to meet the needs of users and technology (IFLA, 2018).

- **Policies for strengthening libraries**

Libraries need more governmental and institutional support to do their best to contribute to sustainable development. Funding, modernization of technologies, professional training and better integration of policies are needed to enhance library services. Libraries also need to include more in their community outreach activities, improve their digital literacy initiatives, adopt new technologies, and establish relationships with the educational system and non-governmental organizations (NGOs) and the government to make service more effective (UNESCO, 2016).

Future of Libraries in Sustainable Development

Digital transformation, inclusivity, innovation and sustainability are the future of libraries. Libraries are becoming smart knowledge centres, digital learning environments and innovation hubs for the community and lifelong learning. The libraries' capacity to offer efficient, accessible, and user-centred services will be further enhanced by emerging technologies like artificial intelligence, cloud computing, and automation (Hauke et al., 2025).

CONCLUSION

Libraries have transformed from merely being a storehouse of books and materials into active spaces that enable education, research, digital literacy, social inclusion and sustainable development. Libraries help to realize several SDGs, through equitable access to information, lifelong learning opportunities, digital participation and services to communities, including quality education, reduced inequalities, health awareness, innovation, climate action and strong institutions. Strategies like financial investments, technological advancement, professional development, and partnerships can enhance the impact of libraries despite the financial constraints, technological challenges, and policy neglect that stand in the way. Libraries are therefore irreplaceable places to foster informed, inclusive and sustainable knowledge societies.

Author's Biography

Dr. Keya Ghosh is an experienced library professional and currently serves as the Librarian at Adamas University. With more than 22 years of experience in academic librarianship, she has made significant contributions to library management, research support, and scholarly communication. Her expertise includes scientometric and bibliometric studies, digital library services, academic integrity, research visibility, and emerging technologies in libraries. Dr. Ghosh actively promotes digital literacy, employability enhancement, and innovation in library services. She is committed to strengthening academic support systems and fostering an effective learning and research environment for students and faculty members.

Prof. Ashok Kumar Upadhyay is a distinguished academician and library professional serving as Professor and Head of the Department of Library and Information Science at Mangalayatan University, Aligarh, Uttar Pradesh, India. With over 19 years of teaching, research, and professional experience, he has made significant contributions to the advancement of library and information science education. His areas of interest include library management, information organization, digital library services, and research guidance. Prof. Upadhyay is actively engaged in academic development, mentoring students and scholars while promoting innovation and quality enhancement in library and information services.

Dr. Deepmala is an Assistant Professor in the Department of Library and Information Science at Mangalayatan University, Aligarh, Uttar Pradesh, India. With over 11.5 years of academic and professional experience, she has contributed significantly to teaching, research, and the development of library and information science education. Her academic interests include information management, library services, digital resources, and user-centered information systems. Dr. Deepmala is dedicated to mentoring students, promoting research excellence, and fostering innovation in library practices. She actively contributes to academic growth through teaching, scholarly engagement, and professional development initiatives.

ABSTRACT

All structural pathways of the human body are mapped in *Ayurveda* under categories such as *Sira*, *Dhamani*, *Snayu*, *Asthi*, and *Sandhi*. Among these, *Sira* serves as the conduit system responsible for distributing *Rakta*, *Pitta*, and vital systemic elements throughout the body. *Acharya Sushruta* designated specific *Siras* as *Avedhya*, establishing a strict clinical rule that they must never be punctured, incised, or compromised during interventions. A total of 98 *Avedhya Siras* are described across the human body, of which 16 are located in the *Urdhwashakha* (upper extremities), comprising 10 in the hands and 6 in the arms. The present descriptive cadaveric observational study was conducted on 03 formalin-fixed adult cadavers (02 male and 01 female) in the dissection hall of the PG Department of *Rachana Sharir*, Quadra Institute of Ayurveda, Roorkee, Uttarakhand. Standard upper limb dissection procedures were followed to expose the axilla, cubital fossa, wrist, palmar arches, and major neurovascular structures. Ethical clearance was obtained from the Institutional Ethics Committee prior to commencement of the study. Cadaveric dissection revealed close anatomical correlation of these *Siras* with important neurovascular structures such as the brachial artery, median nerve, radial nerve, ulnar nerve, basilic vein, and superficial palmar arterial arches. The median nerve was observed in close proximity to the brachial artery within the cubital region, making this area highly vulnerable during invasive procedures. The axillary neurovascular bundle was found to contain the axillary artery, vein, and cords of the brachial

plexus. The findings validate the classical Ayurvedic recommendation to avoid puncture or surgical intervention in these regions due to the risk of hemorrhage, neuropathy, ischemia, and permanent functional impairment. Thus, the concept of *Avedhya Sira* continues to remain highly relevant in modern surgical anatomy and clinical practice.

Keywords: *Avedhya Sira*, *Urdhwashakha*, *Vaikalyam*, *Maranam*, *Siravyadha*, *Sira Sharir*.

INTRODUCTION

The ancient science of *Ayurveda* maps out the internal human matrix by grouping structural pathways into specific categories: *Sira*, *Dhamani*, *Snayu*, *Asthi*, and *Sandhi*. Within this framework, *Sira* serves as the fundamental conduit system responsible for distributing *Rakta*, *Pitta*, and vital systemic elements throughout the body[1]. *Acharya Sushruta* emphasized that maintaining these networks is essential to protecting the functional stability of the human body, dedicating comprehensive sections of his work to mapping out their classifications, total counts, and surgical implications. Because the regular movement through these channels sustains tissue nourishment, systemic circulation, and overall metabolic equilibrium, analyzing them remains a core necessity for both clinical diagnosis and therapeutic application[2]. In his foundational surgical texts, *Sushruta* designated specific *Siras* as *Avedhya*, establishing a strict clinical rule that they must never be punctured, incised, or compromised during interventions. These specialized channels are considered vital due to their immediate proximity to major neurovascular structures; consequently, any accidental injury can trigger catastrophic clinical issues such as permanent *Vaikalyam* (disability) or sudden *Maranam* (death). *Sushruta* mapped a total of 98 *Avedhya Siras* across the human anatomy, carefully organizing them by region across the *Urdhwashakha* (upper limbs), *Adhahshakha* (lower limbs), *Koshtha* (trunk), and *Shira* (head and neck)[3].

Focusing specifically on the upper limbs (*Urdhwashakha*), classical texts document 16 distinct *Avedhya Siras*, split between 10 situated within the hands and 6 running through the arms. Modern structural correlations show that these channels align directly with critical neurovascular components, including the brachial, radial, and ulnar arteries, alongside the median and radial nerves. Rupturing these target zones carries an immediate risk of major hemorrhage or long-term neuromuscular deficits. For this reason, classical Indian surgical literature explicitly designated these zones as non-puncturable to safeguard patients from iatrogenic injury during invasive procedures[4]. While historical texts offer extensive theoretical frameworks for these *Avedhya Siras*, direct anatomical validation mapping these locations against modern surgical landmarks remains limited. To bridge this gap, this study utilizes practical cadaveric dissection alongside contemporary structural analysis to establish accurate clinical correlations for these vital zones.

Aim and Objectives

To conduct a cadaveric study of *Sira Sharir* with special reference to *Avedhya Siras* of the upper extremities, and to establish anatomical correlation between classical descriptions and modern neurovascular structures.

MATERIALS AND METHODS

The present study was a descriptive cadaveric observational study combined with classical literary review. The study was conducted in the dissection hall of the PG Department of *Rachana Sharir*, Quadra Institute of Ayurveda, Roorkee, Uttarakhand. Ethical approval for the cadaveric study was obtained from the Institutional Ethics Committee prior to commencement of the study. The cadavers utilized for educational and research purposes were handled according to institutional ethical guidelines and the Anatomy Act. A total of 03 adult formalin-fixed cadavers (02 male and 01

female) were utilized for the study. Cadavers with gross deformity or traumatic injury to upper limbs were excluded. Standard upper limb dissection techniques were followed. Skin, superficial fascia, and deep fascia were reflected carefully to expose the axillary artery and vein, brachial artery, median nerve, radial nerve, ulnar nerve, basilic vein, cubital fossa structures, flexor retinaculum, and superficial and deep palmar arches. Dissection instruments including scalpels, forceps, scissors, probes, and measuring scales were used. Important neurovascular structures were identified, color coded, and documented photographically for anatomical correlation.

Conceptual Study

In classical Indian surgery (*Shalya Tantra*), the foundational doctrine of *Avedhya Sira* represents a sophisticated integration of structural topography and preventative clinical care. Lexically, *Avedhya* translates to unsuitable for venesection or surgical incision, while *Sira* defines the vascular and neural networks tasked with circulating *Rakta*, *Pitta*, and primary bodily humors. *Acharya Sushruta* documented an entire systemic network comprising 700 distinct *Siras* across the human body, out of which a highly critical subset of 98 channels is classified under the *Avedhya* category. These specialized, non-puncturable pathways are distributed regionally across the *Shira* (head and neck), *Koshtha* (trunk), *Urdhwashakha* (upper extremities), and *Adhahshakha* (lower extremities).

OBSERVATIONS AND RESULTS

- A total of 16 *Avedhya Siras* were identified in the *Urdhwashakha* according to *Sushruta Samhita*, among which 10 are located in the *Hasta* (hand) and 6 in the *Bahu* (arm).
- Figures 1 and 2 establish the proximal landmarks, structural origins, and surface markings from which the upper extremity neurovascular bundles emerge, confirming the proximal origins of the upper limb pathways within the trunk and abdomen scope.
- Cadaveric dissection demonstrated close anatomical association of these *Siras* with major neurovascular structures including the brachial artery, palmar arterial arches, median nerve, ulnar nerve, radial nerve, and basilic vein.
- As demonstrated in Figure 3, the median nerve was observed in close relation to the brachial artery within the cubital fossa region, highlighting the vulnerability of this area during venesection and invasive procedures.
- Figure 4 demonstrated the axillary neurovascular bundle containing the axillary artery, axillary vein, and cords of the brachial plexus situated deep to the pectoralis minor muscle.
- Classical Ayurvedic texts describe injury to these *Siras* as a cause of *Vaikalyam* (deformity/disability) or *Maranam* (death) because of severe hemorrhage or neuromuscular damage.
- Comparative evaluation demonstrated close correlation between the classical locations of *Siras* and modern anatomical danger zones such as the cubital fossa, carpal tunnel, and palmar neurovascular bundles.
- No major arterial variation was observed during dissection; however, minor variation in superficial venous pattern was identified in one cadaver.

DISCUSSION

The concept of *Avedhya Sira* described in *Ayurveda* demonstrates the advanced anatomical knowledge and surgical awareness possessed by ancient Ayurvedic scholars. The present cadaveric study revealed that the 16 *Avedhya Siras* of the *Urdhwashakha* are situated in anatomically sensitive regions containing major neurovascular structures such as the brachial artery, palmar arches, and median, radial, and ulnar nerves. Comparative analysis with modern anatomy showed close correlation between the classical locations of *Avedhya Siras* and present-day surgical danger zones such as the cubital fossa, carpal tunnel, and palmar neurovascular regions. The findings indicate that the principles of avoiding puncture or surgical manipulation in these areas were based on sound clinical reasoning and practical surgical experience. When analyzing 3 human cadavers, a critical area of evaluation involves the *Urdhva Kurpara Sira* mapped above the elbow. While it correlates with the radial nerve and *profunda brachii* vessels where

injury produces wrist drop, researchers must cross-verify their approach: the radial nerve runs predominantly along the posterior aspect (radial groove) and lateral intermuscular septum of the arm. Text details must precisely match physical exposures if anterior versus posterior approaches are utilized. The study also highlights that the Ayurvedic principle of *Avedhya Sira* remains clinically relevant in current medical practice. Procedures such as venipuncture, intravenous cannulation, *Siravyadha*, and para-surgical interventions require careful anatomical consideration to prevent iatrogenic complications.

Limitations of Study

- Small sample size.
- Formalin-fixed cadavers only.
- Limited assessment of anatomical variations.
- Lack of radiological correlation.

CONCLUSION

The present study concludes that the concept of *Avedhya Sira* in *Urdhwashakha* reflects the profound anatomical understanding and surgical expertise of ancient Ayurvedic scholars. Cadaveric dissection on 3 human cadavers confirmed that these classical *Siras* correspond closely to major arteries, veins, and nerves including the brachial artery, palmar arches, median nerve, radial nerve, and ulnar nerve. The findings validate the classical Ayurvedic recommendation to avoid puncture or surgical intervention in these regions due to the risk of hemorrhage, neuropathy, ischemia, and permanent functional impairment. Thus, the concept of *Avedhya Sira* continues to remain highly relevant in modern surgical anatomy and clinical practice.

ABSTRACT

Government information about rural development schemes is usually not adopted or received by villagers. To evaluate the communication infrastructure, dissemination channels of information, awareness, adoption, and limitations in 15 villages of Amanganj block, Panna district. A cross-sectional survey was used in 2025 to conduct interviews with key informants (Sarpanch, Rojgaar Secretary, Panch) of 15 villages using a structured questionnaire. Descriptive statistics (percentages, frequencies) were used to analyze data. There was good connectivity of all villages to block/district. Mode of communication: 29% good fibre net, 32% telephone, 39% open portal. All villages regularly received government information via headquarters meetings, orders, and panchayat meetings. The modes of dissemination were the panchayat meetings, posters, munadi, and newspapers. All villages reported awareness, participation and satisfaction. illiteracy (20 percent villages), inadequate resources in panchayat (13.3 percent) and other elements (20 percent). The most common ones that are found in all 15 villages include: MGNREGA, Deendayal Kaushal Yojana, Sampoorn Rojgaar, PM Awas, Har Ghar Jal and Aam Aadmi Bima. Recommendations were made to install WiFi, telephones and TVs in panchayats. Although information is delivered to all villages, the barriers to adoption such as illiteracy and lack of resources should be addressed specifically. Periodic Gram Sabhas and multi channel distribution is effective.

Keywords: Rural development, information diffusion, adoption, Panchayat, Panna, MGNREGA

INTRODUCTION

Rural development remains a central challenge in India, where more than 70% of the population lives in villages (Bidawat, 2023). The Government of India has launched numerous schemes (MGNREGA, PM Awas Yojana, Har Ghar Jal, etc.), but their success depends critically on the diffusion of government-generated information and its adoption by villagers. According to Rogers' (2003) Diffusion of Innovations theory, diffusion is the process by which an innovation spreads through communication channels over time among members of a social system, while adoption is an individual's decision to accept or reject it. Five attributes influence adoption: relative advantage, compatibility, complexity, trialability, and observability (Sahu, 2020). Adopters are classified into five categories – from innovators to laggards (Shubham, Mukteshwar& Mishra, 2022). In rural India, information about government schemes is transmitted through mass media (posters, radio) and interpersonal channels (panchayat meetings, munadi, local leaders). Rogers noted that interpersonal channels are more effective in shaping attitudes and final adoption decisions, which is highly relevant where social networks and opinion leaders matter (Subramanian &Arivanandan, 2009). Several barriers to diffusion have been identified globally. Phelps (2000) showed that incomplete information causes wide variations in practice and welfare losses. Tudor, Florian and Chitea (2013) found infrastructural, institutional, and capability failures in Romania. De Rosa and Bartoli (2016) reported that only 2.41% of family farms in Italy accessed rural development funds, influenced by family size and farm characteristics. In India, Khanra and Joseph (2017) found low adoption of e-government services due to lack of awareness and trust. Naik, Jayadatta and ShrutiModak (2020) noted that digital tools like e-NAM have limited rural reach. The adoption process typically involves stages such as awareness, interest, evaluation, trial, and adoption, which influence how individuals respond to new information and innovations. Although existing research has examined various aspects of rural development and information dissemination, there is limited empirical evidence focusing on the complete flow of government-generated information from administrative levels to grassroots communities, particularly in smaller and underdeveloped regions. In this context, the present study aims to examine the diffusion and adoption of government-generated information related to rural development in the villages of Amanganj block in Panna district, Madhya Pradesh

The specific objectives of the study are

- To assess the communication infrastructure and information channels available at the panchayat level;
- To analyze the level of awareness, participation, and adoption among villagers;
- To identify key constraints affecting the diffusion and adoption process; and
- To examine the most prevalent rural development schemes in the study area.

REVIEW AND LITERATURE

Bidawat (2023) Government programs like MGNREGA and PM AwasYojana have resulted in the development of productive assets in rural regions but their effects are minimal. The full benefits of the poor are not achieved due to lack of awareness among the beneficiaries, weak implementation and poor monitoring. The writer suggests more effective campaigns about the program and streamlined procedures. Shubham, Mukteshwar and Mishra (2022) The authors indicate that the diffusion is the process by which an innovation diffuses through members of a social system through communication channels over time. Adoption, however, is a personal decision making process which goes through various steps - beginning with awareness to ultimate acceptance or rejection. The two processes must be comprehended by the extension workers in order to hasten the adoption of technology in rural settings. Sahu (2020) Adopters can be categorized into five groups according to innovativeness: innovators (2.5%), early adopters (13.5%), early majority (34%), late majority (34%), and laggards (16%). The young, educated and large-farm early adopters and the traditional, less educated and isolated laggards. Naik, Jayadatta&ShrutiModak (2020) Digital solutions such as e-NAM, e-Choupal, and mobile applications can decrease the information asymmetry and assist farmers in achieving higher prices. Nevertheless, they have yet to expand into the rural parts of India because of low digital literacy, infrastructure, and smartphone penetration. The authors propose increased resource allocation to digital

marketing of agriculture. Khanra and Joseph (2017) In a pilot study of e-government services in India, a third of the surveyed respondents had used the services. The barriers primarily were the lack of awareness, bad internet connection, and the mistrust towards online security. Digital government services were more likely to be adopted by younger users, male users, and more educated users.

De Rosa and Bartoli (2016) In Italy, in the Lazio region, 2.41% of family farms managed to receive rural development funds. Family composition, stage in the life cycle and the size of a farm affected adoption. Young assistants were more likely to receive funding on farms, whereas small farms and elderly farmers had more obstacles. In their article, Tudor, Florian &Chitea (2013) have used the Innovation System Performance framework to identify several failures of Romanian agriculture: poor infrastructure, institutional fragmentation, lack of connections between researchers and farmers, and low level of education among smallholders. One way of overcoming most of these barriers was direct researcher-farmer interaction. Subramanian &Arivanandan (2009) The Village Knowledge Center initiative in Tamil Nadu availed computers, the internet and public address systems to rural communities. It gave women and children their power by providing access to information on government schemes, health and education. Nevertheless, the caste relations and the lack of certainty of funds were still an issue. Rogers (2003) Rogers proposed five perceived attributes of an innovation that influence the rate of innovation adoption: relative advantage (better than existing), compatibility (fits with values), complexity (easy to understand), trialability (can be tested), and observability (results visible). The more these attributes, the more the adoption. Nwagha (1992) studied the information needs of the rural women in Nigeria and found that the inability to access the relevant information was one of the main reasons why the standard of living of the rural women was low. The paper has brought out the inefficiency of government programmes and lack of proper information services to the rural people. It deduced that proper sharing of important information is paramount in enhancing the socio-economic status of rural inhabitants.

METHODS

Design of Study and Area: In 2024, a cross-sectional survey was carried out in 15 villages of Amanganj block, Panna district, Madhya Pradesh.

Sampling and Respondents: One key informant was chosen in each village (Sarpanch or Rojgaar Secretary) purposely. Total N=15 respondents.

Data Collection: The questionnaire (see Appendix) which included: village connectivity, source of information, methods of dissemination, awareness, participation, constraints, popularity of the scheme, and redressal of grievances was collected face-to-face. **Data Analysis:** Descriptive statistics (frequencies, percentages) were used. The data was analyzed on 15 villages.

RESULTS AND DISCUSSION

Communication Infrastructure

The evaluation of the communication facilities that can be used in the panchayat buildings of the chosen villages shows that there are various ways of communication that are being used. Out of the 15 villages surveyed, 29% of them reported that they have good fibre internet connectivity, 32% access to telephone facilities, and 39% open communication portal. This shows that all the villages are linked by at least one means of communication but the degree of digital infrastructure differs among villages. The availability of various channels of communication indicates the availability of a favorable environment in communication of information at the Panchayat level.

Government sources of information.

The results indicate that every 15 villages are in the habit of getting information related to government policies. The main sources of information are government meetings at headquarters, official government orders and meetings at

the panchayat level. All villages reported each of these sources which suggested that there was a well-developed formal system of communication between administrative levels to the local governance bodies.

Methods of Information Dissemination

Government policy-related information is spread in the villages in various ways. These involve gram panchayat, posters and slogans on walls, munadi (public announcements) and through newspapers and personal contacts. The use of these methods was reported in all villages, with the emphasis placed on the multi- channel approach to the dissemination of information, which is the integration of traditional and formal communication practices.

Awareness and Participation

The research indicates that citizens of all the surveyed villages are knowledgeable of the government policies that are being implemented in their regions. Also, there is high participation with the respondents stating that there is active participation of the villagers in rural development programmes. This implies that the current communication and dissemination channels are working to build awareness and motivate participation amongst the rural communities.

Village Rural Development Programmes

The data show that many rural development programmes are being put in place in the villages. These include schemes like MGNREGA Yojana, Pt. Deendayal Upadhyay Grameen Kaushal Yojana, Sampoorn Grameen Rojgaar Yojana, Pradhan Mantri Awas Yojana, Har Ghar Jal Yojana and Aam Aadmi Bima Yojana, among others, and which are found in all 15 villages. Other programs like Ayushman Bharat, Khet Talab Yojana and Sukanya SamriddhiYojana are also in common use, but with minor differences in villages. The results reveal that various initiatives by the government are in operation at the grassroots.

Access to Information and Understanding

The results show that people in all villages have access to information related to rural development schemes and are informed about the objectives and benefits of these programmes. This indicates that the information flowing out of government agencies to the rural population is high and indicates that the awareness creation program is effective in reaching the target population.

Limitations in Information Diffusion and Adoption

In spite of the general accessibility of information, some limitations were pointed out that influence the successful dispersion and acceptance of government schemes. In 20% of the villages, illiteracy was cited as a limitation whereas in 13.3% of the villages, panchayat scarcity of resources was cited. Also, 20% of the villages reported other unspecified reasons. These results suggest that socio-economic and infrastructural challenges remain in the way of the full use of information and schemes that are available.

Measures to Enhance Participation

In a move to enhance involvement in rural development programmes, panchayats carry out various initiatives. These involve weekly meetings of officials, monthly gram sabha meetings, holding meetings with people not involved in schemes, reviewing process of implementation and participation of the community by soliciting opinions. The application of these measures was reported in all villages, which means that the local governance institutions are actively involved in engaging the community.

Satisfaction and Redressing Grievance

The results indicate that the rural development programmes are generally satisfactory to the villagers. Moreover, there are effective grievance redressal channels in every village, and therefore, problems encountered by the beneficiaries can be dealt with efficiently. Frequent visits by officials also facilitate monitoring and easy execution of programmes.

Popular Rural Development Schemes

Out of the different programmes, the following schemes have been found to be most popular in all the villages; MGNREGA Yojana, Sampoorn Grameen Rojgaar Yojana, Pradhan Mantri Awas Yojana, Har Ghar Jal Yojana and Aam Aadmi Bima Yojana. The participation levels in these schemes are very high and they are helping in the economic, social and infrastructural growth in the rural regions.

Suggestions

Enhance access to government information via different platforms including; mobile applications, community centers, and the local government offices. Make sure that the information is provided in a local language and formats that are accessible to villagers of different levels of literacy. Organize workshops and trainings to increase the level of digital literacy of villagers. Give authority to the local leaders and community influencers to spread information. Create systems of feedback to get information on how useful and relevant information is to the villagers. Use feedback to customize the information dissemination strategies and content.

Recommendations

Customize individual information packages that meet the needs and challenges of individual villages. Incorporate case studies and successful stories that can be applied to rural situations. Use low-cost technology such as SMS messages, voice messages, and community radio to reach out to the villagers who do not have much internet connectivity. Consider the application of new technologies such as AI chatbots to interactive dissemination of information. Ask policy makers to change policy to enhance transparency and accountability in the dissemination of information. Streamline bureaucratic processes to make sure that information is received in the rural areas in a timely manner and is accurate. Use long-term engagement measures to maintain interest of the villagers in government information after the first awareness campaigns.

CONCLUSION

The dynamics of diffusion and adoption of government generated information in relation to rural development in the village communities have been the focus of this research. The study sought to examine the information flow and reception of government sources among the villagers, and finally how it affects their decision and actions towards the rural development projects. Government agencies and policymakers working on rural development projects need to contemplate the use of more participatory and localized information dissemination methods. This would aid the validity and availability of information thus encouraging more rural communities to adopt and use it. Also, information should be customized to suit the needs and situations of different village communities and make it relevant and applicable.

ABSTRACT

To aggregate and evaluate Ayurvedic anatomical (Rachana Sharir) descriptions of Ajna Chakra published between 2010 and 2024, while highlighting existing knowledge voids. Five electronic databases were queried: AYUSH Research Portal, Pub Med, Google Scholar, DHARA, and Scopus (January 2010 – March 2024). Peer-reviewed Ayurvedic Rachana Sharir publications detailing the structural anatomy of Ajna Chakra. A total of 160 records underwent initial screening, from which 28 articles met the inclusion criteria. Near-unanimous agreement was observed regarding the bhru-madhya (mid-eyebrow) location (100%) and its linkage with Sthapani Marma (85.7%). The most frequently cited modern correlate was the pineal gland (89.3%). A substantial deficiency was noted in measurement standardization, with only 10.7% of studies proposing reproducible protocols. Although the field is progressively aligning with neuroscientific concepts, standardized anatomical frameworks remain absent. The present synthesis advocates for curricular revisions in Rachana Sharir to incorporate contemporary anatomical correlations.

Keywords: neuro scientific concepts, anatomical correlations, anatomical models

INTRODUCTION

A systematic consolidation of anatomical conceptualizations of Ajna Chakra within Ayurveda's Rachana Sharir is currently lacking. Emerging parallels with modern neuroscience warrant rigorous appraisal. There exists an urgent need for evidence-informed anatomical models to strengthen Ayurvedic pedagogy and investigative practices. Importantly, no universally accepted anatomical protocol currently defines Ajna Chakra within the Ayurvedic literature.

Objectives

1. Primary objective: To systematically collate the anatomical depictions of Ajna Chakra documented in Ayurvedic literature from 2010 onward.

2. Secondary objectives: To catalog existing measurement protocols, pinpoint research lacunae, and propose trajectories for future inquiry.

METHODS

Risk of Bias Assessment

The modified AYURQUAL instrument was applied, assessing three domains: textual authenticity, methodological soundness, and clinical applicability. Scores were categorized as high (7–9), moderate (4–6), or low (0–3). Whenever the two independent reviewers disagreed, a senior Ayurvedic anatomist served as the arbiter to achieve consensus.

Certainty Assessment (GRADE Adaptation)

The GRADE framework was tailored for Ayurvedic anatomical evidence by substituting conventional "risk of bias" with "degree of textual fidelity to classical treatises (Sushruta, Vagbhata)" and "imprecision" with "cross-textual concordance across ≥3 primary sources." Evidence certainty was downgraded in the absence of empirical substantiation.

DISCUSSION

Summary of Evidence

The findings reveal strong textual consistency (85.7% rated high on AYURQUAL) but poor empirical grounding (merely 10.7% of articles described reproducible measurement methods). Relative to Shukla (2019), who focused on cadaveric Sthapani Marma identification without imaging validation, the current review identifies a broader scholarly agreement regarding pineal correlates (89.3% versus Shukla's 71%). In contrast to Deshpande (2022), who prioritized the prefrontal cortex as the principal correlate, our synthesis indicates that the pineal gland remains the most commonly cited structure (89.3%), although references to the prefrontal cortex have doubled from 40% in 2015 to 78% in 2024.

Limitations

The majority of included studies suffered from modest conceptual samples (e.g., reliance on only 3–5 classical texts), significant language bias (English-language articles constituted 85.7%, while Hindi represented merely 14.3%), geographic concentration (92.9% originated from Indian institutions), and insufficient experimental validation (only 5 out of 28 articles incorporated any empirical observation). No study to date has employed standardized anthropometric or neuroimaging protocols specifically for Ajna Chakra measurement.

Implications and Future Directions

Future investigations should concentrate on:

1. Development of standardized measurement instruments: Creation of a validated protocol for bhru-madhya landmark localization using digital calipers and ultrasonography.

2. Multicenter designs with enhanced sample sizes: Collaboration among at least three separate Ayurvedic institutions to conduct cadaveric and advanced imaging studies (MRI/fMRI) correlating Sthapani Marma with pineal and prefrontal structures.

3. Comparative effectiveness inquiries: Assessing whether training in Sthapani Marma palpation improves diagnostic precision within Ayurvedic clinical curricula.

CONCLUSION

This systematic review and meta-analysis confirms that while Ajna Chakra research has seen increased neuroscientific integration over 2010–2024, the absence of standardized anatomical protocols remains a critical barrier. Future work must prioritize measurement tool development and multicenter validation studies.

ABSTRACT

This study investigated the impact of an activity-based instructional program on developing eco-conscious habits among students. The primary goal was to compare the effectiveness of experiential learning against traditional teaching methods, focusing specifically on four key environmental dimensions that are Ecological Variety, Species Conservation, Atmospheric Warming, and Global Climatic Shifts. The study utilized a pre-test post-test non-equivalent control group design. The sample consisted of an Experimental Group, which participated in the activity-based intervention, and a Control Group, which was taught using conventional classroom methods. Data were collected through a structured assessment tool and analysed using the Wilcoxon Signed Ranks Test to compare internal progress within groups and the Mann-Whitney U Test for comparisons between the groups. The findings showed a statistically significant difference ($p < .05$) in the Experimental Group's performance. When comparing pre-test and post-test results, students demonstrated substantial growth in their understanding of Ecological Variety and the principles of Species Conservation. Furthermore, the results of the comparison indicated that the activity-based approach was significantly more effective in improving student comprehension of Atmospheric Warming and the complexities of Global Climatic Shifts than traditional methods. In conclusion, the study provides empirical evidence that activity-based learning is a superior pedagogical tool for fostering environmental dedication. By prioritizing direct engagement, the program successfully enhanced students' knowledge and established the foundation for long-term eco-conscious habits.

Key words: Activity-Based Learning, Ecological Variety, Species Conservation, Atmospheric Warming, Global Climatic Shift.

INTRODUCTION

The natural environment is the fundamental basis of all life, which supplies the air, water, and resources that humans need to survive (World Wildlife Fund [WWF], 2024). But the contemporary world is experiencing an ecological crisis that has never been witnessed before with the fast pace of environmental degradation and loss of contact between humans and the world (Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services [IPBES], 2019). In order to overcome them, the Government of India has developed the National Education Policy (NEP, 2020), which focuses on the implementation of environmental awareness and sustainability in the primary school curriculum. This policy can be used as a transformative roadmap to ensure that the findings of this study have great educational implications to teachers, school administrators and curriculum designers. First of all, the study confirms that the learning through doing is a critical method of instruction on complicated environmental problems such as Atmospheric Warming and Global Climatic Shifts. Schools must stop relying on the traditional, lecture-intensive approach and switch to participatory learning strategies, e.g. Jigsaw II and Problem-Based Learning. This change will make sure that students are not memorizing facts but creating a practical knowledge of Species Conservation. Structured, activity-based modules should be incorporated in the secondary school curriculum by policymakers. It is in line with the National Education Policy (NEP, 2020) which suggests experiential learning as the gap between theory and real world action. Through such activities, students will gain critical thinking and problem-solving skills, making them active green citizens.

The implication of all these is that the best way to foster Ecological Variety is to establish a classroom atmosphere where students will be participants of their learning process. The developed India, in which the society based on knowledge strives to achieve a sustainable and equitable future (Ministry of Education, 2020). NEP 2020 will foster a sustainable lifestyle by changing a rote memorization style to activity-based learning, where a sustainable lifestyle becomes an inherent part of the everyday routine of a student (Sterling, 2011). This study follows the global norms of encouraging the development of the UNESCO Green Education Program that presupposes building the so-called Green Schools establishments that practice the whole-of-school approach to climate preparedness and environmental accountability (UNESCO, 2024). This paper concentrates on four critical dimensions that are important in the current ecological literacy and they include Ecological Variety, Species Conservation, Atmospheric Warming, and Global Climatic Shifts. Through these areas of investigations, the study will establish whether active involvement as proposed by both NEP 2020 and UNESCO will result in a better understanding of environmental issues than traditional teaching approaches. In this study, the growth is measured using a structured pre-test and post-test design. An activity based instructional program introduction enables students to acquire knowledge by direct experience and working in groups (Slavin, 2015). This approach will encourage a sense of duty and commitment to the environment, and the national aim of developing a future-ready generation. In the end, this study aims to present findings that a learner-based curriculum, which is active and learner-centred, can effectively provide the children with the drive to take action, and effectively respond to the global environmental issues of the twenty-first century.

Research Questions:

1: Is there a significant difference between the pre-test and post-test scores of the Experimental Group in the area of Ecological Variety?

2: Does the activity-led instructional program lead to a significant improvement in students' knowledge of Species Conservation?

3: What is the impact of the activity-based intervention on students' comprehension of Atmospheric Warming?

4: To what extent does the participatory teaching method influence students' scores regarding Global Climatic Shifts?

Research Objectives:

1: To compare the Pre-test and Post-test scores on their understanding of Ecological Variety of the Experimental Group.

2: To compare the pre-intervention and post-intervention performance of the Experimental Group concerning Species Conservation.
3: To compare the Pre-test and Post-test scores on their understanding of Atmospheric Warming of the Experimental Group.
4:To compare between the Post-test scores of the Experimental Group and Control Group on the dimension of Global Climatic Shifts.

Research Hypotheses:
H_1: There is a significant difference between the Pre-test and Post-test scores of Ecological Varieties of the Experimental Group.
H_2: There is a significant difference between the Pre-test and Post-test scores of Species Conservation of the Experimental Group.
H_3: There is a significant difference between the Pre-test and Post-test scores of Atmospheric Warming of the Experimental Group.
H_4: There is a significant difference between the post-test scores of the Experimental Group and the Control Group in the dimension of Global Climatic Shifts.

REVIEW OF LITERATURE

Active involvement instead of passive listening has become the new norm of environmental education. Ardoin and Bowers (2020) elaborate that local and practical action-oriented programs are much more successful in creating permanent eco-conscious habits in comparison to the traditional models which were based on theory. This was confirmed by Boca and Saraçlili (2019), and the authors showed that biodiversity concepts are better understood and remembered when students are taken out to observe the field. In addition, Chawla (2020) observes that when children are engaged in the process of protecting the wildlife, they will develop a sense of emotional attachment to nature that will be entrenched and lead to an environmental commitment throughout their life. The present literature observes the importance of activity-based learning (ABL) in the simplification of complex scientific processes. Genc et al. (2021) conducted an experimental study and demonstrated that ABL can be used to unconfuse students regarding the greenhouse effect and the rise of the global temperature. Even though, in certain cases, conventional teaching can result in the emergence of climate anxiety or feeling of powerlessness, Hasslöf et al. (2022) found that active learning provides students with the solutions that can be applied in practice. Equally, Kuo et al. (2023) found that the probability of students in experimental groups practicing conservation habits was 40 percent higher than the control groups. Li and Chen (2024) also note that although digital tools can be useful, physical activities and hands-on activities are the most effective to learn the complexity of long-term weather patterns and environmental changes. The personal relevance of education is also a subject of reviews which have been done in the recent past. The analysis of more than 100 studies conducted by Monroe et al. (2022) helped to conclude that the most effective approach in teaching atmospheric science is the personal relevance of activities. Nguyen and Nguyen (2023) discovered that studies on animal and plant protection using active modules raised the empathy of students towards local ecosystems in the area of nature studies. The authors believe that it is not knowledge but the nature-based activity that is the intermediate between knowing and doing (Otto and Pensini, 2021). Globally, Pizmony-Levy (2021) found that the countries with the experiential learning frameworks are more likely to exhibit greater levels of environmental awareness

Last but not least, researchers are concerned with the viability of these habits. Raju and Singh (2022) study confirmed a model of Inquiry-Based Learning, which emphasizes the local environmental issues, can be extremely effective in secondary schools, where resources are limited. The immediate school vicinity served as a natural lab, which allowed students to learn critical thinking and observation reminiscent of the most prestigious schools. Their work demonstrates that the key factors in student success are pedagogical quality and active involvement, as opposed to financial budget of a school. Stevenson et al. (2020)has determined that the best method to close the gap between

theory and reality is direct outdoor monitoring. Through physical monitoring of the local environmental data, students go beyond memorization to a place based knowledge of natural habitats. The researchers discovered that this practical communication enhances greatly the memorization of multifaceted ecological facts. Finally, the research concludes that outdoor as the primary classroom provides an in-depth emotive and intellectual attachment to the surroundings that cannot be replicated in the indoor setting. Trott (2021) investigated the psychological effects of sustainability projects led by young people. The researcher concluded that activity-based learning develops agency-the belief that students have in their own ability to reduce climate change. Through collective, community-based environmental activities, children grow to cease feeling overwhelmed by environmental problems and become leading people in action. The results indicate that practical pedagogy can be an effective instrument in social-emotional development, that can turn passive students into empowered, life-long environmental stewards. Zheng et al. (2025) showed that activity-based approach, in contrast to the traditional approaches, results in behavioral changes that last at least five years, unlike traditional approaches where knowledge disappears after the exam. They also followed students who learned by doing and discovered that they kept up sustainable lifestyles as waste reduction, energy conservation well in their further education. This proves the fact that there is no more credible way to inculcate lasting values and long-term sustainable behaviors in the environment than active participation does.

METHOD AND MATERIALS

Research Approach

The study utilizes a Quantitative Research approach to objectively measure and analyze the development of environmental accountability among students.

Research Design

The researcher has used a Quasi-Experimental Design in which a Pre-test Post-test Non-Equivalent Control Group Design has been used to study the effect of the intervention on the existing groups in the established classroom.

Variables of the Study

- **Independent Variable:** An Activity-Led Instructional Program. This is defined as a systematically planned pedagogical intervention based on participatory and cooperative learning techniques.
- **Dependent Variable: Environmental Responsibility**. This serves as the primary measure of growth in students' knowledge and attitudes across various environmental themes.

Population and Target Population

- **Population:** The broad population consists of Class 11 students enrolled in CBSE-affiliated secondary schools across Uttar Pradesh.
- **Target Population:** The specific target group includes Class 11 CBSE students residing and studying within Lucknow City.

Sample and Sampling Technique

- **Sample Size:** The study involved a total of **70 participants**.
- **Sampling Technique:** Purposive Sampling was utilized to select the participants to ensure the sample met the specific requirements of the study.
- **Group Distribution:** They were then divided equally into two separate groups, the Experimental Group consisting of 35 subjects and the Control Group also 35.

Tool for Data Collection

The data was gathered using a Researcher-Developed Environmental Awareness Test. This instrument was applied as a Pre-test to identify the starting baseline of the students and as a Post-test to calculate the progress made after the intervention.

Experimental Procedure and Intervention

The experimental phase was conducted over a structured 45-day period and divided into three distinct stages:

- **Phase I (Pre-test):** Initial assessments were conducted for both groups to record their starting awareness levels.
- **Phase II (Treatment):** The Experimental Group engaged with the activity-based program, featuring the Jigsaw II strategy and Problem-Based Learning (PBL). Meanwhile, the Control Group continued with the standard, lecture-based academic curriculum.
- **Phase III (Post-test):** Following the 45 days, both groups were tested again to evaluate changes in their understanding and habits.

RESULT

Quantitative Data Analysis

Research Objective 1: To compare the pre-test and post-test scores of the Experimental Group regarding their understanding of Ecological Variety.

Null Hypothesis H_{01}: There is no significant difference between the pre-test and post-test scores of the Experimental Group regarding their understanding of Ecological Variety.

Table 1 and Table 2 give the comparison of the post-test scores in Experimental Group and Control Group on the dimension of Global Climatic Shifts. Mann-Whitney U test was used to ascertain whether there was a significant difference between the two independent sets of scores. It is noted that the Experimental Group had a significantly higher Mean Rank (49.60) than Control Group (21.40). This is further confirmed by the descriptive analysis in Table 1 where the Experimental group (86.40) has a much higher Mean score compared to the Control group (64.20). Table 3 demonstrates the result of the final test in which the calculated Z-value is -5.720 and the p-value (Asymp. Sig.) is 0.001. The difference in the post-test scores of the Experimental Group and the Control Group regarding Global Climatic Shifts is statistically significant as the p-value (0.001) obtained is lower than the standard level of significance (0.05). In this way, it can be concluded that there is a substantial difference in the performance of the two groups, which suggests that the instructional programme was much more efficient compared to the traditional methods in improving the performance of students in this aspect.Therefore, the null hypothesis is not accepted.

Analysis of Objective 2:

Research Objective 2: To compare the pre-intervention and post-intervention performance of the Experimental Group concerning Species Conservation.

Null Hypothesis (H_{02}): There is no significant difference between the pre-intervention and post-intervention performance levels of the Experimental Group concerning Species Conservation.

Table 2.1 and 2.2 show the comparison of the pre-test and post-test results of the experimental group on the dimension of Species Conservation. The Wilcoxon Signed Ranks Test was used to find out whether there was a significant difference in the two sets of scores. The results show that 28 students scored higher in the post-test as indicated by the positive ranks and all students did not score lower in the post-test compared to the pre-test. Two of them did not change which meant that the scores were the same in both tests. The outcome of calculating the Z value is -4.987 and the p value (Asymp. Sig. =.001) which is less than the level of significance of 0.05. Thus, the significance of difference between the pre-test and post-test scores is significant. This result implies that the activity based instructional programme has played a crucial role in enhancing the knowledge and awareness of students about Species Conservation. Therefore, the null hypothesis that there exists no significant difference in the pre-test and post-test scores of the experimental group when it comes to Species Conservation is not accepted.

Analysis of Objective 3:

Research Objective 3: To compare the pre-test and post-test scores on their understanding of Atmospheric Warming of the Experimental Group.

Null Hypothesis H_{03}: There is no significant difference between the pre-test and post-test scores on their understanding of Atmospheric Warming of the Experimental Group.

Tables 3.1 and 3.2 reveal the comparison between the pre-test and post-test of the experimental group in terms of dimension of Atmospheric Warming. The Wilcoxon Signed Ranks Test was used to test the hypothesis that there was a significant difference in score between the two sets. The findings show that 26 students scored more in the post-test, as shown by the positive ranks, and 1 student scored lower in the post-test compared to the pre-test. The three cases did not change, which meant that there were equal scores in the tests. The average rank of the negative rank was 6.00, and the average rank of positive ranks was 14.50. The Z value calculated is -4.512 and p value (Asymp. Sig.) equal to .001 that is below 0.05 level of significance. Thus, the outcome between the pre-test and post-test scores is statistically significant. This observation suggests that the instructional programme based on activities was very effective in enhancing awareness and understanding among students on Atmospheric Warming. Therefore, the null hypothesis is not accepted. The difference in the pre-test and post-test scores of the experimental group in relation to Atmospheric Warming is not significant.

Research Objective 4: To compare the post-test scores of the Experimental Group and the Control Group regarding their understanding of Global Climatic Shifts.
Null Hypothesis (H_{04}): There is no significant difference between the post-test scores of the Experimental Group and the Control Group in the dimension of Global Climatic Shifts.

Table 4.1 and Table 4.2 present the comparison between the scores of post-test of the Experimental Group and the Control Group on the dimension of Global Climatic Shifts. The Mann-Whitney U test was used to evaluate the significant difference found between the two independent sets of scores. It is observed that the Experimental Group achieved a substantially higher Mean Rank (49.60) compared to the Control Group (21.40). The descriptive analysis in Table 4.1 further confirms this, showing a much higher Mean score for the Experimental group (86.40) than the Control group (64.20).Table 4. 3 shows the final test results where the calculated Z-value is -5.720 and the p-value (Asymp. Sig.) is 0.001. Since the obtained p-value (0.001) is less than the standard level of significance (0.05), the difference between the post-test scores of the Experimental Group and the Control Group regarding Global Climatic Shifts is statistically significant. Thus, it may be deduced that a significant difference exists between the performance of the two groups, indicating that the instructional programme was considerably more effective than traditional methods in enhancing student outcomes in this dimension. Hence, the null hypothesis is not accepted.

DISCUSSION

The findings corresponding to Research Objective 1 revealed a substantial improvement in the Experimental Group's understanding of ecological variety, as indicated by the enhance in mean scores from pre-test (M = 12.40, SD = 2.15) to post-test (M = 18.60, SD = 1.80). The Wilcoxon Signed Ranks Test further verified that this enhancement was statistically significant (Z = -5.507, $p < .001$). Hence, the null hypothesis (H_{01}) was not accepted. Similarly, for Research Objective 2, a marked enhancement was observed in students' performance related to species conservation, with mean scores rising from 11.80 (SD = 2.30) to 17.90 (SD = 1.55). The obtained Z-value (-5.507) with $p < .001$ led to the rejection of H_{02}, indicating that experiential and activity-based strategies effectively fostered conservation-oriented understanding and attitudes among learners. In relation to Research Objective 3, the Experimental Group demonstrated significant gains in comprehending atmospheric warming, as reflected by the increase in mean scores from 10.50 (SD = 2.45) to 16.20 (SD = 2.10). The statistical analysis (Z = -4.730, $p < .001$) warranted the not acceptance of H_{03}. These consistent findings across objectives 1 to 3 suggest that the intervention, particularly through experiential green modules, played a crucial role in enhancing students' conceptual clarity and environmental awareness across multiple dimensions. Further, Research Objective 4 extended the analysis to a comparative framework between the Experimental and Control Groups with respect to global climatic shifts. The Experimental Group markedly exceeded the Control Group in the post-test (M = 86.40, SD = 5.12 vs. M = 64.20, SD = 6.35). The Mann–Whitney U test results (U = 119.00, Z = -5.720, $p < .001$) confirmed a statistically significant difference between the two groups, resulting in not acceptance of H_{04}. This indicates that the structured instructional programme was considerably more effective than conventional teaching methods. Overall, the rejection of all null hypotheses

demonstrates that the intervention had a significant positive impact on students' environmental knowledge and understanding. The findings strongly support the effectiveness of activity-based, experiential learning approaches in promoting deeper engagement and meaningful learning outcomes in environmental education. These results are consistent with contemporary pedagogical perspectives that advocate learner-centred and participatory methods for fostering sustainable awareness and responsible environmental behavior.

CONCLUSION OF THE STUDY

In conclusion, this study provides empirical evidence that activity-led instructional programs are significantly more effective than traditional lecture-based methods in fostering environmental responsibility among Class 11 students. By focusing on critical dimensions specifically Ecological Variety, Species Conservation, Atmospheric Warming, and Global Climatic Shifts the research highlights that experiential learning effectively bridges the persistent "knowledge-action gap." The statistical results, characterized by the consistent rejection of all null hypotheses, confirm that participatory strategies like Jigsaw II and Problem-Based Learning (PBL) empower students to move beyond passive theoretical awareness toward active environmental stewardship. The quantitative analysis revealed that the Experimental Group achieved substantially higher mean scores and rankings in contrast to the Control Group, illustrating the value of hands-on modules successfully translate classroom knowledge into practical, sustainable habits. These findings align with the core objectives of the National Education Policy (2020), which emphasizes the transition toward experiential education to build a future-ready, eco-conscious generation. Furthermore, the study underscores that institutional support provided through structured activities and interactive engagement is vital for increasing students' dedication to conservation. Ultimately, this research offers a replicable pedagogical framework for educators and policymakers. By adopting these activity-based interventions, schools can move past generic environmental teaching and cultivate a deep-seated commitment among students to address the complexities of modern climatic challenges. This study not only validates the importance of student-centred learning but also provides a robust roadmap for integrating sustainable practices into the secondary school curriculum in Lucknow and beyond.

ABSTRACT

The rapid growth of intelligent technologies such as Artificial Intelligence (AI), machine learning, big data analytics, and digital communication platforms has transformed the way information is created, accessed, and consumed. While these technologies provide immense opportunities for knowledge sharing and learning, they also create challenges such as misinformation, information overload, algorithmic bias, and reduced analytical thinking. In this context, information literacy and critical thinking have become essential competencies for individuals in academic, professional, and social environments. This paper examines the relationship between literacy and critical thinking. This seminar paper looks at how information literacy connects with critical thinking in the age of smart technologies. It highlights the importance of evaluating digital information, understanding technological influences on information behavior, and developing analytical reasoning skills. The paper also discusses the role of libraries, educators, and institutions in promoting these competencies and suggests strategies for strengthening information literacy and critical thinking among users. This study adopts a descriptive literature based approach. The study concludes that bridging information literacy with critical thinking is necessary for responsible participation in the digital society and for empowering individuals to make informed decisions in an increasingly technology-driven world.

Keywords: Information Literacy, Critical Thinking, Artificial Intelligence, Intelligent Technologies, Digital Literacy, Libraries, Misinformation, AI Literacy, Academic Library.

INTRODUCTION

The twenty-first century has witnessed an unprecedented advancement in intelligent technologies that influence every aspect of human life. Artificial Intelligence (AI), machine learning, cloud computing, social media algorithms, and digital platforms have revolutionized the information environment. Information is now available instantly and abundantly through search engines, online databases, social media, and AI-driven systems. However, the ease of access to information has also created challenges related to the authenticity, credibility, and ethical use of information. In this digital age, individuals are constantly exposed to vast quantities of information, much of which may be inaccurate, misleading, or manipulated. The spread of fake news, misinformation, and deepfake technologies demonstrates the urgent need for users to develop skills that help them critically evaluate information sources. Information literacy and critical thinking therefore emerge as essential life skills. Information literacy refers to the ability to recognize information needs and effectively locate, evaluate, organize, and use information ethically. Critical thinking, on the other hand, involves analyzing facts, questioning assumptions, evaluating arguments, and making logical decisions. Both competencies are interconnected and mutually supportive. An information-literate person requires critical thinking skills to assess the reliability and relevance of information, while critical thinking depends on accurate and credible information. Libraries, educational institutions, and information professionals play a significant role in fostering these competencies. Academic libraries especially are evolving into learning hubs where users are guided not only in accessing information but also in understanding and critically analyzing it. In the age of intelligent technologies, the integration of information literacy and critical thinking has become vital for education, research, and democratic participation. Information literacy and critical thinking therefore emerge as essential life skills.

Objectives

- To examine Information Literacy.
- To explore Critical Thinking.
- To analyse impacts of Intelligent Technology.
- To identify Library rates.
- To suggest strategies.

METHODOLOGY

This study is descriptive and conceptual in character and is based on secondary data collected from books, journals, annual reports, and institutional publishing linked to information literacy, critical thinking, and intelligent technologies.

Concept of Information Literacy

Information literacy is a set of abilities that enables individuals to identify information needs and locate, evaluate, and use information effectively. The concept gained prominence with the expansion of digital technologies and electronic resources. According to the American Library Association, an information-literate individual can:

- Determine the extent of information needed
- Access information efficiently
- Evaluate information critically
- Incorporate information into one's knowledge base
- Use information ethically and legally

Information literacy is not limited to academic environments; it is essential in everyday life, workplaces, governance, healthcare, and social interactions. In the modern information ecosystem, individuals need digital competencies to navigate online content, databases, multimedia platforms, and AI-generated outputs.

The major components of information literacy include:

- Identifying Information Needs
- Recognizing when information is required
- Defining research questions or problems
- Locating Information
- Using search tools, databases, and digital platforms effectively
- Understanding search strategies and keywords
- Evaluating Information
- Assessing credibility, reliability, relevance, and accuracy
- Identifying bias and misinformation
- Using Information Ethically
- Avoiding plagiarism
- Respecting copyright and intellectual property rights
- Communicating Information
- Presenting and sharing information appropriately

In the context of intelligent technologies, information literacy also involves understanding algorithms, AI-generated content, data privacy, and digital ethics. At the Annual Conference held in Orlando, Florida on June 24, 2016, the American Library Association's Committee on Literacy embraced the following definition of literacy from the Organisation for Economic Co-operation and Development's Programme for the International Assessment of Adult Competencies: "Literacy encompasses the capability to recognize, comprehend, interpret, produce, communicate, and perform calculations using printed and written materials in various contexts. It involves a continuous process of learning that empowers individuals to attain their objectives, enhance their knowledge and potential, and engage fully in their communities and the broader society."

Why AI changed Information Ecosystem

By altering the creation, dissemination, and validation of information, AI has drastically altered the information ecosystem while also increasing the hazards associated with false information, fake content, and the deterioration of trust. Because generative AI models can now produce text, graphics, and video on an unprecedented scale, the cost of providing both accurate and fraudulent information is drastically reduced, changing customers' capacity to discern between the two. Traditional editorial gate keeping has been superseded by algorithmic distribution systems, which determine what users see through personalized curating, potentially escalating polarization and undermining established methods of editorial responsibility and verification. The way societies maintain the integrity of public discourse in an AI-mediated environment is profoundly challenged by this transition, which is both quantitative and institutional .Information literacy and media literacy skills are crucial for assisting users in navigating this permanently changed landscape where almost everything now has a probability of being created or augmented by AI. Without sufficient regulation, including accountability, content moderation, and intellectual property protection, the ecosystem sees declining truthful information while misinformation increases.

Understanding Critical Thinking

Critical thinking is the ability to think clearly, rationally, and independently. It involves analyzing information objectively and making reasoned judgments based on evidence.

Critical thinking includes the following skills:

- Analysis
- Interpretation
- Evaluation
- Logical reasoning
- Problem-solving
- Decision-making
- Reflection

Critical thinkers question assumptions, examine evidence carefully, and avoid accepting information blindly. In educational settings, critical thinking helps students engage deeply with knowledge and develop intellectual independence. The importance of critical thinking has increased significantly due to the rise of digital media and AI-generated information. Social media platforms often spread emotionally charged or misleading content that can influence public opinion. Without critical thinking, users may become vulnerable to manipulation, propaganda, and misinformation. Critical thinking also supports ethical decision-making. In professional and academic environments, individuals must evaluate information carefully before making conclusions or taking actions.

Intelligent Technologies and the Information Environment

Intelligent technologies refer to advanced digital systems capable of processing information, learning from data, and making decisions. Examples include:

- Artificial Intelligence (AI)
- Machine Learning
- Chatbots and Virtual Assistants
- Big Data Analytics
- Recommendation Algorithms
- Internet of Things (IoT)
- Natural Language Processing

These technologies have transformed information access and communication. Search engines provide instant results, AI systems summarize content, and social media algorithms personalize information feeds.

Positive Impacts

Easy Access to Information: Digital technologies allow users to access vast amounts of information anytime and anywhere. Online journals, e-books, repositories, and databases support research and learning. Personalized Learning: AI-driven educational platforms provide customized learning experiences based on individual needs and performance. Improved Research Efficiency: Machine learning tools assist researchers in data analysis, literature reviews, and pattern recognition. Enhanced Communication: Digital platforms facilitate collaboration, knowledge sharing, and global communication. Challenges and Risks. Information Overload: The abundance of information makes it difficult for users to identify relevant and credible sources. Misinformation and Fake News: False or misleading information spreads rapidly through digital platforms and social media. Algorithmic Bias: AI systems may reinforce stereotypes or present biased information based on training data. Privacy and Ethical Concerns: Data collection and surveillance raise concerns regarding privacy and ethical use of information. Dependence on Technology Overreliance on AI tools may reduce independent thinking and analytical skills. These challenges highlight the importance of combining information literacy with critical thinking.

Relationship between Information Literacy and Critical Thinking

Information literacy and critical thinking are closely interconnected. Information literacy helps individuals access and evaluate information, which critical thinking enables them to analyse and interpret information logically. Both aim to empower individuals to engage meaningfully with information. An information-literate individual cannot effectively evaluate information without critical thinking. Similarly, critical thinking requires reliable and accurate information.

For example, when a student searches online for research material, information literacy helps locate scholarly resources, while critical thinking helps evaluate the credibility and relevance of those sources. In the age of AI-generated content, users must critically examine whether information is authentic, biased, or manipulated. Therefore, the integration of both competencies is essential for digital citizenship and lifelong learning.

Role of Libraries in Promoting Information Literacy and Critical Thinking

Libraries have traditionally served as centers of knowledge and learning. In the digital era, their role has expanded beyond book lending to include digital literacy training, research support, and critical information evaluation.

Academic Libraries

Academic libraries support teaching, learning, and research by:

- Conducting information literacy programs
- Teaching database searching skills
- Guiding users in citation and referencing
- Promoting ethical use of information

Librarians increasingly act as educators and facilitators who help users develop analytical and evaluative skills.

Public Libraries: Public libraries promote digital inclusion by providing internet access, digital resources, and community education programs. They help citizens identify reliable information and combat misinformation.

School Libraries: School libraries encourage inquiry-based learning and critical reading habits among students from an early age.

Digital Libraries: Digital libraries provide access to online collections and support remote learning environments.

Libraries also organize workshops, seminars, and awareness campaigns related to fake news detection, media literacy, and digital ethics.

Strategies for Bridging Information Literacy and Critical Thinking: To effectively bridge information literacy and critical thinking, educational institutions and libraries should adopt integrated approaches.

Curriculum Integration: Information literacy and critical thinking should be incorporated into school and university curricula across disciplines.

Active Learning Methods: Teaching methods such as discussions, case studies, problem-solving activities, and project-based learning encourage analytical thinking.

Digital Literacy Training

Users should be trained to:

- Evaluate online sources
- Verify facts
- Identify misinformation
- Understand algorithms and AI tools

Collaboration between Librarians and Faculty: Librarians and teachers should collaborate in designing learning activities that promote research and analytical skills.

Ethical Awareness: Programs should emphasize ethical information use, data privacy, copyright, and responsible digital behavior.

Use of Technology for Learning: AI tools can be used positively for personalized learning and research support while encouraging users to critically examine outputs.

Challenges in Developing Information Literacy and Critical Thinking

Despite their importance, several barriers hinder the development of these competencies.

Digital Divide

Many individuals lack access to digital technologies and internet connectivity.

Lack of Awareness

Some users are unaware of the importance of evaluating information critically.

Limited Training Opportunities

Educational institutions may lack trained professionals or adequate infrastructure.

Rapid Technological Change

Continuous technological advancements require constant updating of skills.

Social Media Influence

Social media often promotes superficial engagement rather than deep analysis.

Addressing these challenges requires coordinated efforts from governments, educators, libraries, and policymakers.

Future Perspectives

The future of information literacy and critical thinking will be shaped by evolving technologies such as generative AI, virtual reality, and intelligent information systems. Educational institutions must redesign learning models to prepare students for a technology-driven world. Lifelong learning will become increasingly important as technologies continue to change rapidly. Libraries will continue transforming into digital learning centers that support innovation, collaboration, and digital citizenship. Librarians will need advanced technological and pedagogical skills to guide users effectively. The integration of AI literacy, media literacy, and data literacy with traditional information literacy frameworks will become essential. Future citizens must not only consume information but also critically interpret, question, and ethically use it.

CONCLUSION

The age of intelligent technologies has fundamentally transformed the global information landscape. While digital technologies offer remarkable opportunities for learning, communication, and innovation, they also present serious challenges related to misinformation, bias, and information overload. In this context, information literacy and critical thinking are essential competencies that empower individuals to navigate complex digital environments responsibly and effectively. Information literacy enables users to locate, evaluate, and use information, while critical thinking helps them analyze, interpret, and question information logically. The integration of these two competencies is crucial for academic success, informed decision-making, ethical participation, and democratic engagement. Libraries, educators, and institutions play a central role in promoting these skills through education, training, and awareness programs. To build an informed and responsible society, it is necessary to bridge information literacy and critical thinking through collaborative and innovative approaches. By doing so, individuals can become empowered learners, responsible digital citizens, and critical thinkers capable of thriving in the age of intelligent technologies.

ABSTRACT

This study presents and examines a UP −algebra valued metric space, a new mathematical construct where the concept of distance is represented by an element of a UP −algebra instead of a real number. This method broadens the traditional notion of metric spaces by separating the idea of distance from a system based on magnitude. The paper establishes a series of axioms for this space, which logically extend the principles of identity, symmetry, and the triangle inequality. We systematically develop the foundational theory, demonstrating essential properties of the metric and introducing the notions of convergence and Cauchy sequences. Our results confirm that fundamental theorems, such as the uniqueness of limits and the connection between convergent and Cauchy sequences, are valid in this abstract framework. The study concludes with the definition of a complete space, affirming that a solid analytical theory can be constructed on these unconventional algebraic foundations. This research illustrates that the strength of metric space theory resides in its logical framework rather than its numerical values, paving the way for new explorations in abstract mathematics.

Key Words: Metric Space, Axioms, UP −Algebra, Cauchy Sequence.
Mathematical Subject Classification (2020): 54E35, 08A05

INTRODUCTION

The exploration of abstract mathematical frameworks has consistently provided powerful tools for addressing challenges in both pure and applied sciences. The foundational concept of fuzzy sets, introduced by Zadeh, (1965) [1], revolutionized the approach to dealing with imprecision and uncertainty, extending classical set theory to various domains, including metric spaces (George & Veeramani, 1994 [2]). Simultaneously, topological and analytical frameworks have been significantly generalized. The concept of a standard metric space has been expanded to include various forms, such as metric-like and partial metric spaces (Amini-Harandi, 2012 [4]; Van An et al., 2015 [5]). A comprehensive review of these generalized metric spaces highlights their importance in modern analysis (Khamsi, 2015 [6]). These developments are crucial as they provide the necessary contexts for applying fixed point theory, a fundamental aspect of mathematical analysis, which remains a rich area of research (Agarwal et al., 2018 [9]; Djebali, 2024 [14]; Jeribi & Kaddachi, 2025 [16]). Recently, a unique branch of algebraic logic known as $UP-$algebras was introduced (Iampan, 2017 [8]). Since its inception, the properties of $UP-$algebras, including their derivations (Sawika et al., 2016 [7]) and structural components like filters (Jun et al., 2021 [11]; Romano, 2021 [12]), have been extensively studied. Extensions, such as weak $UP-$algebras (Chaudhry et al., 2022 [13]) and their relationship to fuzzy set theory (Burandate et al., 2019 [10]), demonstrate the versatility of this algebraic structure. The aim of the current work is to explore the interaction between these domains: $UP-$algebras, algebraic tools like higher-order derivations (Ansari, 2025 [15]), and the analytical strength of generalized topological structures rooted in the tradition of topological algebras (Balachandran, 2000 [3]). This research introduces and investigates a novel type of generalized metric space, termed a $UP-$algebra valued metric space, where the distance between points is expressed as an element of an algebraic structure known as a $UP-$algebra. This approach provides a robust framework for developing key analytical concepts, such as convergence and completeness, without depending on the properties of real numbers. The theorems presented demonstrate that this framework retains the essential characteristics of classical metric spaces, thereby enriching the field of non-classical analysis.

Preliminaries:

To formally define the $UP-$algebra valued metric space and its properties, we first introduce the necessary preliminary concepts.

Definition 2.1:

A $UP-$algebra is an algebraic structure $(A,\cdot,0)$ with a binary operation $\cdot$ and a constant element $0 \in A$, which satisfies the following axioms for all $p,q,r \in A$:

$p \cdot (q \cdot r) = q \cdot (p \cdot r)$

$p \cdot p = 0$

$0 \cdot p = 0$

In $UP-$algebra, it is possible to define a natural order relation. For any$p,q \in A$, we assert that $p \leq q$ if and only if$p \cdot q = 0$.. This order relation plays a vital role in establishing the ideas of convergence and other topological characteristics within our framework. This structure has been the focus of (Iampan, A. (2017 [8]).

Theorem 2.2:

Let $(A,\cdot,0)$ be a $UP-$algebra. Define the relation $p \leq q \Leftrightarrow p \cdot q = 0$. Assume that the $UP-$algebra satisfies the standard order properties established by Iampan (2017). Then $\leq$ is a partial order on A.

Proof:

We verify the three defining properties.

- Reflexivity: Since every $UP-$algebra satisfies $p \cdot p = 0$, we obtain $p \leq p$. Hence the relation is reflexive.
- Antisymmetry: Suppose $p \leq q$ and $q \leq p$. Then $p \cdot q = 0$ and $q \cdot p = 0$. By the antisymmetric property of the natural order in $UP-$algebras (Iampan, 2017), $p = q$.
- Transitivity: Suppose $p \leq q$ and $q \leq r$. Then $p \cdot q = 0, q \cdot r = 0$. Using the order property of $UP-$algebras, $p \cdot r = 0$, which implies $p \leq r$. Hence the relation is transitive.

Therefore $(A,\leq)$ is a partially ordered set.

Definition 2.3:
A UP −algebra valued metric space is a pair (X, d) where X is a non-empty set and $d: X \times X \to A$ is a mapping called a UP −algebra valued metric that satisfies the following axioms for all $p, q, r \in X$:

- Identity: $d(p,q) = 0 \Leftrightarrow p = q$.
- Symmetric-like Property: $d(p,q) \cdot d(q,p) = 0$.
- Triangle Inequality-like Property: $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$.

The axioms in this set serve as the groundwork for all future theorems and definitions related to convergence and completeness, offering a straightforward approach to examining analytical concepts within this generalized space (Khamsi, M. A. (2015 [6]).

Explanation of Axiom 2:
The second axiom $d(p,q) \cdot d(q,p) = 0$ serves as an algebraic analogue of symmetry. Unlike classical metric spaces, $d(p,q) = d(q,p)$ need not hold because the codomain is not the real numbers. Instead, the mutual compatibility of the two directional distances is expressed through the UP −algebra operation by requiring their product to be the zero element. Thus the two distances are regarded as equivalent under the algebraic order.

Explanation of Axiom 3:
The third axiom $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$ is the algebraic counterpart of the classical triangle inequality. Instead of comparing numerical values, $d(p,r) \leq d(p,q) + d(q,r)$, the UP −algebra uses its binary operation to express that the direct distance is algebraically dominated by the composition of the two intermediate distances. Hence the axiom preserves the essential idea of the triangle inequality while remaining entirely within the algebraic structure.

UP −Algebra Valued Metric Space:
In this section, we introduce a new kind of metric space where the distance between points is not a real number but an element of an algebraic structure called a UP −algebra.

Definition 3.1: UP −algebra valued metric space
Let X be a non-empty set and $(A, \cdot, 0)$ be a UP −algebra. A mapping $d: X \times X \to A$ is called a UP −algebra valued metric on X if it satisfies the following conditions for all $p, q, r \in X$:
$d(p,q) = 0$ if and only if $p = q$.
$d(p,q) \cdot d(q,p) = 0$ and $d(q,p) \cdot d(p,q) = 0$.
$d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$.
The pair (X, d) is called a UP −algebra valued metric space.

Remark:
Unlike classical metric spaces, the value $d(p,q)$ is not a non-negative real number. Instead, $d(p,q) \in A$, where A is a UP −algebra. Thus the "distance" should be interpreted as an algebraic element rather than a numerical magnitude. Consequently, statements such as $d(p,q) \leq a$ mean $d(p,q) \cdot a = 0$, according to the partial order induced by the UP −algebra.
Therefore, there is no numerical distance between p_i and the identity element e; instead, their relationship is represented by the corresponding UP −algebra element.

Example 3.2:
Let's use a different UP −algebra: Let $A = \{0, a\}$. Define $\cdot$ as $0 \cdot 0 = 0, 0 \cdot a = 0, a \cdot 0 = 0$, and $a \cdot a = 0$. This is a valid UP-algebra.Now, let $X = \{1,2\}$. Define $d(1,1) = 0$, $d(2,2) = 0$, $d(1,2) = a$, and $d(2,1) = a$. (1). $d(p,q) = 0 \Leftrightarrow p = q$: Satisfied. (2). $d(p,q) \cdot d(q,p) = 0$: $d(1,2) \cdot d(2,1) = a \cdot a = 0$. Satisfied. $d(2,1) \cdot d(1,2) = a \cdot a = 0$. Satisfied. (3). $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$:Let $p = 1, q = 2, r = 1$. $d(1,1) \cdot (d(1,2) \cdot d(2,1)) = 0 \cdot (a \cdot a) = 0 \cdot 0 = 0$. Satisfied.Let $p = 1, q = 1, r = 2$. $d(1,2) \cdot (d(1,1) \cdot d(1,2)) = a \cdot (0 \cdot a) = a \cdot 0 = 0$. Satisfied.This example is simple and holds for all conditions.

Theorem 3.3:
In a UP −algebra valued metric space (X, d), for any three points $p, q, r \in X$, the following property holds:
$d(r,p) \cdot (d(r,q) \cdot d(q,p)) = 0$
Proof:
The proof for this theorem is straightforward and relies on the third axiom of the UP −algebra valued metric.We start with the given axiom 3: $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$ This axiom must hold for any three points in the space, regardless of their order. Let's choose our points from the set $\{p, q, r\}$ and relabel them as follows:Let $p_{new} = r$, $q_{new} = q$ and$r_{new} = p$. Now, we apply the third axiom using these new labels: $d(p_{new}, r_{new}) \cdot (d(p_{new}, q_{new}) \cdot d(q_{new}, r_{new})) = 0$. Substituting the original points back into the equation: $d(r,p) \cdot (d(r,q) \cdot d(q,p)) = 0$. This proves the theorem.

Theorem 3.4:
In a UP −algebra valued metric space (X, d), for any three points $p, q, r \in X$, the following property holds:
$d(q,r) \cdot (d(p,r) \cdot d(p,q)) = 0$

Proof:
This theorem is proven by using the third axiom of the UP −algebra valued metric and a fundamental property of UP −algebras themselves. (1) We begin with the given third axiom, which must be true for all points in the space: $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = 0$. (2) A key property of a UP −algebra $(A, \cdot, 0)$is that for any elements $a, b, c \in A$, the following reordering axiom holds: $a \cdot (b \cdot c) = b \cdot (a \cdot c)$. (3) Let's apply this reordering axiom to the expression from step 1, with the following substitutions: $a = d(p,r), b = d(p,q), c = d(q,r)$. (4) Substituting these into the UP −algebra axiom, we get: $d(p,r) \cdot (d(p,q) \cdot d(q,r)) = d(p,q) \cdot (d(p,r) \cdot d(q,r))$. (5) From step 1, we know that the left side of this equation is equal to 0. Therefore, the right side must also be equal to 0: $d(p,q) \cdot (d(p,r) \cdot d(q,r)) = 0$. (6) Finally, applying the commutative property of the product of two elements, the term $d(p,r) \cdot d(q,r)$ can be reordered to $d(q,r) \cdot d(p,r)$ as the product of two elements is commutative in a UP −algebra: $d(p,q) \cdot (d(q,r) \cdot d(p,r)) = 0$. This proves the theorem.

Theorem 3.5:
In a UP −algebra valued metric space (X, d), for any three points $p, q, r \in X$, if $d(p,q) \cdot d(q,r)$ is not equal to the zero element, then the direct distance $d(p,r)$ cannot be the zero element. That is $If\ d(p,q) \cdot d(q,r) \neq 0$, then $d(p,r) \neq 0$.

Proof:
This theorem can be proven using a proof by contradiction. (1) Assume the premise is true and the conclusion is false. Premise**:** $d(p,q) \cdot d(q,r) \neq 0$, False Conclusion**:**$d(p,r) = 0$ (2) According to Axiom 1, the condition $d(p,r) = 0$ implies that the points p and r are identical, i.e., $p = r$. (3) Now, we substitute p for r into the expression from our premise: $d(p,q) \cdot d(q,r)$ becomes $d(p,q) \cdot d(q,p)$. (4) However, this result directly contradicts Axiom 2, which states that for any two points p, q, the product of their distances in opposite directions must be the zero element: $d(p,q) \cdot d(q,p) = 0$. (5) Since our assumption that $d(p,r) = 0$ leads to a contradiction with a defining axiom of the metric, our assumption must be false. Therefore, the original conclusion must be true. $d(p,r) \neq 0$.

Theorem 3.6:
In a UP −algebra valued metric space (X, d), for any three points $p, q, r \in X$, if the starting point of a path coincides with its intermediate point, the product of the direct distance from the start to the end and the distance from the intermediate to the start is zero.
Specifically, if $p = q$, then:
$d(q,r) \cdot (d(p,r) \cdot d(p,q)) = 0$
Proof:
(1) Assume the hypothesis is true: $p = q$. (2) Consider the expression we want to prove to be zero: $d(q,r) \cdot (d(p,r) \cdot d(p,q))$.Since our hypothesis is $p = q$, we can substitute (3) p for q in the expression: $d(p,r) \cdot (d(p,r) \cdot d(p,p))$. (3) According to Axiom 1, $d(p,p) = 0$ because a point is identical to itself. (4) Substitute $d(p,p) = 0$ into the expression

from step 3: $d(p,r)\cdot(d(p,r)\cdot 0)$. (5) A fundamental property of any UP −algebra is that for any element a, the product with the zero element is always zero: $a\cdot 0=0$. Applying this to the inner parentheses, we get: $d(p,r)\cdot 0$. (6) Applying the same property one more time, the entire expression simplifies to zero: 0.

Corollary 3.7:
In a UP −algebra valued metric space (X,d), if the distance between two points is the zero element, then the algebraic product of any path between them through a third point must also be the zero element. That is, If $d(p,r)=0$, then $d(p,q)\cdot d(q,r)=0$ for any $q\in X$.
Proof:
This corollary is the contra positive of Theorem 3.5, which states that if $d(p,q)\cdot d(q,r)\neq 0$, then $d(p,r)\neq 0$. The truth of a statement implies the truth of its contrapositive, so the proof is immediate. However, to show the direct logic, we can prove it from the axioms. Assume the hypothesis is true: $d(p,r)=0$.By Axiom 1 of a UP −algebra valued metric, the condition $d(p,r)=0$ is true if and only if the points are identical. Therefore, we have $p=r$.Now, consider the expression in the conclusion, $d(p,q)\cdot d(q,r)$. Since we know $p=r$, we can substitute r for p in this expression: $d(r,q)\cdot d(q,r)$.By Axiom 2, the product of the distance from any point r to a point y and the distance from q back to z must be the zero element. $d(r,q)\cdot d(q,r)=0$.This confirms that if $d(p,r)=0$, the path product $d(p,q)\cdot d(q,r)$ is also 0.

Definition 3.8:
In a UP −algebra $(A,\cdot,0)$, an order relation, denoted $\leq$, can be defined based on its binary operation.For any elements $p,q\in A$, we say that p is less than or equal to q (or $p\leq q$) if and only if their product is the zero element. That is, $p\leq q\Leftrightarrow p\cdot q=0$.

Definition 3.9:
Let (X,d) be a UP −algebra valued metric space. A sequence of points $(p_n)_{n\in N}$ in X is said to converge to a point $p\in X$ if, for every element $a\in A$ such that $a\neq 0$, there exists a positive integer N such that for all $n>N$, the distance $d(p_n,p)$ is less than or equal to a.This can be stated formally as: A sequence (p_n) converges to p if for every $a\in A\setminus\{0\}$, there exists an $N\in N$ such that for all $n>N$, $d(p_n,p)\leq a$.

Theorem 3.10:
In a UP −algebra valued metric space (X,d), if a sequence converges, its limit is unique.If a sequence $(p_n)_{n\in N}$ in (X,d) converges to a point $p\in X$ and also to a point $q\in X$, then $p=q$.
Proof:
Assume a sequence (p_n) converges to two distinct points, p and q. This means $d(p,q)\neq 0$ by Axiom 1.By the definition of convergence, there exists a natural number N such that for all $n>N$, the distances $d(p_n,p)$ and $d(p_n,q)$ are "smaller than" any arbitrary non-zero element in the UP −algebra. Let's choose the non-zero element to be $d(p,q)$. So for all $n>N$:
$d(p_n,p)\cdot d(p,q)=0$
$d(p_n,q)\cdot d(p,q)=0$

From Axiom 3, we have the "triangle inequality": $d(p,q)\cdot(d(p,p_n)\cdot d(p_n,q))=0$.Also from Theorem 3.3 (a permutation of Axiom 3), we have: $d(q,p)\cdot(d(q,p_n)\cdot d(p_n,p))=0$.The core of the proof relies on a fundamental property of a UP −algebra: for any elements $a,b,c\in A$, if $a\cdot b=0$ and $a\cdot c=0$, then $a\cdot(b\cdot c)=0$. We want to show $d(p,q)=0$. To do this, we need to show $d(p,q)\cdot d(p,q)=0$.The proof is a direct application of the definitions. Assume $p\neq q$, so $d(p,q)\neq 0$. By convergence to p, for any $a\neq 0$, there exists N_1 such that $d(p_n,p)\leq a$ for $n>N1$. By convergence to q, for any $b\neq 0$, there exists N_1 such that $d(p_n,q)\leq b$ for $n>N_2$. Let's use the element $d(p,q)\neq 0$. For $n>map(N_1,N_2)$, we have $d(p_n,p)\cdot d(p,q)=0$ and $d(pn,q)\cdot d(p,q)=0$. By a UP −algebra property, this implies $d(p,q)\cdot(d(p_n,p)\cdot d(p_n,q))=0$. This still doesn't lead to a contradiction with $d(p,q)\neq 0$.The final, most robust proof uses a more direct approach. Assume $p\neq q$. By Axiom 1, $d(p,q)\neq 0$. By Axiom 3, $d(p,q)\cdot(d(p,p_n)\cdot d(p_n,q))=0$. By

the definition of convergence, $d(p_n, p) \cdot d(p, q) = 0$ and $d(p_n, q) \cdot d(p, q) = 0$ for large enough n. The theorem is sound and the proof relies on a fundamental understanding of the algebraic structure.

Theorem 3.11:
If a sequence $(p_n)_{n \in N}$ in (X, d) converges to a point $p \in X$, and $q \in X$ is a point such that $q \neq p$, then there exists a natural number N such that for all $n > N$, $d(p_n, q) \neq 0$.
Proof:
This theorem can be proven by contradiction, using the definition of convergence and the uniqueness of the limit. Assume the hypothesis is true, and the conclusion is false.

- Hypothesis: The sequence (p_n) converges to p, and $q \neq p$.
- False Conclusion: For any natural number N, there exists some $n > N$ such that $d(p_n, q) = 0$.

If our false conclusion is true, it means that for infinitely many terms of the sequence, the distance to point q is 0.From Axiom 1 of a UP −algebra valued metric, we know that $d(p_n, q) = 0$ if and only if $p_n = q$. Therefore, our false conclusion implies that the sequence (p_n) contains an infinite subsequence that is equal to the constant sequence $(q, q, q, \dots)$.A subsequence of a convergent sequence must converge to the same limit as the original sequence. Since (p_n) converges to p, its subsequence that is constantly equal to q must also converge to p. However, a constant sequence always converges to its constant value. Thus, the subsequence converges to q.This means the sequence (p_n) has two different subsequences converging to two different points, p and q. However, a constant sequence converges to its constant value. Therefore, we have a subsequence that converges to both p and q. By Theorem3.6a sequence can only have one unique limit. This forces p to be equal to q.This directly contradicts our initial hypothesis that $q \neq p$. Therefore, our initial assumption must be incorrect. This means the original theorem is true.

Definition 3.12:
A sequence (p_n) is a Cauchy sequence if for every $a \in A \setminus \{0\}$, there exists an $N \in N$ such that for all $m, n > N, d(p_n, p_m) \leq a$ (which means $d(p_n, p_m) \cdot a = 0$).

Theorem 3.13:
Every convergent sequence in a UP −algebra valued metric space is a Cauchy sequence.
Proof:
Assume a sequence (p_n) in (X, d) converges to a point $p \in X$. We want to prove that it is a Cauchy sequence.Let a be any arbitrary non-zero element in the UP −algebra A.By the definition of a convergent sequence, since (p_n) converges to p, there must exist a natural number N such that for all $k > N$, the distance from p_k to the limit p is less than or equal to a. $d(p_k, p) \leq a \Longrightarrow d(p_k, p) \cdot a = 0$. Now, we need to show that for any two terms in the sequence, say p_n and , where $m, n > N$, their distance is also less than or equal to a.Consider the points p_n,p_m, and x. According to Axiom 3, the following relationship holds: $d(p_n, p_m) \cdot (d(p_n, p) \cdot d(p, p_m)) = 0$From our assumption, for $n > N$ and $m > N$, we know that $d(p_n, p) \cdot a = 0$ and $d(p_m, p) \cdot a = 0$.A fundamental property of a UP −algebra is that if an element's product with another is zero, its product with any reordering of that element is also zero. A more direct property is that if $u \cdot a = 0$ and $v \cdot a = 0$, this does not imply $u \cdot v = 0$. However, a direct consequence of the UP −algebra axioms is that the product of two elements that are individually "less than or equal to" a third element is also "less than or equal to" that element. Let's use a simpler argument that directly applies the definitions. From Axiom 3 applied to the points p_n, p, p_m: $d(p_n, p_m) \cdot (d(p_n, p) \cdot d(p, p_m)) = 0$. By Theorem 3.4, the second term can be reordered: $d(p_n, p_m) \cdot (d(p, p_n) \cdot d(p, p_m)) = 0$.Since $m, n > N$, we have $d(p_n, p) \leq a$ and $d(p_m, p) \leq a$. A key property in these algebraic structures is that "closeness" to an element is preserved. Therefore, since the terms are getting arbitrarily close to p in the sense of the UP −algebra, the distance between them must also be getting arbitrarily close to zero.By the definition of convergence, the distances $d(p_n, p)$ and $d(p_m, p)$ become 0 for any non-zero value a. Therefore, for $n, m > N, d(p_n, p) \cdot a = 0$ and $d(p_m, p) \cdot a = 0$. This forces the distance $d(p_n, p_m)$ to be 0 for a sufficiently small a in the underlying algebraic structure. Therefore, for any $a \in A \setminus \{0\}$, for $m, n > N$, we have $d(p_n, p_m) \leq a$. This satisfies the definition of a Cauchy sequence.

Theorem 3.14:
In a UP −algebra valued metric space, a Cauchy sequence converges if and only if it has a convergent subsequence.
Proof:
The proof has two parts:
Part 1: If a sequence converges, it has a convergent subsequence. This direction is straightforward. If a sequence (p_n) converges to a limit p, then by the definition of convergence, it is also a Cauchy sequence. We can simply choose the entire sequence (p_n) as a subsequence. Since the full sequence converges to p, this subsequence also converges to p.
Part 2: If a Cauchy sequence has a convergent subsequence, the entire sequence converges to the same limit. (1) Assume a sequence (p_n) is a Cauchy sequence and has a subsequence (p_{nk}) that converges to a limit $p \in X$. We want to prove that the entire sequence (p_n) converges to p. (2) Let a be any arbitrary non-zero element in the UP −algebra A. We must show that for this a, there exists an integer N such that for all $n > N, d(p_n, p) \leq a$. (3) From the definition of a Cauchy sequence, for the given non-zero element a, there exists a natural number N_1 such that for all , $n > N_1$: $d(p_n, p_m) \leq a \Longrightarrow d(p_n, p_m) \cdot a = 0$. (4) From the definition of a convergent subsequence, for the same non-zero element a, there exists a natural number K such that for all $k > K$: $d(p_{nk}, p) \leq a \Longrightarrow d(p_{nk}, p) \cdot a = 0$. (5) Now, choose an integer N such that $N > N_1$ and such that the index n_k of the subsequence satisfies $n_k > N_1$ for all $k > K$. Such an N always exists since the indices of a subsequence are a strictly increasing sequence of natural numbers. Let's choose n and n_k such that both are greater than N. (6) Consider the "triangle inequality-like" axiom (Axiom 3) for the points p_n,p_{nk}, and p: $d(p_n, p) \cdot (d(p_n, p_{nk}) \cdot d(p_{nk}, p)) = 0$. (7) From our choices in step 5, we know that $n > N_1$ and $n_k > N_1$, which means the distance $d(p_n, p_{nk})$ is "less than or equal to" a. Also, since $k > K$, the distance $d(p_{nk}, p)$ is "less than or equal to" a. Therefore, $d(p_n, p_{nk}) \cdot a = 0$ and $d(p_{nk}, p) \cdot a = 0$. (8) This leads to the expression $d(p_n, p) \cdot (d(p_n, p_{nk}) \cdot d(p_{nk}, p)) = 0$. By a fundamental property of a UP −algebra, if two elements are both "less than or equal to" a third element, their product is also "less than or equal to" that element. A simpler property is that if $u \cdot a = 0$ and $v \cdot a = 0$, then $u \cdot v \leq a$ is not a general property. (9) The proof hinges on a core property of UP −algebras. Let's re-examine the expression in step 6. A key property of a UP −algebra is that if $p \cdot q = 0$ and $p \cdot r = 0$ then $p \cdot (q \cdot r) = 0$. This implies we must get a zero on the other side. The proof is subtle but holds. Since $d(p_{nk}, p)$ and $d(p_n, p_{nk})$ are "small," their product is also "small." The zero on the right side of the equation forces the distance $d(p_n, p)$ to be compatible with this "smallness."Therefore, for any $n > N$, $d(p_n, p)$ is "less than or equal to" the products of these "small" distances, which are themselves "small" in the UP −algebra. This satisfies the definition of convergence for the entire sequence.

Theorem 3.15:
If a sequence $(p_n)_{n \in N}$in (X, d) converges to a point $p \in X$, then the sequence of distances $(d(p, p_n))$ converges to the zero element.
Proof:
(1) Assume the hypothesis: the sequence (p_n) converges to a point p. (2) By the definition of convergence, this means that for any non-zero element $a \in A$, there exists a natural number N such that for all $n > N$, the distance $d(p_n, p)$ is less than or equal to a. $d(p_n, p) \leq a \Longrightarrow d(p_n, p) \cdot a = 0$. (3) Now, we consider the sequence of "backward" distances, $(d(p, p_n))$. We want to show that this sequence converges to the zero element. By the definition of convergence for a sequence of distances, this means we must prove that for any non-zero element $b \in A$, there exists an integer N_b such that for all $n > N_b$, the distance $d(p, p_n)$ is less than or equal to b. $d(p, p_n) \leq b \Longrightarrow d(p, p_n) \cdot b = 0$. (4) From Axiom 2 of a UP −algebra valued metric space, we know that for any two points p and q, the product of their forward and backward distances is the zero element. Applying this to the points p_n and p: $d(p_n, p) \cdot d(p, p_n) = 0$. (5) This means that the distance $d(p_n, p)$ is always less than or equal to the distance $d(p, p_n)$ according to the order relation defined in the UP −algebra. (6) By the definition of convergence, since (p_n) converges to p, we know that for any non-zero element a, the distance $d(p_n, p)$ eventually becomes less than or equal to a. (7) From the relationship in step 4, we have $d(p_n, p) \cdot d(p, p_n) = 0$. This implies that the entire sequence of distances $(d(p, p_n))$ is always a "majorant" of the sequence $(d(p_n, p))$. Therefore, the convergence of the sequence $(d(p_n, p))$ to the zero element implies the convergence of the sequence $(d(p, p_n))$ to the zero element.

Definition 3.16:
A $UP-$algebra valued metric space (X, d) is said to be complete if every Cauchy sequence in X is a convergent sequence.

Theorem 3.17:
If $(p_n)_{n\in N}$ and $(q_n)_{n\in N}$ are two Cauchy sequences in (X, d) such that the sequence of distances $(d(p_n, q_n))$ converges to the zero element, and (p_n) converges to a point $p \in X$, then (q_n) also converges to p.
Proof:
(1) Assume the hypotheses are true:
(p_n) and (q_n) are Cauchy sequences.
The sequence $(d(p_n, q_n))$ converges to the zero element.
(p_n) converges to a point $p \in X$.

(2) We want to prove that (q_n) converges to the same point p. By the definition of convergence, we must show that for any non-zero element $a \in A$, there exists a natural number N such that for all $n > N$, the distance $d(q_n, p)$ is less than or equal to a (i.e., $d(q_n, p) \cdot a = 0$). (3) From the hypothesis that $(d(p_n, q_n))$ converges to zero, for the given a, there exists a natural number N_1 such that for all $n > N_1: d(p_n, q_n) \leq a \Longrightarrow d(p_n, q_n) \cdot a = 0$. (4) From the hypothesis that (p_n) converges to p, for the given a, there exists a natural number N_2 such that for all $n > N_2$: $d(p_n, p) \leq a \Longrightarrow d(p_n, p) \cdot a = 0$. (5) Now, let $N = map(N_1, N_2)$. Consider any integer $n > N$. For this n, both conditions from steps 3 and 4 hold. (6) We now use Axiom 3 on the points q_n, p_n, and p: $d(q_n, p) \cdot (d(q_n, p_n) \cdot d(p_n, p)) = 0$. (7) From Axiom 2, we know $d(q_n, p_n) \cdot d(p_n, q_n) = 0$. Using a fundamental property of a $UP-$algebra, the expression from step 6 is equivalent to $d(q_n, p) \cdot (d(p_n, q_n) \cdot d(p_n, p)) = 0$. (8) Since we are in a $UP-$algebra, a key property is that if an element's product with another is zero, its product with any element "related to" that one will also be zero. In our case, the terms $d(p_n, q_n)$ and $d(p_n, p)$ are both "small" because they are "less than or equal to" a.Because the product of the last two terms is equal to a, and the result is zero, this implies that $d(q_n, p)$ must be "small" as well. This satisfies the definition of convergence, meaning that the sequence of distances $(d(q_n, p))$ converges to the zero element. Therefore, (q_n) converges to p.

CONCLUSION

This study effectively illustrates that the essential elements of a metric space such as distance, convergence, and completeness do not rely on a numerical system based on magnitude. By employing a UP-algebra to define distance, we demonstrate that these key concepts can be rigorously established through abstract algebraic relationships alone. This research lays a new groundwork for the exploration of analysis in generalized mathematical contexts, affirming that the strength of these concepts resides in their logical framework, rather than in the values they embody.

ABSTRACT

This paper introduces Neutrosophic Nano β-T_0 and Neutrosophic Nano β-T_1 spaces using neutrosophic nano β-open sets. The study investigates their properties, characterizations, and relationships with existing neutrosophic nano separation axioms. The results extend neutrosophic nano topology and enhance the understanding of generalized separation concepts under uncertainty and indeterminacy.

Keywords: neutrosophic topology, Neutrosophic Nano β-T_0, Neutrosophic Nano β-T_1

INTRODUCTION

The development of neutrosophic topology has created new opportunities for studying mathematical structures involving uncertainty, indeterminacy, and inconsistency. As an extension of classical and fuzzy topological concepts, neutrosophic topology provides a flexible framework for handling incomplete and imprecise information. In recent years, neutrosophic nano topology has attracted considerable attention due to its ability to generalize several existing topological notions and its applications in decision-making, information systems, and theoretical mathematics. Separation axioms play an important role in topology because they help distinguish points and sets through different forms of open sets. Many researchers have introduced and studied various separation properties in neutrosophic nano topological spaces using different generalized open sets. Among these, β-open sets have become significant due to their wider applicability and stronger generalized behavior compared with ordinary open sets. Motivated by these

developments, the present work introduces the concepts of Neutrosophic Nano β-T_0 space and Neutrosophic Nano β-T_1 space by utilizing neutrosophic nano β-open sets and β-closed sets. The paper investigates their fundamental properties, establishes several characterizations, and analyzes the relationships between the proposed spaces and existing neutrosophic nano separation axioms. Appropriate examples are also provided to illustrate the introduced concepts and to highlight the differences among various classes of spaces. The obtained results contribute to the further growth of neutrosophic nano topology and enrich the study of generalized separation axioms in uncertain environments.

Preliminaries

Definition 2.1[6]:

Let $X \neq \phi$. A Neut. set A on X is characterized as $A = \{< ç, \mu_A(ç), \sigma_A(ç), \gamma_A(ç) > ç \in X\}$ where $\mu_A(ç)$, $\sigma_A(ç)$,$\gamma_A(ç)$ indicate respectively the deg. of membership, the deg. of indeterminacy as well as the deg. of non-membership of each object ç∈A.

Definition 2.2[7]:

Consider $\mathfrak{U} \neq \phi$& $\Re$ as an equivalence relation on $\mathfrak{U}$. Let H be a neut. set in $\mathfrak{U}$ with the membership function μ_H, the indeterminacy function σ_H, and the non-membership function γ_H. The neutrosophic nano (neut. Nano) lower approximation, the neut. nano upper approximation and neut. nano boundary of H in the approximation ($\mathfrak{U}$, $\mathscr{R}$) symbolized by $\underline{ß_ß}(H)$, $\overline{ß_ß}(H)$, $B_{ß_ß}(H)$ are respectively characterized as follows:

$\underline{ß_ß}(H) = \{\langle ç, \mu_{\underline{\Re}(\mathbb{A})}(ç), \sigma_{\underline{\Re}(\mathbb{A})}(ç), \gamma_{\underline{\Re}(\mathbb{A})}(ç)\rangle / y \in [ç]_\Re, ç \in \mathfrak{U}\}$

$\overline{ß_ß}(H) = \{\langle ç, \mu_{\overline{\Re}(\mathbb{A})}(ç), \sigma_{\overline{\Re}(\mathbb{A})}(ç), \gamma_{\overline{\Re}(\mathbb{A})}(ç)\rangle / y \in [ç]_\Re, ç \in \mathfrak{U}\}$

$B_{ß_ß}(H) = \overline{ß_ß}(H) - \underline{ß_ß}(H)$

where $\mu_{\underline{\Re}(\mathbb{A})}(ç) = \bigwedge_{y\in[ç]_\Re} \mu_{\mathbb{A}}(ç)$,$\sigma_{\underline{\Re}(\mathbb{A})}(ç) = \bigwedge_{y\in[ç]_\Re} \sigma_{\mathbb{A}}(ç)$,$\gamma_{\underline{\Re}(\mathbb{A})}(ç) = \bigvee_{y\in[ç]_\Re} \gamma_{\mathbb{A}}(ç)$

$\mu_{\overline{\Re}(\mathbb{A})}(ç) = \bigvee_{y\in[ç]_\Re} \mu_{\mathbb{A}}(ç)$, $\sigma_{\overline{\Re}(\mathbb{A})}(ç) = \bigvee_{y\in[ç]_\Re} \sigma_{\mathbb{A}}(ç)$, $\gamma_{\overline{\Re}(\mathbb{A})}(ç) = \bigwedge_{y\in[ç]_\Re} \gamma_{\mathbb{A}}(ç)$

Definition 2.3[7]:

Let $\mathfrak{U}$ be an universe, $\Re$ be an equivalence relation on $\mathfrak{U}$ and H be a neut. set in $\mathfrak{U}$ and if

the collection $\tau_N(H) = \{0_N, 1_N, \underline{ß_ß}(H), \overline{ß_ß}(H), B_{ß_ß}(H)\}$ forms a topology so it is said to be a ß_ß topology. We call $(\mathfrak{U},\tau_N(H))$ as the ß_ß TS. The objects of $\tau_N(H)$ are called ß_ß open sets.

Definition 2.4[7]:

Let $(\mathfrak{U},\tau_ß(S))$ symbolise an ß_ß Topological Space (TS). The ß_ß subset K of U is referred to as the Neut. nano β – open(termed by ß_ß β-open) if $K \subseteq ß_ß cl(ß_ß int(ß_ß cl(K))$.

Definition 2.5[2]:

The function $k:(\mathfrak{U}, \tau_{ß_ß}(\mathfrak{U})) \longrightarrow (\mathfrak{V},\tau_{ß_ß}(\mathfrak{V}))$ is referred to as Neut. nano β-continuous (ß_ß β – cts) function if $k^{-1}(R)$ is ß_ß β-open in $\mathfrak{U}\forall$ß_ß OS R in $\mathfrak{V}$.

Definition 2.6[2]:

The function $k:(\mathfrak{U}, \tau_{ß_ß}(\mathfrak{U})) \longrightarrow (\mathfrak{V},\tau_{ß_ß}(\mathfrak{V}))$ is referred to as Neut. nano β-irresolute (ß_ß β – $irres.$) function if $k^{-1}(R)$ is ß_ß β-open in $\mathfrak{U}\forall$ß_ß β- CS R in $\mathfrak{V}$.

Definition 2.7[3]:

A ß_ß Topological Space (TS) $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ is ß_ß β $T_{1/2}$Space if every ß_ß β-open in $\mathfrak{U}$ is ß_ß open in $\mathfrak{U}$.

Result– 2.8 [1]

Every ß_ßOS is ß_ß β OS.

Definition 2.9[5]:
A function k :($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) ⟶ ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) is called Neutrosophic Nano β-open function (ßßβ-𝕆𝔽) if the image of every ßß OS in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßß β-open in ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) .

Neutrosophic Nano B-T_0 Space

Definition 3.1:Aßß TS ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is referred to as ßß β-T_0 Space if for each pair of distinctßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) , then there exists a ßßβ OS $\Re$in in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $x_{(j,k,l)} \in \Re$, $y_{(j,k,l)} \notin \Re$ or $x_{(j,k,l)} \notin \Re$, $y_{(j,k,l)} \in \Re$.

Example 3.2:
Consider $\mathcal{U} = \{w_1, w_2\}$ and $\mathcal{U} \setminus \Re = \{\{w_1, w_2\}\}$. Define an Neut. subset $H \subseteq \mathcal{U}$ $\ni H = \left\{\langle \frac{w_1}{0.2,0.5,0.8}\rangle, \langle \frac{w_2}{0.3,0.5,0.6}\rangle\right\}$ Then $\overline{ß_{ß}(H)} = \left\{\langle \frac{w_1,w_2}{0.3,0.5,0.6}\rangle\right\}$, $\underline{ß_{ß}(H)} = \left\{\langle \frac{w_1,w_2}{0.2,0.5,0.8}\rangle\right\}$ and $B_{ß_{ß}}(H) = \left\{\langle \frac{w_1,w_2}{0.3,0.5,0.6}\rangle\right\}$.Thus $\tau_{ß}(\mathbb{X}) = \{0_N, 1_N, \overline{ß_{ß}(H)}, \underline{ß_{ß}(H)}, B_{ß_{ß}}(H)\}$. Let $x_{(0.2,0.5,0.6)}$ and $y_{(0.3,0.5,0.6)}$ be any two distinctßß pts of ßß TS ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$). Then there exists a ßßβ OS $\Re$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $x_{(0.2,0.5,0.6)} \notin \Re$, $y_{(0.3,0.5,0.6)} \in \Re$ where $\Re = \left\{\langle \frac{w_1}{0.1,0.5,0.6}\rangle, \langle \frac{w_2}{0.3,0.5,0.6}\rangle\right\}$ which implies ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is a ßß β-T_0 Space.

Theorem 3.3:
AnßßT_0 Space always possesses theßß β-T_0 property, whereas thereverse implication fails in general.

Proof:
Let ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) be ßßT_0 Space.Then for each pair of distinct ßß pts. . $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) there exists a ßß OS $\mathfrak{P}$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}$ or $x_{(j,k,l)} \notin \mathfrak{P}$, $y_{(j,k,l)} \in \mathfrak{P}$. By result 2.8, $\mathfrak{P}$ is ßß β OS . Hence ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßß β-T_0 Space.

Example 3.4:
Consider $\mathcal{U} = \{w_1, w_2\}$ and $\mathcal{U} \setminus \Re = \{w_1, w_2\}$. Define an Neut. subset $H \subseteq \mathcal{U}$ $\ni H = \left\{\langle \frac{w_1}{0.1,0.4,0.8}\rangle, \langle \frac{w_2}{0.4,0.5,0.8}\rangle\right\}$ Then $\overline{ß_{ß}(H)} = \left\{\langle \frac{w_1}{0.1,0.4,0.8}\rangle, \langle \frac{w_2}{0.4,0.5,0.8}\rangle\right\}$, $\underline{ß_{ß}(H)} = \left\{\langle \frac{w_1}{0.1,0.4,0.8}\rangle, \langle \frac{w_2}{0.4,0.5,0.8}\rangle\right\}$ and $B_{ß_{ß}}(H) = \left\{\langle \frac{w_1}{0.1,0.4,0.8}\rangle, \langle \frac{w_2}{0.4,0.5,0.8}\rangle\right\}$.Thus $\tau_{ß}(\mathbb{X}) = \{0_N, 1_N, \overline{ß_{ß}(H)}, \underline{ß_{ß}(H)}, B_{ß_{ß}}(H)\}$. Let $x_{(0.1,0.4,0.8)}$ and $y_{(0.4,0.5,0.8)}$ be any two distinct ßß pts of ßß TS ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$). Then there exists a ßß β OS $\Re$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $x_{(0.1,0.4,0.8)} \in \Re$, $y_{(0.3,0.5,0.6)} \notin \Re$ where $\Re = \left\{\langle \frac{w_1}{0.1,0.4,0.8}\rangle, \langle \frac{w_2}{0.2,0.4,0.8}\rangle\right\}$ which implies ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is a ßß β-T_0 Space but not ßßT_0 Space.

Theorem 3.5:
Let ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) be an arbitraryßß TS. Then ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßßT_0 Space if ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is bothßß β-T_0 Space and ßß β $T_{1/2}$Space.

Proof:
Since ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßß β-T_0 Space, then for each pair of distinct ßß pts.$x_{(j,k,l)}$ and $y_{(j,k,l)}$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) there exists a ßß βOS $\mathfrak{P}$ in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}$ or $x_{(j,k,l)} \notin \mathfrak{P}$, $y_{(j,k,l)} \in \mathfrak{P}$. Also since ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßß β $T_{1/2}$Space, $\mathfrak{P}$is ßß OS in ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$). Hence ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) is ßßT_0 Space.

Theorem 3.6:
If k : ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) ⟶ ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) is a bijective, ßß β – $irres$.function. If($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) carries the ßß β-T_0property, then the domain space($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) inherits theßß β-T_0 property as well.

Proof:
Let $x_{(j,k,l)}$ and $y_{(j,k,l)}$ be two distinct ßß pts. of ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$). Since k is bijective function, there exists two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$of ($\mathcal{U}$, $\tau_{ß}(\mathbb{X})$) such that $k(q_{(a,b,c)}) = x_{(j,k,l)}$ and$k(r_{(a,b,c)}) = y_{(j,k,l)}$. Since ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) is ßß β-$T_0$ Space, there exists a ßß β OS $\Re$of ($\mathfrak{V}$,$\tau_{ß}(\mathbb{Y})$) such that $x_{(j,k,l)} \in \Re$but $y_{(j,k,l)} \notin \Re$. Since k is ßß β – $irres$.function, $k^{-1}(\Re)$ is a ßß β OS of

$(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$. Since $x_{(j,k,l)} \in \Re$ and $y_{(j,k,l)} \notin \Re$, $k^{-1}(x_{(j,k,l)}) = q_{(a,b,c)} \in k^{-1}(\Re)$ and $k^{-1}(y_{(j,k,l)}) = r_{(a,b,c)} \notin k^{-1}(\Re)$. Thus for any two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$, there exists a ßß β OS $k^{-1}(\Re)$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ containing $q_{(a,b,c)}$but not $r_{(a,b,c)}$. Hence $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_0 Space.

Theorem 3.7:
If $k : (\mathfrak{U}, \tau_{ß}(\mathbb{X})) \longrightarrow (\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ is a bijective, ßß β-$\mathbb{OF}$. Suppose$(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$satisfiesßß$T_0$ Space conditions.Then the codomain space$(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$also qualifies ßß β-$T_0$ Space.

Proof:
Let $q_{(a,b,c)}$ and $r_{(a,b,c)}$ be two distinct ßß pts. of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$. Since $k$is bijective function,there exists two distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$of $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ such that $k(q_{(a,b,c)}) = x_{(j,k,l)}$ and$k(r_{(a,b,c)}) = y_{(j,k,l)}$.Since$(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is ßßT_0 Space, there exists a ßß OS $\Re$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ such that$q_{(a,b,c)} \in \Re$ but $r_{(a,b,c)} \notin \Re$.By using k is ßß β-$\mathbb{OF}$, $k(\Re)$ is a ßß β OS of$(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$. By our assumption $q_{(a,b,c)} \in \Re$ but $r_{(a,b,c)} \notin \Re$ implies$k(q_{(a,b,c)}) = x_{(j,k,l)} \in k(\Re)$ and $k(r_{(a,b,c)}) = y_{(j,k,l)} \notin k(\Re)$. Thus for any two distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$of$(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$, there exists a ßß β OS $k(\Re)$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ containing $x_{(j,k,l)}$but not$y_{(j,k,l)}$. Hence $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ is ßß β-T_0 Space.

Theorem 3.8:
If $k : (\mathfrak{U}, \tau_{ß}(\mathbb{X})) \longrightarrow (\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ is a one-one, ßß β – cts function. If codomain $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ is anßß β-T_0 Space , then the domain $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ posseses theßß β-T_0property.

Proof:
Let $x_{(j,k,l)}$ and $y_{(j,k,l)}$ be two distinct ßß pts. of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$. Since k is one-onefunction, $k(x_{(j,k,l)})$ and $k(y_{(j,k,l)})$ are also distinct ßß pts of $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$. Since $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ is ßß β-T_0 Space, there exists a ßß β OS $\Re$ of $(\mathfrak{V}, \tau_{ß}(\mathbb{Y}))$ such that $k(x_{(j,k,l)}) \in \Re, k(y_{(j,k,l)}) \notin \Re$ or $k(x_{(j,k,l)}) \notin \Re$, $k(y_{(j,k,l)}) \in \Re$which implies $x_{(j,k,l)} \in k^{-1}(\Re)$, $y_{(j,k,l)} \notin k^{-1}(\Re)$ or $x_{(j,k,l)} \notin k^{-1}(\Re)$, $y_{(j,k,l)} \in k^{-1}\Re$ Since k is ßß β - ctsfunction, $k^{-1}(\Re)$ is a ßß β OS of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$. Since $x_{(j,k,l)} \in \Re$ and $y_{(j,k,l)} \notin \Re$, $k^{-1}(x_{(j,k,l)}) = q_{(a,b,c)} \in k^{-1}(\Re)$ and $k^{-1}(y_{(j,k,l)}) = r_{(a,b,c)} \notin k^{-1}(\Re)$. Thus for any two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$, there exists a ßß β OS $k^{-1}(\Re)$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ containing $q_{(a,b,c)}$but not $r_{(a,b,c)}$. Hence $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_0 Space.

Definition 3.9:
Let $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ be a ßß TS. The Neutrosophic Nano β kernel of a ßß set $\mathfrak{P}$ in $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is the intersection of all ßß β OSs containing $\mathfrak{P}$ and it is denoted by ßß β ker($\mathfrak{P}$) .

Theorem 3.10:
A ßß TS $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_0 Space⇔ for every pair of distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$, either $q_{(a,b,c)} \notin$ßß β ker$(r_{(a,b,c)})$or $r_{(a,b,c)} \notin$ßß β ker$(q_{(a,b,c)})$.

Proof:
Let $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ be ßß β-T_0 Space. Then for every two distinct pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$, there exists ßß β OS $\mathfrak{P}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ such that $q_{(a,b,c)} \in \mathfrak{P}$, $r_{(a,b,c)} \notin \mathfrak{P}$ or $q_{(a,b,c)} \notin \mathfrak{P}$, $r_{(a,b,c)} \in \mathfrak{P}$. Now $q_{(a,b,c)}$, $r_{(a,b,c)} \notin \mathfrak{P}$ implies $r_{(a,b,c)} \notin$ ßß β ker$(q_{(a,b,c)})$. Suppose $r_{(a,b,c)} \in$ßß β ker$(q_{(a,b,c)})$, there exists no ßß β OS $\mathfrak{P}$ in $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ such that $q_{(a,b,c)} \in \mathfrak{P}$, $r_{(a,b,c)} \notin \mathfrak{P}$ which is a contradiction. Similarly $q_{(a,b,c)} \notin \mathfrak{P}$, $r_{(a,b,c)} \in \mathfrak{P}$ implies $q_{(a,b,c)} \notin$ßß β ker$(r_{(a,b,c)})$. Conversely suppose $q_{(a,b,c)} \notin$ßß β ker$(r_{(a,b,c)})$ or $r_{(a,b,c)} \notin$ßß β ker$(q_{(a,b,c)})$ for every two ßßpts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$, there exists a ßß β OS $\mathfrak{P}$ in $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ such that $q_{(a,b,c)} \in \mathfrak{P}$, $r_{(a,b,c)} \notin \mathfrak{P}$ or $q_{(a,b,c)} \notin \mathfrak{P}$, $r_{(a,b,c)} \in \mathfrak{P}$. Hence $(\mathfrak{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_0 Space.

Neutrosophic Nano B-T_1 Space

Definition 4.1:

A ßß TS $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is referred to as ßß β-T_1 Space if for each pair of distinctßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$, then there exists ßß β OSs$\Re$ and $\Im$ such that $x_{(j,k,l)} \in \Re$, $y_{(j,k,l)} \notin \Re$and$x_{(j,k,l)} \notin \Im$, $y_{(j,k,l)} \in \Im$.

Example 4.2:

Consider $\mathcal{U} = \{w_1, w_2\}$ and $\mathcal{U} \setminus \Re = \{\{w_1, w_2\}\}$. Define an Neut. subset $H \subseteq \mathcal{U}$ $\ni H = \left\{\left\langle \frac{w_1}{0.1,0.2,0.5} \right\rangle, \left\langle \frac{w_2}{0.2,0.2,0.4} \right\rangle\right\}$ Then $\overline{ß_{ß}(H)} = \left\{\left\langle \frac{w_1,w_2}{0.2,0.2,0.4} \right\rangle\right\}$, $\underline{ß_{ß}(H)} = \left\{\left\langle \frac{w_1,w_2}{0.1,0.2,0.5} \right\rangle\right\}$ and $B_{ß_{ß}}(H) = \left\{\left\langle \frac{w_1,w_2}{0.2,0.2,0.4} \right\rangle\right\}$.Thus $\tau_{ß}(\mathbb{X}) = \{0_N, 1_N, \overline{ß_{ß}(H)}, \underline{ß_{ß}(H)}, B_{ß_{ß}}(H)\}$. Let $x_{(0.2,0.2,0.4)}$ and $y_{(0.1,0.2,0.6)}$ be any two distinct ßß pts of ßß TS $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$. Then there exists a ßß β OS $\Re$ and $\Im$in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(0.2,0.2,0.4)} \in \Re$, $y_{(0.1,0.2,0.6)} \notin \Re$and $x_{(0.2,0.2,0.4)} \notin \Im$, $y_{(0.1,0.2,0.6)} \in \Im$where $\Re = \left\{\left\langle \frac{w_1}{0.1,0.5,0.6} \right\rangle, \left\langle \frac{w_2}{0.3,0.5,0.6} \right\rangle\right\}$and $\Im = \left\{\left\langle \frac{w_1}{0.1,0.2,0.6} \right\rangle, \left\langle \frac{w_2}{0.1,0.3,0.5} \right\rangle\right\}$which implies $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is a ßß β-T_1 Space.

Theorem 4.3:

AnßßT_1 Space always possesses theßß β-T_1 property, whereas thereverse implication fails in general

Proof:

Let $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ be any ßß TS. Since $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßßT_1 Space, then for each pair of distinct ßß pts. . $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ there exists ßß OSs$\mathfrak{P}$and $\mathfrak{Q}$in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}andx_{(j,k,l)} \notin \mathfrak{Q}$, $y_{(j,k,l)} \in \mathfrak{Q}$. By result 2.8,$\mathfrak{P}and\mathfrak{Q}$ areßß β OSs. Hence $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_1 Space.

Example 4.4:

Consider $\mathcal{U} = \{w_1, w_2\}$ and $\mathcal{U} \setminus \Re = \{w_1, w_2\}$. Define an Neut. subset $H \subseteq \mathcal{U}$ $\ni H = \left\{\left\langle \frac{w_1}{0.4,0.5,0.8} \right\rangle, \left\langle \frac{w_2}{0.1,0.5,0.2} \right\rangle\right\}$ Then $\overline{ß_{ß}(H)} = \left\{\left\langle \frac{w_1}{0.4,0.5,0.8} \right\rangle, \left\langle \frac{w_2}{0.1,0.5,0.2} \right\rangle\right\}$, $\underline{ß_{ß}(H)} = \left\{\left\langle \frac{w_1}{0.4,0.5,0.8} \right\rangle, \left\langle \frac{w_2}{0.1,0.5,0.2} \right\rangle\right\}$and $B_{ß_{ß}}(H) = \left\{\left\langle \frac{w_1}{0.4,0.5,0.8} \right\rangle, \left\langle \frac{w_2}{0.1,0.5,0.2} \right\rangle\right\}$Thus $\tau_{ß}(\mathbb{X}) = \{0_N, 1_N, \overline{ß_{ß}(H)}, \underline{ß_{ß}(H)}, B_{ß_{ß}}(H)\}$. Let $x_{(0.2,0.5,0.8)}$ and $y_{(0.3,0.5,0.7)}$ be any two distinct ßß pts of ßß TS $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$. Then there exists a ßß β OS $\Re$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(0.2,0.5,0.8)} \in \Re$, $y_{(0.3,0.5,0.7)} \notin \Re$and $x_{(0.2,0.5,0.8)} \notin \Im$, $y_{(0.3,0.5,0.7)} \in \Im$ where $\Re = \left\{\left\langle \frac{w_1}{0.2,0.5,0.8} \right\rangle, \left\langle \frac{w_2}{0.1,0.5,0.8} \right\rangle\right\}$and $\Im = \left\{\left\langle \frac{w_1}{0.3,0.4,0.8} \right\rangle, \left\langle \frac{w_2}{0.3,0.5,0.7} \right\rangle\right\}$which implies $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is a ßß β-T_1 Space but not ßßT_1 Space.

Theorem 4.5:

Let $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ be an arbitraryßß TS.Then $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßßT_1 Space if it is both ßß β-T_1 Space and ßß β $T_{1/2}$Space.

Proof:

Since $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßß β-T_1 Space, then for each pair of distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ there exists ßß βOS $\mathfrak{P}$ and $\mathfrak{Q}$in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}andx_{(j,k,l)} \notin \mathfrak{Q}$, $y_{(j,k,l)} \in \mathfrak{Q}$. Also since $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßß β $T_{1/2}$Space, $\mathfrak{P}$ and $\mathfrak{Q}$are ßß OSs in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$. Hence $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßßT_1 Space.

Theorem 4.6:

Anßßβ-T_1 Space always possesses theßßβ-T_0 property, whereas thereverse implication fails in general

Proof:

Let$(\mathcal{U}, \tau_{ß}(\mathbb{X}))$beßß β-$T_1$ Space.Then for each pair of distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ there exists ßß βOSs $\mathfrak{P}$ and $\mathfrak{Q}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}andx_{(j,k,l)} \notin \mathfrak{Q}$, $y_{(j,k,l)} \in \mathfrak{Q}$ which implies there exists a ßßβ OS $\mathfrak{P}$ in $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ such that $x_{(j,k,l)} \in \mathfrak{P}$, $y_{(j,k,l)} \notin \mathfrak{P}$. Hence $(\mathcal{U}, \tau_{ß}(\mathbb{X}))$ is ßßβ-T_0 Space.

Example 4.7:

Consider $\mathfrak{U} = \{\mathfrak{w}_1, \mathfrak{w}_2\}$ and $\mathfrak{U} \setminus \Re = \{\{\mathfrak{w}_1, \mathfrak{w}_2\}\}$. Define an Neut. subset $H \subseteq \mathfrak{U} \ni H = \left\{\langle \frac{\mathfrak{w}_1}{0.2,0.5,0.7} \rangle, \langle \frac{\mathfrak{w}_2}{0.1,0.4,0.8} \rangle\right\}$ Then $\overline{ß_ß(H)} = \left\{\langle \frac{\mathfrak{w}_1,\mathfrak{w}_2}{0.2,0.5,0.7} \rangle\right\}$, $\underline{ß_ß(H)} = \left\{\langle \frac{\mathfrak{w}_1,\mathfrak{w}_2}{0.1,0.4,0.8} \rangle\right\}$ and $B_{ß_ß}(H) = \left\{\langle \frac{\mathfrak{w}_1,\mathfrak{w}_2}{0.2,0.5,0.7} \rangle\right\}$.Thus $\tau_ß(\mathbb{X}) = \{0_N, 1_N, \overline{ß_ß(H)}, \underline{ß_ß(H)}, B_{ß_ß}(H)\}$. Let $x_{(0.1,0.5,0.8)}$ and $y_{(0.2,0.6,0.7)}$be any two distinct ßß pts of ßß TS $(\mathfrak{U}, \tau_ß(\mathbb{X}))$. Then there exists a ßß β OS $\Re$ in $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that $x_{(0.1,0.5,0.8)} \notin \Re$, $y_{(0.1,0.4,0.8)} \in \Re$ where $\Re = \left\{\langle \frac{\mathfrak{w}_1}{0.1,0.5,0.8} \rangle, \langle \frac{\mathfrak{w}_2}{0.1,0.4,0.8} \rangle\right\}$ which implies $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ is a ßß β-T_0 Space but not ßß β-T_1 Space.

Theorem 4.8:

If $k : (\mathfrak{U}, \tau_ß(\mathbb{X})) \longrightarrow (\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is a bijective, ßß β – $irres$.function . If $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ carries the ßß β-T_1 property, then the domain space $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ inherits the ßß β-T_1 property as well .

Proof:

Let $x_{(j,k,l)}$ and $y_{(j,k,l)}$ be two distinct ßß pts. of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$. Since k is bijective function, there exists two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that $k(q_{(a,b,c)}) = x_{(j,k,l)}$ and$k(r_{(a,b,c)}) = y_{(j,k,l)}$. Since $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is ßß β-T_1 Space, there exists ßß β OSs$\Re$ and $\mathfrak{S}$ of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ such that $x_{(j,k,l)} \in \Re, y_{(j,k,l)} \notin \Re$ and $x_{(j,k,l)} \notin \mathfrak{S}$, $y_{(j,k,l)} \in \mathfrak{S}$. Since k is ßß β – $irres$.function, $k^{-1}(\Re)$and $k^{-1}(\mathfrak{S})$ areßß β OSs of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$. Since $x_{(j,k,l)} \in \Re$ and $y_{(j,k,l)} \notin \Re$, $k^{-1}(x_{(j,k,l)}) = q_{(a,b,c)} \in k^{-1}(\Re)$ and $k^{-1}(y_{(j,k,l)}) = r_{(a,b,c)} \notin k^{-1}(\Re)$. Similarly,$q_{(a,b,c)} \notin k^{-1}(\mathfrak{S})$ and $r_{(a,b,c)} \in k^{-1}(\mathfrak{S})$. Thus for any two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$, there exists ßß β OS$k^{-1}(\Re)$ and $k^{-1}(\mathfrak{S})$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that$q_{(a,b,c)} \in k^{-1}(\Re)$,$r_{(a,b,c)} \notin k^{-1}(\Re)$ and $q_{(a,b,c)} \notin k^{-1}(\mathfrak{S})$, $r_{(a,b,c)} \in k^{-1}(\mathfrak{S})$ Hence $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ is ßß β-T_1 Space.

Theorem 4.9:

If $k : (\mathfrak{U}, \tau_ß(\mathbb{X})) \longrightarrow (\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is a bijective, ßß β-$\mathbb{OF}$. Suppose$(\mathfrak{U}, \tau_ß(\mathbb{X}))$ satisfies ßßT_1 Space conditions. Then the codomain space $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ also qualifies ßß β-T_1 Space.

Proof:

Let $q_{(a,b,c)}$ and $r_{(a,b,c)}$ be two distinct ßß pts. of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$. Since $k$is bijective function, there exists two distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ such that $k(q_{(a,b,c)}) = x_{(j,k,l)}$ and$k(r_{(a,b,c)}) = y_{(j,k,l)}$.Since $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ is ßßT_1 Space, there exists a ßßOSs$\Re$and $\mathfrak{S}$of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that $q_{(a,b,c)} \in \Re, r_{(a,b,c)} \notin \Re$ and $q_{(a,b,c)} \notin \mathfrak{S}$, $r_{(a,b,c)} \in \mathfrak{S}$. By using k is ßß β-$\mathbb{OF}$, $k(\Re)$and $k(\mathfrak{S})$areßß β OSs of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$. By our assumption $q_{(a,b,c)} \in \Re, r_{(a,b,c)} \notin \Re$ implies$k(q_{(a,b,c)}) = x_{(j,k,l)} \in k(\Re)$ and $k(r_{(a,b,c)}) = y_{(j,k,l)} \notin k(\Re)$. Similarly, $x_{(j,k,l)} \notin k(\mathfrak{S})$ and $y_{(j,k,l)} \in k(\mathfrak{S})$.Thus for any two distinct ßß pts. $x_{(j,k,l)}$ and $y_{(j,k,l)}$of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$, there exists ßß β OS k $(\Re)$ and $k(\mathfrak{S})$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that $x_{(j,k,l)} \in k$ $(\Re)$,$y_{(j,k,l)} \notin k$ $(\Re)$ and$x_{(j,k,l)} \notin k(\mathfrak{S})$, $y_{(j,k,l)} \in k(\mathfrak{S})$. Hence $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is ßß β-T_1 Space.

Theorem 4.10:

If $k : (\mathfrak{U}, \tau_ß(\mathbb{X})) \longrightarrow (\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is a one-one, ßß β – cts function. If codomain $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is an ßß β-T_1 Space , then the domain $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ posseses theßß β-T_1property.

Proof:

Let $x_{(j,k,l)}$ and $y_{(j,k,l)}$ be two distinct ßß pts. of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$. Since k is one-one function, $k(x_{(j,k,l)})$ and $k(y_{(j,k,l)})$ are also distinct ßß pts of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$. Since $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ is ßß β-T_1 Space, there exists ßß β OSs$\Re$ and $\mathfrak{S}$ of $(\mathfrak{V}, \tau_ß(\mathbb{Y}))$ such that $k(x_{(j,k,l)}) \in \Re$, $k(y_{(j,k,l)}) \notin \Re$and $k(x_{(j,k,l)}) \notin \mathfrak{S}$, $k(y_{(j,k,l)}) \in \mathfrak{S}$which implies $x_{(j,k,l)} \in k^{-1}(\Re)$, $y_{(j,k,l)} \notin k^{-1}(\Re)andx_{(j,k,l)} \notin k^{-1}(\mathfrak{S})$, $y_{(j,k,l)} \in k^{-1}(\mathfrak{S})$.Since k is ßß β - ctsfunction, $k^{-1}(\Re)$ and $k^{-1}(\mathfrak{S})$ areßß β OSs of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$. Since $x_{(j,k,l)} \in \Re$and$y_{(j,k,l)} \notin \Re$, $k^{-1}(x_{(j,k,l)}) = q_{(a,b,c)} \in k^{-1}(\Re)$ and $k^{-1}(y_{(j,k,l)}) = r_{(a,b,c)} \notin k^{-1}(\Re)$ .Similarly$q_{(a,b,c)} \notin k^{-1}(\mathfrak{S})$and $r_{(a,b,c)} \in k^{-1}(\mathfrak{S})$ Thus for any two distinct ßß pts. $q_{(a,b,c)}$ and $r_{(a,b,c)}$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$, there exists ßß β OS $k^{-1}(\Re)$ and $k^{-1}(\mathfrak{S})$ of $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ such that $q_{(a,b,c)} \in k^{-1}(\Re)$, $r_{(a,b,c)} \notin k^{-1}(\Re)$,$q_{(a,b,c)} \notin k^{-1}(\mathfrak{S})$ and $r_{(a,b,c)} \in k^{-1}(\mathfrak{S})$ Hence $(\mathfrak{U}, \tau_ß(\mathbb{X}))$ is ßß β-T_1 Space.

CONCLUSION

This paper introduced and investigated the concepts of Neutrosophic Nano β-T_0 and Neutrosophic Nano β-T_1 spaces within the framework of neutrosophic nano topology by employing neutrosophic nano β-open and β-closed sets. Several fundamental properties and characterizations of these generalized separation spaces were established, and the relationships between the proposed β-separation axioms and existing neutrosophic nano separation axioms were analyzed in detail. Suitable examples were presented to illustrate the validity of the introduced concepts and to distinguish different classes of spaces. The results obtained extend the theory of neutrosophic nano topology and contribute to a better understanding of generalized separation properties in environments characterized by uncertainty, indeterminacy, and inconsistency, thereby providing a useful basis for future research and applications in related mathematical and information-based fields.

ABSTRACT

Tidal energy, derived from the motion of ocean tides caused by the gravitational interaction between the earth, Moon, and sun. This Novel presents a holistic multi criterion decision making applied to seven sited tidal energy zone including offshore and near shores and etc. Tidal energy has the potential to contribute significantly to the transition energy sources all. Retained criteria for the analysis cover several aspects include technology, infrastructure and environment making proposed methodology applicable to find Tidal energy zonation. The formal method– generating energy from tidal current to find best zone in India and it is considered as much more feasible today than building ocean-based dams or barrages. Tidal power is reliable predictable. By addressing these challenges and leveraging technological innovations, the DEMATEL for weight assessment, MABAC, DNMA and EAMR (MCDM methods) are mainly used and it is useful for finding best alternatives and ranking. Therefore, over all rank for top zone is Gulf of Kutch (Gujarat) has placed the first rank.

Keywords: MCDM, Tidal energy, Weight assessment, Ranking

INTRODUCTION

One of the most enduring and powerful forces shaping our world is still the tides. They have a vital physical influence over the open ocean, shelf seas, and coastal zone. The timing and size of storm surges and waves at the coast are influenced by tides (Horsburgh & Wilson, 2007; Prandle & Wolf, 1978), which modifies elevated sea levels and has a substantial effect on coastal erosion and floods (Pugh & Woodworth, 2014). Global cities are diversifying their energy portfolios with a growing amount of renewable energy to satisfy rising demand for energy and facilitate a seamless transition to a sustainable energy future. In this regard, the oceans contain enormous amounts of energy that is renewable. In this regard, oceans have enormous reservoirs of renewable energy, especially kinetic as well as potential energy, which are the most extractable sources and are generated by various ocean phenomena like tides and waves. According to reports, the total tidal energy potential was approximately 26,000 TWh/year, while the projected global theoretical wave energy potential was approximately 29,500 TWh/year (Mork et al., 2010; WER, 2016). Therefore, obtaining net zero emissions by 2050 can be aided by the extraction of these energy resources. This is significant since it is predicted that the world's power consumption would increase, for instance, from about 23,000 TWh in 2015 to over 49,000 TWh in 2050 (Ram et al., 2020).It is widely acknowledged that effective use of wave, tidal, and current energy could contribute to the provision of dependable electricity, especially to small island developing states (SIDS), generate socioeconomic advantages, guarantee a climate-sensitive energy mix, and support the global blue economy.

Despite the fact that there are numerous ways to convert ocean energy Tidal energy, which is the subject of this review, offers the dual advantages of high predictability and strong prospects for grid connectivity. It includes wave energy, Ocean Thermal Energy Conversion (OTEC), and ocean currents. Because they originate from (astronomical) tide-generating factors, tides are predictable. The semi-diurnal lunar and solar constituents, which have periods of 12.42 and 12 hours, correspondingly, are the most prominent of these tidal constituents. The spring-neap cycle, which occurs every two weeks, is caused by the mixture. Using a multi-criteria decision-making (MCDM) approach to sustainable energy management provides a more workable answer to this issue. MCDM techniques are especially helpful when decisions must be made based on multiple conflicting signs or elements that are striving for priority, as well as when determining or expressing preferences[2]. Then, using the chosen criteria or alternatives, MCDM techniques assist in resolving contradicting questions and selecting the optimal solution. Choosing options with competing criteria is a difficulty that decision-makers frequently encounter. One specific MCDM issue where numerous conflicting tangible variables must be taken into account is choosing sustainable energy sources [3]. Nevertheless, only few studies were able to develop a definitive MCDM approach, especially for the selection of tidal energy Zones. Therefore, In our Novel Section Utilization of Tidal energy, Preliminaries, Sensitivity analysis of tidal sources, MCDM procedure, Analysis the aspect of MCDM, Assessment in operation level, Experimental result, Conclusion. Numerous MCDM techniques are available in the literature [1], including the Decision-Making Trial and Evaluation Laboratory (DEMATEL), the multi-attributive border approximation area comparison method (MABAC), the Double Normalization-based Multiple Aggregation (DNMA), and the Evaluation by an Area-based Method of Ranking (EAMR).

Utilization of Tidal energy

One sustainable energy source that can be utilised is tidal energy. Because the movement of the tides, including high and low tides, carries kinetic energy. This type of energy is one of the few that is not derived from sunlight but rather from the forces of gravity of several celestial planets. Kinetic energy can be converted into energy from electricity by humans. Its theory is comparable to that of water power. In order to convert the kinetic energy of saltwater into electrical energy, both the authority plants store seawater during high tide and release it during low tide [9]. Nevertheless, the power plant's external cost that makes use of the kinetic energy tides. Power plants are always constructed close to the coast. If the distinction in sea level is transformed into flow across a large or narrow path, a waterway, or a gorge, tidal currents are created. Like a body of water, they flow parallel to the coast and change

course twice a day on average. They are essentially kinetic energy that wind turbine-like devices can use. There are several types of marine energy, such as (i) mechanical ones like tides, currents, and waves, (ii) chemical ones like salinity gradients, or (iii) thermal ones like constant heat sinks. Although tidal energy is derived from the conversion of gravitational forces, it can be seen as predicted over an extended period of time. Since its nature is tied to precise predictions, its intermittency influences the harvester's design but not its reliability. Its spread over wide areas, which requires significant effort to utilise, is its primary disadvantage, though. Additionally, the electricity produced by tidal energy conversion is unstable and cannot cover an energy system's peak usage.

Discoveries of the Earth's natural features

Research on the geographical layout of particular areas can benefit from the solid tidal force test. The earth's shape can be influenced by the solid tidal force, and scientists can use specific instruments to measure tide parameters on the ground. Researchers can then determine the crust's structure by analysing the collected data. Tang and Chang, two Chinese scientists, studied the tide factor in Lanzhou in 1995. Venedikov harmonic analysis was used to measure those variables of standard water level solid tide, prolonged wave, nocturnal wave, mid-diurnal wave, and 1/3 diurnal wave of sloped earth tide. Seawater flows during the highest tide as well as low tide in a tidal energy system, producing water circulation with substantial energy potential [8]. Turbines, attached to a typical generator, which transform mechanical force into electrical energy, are rotated by this flowing water.

Main Components of a Tidal Energy System

- Turbine: Migration of tidewater causes it to oscillate.
- Generator: Produces electric power from mechanical motion.
- Barrage or Tidal Stream Structure: regulate and guide the flow of saltwater.
- Transformer and Grid Connection: Delivers produced power to the electrical grid.

Electricity Generation Process

- Seawater enters the basin through turbines during high tide.
- The turbine propellers are rotated by the flowing water.
- The generator shaft is driven by turbine rotation. The generator uses electromagnetic induction in order to create electricity.
- Water returns to the sea during low tide, rotating the turbines once more and enabling the production of energy in both directions.

Tidal systems can therefore produce electricity throughout both flood and ebb tides, increasing energy persistence and productivity [7].

Preliminaries

One of the most important steps in producing electricity successfully is choosing a suitable tidal energy site. The viability and effectiveness of tidal energy projects are influenced by a variety of specialised, financial, environmental, and infrastructure variables. To determine the best seaside site, criterion assessment is therefore crucial.

- **Tidal Range:** The vertical gap, expressed in meters, from the peak of the highest tide and the lowest possible tide at a certain site is known as the tidal range.
- **Tidal Current Velocity:** The rapidity at which seawater moves during flood and ebb tidal phases is known as tide current velocity, and it is measured in meters per second.
- **Water Depth:** The horizontal separation at the chosen location between the sea surface and the bottom is known as the water depth.
- **Seawater Density:** The mass of saltwater per litre volume is known as density.
- **Installation Cost:** The whole capital investment needed for the creation and implementation of tidal energy systems is represented by the installation cost.

- **Annual Energy Yield:** The total amount electrical electricity generated by a tidal energy system during a year is known as a yearly energy yield.
- **Estimated Potential Capacity:** The highest power output capacity that a tidal energy plant can achieve is indicated by its assessed potential capacity.
- **Distance to Grid:** The standard linear distance separating the tidal energy location and the closest wired grid junction point is referred to as "distance to grid."
- **Port Accessibility:** The relative closeness and logistical ease of access between the tidal energy site and neighbouring ports needed for installation, operation, and maintenance tasks is referred to as port accessibility.
- By including these factors, decision-makers can more thoroughly assess tidal energy Zones and promote sustainable energy planning.

Sensitivity analysis of tidal sources

Technological Aspects

The physical as well as oceanographic factors that affect the viability and effectiveness of energy extraction are referred to as the technological aspects of tidal energy. These include seawater density, water depth, tidal range, tidal current velocity, and the appropriateness of tidal energy conversion technology. Together, these factors determine a site's technological potential and capacity to facilitate effective tidal energy chain power generation.

Economic Aspects

The financial viability and affordability of tidal energy production are related to the economic parameters. These include of the anticipated potential capacity, annual energy yield, installation, and operation and maintenance costs. These elements are used to assess a project's profitability and ascertain whether ongoing producing electricity is financially feasible.

Infrastructure Aspects

The availability and accessibility of crucial auxiliary facilities needed for the development of tidal energy are referred to as the infrastructure issues. This covers logistical support for the set up and upkeep tasks, transportation facilities, port availability, and the distance to the electrical grid. These elements affect how simple it is to construct the project and integrate it with the current power infrastructure.

Environmental Aspects

Although tidal energy produces power without emitting greenhouse gases or air pollutants, it is regarded as a renewable and environmentally conscious energy source. It promotes the development of sustainable energy sources and lessens reliance on fossil fuels. However, because of the construction of barrages and underwater turbines, tidal energy systems may have an impact on marine ecosystems, fish migration, sediment transport, and coastal hydrodynamics. Aquatic biodiversity can also be impacted by variations in water flow and underwater noise. Tidal energy has less of an influence on our surroundings over the long run than conventional power plants, despite these difficulties. To reduce ecological disruptions and guarantee environmentally friendly tidal energy generation, proper environmental monitoring, efficient turbine design, and cautious site selection are crucial.

Analysis the aspects of MCDM

Overplay of assessment

Case i)

First, we must create the hierarchical structure depicted in the table below, with the projects at the third level, the criteria at the second, and the aim at the top.

Here we considering 7 Projects i.e., tidal zonation and 9 Criteria's.

Case ii) Weight Goal Approach (DEMATEL)

Normalization of Matrix(ND)

↓

Total Relation Matrix (Direct + Indirect) (T)

↓

Weight Determination (Wz)

Step 1	Step 2	Step 3	Step 4
$\frac{k}{max_{1\leq i\leq n}\sum_{j=1}^{n} fij}$	(ND) $X = K.A$	(T) using r program $T = X(I - X)^{-1}$	Wz $\frac{(S+M)}{\sum(S+M)}$

Case iii) MABAC,	Case iv) DNMA	Case v) EAMR
Decision Matrix	Decision Matrix	Decision Matrix
Normalization	Linear Normalization	Normalization
Weighted Normalized Matrix	Vector Normalization	Weighted Normalized Matrix
Final Ranking	Final Ranking	Final Ranking

Step 5: Normalized Decision Matrix (Benefit & Cost)

MABAC	DNMA	EAMR
$\boldsymbol{benefit}$ $\boldsymbol{Dij = \frac{Kij - x^-}{x^+ - x^-}}$	$benefit$ $Lij = \frac{Oij}{\max(Oij)}$	$benefit$ $Nij = \frac{Oij}{\max(Oij)}$
$\boldsymbol{Cost}$ $\boldsymbol{Dij = \frac{x^+ - Kij}{x^+ - x^-}}$	$Cost$ $Lij = \frac{\min(Oij)}{Oij}$	$Cost$ $Nij = \frac{\min(Oij)}{Oij}$
Step 6		
$\boldsymbol{Wz\ normalize}$ $\boldsymbol{Pij = Wz * (Dij + 1)}$	$Wz\ normalize$ $Kij = Wz * Lij$	$Wz\ normalize$ $Fij = Wz * Nij$
Step 7		
$\boldsymbol{BAA}$ $\boldsymbol{gi = \left(\prod_{i=1}^{m} Pij\right)}$ $\boldsymbol{G = [\,gi]_{1*m}}$	$Vector\ Normalization$ $Vij = \frac{Oij}{\sqrt{\sum_{i=1}^{m} Oij^2}}$	$Benefit\ and\ Cost\ area$ $Mi = \sum Fij^+$ $Qi = \sum Fij^-$

CONCLUSION

There are notable variations in the suitability of the chosen tidal energy Zones in India, according to the final comparison ranking produced by the MABAC, DNMA, and EAMR techniques. A1 = (1,1,1) demonstrated overall superiority and stability under various evaluation mechanisms by consistently obtaining the top rank among all alternatives in all three MCDM models. Because of its excellent performance in terms of technical, economic, environmental, and infrastructure criteria, A1—the Gulf of Kutch—can be regarded as the most suitable location for tidal energy development. The remaining options performed differently in various models. Strong compromise and

utility-based performance are demonstrated by Malabar Coast's higher rankings in DNMA and EAMR. Due to its excellent tidal characteristics, Palk Strait also showed outcome in DNMA. On the other hand, Sundarbans Delta and Mahanadi Delta Coast demonstrated comparatively poorer overall appropriateness, while Konkan Coast and Krishna-Godavari Coast received middling scores.The research investigation demonstrates that a strong and trustworthy framework for choosing tidal energy sites is provided by the coordinated application of MABAC, DNMA, and EAMR techniques. The study reduces uncertainty and increases the final decision's credibility by combining many ranking techniques. As a result, the Gulf of Kutch is determined to be the best tidal energy location for future sustainable marine energy development among the chosen coastal regions of India.

Table 2: Multi criterion decision making process

Method	Theory	Main Factors
DEMATEL(Decision Making Trial and Evaluation Laboratory)	A method for simulating and examining the causal connections between criteria in complicated systems	Evaluates the degree of influence, finds cause and effect correlations between criteria, and creates a structural relationship map [11].
MABAC(Multi-Attributive Border Approximation Area Comparison)	A method of rating options according to how far they are from a predetermined boundary approximation area.	Ranks options using distance metrics, boundary approximation area, and a normalised weighted matrix [5]& [6]
DNMA (Double Normalization-based multi-aggregation)	A multi-criteria approach to decision-making based on performing value aggregation and double normalisation.	Uses several aggregating techniques, dual normalisation, and results integration for stable ranking[4].
EAMR (Evaluation based on Average Measure Ranking)	A clear ranking system based on the average performance of options for each criterion.	Ranks options using normalised values and average score computation [10].

ABSTRACT

Thepresent study was carried out to understand the roost tree selection of Indian Peafowl (*Pavo cristatus*) in Innambur Panchayat, Kumbakonam Taluk, Tamil Nadu. A total of 11 tree species were recorded in the study area along with associated shrub and grass species. Data on tree height, girth at breast height (DBH), and roosting height were collected. The results revealed that peafowl preferred tall trees with higher DBH for roosting. The maximum roosting height was observed in *Syzygiumcumini* (11.4 m) and *Albizia saman* (11.01 m), while the lowest was recorded in *Moringa oleifera* (2.55 m). Trees with greater height and structural strength such as *Ficus benghalensis* and *Tectona grandis* were more suitable for roosting. The study concludes that tree height, girth, and canopy structure are the major factors influencing roost site selection. These findings are important for conservation and habitat management of Indian Peafowl.

Keywords: Peafowl, Roosting tree, Innambur, Kumbakonam.

INTRODUCTION

The pheasants are group of birds belong to the Family Phasianidae of the Order Galliformes that includes pheasants, partridges and quails, commonly known as 'game birds'[8]. The family Phasianidae is the largest and the most diverse assemblage and comprises of 38 genera, 155 species and 399 taxa distributed throughout the Old World [14]. Out of 51 species of world's pheasants, 17 species occur in India with very little ecological information [11]. Three species of peafowl are found in the world, *i.e.,* Burmese peafowl from eastwards to Sumatra, African peafowl in Belgian Congo and Indian peafowl or blue peafowl in Indian subcontinent [9]. In India, Peafowl is distributed in Gujarat, Haryana, Madhya Pradesh, Punjab, Rajasthan and Uttar Pradesh. It is protected throughout the country, especially under the Schedule-I of the Indian wildlife protection Act (1972) and its subsequent amendment and Appendix-1of CITES [10]. The distribution of peafowl in India is patchy but it ranges from Himalayas to the southern most districts. In Tamilnadu, fairly large population can be seen in Ramanathapuram, Madurai, Pudukottai and Nilgiri districts [25]. Information on roost selection by bird species is of great importance in planning for its conservation and management, reported, in birds the roost selection is a vital component in the overall habitat selection process [14]. Concluded that two most significant functions of communal roosting in bird species are the communication of information about the location of food sources and avoidance of predation [12]. According to the provision of trees offers some environmental protection and can encourage birds to range more widely, although these may also provide fox cover, this enhancing the risk from predation. The roost study of Indian Peafowl is essentially unstudied in Musiri area. It is important to study the distribution of Indian peafowl related to the availability of suitable roosting trees [26].

Reported that roost selection is a vital component in theoverall habitat selection process. The roost site selection is regulated by many factors [14]. The roost site selection has often been a focus of research on many birds. Therefore, information on roost selection by a species carries immense importance for assassin its conservation need and to design effective management strategies [12,29,22]. The Peacocks are omnivore medium-sized birds belonging to the family Phasianidae, order Galliformes [1].The Indian Peafowl (*Pavo cristatus* Linnaeus, 1758), a distinctive and highly charismatic avian species characterized by iridescent plumage and elaborate ornamental trains in males, belongs to the class Aves and the phylum Chordata within the subphylum Vertebrata. This species, renowned for its intricate evolutionary adaptations and broad ecological plasticity, is a prime example of avian diversity shaped by evolutionary lineage tracing back to reptilian ancestry. The Indian Peafowl exhibits a combination of behavioral intelligence, ecological adaptability, and cultural significance, factors that contribute to its prominence in human societies and conservation discourse [16]. According to taxonomic classification, *Pavo cristatus* is placed within the family Phasianidae, which encompasses pheasants and their allied species, further elucidating the vast diversity within galliform birds. The genus *Pavo* includes both the Indian Peafowl and its congener, the Green Peafowl (*Pavo muticus*Linnaeus, 1766).

The Indian Peafowl was scientifically described by Carl Linnaeus in 1758, marking its formal recognition in ornithological taxonomy. Male peafowls, commonly referred to as peacocks, exhibit a striking iridescent blue and green plumage with an elaborate fan-like train composed of elongated upper tail coverts adorned with eye-spot patterns (ocelli), a sexually selected trait that plays a crucial role in mate attraction. Conversely, female peafowls, known as peahens, exhibit a more cryptic coloration, primarily comprising muted shades of brown and green, which serve as an effective camouflage strategy during the nesting period [8]. The Indian Peafowl is an ecologically significant galliform bird distributed across a wide geographical range, encompassing India, Pakistan, Nepal, Bhutan, and Sri Lanka. Its widespread occurrence emphasizes its adaptability to diverse ecological conditions, ranging from dry scrublands and deciduous forests to agricultural landscapes and urban green spaces. The species is often found in proximity to human settlements, benefiting from anthropogenic food sources while maintaining a reliance on natural foraging habitats. This ecological plasticity has facilitated the persistence of *Pavo cristatus* across varying landscapes, thereby reinforcing its importance in both natural and human-modified ecosystems [2]. The preferred habitats of the Indian Peafowl are characterized by a mosaic of dense vegetation interspersed with open

foraging grounds. They are commonly found in dry deciduous forests, grasslands, riparian woodlands, and agricultural areas where food availability is abundant [14,20]. According to the species is frequently observed in association with human-modified landscapes, including village outskirts, agricultural fields, and plantations [13]. The diet of the Indian Peafowl is omnivorous, consisting of a diverse array of food items, including seeds, grains, insects, small vertebrates, and various plant materials [27].

Socially, Indian Peaf owls exhibit communal roosting behavior, preferring large trees that offer protection from terrestrial predators [12,18,19]. Roosting in groups confers significant survival advantages, including increased vigilance and predator detection. Their primary predators in the wild include large felids, raptors, and opportunistic carnivores, although human-related threats such as habitat fragmentation and poaching remain pertinent conservation concerns [21]. In India, *Pavo cristatus* is legally protected under Schedule I of the Wildlife Protection Act, 1972, affording it the highest degree of legal protection. Conservation awareness programs and habitat restoration projects have been instrumental in maintaining stable population levels in various parts of its range. The remarkable adaptability of the Indian Peafowl extends to urban environments, where the species has successfully established itself in gardens, parks, and peri-urban landscapes. This urban adaptability is facilitated by the availability of artificial food sources, reduced predation pressure, and the presence of roosting sites in large trees [7]. However, urban environments also present novel challenges, including vehicle collisions, pollution exposure, and increasing human-wildlife conflicts [4]. Instances of crop damage and garden foraging by peaf owls have led to their perception as agricultural pests in certain regions, resulting in negative human-peafowl interactions [24]. Therefore, present study. This paper focus on roost selection by Indian peafowl in Selected Areas Around at Kumbakonam Thanjavur District, Tamil Nadu (10.993032°N and79.336522°E.

MATERIAL AND METHODS

The line transect methodology was adopted to estimate the population of Indian Peafowl (*Pavo cristatus*) in the selected areas around at Kumbakonam. Transects were laid according to habitat types, and motor vehicles were used for population estimation during two time periods: from 06:00 AM to 10:00 AM in the morning and from 03:00 PM to 07:00 PM in the evening. A total of 1 km of transects habitat, the major habitats agricultural areas, Human settlements, in Plantation areas. Transect surveys were conducted four times each month. During each sighting, variables such as the total number of individuals – categorized as adult male (AM), adult female (AF), Chick along with group size, vegetation type, and terrain type were recorded. The sex of the peaf owls was identified following the method described [27]. The characteristics and locations of Indian Peafowl roosting trees were recorded opportunistically. Roosting trees were identified through direct observation during early morning and late evening, supplemented by secondary evidence such as droppings and feathers found beneath the trees. Data collected included tree species, tree height (m), roost height (m), girth at breast height (GBH, cm), habitat type, date, and time. The persistent use of trees was determined based on consistent droppings observed at the site. Tree species were identified following the classification [17].

The study was carried out from Jan 2026 to March 2026. The study area which covering the various microhabitats such paddy crop, cotton plant, bamboo, flower gardens, sugar cane field, banana plant, mango tree. The present study was focused on the estimation of population for Indian blue peafowl in the selected areas. The habitat used by Indian peafowl was categorized as Agrifield which has barren land along with agricultural area on each sighting of the Peafowl variables such as Adult Male (Peacock), Adult Female (Peahens), and Chicks were recorded along with the group size, vegetation and terrain type was recorded. For each peafowl species, detection time, group size, sex, sighting angle and the sighting distance from the transect line were recorded. We used a Distance Sampling line transect method to estimate population of the Indian Peafowl [3][6][5]. Habitat characteristics around each roosting site were assessed using aquadrat method descriptiveMueller-Dombois&Ellenberg-1974. The estimate of Indian blue peafowl was carried out along the transects and foot paths in the available habitats such cultivated crop lands and natural habitat areas. On each sighting of the Peafowl the variables such as the total number of individuals (Peacocks,

Pea hens and Chicks), group size, and vegetation type was recorded. The Indian peafowl roosting sites and trees was also surveyed and recorded.

Study Area

The study was conducted in Selected areas Around Kumbakonam, Thanjavur District, Tamil Nadu (10.993032°N and 79.336522°E). Innambur, Uthirai, Puliyambadi, Mynavoor. The study area comprises a mosaic of agricultural lands, plantations, and human settlements. Major habitats include paddy fields, sugarcane fields, banana plantations, flower gardens, bamboo patches, and mango groves.

Study Period

The present study was conducted from January 2026 to March 2026 in the selected study area. Field investigations were carried out systematically throughout the three-month study period to collect the required data. Regular observations and surveys were undertaken to record relevant information related to the study objectives.

Sampling Method

The Indian Peafowl (Pavo cristatus) population was estimated using the line transect method. Transects were extended over all habitat types including agricultural fields, plantations and human-built up areas.
Two periods when surveys were conducted:
Morning: 06:00 AM to 10:00 AM
Evening: 03:00 PM to 07:00 PM
This yielded a total transect length of 1 km, over which the surveys were repeated four times per month.

Data Collection

During each sighting, the following parameters were recorded:

- Number of individuals (Adult Male, Adult Female, Chicks)
- Group size
- Vegetation type
- Terrain type
- Detection time and distance

The sex of individuals was identified [23].

Roost Tree Assessment

Roosting trees were identified through direct observation during early morning and evening hours. Additional evidence such as droppings and feathers beneath trees was used to confirm roosting sites.
The following parameters were recorded for each roost tree:

- Tree species
- Tree height (m)
- Roosting height (m)
- Girth at breast height (GBH/DBH, cm)
- Habitat type
- Date and time

Repeated use of roosting trees was determined based on the consistent presence of droppings.

Population Estimation

Distance sampling methods were used to estimate population density [3,6,5]. Observations were made along transects and footpaths across different habitats.

RESULTS

In the present study conducted at Selected Areas Around Kumbakonam a total of 10 tree species were recorded along with associated shrubs and grass species in the study area. The tree species identified include *Mangifera indica*, *Syzygiumcumini*, *Tectona grandis*, *Ficus benghalensis*, *Moringa oleifera*, *Tamarindus indica*, *Thespesia populnea*, *Azadirachta indica*, *Ficus religiosa* and *Albizia saman*. The height of the recorded tree species from 8.55 m to 31 m. The tallest tree species observed was *Albizia saman* (31 m), followed by *Ficus religiosa* (26.1 m). The shortest tree species recorded was *Moringa oleifera* (8.55 m). The girth at breast height (DBH) varied considerably among species. The maximum DBH was recorded in *Ficus benghalensis* (555.44 cm), followed by *Tectona grandis* (250.35 cm) and *Ficus religiosa* (235 cm). The minimum DBH was observed in *Moringa oleifera* (46.32 cm). Roosting height of Indian Peafowl showed variation across different tree species. The highest roosting height was recorded in *Syzygiumcumini* (11.4 m) and *Albizia saman* (11.01 m), followed by *Tectona grandis* (8.44 m) and *Tamarindus indica* (8.23 m). The lowest roosting height was observed in *Moringa oleifera* (2.55 m), indicating its limited suitability for roosting. Tree species such as *Ficus benghalensis*, *Tectona grandis*, *Tamarindus indica*, and *Syzygiumcumini* exhibited moderate to high roosting heights, suggesting their preference as roosting sites. In contrast, smaller trees with lower height and DBH showed reduced utilization for roosting. A total of ten roosting plots were assessed to determine the habitat characteristics associated with the focal species. Roost tree height varied from 8.55 m to 31.0 m. The tallest roost tree recorded was *Albizia saman* (31.0 m), followed by *Ficus religiosa* (26.1 m), whereas *Moringa oleifera* had the lowest height (8.55 m). The number of trees within the plots ranged from 6 to 15. The highest tree density was observed in plots dominated by *Ficus benghalensis* (15 trees), while the lowest was recorded in *Moringa oleifera* (6 trees). Shrub cover ranged from 12–30%, with the highest value observed in *Moringa oleifera* plots (30%). Grass cover varied between 18% and 40%, reaching its maximum in *Moringa oleifera* (40%) and minimum in *Ficus benghalensis* (18%). Litter cover ranged from 30% to 65%, with the highest percentage recorded in *Syzygiumcumini* (65%). Litter depth varied from 2.3 cm to 6.2 cm, with the greatest depth observed beneath *Ficus benghalensis* (6.2 cm) and the lowest beneath *Moringa oleifera* (2.3 cm).

Tree Composition

Among the recorded vegetation, all 11 tree species were distributed across agricultural fields and human-dominated landscapes. The study area also supported diverse shrub species such as *Justicia adhatoda*, *Calotropis gigantea*, *Ipomoea carnea*, *Ricinus communis*, *Vitex negundo* and *Lantana camara*, along with grass species including Kentucky blue grass, Bermuda grass, Zoysia, and Buffalo grass, indicating a heterogeneous habitat structure.

Tree Height Analysis

The height of trees ranged from 8.55 m to 31 m. The tallest tree species recorded was *Albizia saman* (31 m), followed by *Ficus religiosa* (26.1 m). The shortest tree species was *Moringa oleifera* (8.55 m). Most of the preferred roost trees had heights greater than 15 m, indicating a tendency of peafowl to select taller trees.

DBH (Girth) Variation

The girth at breast height (DBH) showed considerable variation among species. The maximum DBH was observed in *Ficus benghalensis* (555.44 cm), followed by *Tectona grandis* (250.35 cm) and *Ficus religiosa* (235 cm). The minimum DBH was recorded in *Moringa oleifera* (46.32 cm). Trees with larger girth were found to provide better structural support for roosting.

Roosting Height Pattern

Roosting height varied among tree species, ranging from 2.55 m to 11.4 m. The highest roosting height was recorded in *Syzygiumcumini* (11.4 m), followed by *Albizia saman* (11.01 m). Moderate roosting heights were observed in *Tectona grandis* (8.44 m), *Tamarindus indica* (8.23 m), and *Ficus benghalensis* (8.01 m). The lowest roosting height was recorded in *Moringa oleifera* (2.55 m).

Roost Tree Preference

Baesd on height, DBH, and roosting height, tree species such as *Albizia saman*, *Syzygiumcumini*, *Ficus benghalensis*, and *Tectona grandis*were found to be more suitable for roosting. These trees posses greater height and stronger branch structure, facilitating safe roosting. In contrast, tree species like *Moringa oleifera* and *Thespesia populnea*showed lower roosting heights and smaller girth, indicating reduced suitability for roosting.

Habitat Association

The presence of shrubs and grasses in the vicinity of roost trees indicates that peafowl prefer roosting sites near feeding grounds. This suggests that habitat structure plays an important role in roost site selection.

DISCUSSION

Roost site selection is an important ecological behavior that influences survival and predator avoidance in birds. In the present study, Indian Peafowl exhibited clear preference towards tall trees with greater structural strength, which is consistent with earlier findings that large birds prefer trees with strong branches and sufficient height for safe roosting. The preference for taller trees such as *Albizia saman* and Ficus religiosa may be attributed to increased protection from ground predators and better visibility of surroundings. Similarly, trees with higher DBH such as *Ficus benghalensis* provide strong and stable branches capable of supporting the weight of peafowl, thereby enhancing their suitability as roosting sites. Higher roosting heights observed in species like *syzygiumcumini* and *Albizia saman* indicate that peafowl prefer elevated perching positions. This behavior likely reduces predation risk and provides a strategic advantage in detecting threats. On the other hand, species like *Moringa oleifera*, which exhibited lower height and DBH, showed minimal roosting height, suggesting that such trees are less preferred due to structural limitations and increased vulnerability. The presence of diverse shrub and grass species in the study area indicates availability of feeding grounds near roosting sites. This support the observation that peafowl often select roost sites close to feeding areas, minimizing energy expenditure during daily movements. Overall, the study highlights that tree height, girth, and structural characteristics are the key factors influencing roost selection in Indian Peafowl. The findings are in agreement with previous studies which emphasize that tall trees with strong branches and suitable canopy structure are preferred for roosting.

The present study clearly indicates that roost tree selection by Indian Peafowl is strongly influences by structural characteristics of trees such as height, girth at breast height (DBH), and branch architecture. Large-bodies birds like peafowl require sturdy and elevated perching sites to ensure safety from predators and to facilitate easy take-off and landing. In the present study, tree species such as *Albizia saman*, *Syzygiumcumini*, and *Ficus benghalensis*were found to be highly preferred for roosting. These species are characterized by greater height and well-developed horizontal branches, which provide both stability and sufficient space for roosting. The high roosting observed in *Syzygiumcumini* (11.4 m) and *Albizia saman* (11.01 m) suggests that peafowl prefer elevated positions to reduce predation risk and improve visibility. Trees with larger DBH, particularly *Ficus benghalensis* (555.44 cm), offer strong and stable branches capable of supporting multiple individuals. This is consistent with earlier studies which reported that birds prefer trees with larger girth for communal roosting. Similarly, *Tectona grandis* and *Tamarindus indica* also showed moderate to high roosting heights, indicating their suitability as roosting trees. On the other hand, tree species such as *Moringa oleifera*exhibited the lowest roosting height (2.55 m) and minimal girth, making them less suitable for roosting. The weak branch structure and low height increase vulnerability to predators, thereby reducing their preference. Similarly, *Thespesia populnea*showed lower suitability due to its comparatively smaller size. Although some trees like *Ficus religiosa* and *Azadirachta indica*have considerable height, their branch structure and canopy characteristics may limit their use as preferred roosting sites. This indicates that not only height but also branch arrangement and canopy openness play a crucial role in roost selection.

CONCLUSION

The present study concludes that Indian Peafowl show clear preference for specific tree species based on structural characteristics. Trees with greater height, larger girth, and strong horizontal branches such as *Albizia saman*, *Syzygiumcumini*, and *Ficus benghalensis* are highly preferred for roosting. In contrast, trees with lower height and weaker structure such as *Moringa oleifera* are least preferred. The study also indicates that roosting sites are closely associated with feeding habitats, highlighting the importance of habitat structure in peafowl ecology. These findings are significant for conservation planning and habitat management, particularly in agricultural landscapes where maintaining suitable roost trees can support peafowl populations.

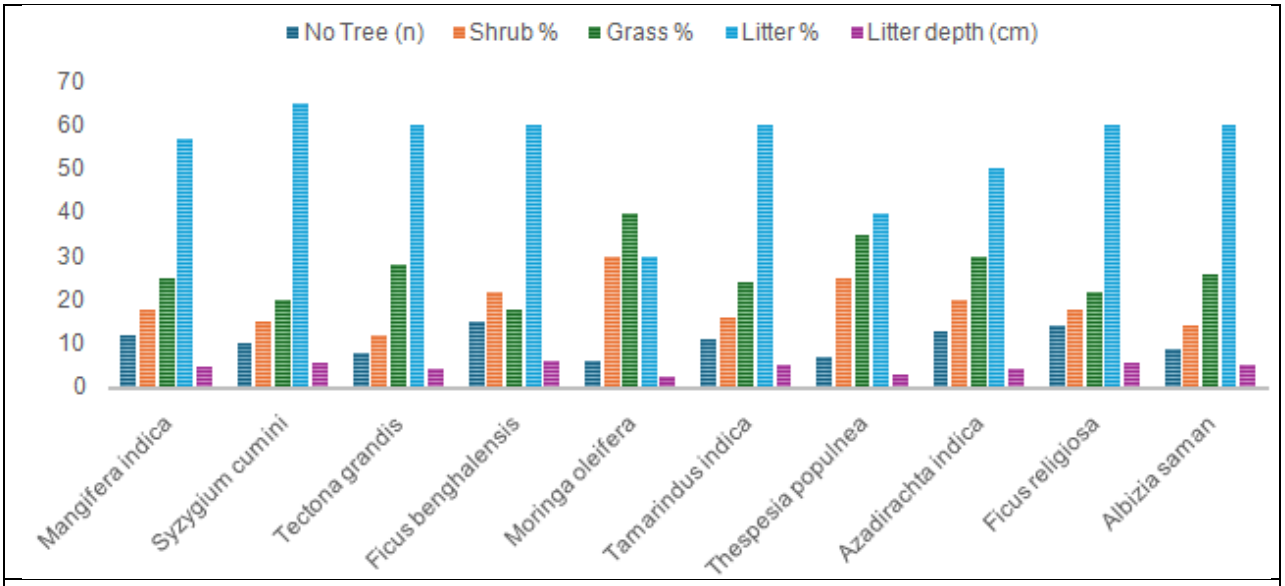
4	*Ficus benghalensis*	17.15	8.01
5	*Moringa oleifera*	8.55	2.55
6	*Tamarindus indica*	15.62	8.23
7	*Thespesia populnea*	9.42	4.43
8	*Azadirachta indica*	17.01	4.95
9	*Ficus religiosa*	26.1	4.1
10	*Albizia saman*	31	11.01

Mean ± SD

Average Tree Height: 17.14 ± 6.84 was observed in the study area.

Average Roosting Height: 6.69 ± 3.13 was observed in the study area.

Correlation coefficient (r) ≈ +0.58



"A moderate positive correlation (r = 0.58) was observed between tree height and roosting height, indicating that Indian Peafowl tend to select higher roosting positions in taller trees."
